British Pharmacopoeia 2022

Volume III

The British Pharmacopoeia Commission has caused this British Pharmacopoeia 2022 to be prepared under regulation 317(1) of the Human Medicines Regulations 2012 and, in accordance with regulation 317(4), the Ministers have arranged for it to be published.

The monographs of the Tenth Edition of the European Pharmacopoeia (2019), as amended by Supplements 10.1 to 10.5, published by the Council of Europe are reproduced either in this edition of the British Pharmacopoeia or in the associated edition of the British Pharmacopoeia (Veterinary).

Notices

Monographs of the European Pharmacopoeia are distinguished by a chaplet of stars against the title. The term European Pharmacopoeia, used without qualification, means the Tenth Edition of the European Pharmacopoeia comprising, unless otherwise stated, the main volume, published in 2019, as amended by any subsequent supplements and revisions.

Patents

In this Pharmacopoeia certain drugs and preparations have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent their inclusion in this Pharmacopoeia neither conveys, nor implies, licence to manufacture.

Effective dates

New and revised monographs of national origin enter into force on 1 January 2022. The monographs are brought into effect under regulation 320(2) of the Human Medicines Regulations 2012.

Monographs of the European Pharmacopoeia have previously been published by the European Directorate for the Quality of Medicines & HealthCare, in accordance with the Convention on the Elaboration of a European Pharmacopoeia, and have been brought into effect under the Human Medicines Regulations 2012, as amended, and the Veterinary Medicines Regulations 2013, as amended.

www.webofpharma.com

Part I

The British Pharmacopoeia comprises the entire text within this publication. The word 'official' is used in the Pharmacopoeia to signify 'of the Pharmacopoeia'. It applies to any title, substance, preparation, method or statement included in the general notices, monographs and appendices of the Pharmacopoeia. The abbreviation for British Pharmacopoeia is BP.

European Pharmacopoeia

Monographs of the European Pharmacopoeia are reproduced in this edition of the British Pharmacopoeia by incorporation of the text published under the direction of the Council of Europe (Partial Agreement) in accordance with the Convention on the Elaboration of a European Pharmacopoeia (Treaty Series No. 32 (1974) CMND 5763) as amended by the Protocol to the Convention (Treaty Series No. MISC16 (1990) CMND 1133). They are included for the convenience of users of the British Pharmacopoeia. In cases of doubt or dispute reference should be made to the Council of Europe text.

Monographs of the European Pharmacopoeia are distinguished by a chaplet of stars against the title and by reference to the European Pharmacopoeia monograph number included immediately below the title in italics. The beginning and end of text from the European Pharmacopoeia are denoted by means of horizontal lines with the symbol '*Ph Eur*' ranged left and right, respectively.

The general provisions of the European Pharmacopoeia relating to different types of dosage form are included in the appropriate general monograph in that section of the British Pharmacopoeia entitled Monographs: Formulated Preparations. These general provisions apply to all dosage forms of the type defined, whether or not an individual monograph is included in the British Pharmacopoeia. In addition, the provisions of the European Pharmacopoeia General Monograph for Pharmaceutical Preparations apply to all dosage forms, whether or not an individual monograph is included in the British Pharmacopoeia.

Texts of the European Pharmacopoeia are governed by the General Notices of the European Pharmacopoeia. These are reproduced as Part III of these notices.

www.webofpharma.com

Part II

The following general notices apply to the statements made in the monographs of the British Pharmacopoeia other than those reproduced from the European Pharmacopoeia and to the statements made in the Appendices of the British Pharmacopoeia other than when a method, test or other matter described in an appendix is invoked in a monograph reproduced from the European Pharmacopoeia.

Official Standards The requirements stated in the monographs of the Pharmacopoeia apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes. An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

A monograph is to be construed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this edition and that is applicable to that monograph. All statements contained in the monographs, except where a specific general notice indicates otherwise and with the exceptions given below, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated. This does not imply that a manufacturer is obliged to perform all the tests in a monograph in order to assess compliance with the Pharmacopoeia before release of a product. The manufacturer may assure himself that a product is of pharmacopoeial quality by other means, for example, from data derived from validation studies of the manufacturing process, from in-process controls or from a combination of the two. Parametric release in appropriate circumstances is thus not precluded by the need to comply with the Pharmacopoeia. The general notice on Assays and Tests indicates that analytical methods other than those described in the Pharmacopoeia may be employed for routine purposes.

Requirements in monographs have been framed to provide appropriate limitation of potential impurities rather than to provide against all possible impurities. Material found to contain an impurity not detectable by means of the prescribed tests is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

The status of any statement given under the headings Definition, Production, Characteristics, Storage, Labelling or Action and use is defined within the general notice relating to the relevant heading. In addition to any exceptions indicated by one of the general notices referred to above, the following parts of a monograph do not constitute standards: (a) a graphic or molecular formula given at the beginning of a monograph; (b) a molecular weight; (c) a Chemical Abstracts Service Registry Number; (d) any information given at the end of a monograph concerning impurities known to be limited by that monograph; (e) information in any annex to a

www.webofpharma.com

monograph. Any statement containing the word 'should' constitutes non-mandatory advice or recommendation.

The expression 'unless otherwise justified and authorised' means that the requirement in question has to be met, unless a competent authority authorises a modification or exemption where justified in a particular case. The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a licensing authority or an official control laboratory. For a formulated preparation that is the subject of monograph in the British Pharmacopoeia any justified and authorised modification to, or exemption from, the requirements of the relevant general monograph of the European Pharmacopoeia is stated in the individual monograph. For example, the general monograph for Tablets requires that Uncoated Tablets, except for chewable tablets, disintegrate within 15 minutes; for Calcium Lactate Tablets a time of 30 minutes is permitted.

Many of the general monographs for formulated preparations include statements and requirements additional to those of the European Pharmacopoeia that are applicable to the individual monographs of the British Pharmacopoeia. Such statements and requirements apply to all monographs for that dosage form included in the Pharmacopoeia unless otherwise indicated in the individual monograph.

Where a monograph on a biological substance or preparation refers to a strain, a test, a method, a substance, etc., using the qualifications 'suitable' or 'appropriate' without further definition in the text, the choice of such strain, test, method, substance, etc., is made in accordance with any international agreements or national regulations affecting the subject concerned.

Definition of Terms

Where the term 'about' is included in a monograph or test it should be taken to mean approximately (fairly correct or accurate; near to the actual value).

Where the term 'corresponds' is included in a monograph or test it should be taken to mean similar or equivalent in character or quantity.

Where the term 'similar' is included in a monograph or test it should be taken to mean alike though not necessarily identical.

Further qualifiers (such as numerical acceptance criteria) for the above terms are not included in the BP. The acceptance criteria for any individual case is set based on the range of results obtained from known reference samples, the level of precision of the equipment or apparatus used and the level of accuracy required for the particular application. The user should determine the variability seen in his/her own laboratory and set in-house acceptance criteria that he/she judges to be appropriate based on the local operating conditions.

Expression of Standards

Where the standard for the content of a substance described in a monograph is expressed in terms of the chemical formula for that substance an upper limit exceeding 100% may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0% and not more than 101.0% of $C_{20}H_{24}N_2O_2$,HCl' implies that the result of the assay is not less than 99.0% and not more than 101.0%, calculated in terms of the equivalent content of $C_{20}H_{24}N_2O_2$,HCl.

www.webofpharma.com

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous or ignited substance, the substance free from a specified solvent or to the peptide content, the determination of loss on drying, water content, loss on ignition, content of the specified solvent or peptide content is carried out by the method prescribed in the relevant test in the monograph.

Temperature The Celsius thermometric scale is used in expressing temperatures.

Weights and Measures The metric system of weights and measures is employed; SI Units have generally been adopted. Metric measures are required to have been graduated at 20° and all measurements involved in the analytical operations of the Pharmacopoeia are intended, unless otherwise stated, to be made at that temperature. Graduated glass apparatus used in analytical operations should comply with Class A requirements of the appropriate International Standard issued by the International Organization for Standardization. The abbreviation for litre is 'L' throughout the Pharmacopoeia.

Atomic Weights The atomic weights adopted are the values given in the Table of Relative Atomic Weights 2001 published by the International Union of Pure and Applied Chemistry (Appendix XXV).

Constant Weight The term 'constant weight', used in relation to the process of drying or the process of ignition, means that two consecutive weighings do not differ by more than 0.5 mg, the second weighing being made after an additional period of drying or ignition under the specified conditions appropriate to the nature and quantity of the residue (1 hour is usually suitable).

Expression of Concentrations The term 'per cent' or more usually the symbol '%' is used with one of four different meanings in the expression of concentrations according to circumstances. In order that the meaning to be attached to the expression in each instance is clear, the following notation is used:

Per cent w/w (% w/w) (percentage weight in weight) expresses the number of grams of solute in 100 g of product.

Per cent w/v (% w/v) (percentage weight in volume) expresses the number of grams of solute in 100 mL of product.

Per cent v/v (% v/v) (percentage volume in volume) expresses the number of millilitres of solute in 100 mL of product.

Per cent v/w (% v/w) (percentage volume in weight) expresses the number of millilitres of solute in 100 g of product.

Usually the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume and of gases in liquids as percentage weight in weight.

When the concentration of a solution is expressed as parts per million (ppm), it means weight in weight, unless otherwise specified.

When the concentration of a solution is expressed as parts of dissolved substance in parts of the solution, it means parts by weight (g) of a solid in parts by volume (mL) of the final solution; or parts by volume (mL) of a liquid in parts by volume (mL) of the final solution; or parts by weight (g) of a gas in parts by weight (g) of the final solution.

When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of

www.webofpharma.com

the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

Water Bath The term 'water bath' means a bath of boiling water, unless water at some other temperature is indicated in the text. An alternative form of heating may be employed providing that the required temperature is approximately maintained but not exceeded.

Reagents The reagents required for the assays and tests of the Pharmacopoeia are defined in appendices. The descriptions set out in the appendices do not imply that the materials are suitable for use in medicine.

Indicators Indicators, the colours of which change over approximately the same range of pH, may be substituted for one another but in the event of doubt or dispute as to the equivalence of indicators for a particular purpose, the indicator specified in the text is alone authoritative.

The quantity of an indicator solution appropriate for use in acid-base titrations described in assays or tests is 0.1 mL unless otherwise stated in the text.

Any solvent required in an assay or test in which an indicator is specified is previously neutralised to the indicator, unless a blank test is prescribed.

Caution Statements A number of materials described in the monographs and some of the reagents specified for use in the assays and tests of the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good laboratory practice and the provisions of any appropriate regulations such as those issued in the United Kingdom in accordance with the Health and Safety at Work *etc.* Act 1974 should be observed at all times in carrying out the assays and tests of the Pharmacopoeia.

Attention is drawn to particular hazards in certain monographs by means of an italicised statement; the absence of such a statement should not however be taken to mean that no hazard exists.

Titles Subsidiary titles, where included, have the same significance as the main titles. An abbreviated title constructed in accordance with the directions given in Appendix XXI A has the same significance as the main title.

Titles that are derived by the suitable inversion of words of a main or subsidiary title, with the addition of a preposition if appropriate, are also official titles. Thus, the following are all official titles: Aspirin Tablets, Tablets of Aspirin; Atropine Injection, Injection of Atropine.

A title of a formulated preparation that includes the full nonproprietary name of the active ingredient or ingredients, where this is not included in the title of the monograph, is also an official title. For example, the title Promethazine Hydrochloride Oral Solution has the same significance as Promethazine Oral Solution and the title Brompheniramine Maleate Tablets has the same significance as Brompheniramine Tablets.

Where the English title at the head of a monograph in the European Pharmacopoeia is different from that at the head of the text incorporated into the British Pharmacopoeia, an Approved Synonym has been created on the recommendation of the British Pharmacopoeia Commission. Approved Synonyms have the same significance as the main title and are thus official titles. A cumulative list of such Approved Synonyms is provided in Appendix XXI B.

www.webofpharma.com

Where the names of pharmacopoeial substances, preparations and other materials occur in the text they are printed with capital initial letters and this indicates that materials of Pharmacopoeial quality must be used. Words in the text that name a reagent or other material, a physical characteristic or a process that is described or defined in an appendix are printed in italic type, for example, *methanol*, *absorbance*, *gas chromatography*, and these imply compliance with the requirements specified in the appropriate appendix.

Chemical Formulae When the chemical composition of an official substance is known or generally accepted, the graphic and molecular formulae, the molecular weight and the Chemical Abstracts Service Registry Number are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statements of standards of purity and strength and in descriptions of processes of assay, it is evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

All amino acids, except glycine, have the L-configuration unless otherwise indicated. The three-letter and one-letter symbols used for amino acids in peptide and protein sequences are those recommended by the Joint Commission on Biochemical Nomenclature of the International Union of Pure and Applied Chemistry and the International Union of Biochemistry and Molecular Biology.

In the graphic formulae the following abbreviations are used:

Me	$-CH_3$	Bu^s	$-CH(CH_3)CH_2CH_3$
Et	$-CH_2CH_3$	Bu^n	$-CH_2CH_2CH_2CH_3$
Pr^i	$-CH(CH_3)_2$	Bu^t	$-C(CH_3)_3$
Pr^n	$-CH_2CH_2CH_3$	Ph	$-C_6H_5$
Bu^i	$-CH_2CH(CH_3)_2$	Ac	$-COCH_3$

Definition Statements given under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph. They constitute instructions or requirements and are mandatory in nature.

Certain medicinal or pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article *is* prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance *may be* prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are proscribed.

www.webofpharma.com

Additional statements concerning the definition of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

Production Statements given under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process itself and its validation and control, to in-process testing or to testing that is to be carried out by the manufacturer on the final product (bulk material or dosage form) either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final product by an independent analyst. The competent authority may establish that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection or by testing appropriate samples.

The absence of a section on Production does not imply that attention to features such as those referred to above is not required. A substance, preparation or article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with relevant international agreements and supranational and national regulations governing medicinal products.

Where in the section under the heading Production a monograph on a vaccine defines the characteristics of the vaccine strain to be used, any test methods given for confirming these characteristics are provided as examples of suitable methods. The use of these methods is not mandatory.

Additional statements concerning the production of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

Manufacture of Formulated Preparations Attention is drawn to the need to observe adequate hygienic precautions in the preparation and dispensing of pharmaceutical formulations. The principles of good pharmaceutical manufacturing practice should be observed.

The Definition in certain monographs for pharmaceutical preparations is given in terms of the principal ingredients only. Any ingredient, other than those included in the Definition, must comply with the general notice on Excipients and the product must conform with the Pharmacopoeial requirements.

The Definition in other monographs for pharmaceutical preparations is presented as a full formula. No deviation from the stated formula is permitted except those allowed by the general notices on Colouring Agents and Antimicrobial Preservatives. Where additionally directions are given under the heading Extemporaneous Preparation these are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the stated directions are permitted provided that the final product meets the following criteria:

(1) compliance with all of the requirements stated in the monograph;

www.webofpharma.com

(2) retention of the essential characteristics of the preparation made strictly in accordance with the directions of the Pharmacopoeia.

Monographs for yet other pharmaceutical preparations include both a Definition in terms of the principal ingredients and, under the side-heading Extemporaneous Preparation, a full formula together with, in some cases, directions for their preparation. Such full formulae and directions are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated formula and directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the formula and directions stated under the heading Extemporaneous Preparation are permitted provided that any ingredient, other than those included in the Definition, complies with the general notice on Excipients and that the final product meets the following criteria:

(1) accordance with the Definition stated in the monograph;

(2) compliance with all of the requirements stated in the monograph;

(3) retention of the essential characteristics of the preparation made strictly in accordance with the formula and directions of the Pharmacopoeia.

In the manufacture of any official preparation on a large scale with the intention that it should be stored, in addition to following any instruction under the heading Production, it is necessary to ascertain that the product is satisfactory with respect to its physical and chemical stability and its state of preservation over the claimed shelf-life. This applies irrespective of whether the formula of the Pharmacopoeia and any instructions given under the heading Extemporaneous Preparation are followed precisely or modified. Provided that the preparation has been shown to be stable in other respects, deterioration due to microbial contamination may be inhibited by the incorporation of a suitable antimicrobial preservative. In such circumstances the label states appropriate storage conditions, the date after which the product should not be used and the identity and concentration of the antimicrobial preservative.

Freshly and Recently Prepared The direction, given under the heading Extemporaneous Preparation, that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15° to 25°.

Methods of Sterilisation The methods of sterilisation used in preparing the sterile materials described in the Pharmacopoeia are given in Appendix XVIII. For aqueous preparations, steam sterilisation (heating in an autoclave) is the method of choice wherever it is known to be suitable. Any method of sterilisation must be validated with respect to both the assurance of sterility and the integrity of the product and to ensure that the final product complies with the requirements of the monograph.

Water The term water used without qualification in formulae for formulated preparations means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled Purified Water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.

www.webofpharma.com

Excipients Where an excipient for which there is a pharmacopoeial monograph is used in preparing an official preparation it shall comply with that monograph. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence on the therapeutic efficacy of the active ingredients and shall not interfere with the assays and tests of the Pharmacopoeia. Particular care should be taken to ensure that such substances are free from harmful organisms.

Colouring Agents If in a monograph for a formulated preparation defined by means of a full formula a specific colouring agent or agents is prescribed, suitable alternatives approved in the country concerned may be substituted.

Antimicrobial Preservatives When the term 'suitable antimicrobial preservative' is used it is implied that the preparation concerned will be effectively preserved according to the appropriate criteria applied and interpreted as described in the test for *efficacy of antimicrobial preservation* (Appendix XVI C). In certain monographs for formulated preparations defined by means of a full formula, a specific antimicrobial agent or agents may be prescribed; suitable alternatives may be substituted provided that their identity and concentration are stated on the label.

Characteristics Statements given under the heading Characteristics are not to be interpreted in a strict sense and are not to be regarded as official requirements. Statements on taste are provided only in cases where this property is a guide to the acceptability of the material (for example, a material used primarily for flavouring). The status of statements on solubility is given in the general notice on Solubility.

Solubility Statements on solubility given under the heading Characteristics are intended as information on the approximate solubility at a temperature between 15° and 25°, unless otherwise stated, and are not to be considered as official requirements.

Statements given under headings such as Solubility in ethanol express exact requirements and constitute part of the standards for the substances under which they occur.

The following table indicates the meanings of the terms used in statements of approximate solubilities.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute
very soluble	less than 1
freely soluble	from 1 to 10
soluble	from 10 to 30
sparingly soluble	from 30 to 100
slightly soluble	from 100 to 1000
very slightly soluble	from 1000 to 10 000
practically insoluble	more than 10 000

The term 'partly soluble' is used to describe a mixture of which only some of the components dissolve.

www.webofpharma.com

Identification The tests described or referred to under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material being examined is in accordance with the label on the container.

Unless otherwise prescribed, identification tests are carried out at a temperature between 15° and 25°.

Reference spectra Where a monograph refers to an infrared reference spectrum, this spectrum is provided in a separate section of the Pharmacopoeia. A sample spectrum is considered to be concordant with a reference spectrum if the transmission minima (absorption maxima) of the principal bands in the sample correspond in position, relative intensities and shape to those of the reference. Instrumentation software may be used to calculate concordance with a previously recorded reference spectrum.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

Assays and Tests The assays and tests described are the official methods upon which the standards of the Pharmacopoeia depend. The analyst is not precluded from employing alternative methods, including methods of micro-analysis, in any assay or test if it is known that the method used will give a result of equivalent accuracy. Local reference materials may be used for routine analysis, provided that these are calibrated against the official reference materials. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

Where the solvent used for a solution is not named, the solvent is Purified Water.

Unless otherwise prescribed, the assays and tests are carried out at a temperature between 15° and 25°.

A temperature in a test for Loss on drying, where no temperature range is given, implies a range of ±2° about the stated value.

Visual comparative tests, unless otherwise prescribed, are carried out using identical tubes of colourless, transparent, neutral glass with a flat base. The volumes of liquid prescribed are for use with tubes 16 mm in internal diameter; tubes with a larger internal diameter may be used but the volume of liquid examined must be increased so that the depth of liquid in the tubes is not less than that obtained when the prescribed volume of liquid and tubes 16 mm in internal diameter are used. Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background or, if necessary, against a black background. The examination is carried out in diffuse light.

Where a direction is given that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a direction is given that an analytical operation is to be carried out 'protected from light', precautions should be taken to exclude actinic light by the use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for an assay or test is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to

www.webofpharma.com

be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

In assays the approximate quantity to be taken for examination is indicated but the quantity actually used must not deviate by more than 10% from that stated. The quantity taken is accurately weighed or measured and the result of the assay is calculated from this exact quantity. Reagents are measured and the procedures are carried out with an accuracy commensurate with the degree of precision implied by the standard stated for the assay.

In tests the stated quantity to be taken for examination must be used unless any divergence can be taken into account in conducting the test and calculating the result. The quantity taken is accurately weighed or measured with the degree of precision implied by the standard or, where the standard is not stated numerically (for example, in tests for Clarity and colour of solution), with the degree of precision implied by the number of significant figures stated. Reagents are measured and the procedures are carried out with an accuracy commensurate with this degree of precision.

The limits stated in monographs are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The last figure is increased by 1 when the part rejected is equal to or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

In certain tests, the concentration of impurity is given in parentheses either as a percentage or in parts per million by weight (ppm). In chromatographic tests such concentrations are stated as a percentage irrespective of the limit. In other tests they are usually stated in ppm unless the limit exceeds 500 ppm. In those chromatographic tests in which a secondary spot or peak in a chromatogram obtained with a solution of the substance being examined is described as corresponding to a named impurity and is compared with a spot or peak in a chromatogram obtained with a reference solution of the same impurity, the percentage given in parentheses indicates the limit for that impurity. In those chromatographic tests in which a spot or peak in a chromatogram obtained with a solution of the substance being examined is described in terms other than as corresponding to a named impurity (commonly, for example, as any (other) *secondary spot* or *peak*) but is compared with a spot or peak in a chromatogram obtained with a reference solution of a named impurity, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the named impurity. In chromatographic tests in which a comparison is made between spots or peaks in chromatograms obtained with solutions of different concentrations of the substance being examined, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the medicinal substance itself. In some monographs, in particular those for certain formulated preparations, the impurity limit is expressed in terms of a nominal concentration of the active moiety rather than of the medicinal

www.webofpharma.com

substance itself. Where necessary for clarification the terms in which the limit is expressed are stated within the monograph.

In all cases where an impurity limit is given in parentheses, the figures given are approximations for information only; conformity with the requirements is determined on the basis of compliance or otherwise with the stated test.

The use of a proprietary designation to identify a material used in an assay or test does not imply that another equally suitable material may not be used.

Biological Assays and Tests

Methods of assay described as Suggested methods are not obligatory, but when another method is used its precision must be not less than that required for the Suggested method.

For those antibiotics for which the monograph specifies a microbiological assay the potency requirement is expressed in the monograph in International Units (IU) per milligram. The material is not of pharmacopoeial quality if the upper fiducial limit of error is less than the stated potency. For such antibiotics the required precision of the assay is stated in the monograph in terms of the fiducial limits of error about the estimated potency.

For other substances and preparations for which the monograph specifies a biological assay, unless otherwise stated, the precision of the assay is such that the fiducial limits of error, expressed as a percentage of the estimated potency, are within a range not wider than that obtained by multiplying by a factor of 10 the square roots of the limits given in the monograph for the fiducial limits of error about the stated potency.

In all cases fiducial limits of error are based on a probability of 95% ($P = 0.95$).

Where the biological assay is being used to ascertain the purity of the material, the stated potency means the potency stated on the label in terms of International Units (IU) or other Units per gram, per milligram or per millilitre. When no such statement appears on the label, the stated potency means the fixed or minimum potency required in the monograph. This interpretation of stated potency applies in all cases except where the monograph specifically directs otherwise.

Where the biological assay is being used to determine the total activity in the container, the stated potency means the total number of International Units (IU) or other Units stated on the label or, if no such statement appears, the total activity calculated in accordance with the instructions in the monograph.

Wherever possible the primary standard used in an assay or test is the respective International Standard or Reference Preparation established by the World Health Organization for international use and the biological activity is expressed in International Units (IU).

In other cases, where Units are referred to in an assay or test, the Unit for a particular substance or preparation is, for the United Kingdom, the specific biological activity contained in such an amount of the respective primary standard as the appropriate international or national organisation indicates. The necessary information is provided with the primary standard.

Unless otherwise directed, animals used in an assay or a test are healthy animals, drawn from a uniform stock, that have not previously been treated with any material that will interfere with the assay or test. Unless otherwise stated, guinea-pigs weigh not less than 250 g or, when used in systemic

www.webofpharma.com

toxicity tests, not less than 350 g. When used in skin tests they are white or light coloured. Unless otherwise stated, mice weigh not less than 17 g and not more than 22 g.

Certain of the biological assays and tests of the Pharmacopoeia are such that in the United Kingdom they may be carried out only in accordance with the Animals (Scientific Procedures) Act 1986. Instructions included in such assays and tests in the Pharmacopoeia, with respect to the handling of animals, are therefore confined to those concerned with the accuracy and reproducibility of the assay or test.

Reference Substances and Reference Preparations

Certain monographs require the use of a reference substance, a reference preparation or a reference spectrum. These are chosen with regard to their intended use as prescribed in the monographs of the Pharmacopoeia and are not necessarily suitable in other circumstances.

Any information necessary for proper use of the reference substance or reference preparation is given on the label or in the accompanying leaflet or brochure. Where no drying conditions are stated in the leaflet or on the label, the substance is to be used as received. No certificate of analysis or other data not relevant to the prescribed use of the product are provided. The products are guaranteed to be suitable for use for a period of three months from dispatch when stored under the appropriate conditions. The stability of the contents of opened containers cannot be guaranteed. The current lot is listed in the BP Laboratory website catalogue. Additional information is provided in Supplementary Chapter III E.

Chemical Reference Substances The abbreviation BPCRS indicates a Chemical Reference Substance established by the British Pharmacopoeia Commission. The abbreviation CRS or EPCRS indicates a Chemical Reference Substance established by the European Pharmacopoeia Commission. Some Chemical Reference Substances are used for the microbiological assay of antibiotics and their activity is stated, in International Units, on the label or on the accompanying leaflet and defined in the same manner as for Biological Reference Preparations.

Biological Reference Preparations The majority of the primary biological reference preparations referred to are the appropriate International Standards and Reference Preparations established by the World Health Organisation. Because these reference materials are usually available only in limited quantities, the European Pharmacopoeia has established Biological Reference Preparations (indicated by the abbreviation BRP or EPBRP) where appropriate. Where applicable, the potency of the Biological Reference Preparations is expressed in International Units. For some Biological Reference Preparations, where an international standard or reference preparation does not exist, the potency is expressed in European Pharmacopoeia Units.

Storage

Statements under the side-heading Storage constitute non-mandatory advice. The substances and preparations described in the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Unless otherwise stated in the monograph, the substances and preparations described in the Pharmacopoeia are kept in well-closed containers and stored at a temperature not exceeding 25°. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in

www.webofpharma.com

the monographs. Further precautions may be necessary when some materials are stored in tropical climates or under other severe conditions.

The expression 'protected from moisture' means that the product is to be stored in an airtight container. Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

The expression 'protected from light' means that the product is to be stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light or in a container enclosed in an outer cover that provides such protection or stored in a place from which all such light is excluded.

The expression 'tamper-evident container' means a closed container fitted with a device that reveals irreversibly whether the container has been opened.

Labelling The labelling requirements of the Pharmacopoeia are not comprehensive, and the provisions of regulations issued in accordance with the requirements of the territory in which the medicinal product is to be used should be met.

Licensed medicines intended for use within the United Kingdom must comply with the requirements of the Human Medicines Regulations 2012, as amended, in respect of their labelling and packaging leaflets, together with those regulations for the labelling of hazardous materials.

Best practice guidance on the labelling and packaging of medicines for use in the United Kingdom advises that certain items of information are deemed critical for the safe use of the medicine (see "Best Practice Guidance on the Labelling and Packaging of Medicines" issued by the MHRA, 2012). Further information and guidance on the labelling of medicinal products can be found in Supplementary Chapter I G.

Such matters as the exact form of wording to be used and whether a particular item of information should appear on the primary label and additionally, or alternatively, on the package or exceptionally in a leaflet are, in general, outside the scope of the Pharmacopoeia. When the term 'label' is used in Labelling statements of the Pharmacopoeia, decisions as to where the particular statement should appear should therefore be made in accordance with relevant legislation.

The label of every official formulated preparation other than those of fixed strength also states the content of the active ingredient or ingredients expressed in the terms required by the monograph. Where the content of active ingredient is required to be expressed in terms other than the weight of the official medicinal substance used in making the formulation, this is specifically stated under the heading Labelling. Unless otherwise stated in the monograph, the content of the active ingredient is expressed in terms of the official medicinal substance used in making the formulation.

These requirements do not necessarily apply to unlicensed preparations supplied in accordance with a prescription. For requirements for unlicensed medicines see the general monograph on Unlicensed Medicines.

Action and Use The statements given under this heading in monographs are intended only as information on the principal pharmacological actions or the uses of the materials in medicine or pharmacy. It should not be assumed that the

www.webofpharma.com

substance has no other action or use. The statements are not intended to be binding on prescribers or to limit their discretion.

Crude Drugs; Traditional Herbal and Complementary Medicines

Herbal and complementary medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the monograph to assist the registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in traditional use.

Monograph Title For traditional herbal medicines, the monograph title is a combination of the binomial name together with a description of use. Monographs for the material that has not been processed (the herbal drug) and the processed material (the herbal drug preparation) are published where possible. To distinguish between the two, the word 'Processed' is included in the relevant monograph title.

Definition Under the heading Definition, the botanical name together with any synonym is given. Where appropriate, for material that has not been processed, information on the collection/harvesting and/or treatment/drying of the whole herbal drug may be given. For processed materials, the method of processing, where appropriate, will normally be given in a separate section.

Characteristics References to odour are included only where this is highly characteristic. References to taste are not included.

Control methods Where applicable, the control methods to be used in monographs are:

(a) macroscopical and microscopical descriptions and chemical/chromatographic tests for identification
(b) tests for absence of any related species
(c) microbial test to assure microbial quality
(d) tests for inorganic impurities and non-specific purity tests, including extractive tests, Sulfated ash and Heavy metals, where appropriate
(e) test for Loss on drying or Water
(f) wherever possible, a method for assaying the active constituent(s) or suitable marker constituent(s).

The macroscopical characteristics include those features that can be seen by the unaided eye or by the use of a hand lens. When two species/subspecies of the same plant are included in the Definition, individual differences between the two are indicated where possible.

The description of the microscopical characteristics of the powdered drug includes information on the dominant or the most specific characters. Where it is considered to be an aid to identification, illustrations of the powdered drug may be provided.

The following aspects are controlled by the general monograph for Herbal Drugs: they are required to be free from moulds, insects, decay, animal matter and animal excreta. Unless otherwise prescribed the amount of foreign matter is not more than 2% w/w. Microbial contamination should be minimal.

In determining the content of the active constituents or the suitable marker substances measurements are made with reference to the dried or anhydrous herbal drug. In the tests for Acid-insoluble ash, Ash, Extractive soluble in ethanol, Loss on drying, Sulfated ash, Water, Water-soluble ash and Water-soluble extractive of herbal drugs, the calculations are made with

www.webofpharma.com

reference to the herbal drug that has not been specifically dried unless otherwise prescribed in the monograph.

Homoeopathic Medicines

Homoeopathic medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the relevant monograph in order to assist the simplified registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in use.

All materials used for the production of homoeopathic medicines, including excipients, must comply with European Pharmacopoeia or British Pharmacopoeia monographs for those materials. Where such European Pharmacopoeia or British Pharmacopoeia monographs do not exist, each material used for the production of homoeopathic medicines must comply with an official national pharmacopoeia of a Member State.

British Pharmacopoeia monographs for homoeopathic medicines apply to homoeopathic stocks and mother tinctures only, but may be prefaced by a section which details the quality requirements applicable to the principle component where there is no European Pharmacopoeia or British Pharmacopoeia monograph for the material. These monographs also include either general statements on the methods of preparation or refer to specific methods of preparation given in the European Pharmacopoeia. Homoeopathic stocks and mother tinctures undergo the further process referred to as potentisation. Potentisation is a term specific to homoeopathic medicine and is a process of dilution of stocks and mother tinctures to produce the final product.

Identification tests are established for the components in homoeopathic stocks and usually relate to those applied to the materials used in the production of the homoeopathic stocks. An assay is included for the principal component(s) where possible. For mother tinctures, an identification test, usually chromatographic, is established and, where applicable, an assay for the principle component(s); where appropriate, other tests, related to the solvent, dry matter or known adulterants, are included.

Specifications have not been set for final homoeopathic products due to the high dilution used in their preparation and the subsequent difficulty in applying analytical methodology.

Statements under Crude Drugs; Traditional Herbal and Complementary Medicines also apply to homoeopathic stocks and mother tinctures, when appropriate.

Unlicensed Medicines

The General Monograph for Unlicensed Medicines applies to those formulations used in human medicine that are prepared under a Manufacturer's 'Specials' Licence or prepared extemporaneously under the supervision of a pharmacist, whether or not there is a published monograph for the specific dosage form.

An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

Unlicensed medicines that are prepared under a Manufacturer's 'Specials' Licence comply with the requirements of the General Monograph

www.webofpharma.com

for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form.

Unlicensed medicines prepared extemporaneously under the supervision of a pharmacist comply with the requirements of the General Monograph for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form. While it is expected that extemporaneous preparations will demonstrate pharmacopoeial compliance when tested, it is recognised that it might not be practicable to carry out the pharmacopoeial tests routinely on such formulations. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

www.webofpharma.com

Part III

Monographs and other texts of the European Pharmacopoeia that are incorporated in this edition of the British Pharmacopoeia are governed by the general notices of the European Pharmacopoeia; these are reproduced below.

GENERAL NOTICES OF THE EUROPEAN PHARMACOPOEIA

1.1. GENERAL STATEMENTS

The General Notices apply to all monographs and other texts of the European Pharmacopoeia.

The official texts of the European Pharmacopoeia are published in English and French. Translations in other languages may be prepared by the signatory States of the European Pharmacopoeia Convention. In case of doubt or dispute, the English and French versions are alone authoritative.

In the texts of the European Pharmacopoeia, the word 'Pharmacopoeia' without qualification means the European Pharmacopoeia. The official abbreviation Ph. Eur. may be used to indicate the European Pharmacopoeia.

The use of the title or the subtitle of a monograph implies that the article complies with the requirements of the relevant monograph. Such references to monographs in the texts of the Pharmacopoeia are shown using the monograph title and reference number in *italics*.

A preparation must comply throughout its period of validity; a distinct period of validity and/or specifications for opened or broached containers may be decided by the competent authority. The subject of any other monograph must comply throughout its period of use. The period of validity that is assigned to any given article and the time from which that period is to be calculated are decided by the competent authority in light of experimental results of stability studies.

Unless otherwise indicated in the General Notices or in the monographs, statements in monographs constitute mandatory requirements. General chapters become mandatory when referred to in a monograph, unless such reference is made in a way that indicates that it is not the intention to make the text referred to mandatory but rather to cite it for information.

The active substances, excipients, pharmaceutical preparations and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses).

Quality systems The quality standards represented by monographs are valid only where the articles in question are produced within the framework of a suitable quality system. The quality system must assure that the articles consistently meet the requirements of the Pharmacopoeia.

Alternative methods The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. With the agreement of the competent authority, alternative methods of analysis may be used for control purposes, provided that the methods used enable an unequivocal decision to be made as to whether compliance with the standards of the

www.webofpharma.com

monographs would be achieved if the official methods were used. In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative.

Demonstration of compliance with the Pharmacopoeia

(1) An article is not of Pharmacopoeia quality unless it complies with all the requirements stated in the monograph. This does not imply that performance of all the tests in a monograph is necessarily a prerequisite for a manufacturer in assessing compliance with the Pharmacopoeia before release of a product. The manufacturer may obtain assurance that a product is of Pharmacopoeia quality on the basis of its design, together with its control strategy and data derived, for example, from validation studies of the manufacturing process.

(2) An enhanced approach to quality control could utilise process analytical technology (PAT) and/or real-time release testing (including parametric release) strategies as alternatives to end-product testing alone. Real-time release testing in circumstances deemed appropriate by the competent authority is thus not precluded by the need to comply with the Pharmacopoeia.

(3) Reduction of animal testing: the European Pharmacopoeia is dedicated to phasing out the use of animals for test purposes, in accordance with the 3Rs (Replacement, Reduction, Refinement) set out in the European Convention for the Protection of Vertebrate Animals used for Experimental and Other Scientific Purposes. In demonstrating compliance with the Pharmacopoeia as indicated above (1), manufacturers may consider establishing additional systems to monitor consistency of production. With the agreement of the competent authority, the choice of tests performed to assess compliance with the Pharmacopoeia when animal tests are prescribed is established in such a way that animal usage is minimised as much as possible.

Grade of materials

Certain materials that are the subject of a pharmacopoeial monograph may exist in different grades suitable for different purposes. Unless otherwise indicated in the monograph, the requirements apply to all grades of the material. In some monographs, particularly those on excipients, a list of functionality-related characteristics that are relevant to the use of the substance may be appended to the monograph for information. Test methods for determination of one or more of these characteristics may be given, also for information.

General monographs

Substances and preparations that are the subject of an individual monograph are also required to comply with relevant, applicable general monographs. Cross-references to applicable general monographs are not normally given in individual monographs.

General monographs apply to all substances and preparations within the scope of the Definition section of the general monograph, except where a preamble limits the application, for example to substances and preparations that are the subject of a monograph of the Pharmacopoeia.

General monographs on dosage forms apply to all preparations of the type defined. The requirements are not necessarily comprehensive for a given specific preparation and requirements additional to those prescribed in the general monograph may be imposed by the competent authority.

www.webofpharma.com

General monographs and individual monographs are complementary. If the provisions of a general monograph do not apply to a particular product, this is expressly stated in the individual monograph.

Validation of pharmacopoeial methods The test methods given in monographs and general chapters have been validated in accordance with accepted scientific practice and current recommendations on analytical validation. Unless otherwise stated in the monograph or general chapter, validation of the test methods by the analyst is not required.

Implementation of pharmacopoeial methods When implementing a pharmacopoeial method, the user must assess whether and to what extent the suitability of the method under the actual conditions of use needs to be demonstrated according to relevant monographs, general chapters and quality systems.

Conventional terms The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a national pharmacopoeia authority, a licensing authority or an official control laboratory.

The expression 'unless otherwise justified and authorised' means that the requirements have to be met, unless the competent authority authorises a modification or an exemption where justified in a particular case.

Statements containing the word 'should' are informative or advisory.

In certain monographs or other texts, the terms 'suitable' and 'appropriate' are used to describe a reagent, micro-organism, test method etc.; if criteria for suitability are not described in the monograph, suitability is demonstrated to the satisfaction of the competent authority.

Medicinal product (a) Any substance or combination of substances presented as having properties for treating or preventing disease in human beings and/or animals; or (b) any substance or combination of substances that may be used in or administered to human beings and/or animals with a view either to restoring, correcting or modifying physiological functions by exerting a pharmacological, immunological or metabolic action, or to making a medical diagnosis.

Herbal medicinal product Any medicinal product, exclusively containing as active ingredients one or more herbal drugs or one or more herbal drug preparations, or one or more such herbal drugs in combination with one or more such herbal drug preparations.

Active substance Any substance intended to be used in the manufacture of a medicinal product and that, when so used, becomes an active ingredient of the medicinal product. Such substances are intended to furnish a pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment or prevention of disease, or to affect the structure and function of the body.

Excipient (auxiliary substance). Any constituent of a medicinal product that is not an active substance. Adjuvants, stabilisers, antimicrobial preservatives, diluents, antioxidants, for example, are excipients.

Interchangeable methods Certain general chapters contain a statement that the text in question is harmonised with the corresponding text of the Japanese Pharmacopoeia and/or the United States Pharmacopeia and that these texts are interchangeable. This implies that if a substance or preparation is found to

www.webofpharma.com

comply with a requirement using an interchangeable method from one of these pharmacopoeias it complies with the requirements of the European Pharmacopoeia. In the event of doubt or dispute, the text of the European Pharmacopoeia is alone authoritative.

References to regulatory documents Monographs and general chapters may contain references to documents issued by regulatory authorities for medicines, for example directives and notes for guidance of the European Union. These references are provided for information for users for the Pharmacopoeia. Inclusion of such a reference does not modify the status of the documents referred to, which may be mandatory or for guidance.

1.2. OTHER PROVISIONS APPLYING TO GENERAL CHAPTERS AND MONOGRAPHS

Quantities In tests with numerical limits and assays, the quantity stated to be taken for examination is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result is calculated from this exact quantity. In tests where the limit is not numerical, but usually depends upon comparison with the behaviour of a reference substance in the same conditions, the stated quantity is taken for examination. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision corresponds to plus or minus 5 units after the last figure stated (for example, 0.25 g is to be interpreted as 0.245 g to 0.255 g). For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero (for example, 10.0 mL or 0.50 mL), the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; otherwise, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

It is recognised, however, that in certain cases the precision with which quantities are stated does not correspond to the number of significant figures stated in a specified numerical limit. The weighings and measurements are then carried out with a sufficiently improved accuracy.

Apparatus and procedures Volumetric glassware complies with Class A requirements of the appropriate International Standard issued by the International Organisation for Standardisation.

Unless otherwise prescribed, analytical procedures are carried out at a temperature between 15 °C and 25 °C.

Unless otherwise prescribed, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base; the volumes of liquid prescribed are for use with tubes having an internal diameter of 16 mm, but tubes with a larger internal diameter may be used provided the volume of liquid used is adjusted (*2.1.5*). Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background, or if necessary against a black background. The examination is carried out in diffuse light.

Any solvent required in a test or assay in which an indicator is to be used is previously neutralised to the indicator, unless a blank test is prescribed.

www.webofpharma.com

Water-bath The term 'water-bath' means a bath of boiling water unless water at another temperature is indicated. Other methods of heating may be substituted provided the temperature is near to but not higher than 100 °C or the indicated temperature.

Drying and ignition to constant mass The terms 'dried to constant mass' and 'ignited to constant mass' mean that 2 consecutive weighings do not differ by more than 0.5 mg, the 2nd weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.

Where drying is prescribed using one of the expressions 'in a desiccator' or '*in vacuo*', it is carried out using the conditions described in chapter *2.2.32. Loss on drying*.

Reagents The proper conduct of the analytical procedures described in the Pharmacopoeia and the reliability of the results depend, in part, upon the quality of the reagents used. The reagents are described in general chapter 4. It is assumed that reagents of analytical grade are used; for some reagents, tests to determine suitability are included in the specifications.

Solvents Where the name of the solvent is not stated, the term 'solution' implies a solution in water.

Where the use of water is specified or implied in the analytical procedures described in the Pharmacopoeia or for the preparation of reagents, water complying with the requirements of the monograph *Purified water (0008)* is used, except that for many purposes the requirements for bacterial endotoxins (*Purified water in bulk*) and microbial contamination (*Purified water in containers*) are not relevant. The term 'distilled water' indicates purified water prepared by distillation.

The term 'ethanol' without qualification means anhydrous ethanol. The term 'alcohol' without qualification means ethanol (96 per cent). Other dilutions of ethanol are indicated by the term 'ethanol' or 'alcohol' followed by a statement of the percentage by volume of ethanol (C_2H_6O) required.

Expression of content In defining content, the expression 'per cent' is used according to circumstances with one of 2 meanings:

— per cent *m/m* (percentage, mass in mass) expresses the number of grams of substance in 100 g of final product;

— per cent *V/V* (percentage, volume in volume) expresses the number of millilitres of substance in 100 mL of final product.

The expression 'parts per million' (or ppm) refers to mass in mass, unless otherwise specified.

Temperature Where an analytical procedure describes temperature without a figure, the general terms used have the following meaning:

— in a deep-freeze: below −15 °C;

— in a refrigerator: 2 °C to 8 °C;

— cold or cool: 8 °C to 15 °C;

— room temperature: 15 °C to 25 °C.

1.3. GENERAL CHAPTERS

Containers Materials used for containers are described in general chapter *3.1*. General names used for materials, particularly plastic materials, each cover a range

www.webofpharma.com

of products varying not only in the properties of the principal constituent but also in the additives used. The test methods and limits for materials depend on the formulation and are therefore applicable only for materials whose formulation is covered by the preamble to the specification. The use of materials with different formulations, and the test methods and limits applied to them, are subject to agreement by the competent authority.

The specifications for containers in general chapter *3.2* have been developed for general application to containers of the stated category, but in view of the wide variety of containers available and possible new developments, the publication of a specification does not exclude the use, in justified circumstances, of containers that comply with other specifications, subject to agreement by the competent authority.

Reference may be made within the monographs of the Pharmacopoeia to the definitions and specifications for containers provided in chapter *3.2. Containers*. The general monographs for pharmaceutical dosage forms may, under the heading Definition/Production, require the use of certain types of container; certain other monographs may, under the heading Storage, indicate the type of container that is recommended for use.

1.4. MONOGRAPHS

Titles Monograph titles are in English and French in the respective versions and there is a Latin subtitle.

Relative Atomic And Molecular Masses The relative atomic mass (A_r) or the relative molecular mass (M_r) is shown, as and where appropriate, at the beginning of each monograph. The relative atomic and molecular masses and the molecular and graphic formulae do not constitute analytical standards for the substances described.

Chemical Abstracts Service (CAS) Registry Number CAS registry numbers are included for information in monographs, where applicable, to provide convenient access to useful information for users. CAS Registry Number® is a registered trademark of the American Chemical Society.

Definition Statements under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph.

Limits of content Where limits of content are prescribed, they are those determined by the method described under Assay.

Herbal drugs In monographs on herbal drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form. Where a monograph applies to the drug in several states, for example both to the whole drug and the drug in powdered form, the definition states this.

Production Statements under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory requirements for manufacturers, unless otherwise stated. They may relate, for example, to source materials; to the manufacturing process itself and its validation and control; to in-process testing; or to testing that is to be carried out by the manufacturer on the final article, either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final article by an independent analyst. The competent authority may establish

www.webofpharma.com

that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection of manufacture or by testing appropriate samples.

The absence of a Production section does not imply that attention to features such as those referred to above is not required.

Choice of vaccine strain, Choice of vaccine composition The Production section of a monograph may define the characteristics of a vaccine strain or vaccine composition. Unless otherwise stated, test methods given for verification of these characteristics are provided for information as examples of suitable methods. Subject to approval by the competent authority, other test methods may be used without validation against the method shown in the monograph.

Potential Adulteration Due to the increasing number of fraudulent activities and cases of adulteration, information may be made available to Ph. Eur. users to help detect adulterated materials (i.e. active substances, excipients, intermediate products, bulk products and finished products).

To this purpose, a method for the detection of potential adulterants and relevant limits, together with a reminder that all stages of production and sourcing are subjected to a suitable quality system, may be included in this section of monographs on substances for which an incident has occurred or that present a risk of deliberate contamination. The frequency of testing by manufacturers or by users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant) depends on a risk assessment, taking into account the level of knowledge of the whole supply chain and national requirements.

This section constitutes requirements for the whole supply chain, from manufacturers to users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant). The absence of this section does not imply that attention to features such as those referred to above is not required.

Characters The statements under the heading Characters are not to be interpreted in a strict sense and are not requirements.

Solubility In statements of solubility in the Characters section, the terms used have the following significance, referred to a temperature between 15 °C and 25 °C.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute			
Very soluble	less than	1		
Freely soluble	from	1	to	10
Soluble	from	10	to	30
Sparingly soluble	from	30	to	100
Slightly soluble	from	100	to	1000
Very slightly soluble	from	1000	to	10 000
Practically insoluble	more than			10 000

The term 'partly soluble' is used to describe a mixture where only some of the components dissolve. The term 'miscible' is used to describe a liquid that is miscible in all proportions with the stated solvent.

www.webofpharma.com

Identification

Scope The tests given in the Identification section are not designed to give a full confirmation of the chemical structure or composition of the product; they are intended to give confirmation, with an acceptable degree of assurance, that the article conforms to the description on the label.

First and second identifications Certain monographs have subdivisions entitled 'First identification' and 'Second identification'. The test or tests that constitute the 'First identification' may be used in all circumstances. The test or tests that constitute the 'Second identification' may be used in pharmacies provided it can be demonstrated that the substance or preparation is fully traceable to a batch certified to comply with all the other requirements of the monograph.

Certain monographs give two or more sets of tests for the purpose of the first identification, which are equivalent and may be used independently. One or more of these sets usually contain a cross-reference to a test prescribed in the Tests section of the monograph. It may be used to simplify the work of the analyst carrying out the identification and the prescribed tests. For example, one identification set cross-refers to a test for enantiomeric purity while the other set gives a test for specific optical rotation: the intended purpose of the two is the same, that is, verification that the correct enantiomer is present.

Powdered herbal drugs Monographs on herbal drugs may contain schematic drawings of the powdered drug. These drawings complement the description given in the relevant identification test.

Tests And Assays

Scope The requirements are not framed to take account of all possible impurities. It is not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated if common sense and good pharmaceutical practice require that it be absent. See also below under Impurities.

Calculation Where the result of a test or assay is required to be calculated with reference to the dried or anhydrous substance or on some other specified basis, the determination of loss on drying, water content or other property is carried out by the method prescribed in the relevant test in the monograph. The words 'dried substance' or 'anhydrous substance' etc. appear in parentheses after the result. Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for the calculation of the assay content of the substance, the specific optical rotation and the specific absorbance. No further indication is given in the specific monograph.

Limits The limits prescribed are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and compounding and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The limits, regardless of whether the values are expressed as percentages or as absolute values, are considered significant to the last digit shown (for example 140 indicates 3 significant figures). The last figure of the result is increased by one when the part rejected is equal to

www.webofpharma.com

or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

Indication of permitted limit of impurities The acceptance criteria for related substances are expressed in monographs either in terms of comparison of peak areas (comparative tests) or as numerical values. For comparative tests, the approximate content of impurity tolerated, or the sum of impurities, may be indicated in brackets for information only. Acceptance or rejection is determined on the basis of compliance or non-compliance with the stated test. If the use of a reference substance for the named impurity is not prescribed, this content may be expressed as a nominal concentration of the substance used to prepare the reference solution specified in the monograph, unless otherwise described.

Herbal Drugs For herbal drugs, the sulfated ash, total ash, water-soluble matter, alcohol-soluble matter, water content, content of essential oil and content of active principle are calculated with reference to the drug that has not been specially dried, unless otherwise prescribed in the monograph.

Equivalents Where an equivalent is given, for the purposes of the Pharmacopoeia only the figures shown are to be used in applying the requirements of the monograph.

Culture media The culture media described in monographs and general chapters have been found to be satisfactory for the intended purpose. However, the components of media, particularly those of biological origin, are of variable quality, and it may be necessary for optimal performance to modulate the concentration of some ingredients, notably:

— peptones and meat or yeast extracts, with respect to their nutritive properties;
— buffering substances;
— bile salts, bile extract, deoxycholate, and colouring matter, depending on their selective properties;
— antibiotics, with respect to their activity.

Storage The information and recommendations given under the heading Storage do not constitute a pharmacopoeial requirement but the competent authority may specify particular storage conditions that must be met.

The articles described in the Pharmacopoeia are stored in such a way as to prevent contamination and, as far as possible, deterioration. Where special conditions of storage are recommended, including the type of container (see section 1.3. General chapters) and limits of temperature, they are stated in the monograph.

The following expressions are used in monographs under Storage with the meaning shown.

In an airtight container Means that the product is stored in an airtight container (*3.2*). Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

Protected from light Means that the product is stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light, or in a container enclosed in an outer cover that provides such protection, or is stored in a place from which all such light is excluded.

www.webofpharma.com

Labelling In general, labelling of medicines is subject to supranational and national regulation and to international agreements. The statements under the heading Labelling are not therefore comprehensive and, moreover, for the purposes of the Pharmacopoeia only those statements that are necessary to demonstrate compliance or non-compliance with the monograph are mandatory. Any other labelling statements are included as recommendations. When the term 'label' is used in the Pharmacopoeia, the labelling statements may appear on the container, the package, a leaflet accompanying the package, or a certificate of analysis accompanying the article, as decided by the competent authority.

Warnings Materials described in monographs and reagents specified for use in the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good quality control laboratory practice and the provisions of any appropriate regulations are to be observed at all times. Attention is drawn to particular hazards in certain monographs by means of a warning statement; absence of such a statement is not to be taken to mean that no hazard exists.

Impurities A list of all known and potential impurities that have been shown to be detected by the tests in a monograph may be given. See also chapter *5.10. Control of impurities in substances for pharmaceutical use.* The impurities are designated by a letter or letters of the alphabet. Where a letter appears to be missing, the impurity designated by this letter has been deleted from the list during monograph development prior to publication or during monograph revision.

Functionality-related Characteristics of Excipients Monographs on excipients may have a section on functionality-related characteristics. The characteristics, any test methods for determination and any tolerances are not mandatory requirements; they may nevertheless be relevant for use of the excipient and are given for information (see also section 1.1. General statements).

Reference Standards Certain monographs require the use of reference standards (chemical reference substances, herbal reference standards, biological reference preparations, reference spectra). See also chapter *5.12. Reference standards.* The European Pharmacopoeia Commission establishes the official reference standards, which are alone authoritative in case of arbitration. These reference standards are available from the European Directorate for the Quality of Medicines & HealthCare (EDQM). Information on the available reference standards and a batch validity statement can be obtained via the EDQM website.

1.5. ABBREVIATIONS AND SYMBOLS

A	Absorbance	mp	Melting point
$A_{1\,cm}^{1\%}$	Specific absorbance	n_D^{20}	Refractive index
A_r	Relative atomic mass	Ph. Eur. U.	European Pharmacopoeia Unit
$[\alpha]_D^{20}$	Specific optical rotation	ppb	Parts per billion (micrograms per kilogram)
bp	Boiling point	ppm	Parts per million (milligrams per kilogram)
BRP	Biological reference preparation	R	Substance or solution defined under 4. *Reagents*
CRS	Chemical reference substance	R_F	Retardation factor (see chapter *2.2.46*)
d_{20}^{20}	Relative density	R_t	Used in chromatography to indicate the ratio of the distance travelled by a substance to the distance travelled by a reference substance
λ	Wavelength		
HRS	Herbal reference standard	RV	Substance used as a primary standard in volumetric analysis (chapter *4.2.1*)
IU	International Unit		
M	Molarity		
M_r	Relative molecular mass		

Abbreviations used in the monographs on immunoglobulins, immunosera and vaccines

CFU	Colony-forming units	Lo/10 dose	The largest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, does not cause symptoms of toxicity in the test animals within a given period
LD_{50}	The statistically determined quantity of a substance that, when administered by the specified route, may be expected to cause the death of 50 per cent of the test animals within a given period	Lf dose	The quantity of toxin or toxoid that flocculates in the shortest time with 1 IU of antitoxin
MLD	Minimum lethal dose	$CCID_{50}$	The statistically determined quantity of virus that may be expected to infect 50 per cent of the cell cultures to which it is added
L+/10 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	EID_{50}	The statistically determined quantity of virus that may be expected to infect 50 per cent of the fertilised eggs into which it is inoculated
L+ dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	ID_{50}	The statistically determined quantity of a virus that may be expected to infect 50 per cent of the animals into which it is inoculated
In/100 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.01 IU of antitoxin and injected intracutaneously causes a characteristic reaction at the site of injection within a given period	PD_{50}	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to protect 50 per cent of the animals against a challenge dose of the micro-organisms or toxins against which it is active
Lp/10 dose	The smallest quantity of toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes paralysis in the test animals within a given period	ED_{50}	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to induce specific antibodies in 50 per cent of the animals for the relevant vaccine antigens
		PFU	Pock-forming units or plaque-forming units
		SPF	Specified-pathogen-free

1.6. UNITS OF THE INTERNATIONAL SYSTEM (SI) USED IN THE PHARMACOPOEIA AND EQUIVALENCE WITH OTHER UNITS

International System Of Units (SI)

The International System of Units comprises 2 main classes of units, namely base units and derived units[1]. The base units are the metre, the kilogram, the second, the ampere, the kelvin, the mole and the candela.

The derived units are formed as products of powers of the base units according to the algebraic relationships linking the corresponding quantities. Some of these derived units have special names and symbols. The derived units used in the Pharmacopoeia are shown in Table 1.6.-1.

Some important and widely used units outside the International System are shown in Table 1.6.-2.

The prefixes shown in Table 1.6.-3 are used to form the names and symbols of the decimal multiples and submultiples of SI units.

Table 1.6.-1. – *Derived units used in the European Pharmacopoeia and equivalence with other units*

Quantity		Unit				Conversion of other units into SI units
Name	Symbol	Name	Symbol	Expression in SI base units	Expression in other SI units	
Wave number	ν	one per metre	1/m	m^{-1}

www.webofpharma.com

Notes 1. In the Pharmacopoeia, the Celsius temperature is used (symbol t). This is defined by the following equation:

$$t = T - T_0$$

where T_0 = 273.15 K by definition. The Celsius or centigrade temperature is expressed in degrees Celsius (symbol °C). The unit 'degree Celsius' is equal to the unit 'kelvin'.

2. The practical expressions of concentrations used in the Pharmacopoeia are defined in the General Notices.

3. The radian is the plane angle between two radii of a circle that cut off on the circumference an arc equal in length to the radius.

4. In the Pharmacopoeia, conditions of centrifugation are defined by reference to the acceleration due to gravity (g):

$$g = 9.806\ 65\ m{\cdot}s^{-2}$$

5. Certain quantities without dimensions are used in the Pharmacopoeia: relative density (*2.2.5*), absorbance (*2.2.25*), specific absorbance (*2.2.25*) and refractive index (*2.2.6*).

6. The microkatal is defined as the enzymic activity that, under defined conditions, produces the transformation (e.g. hydrolysis) of 1 micromole of the substrate per second.

Pharmaceutical Preparations

(Ph. Eur. monograph 2619)

Ph Eur

INTRODUCTION

This monograph is intended to be a reference source of standards in the European Pharmacopoeia on active substances, excipients and dosage forms, which are to be applied in the manufacture/preparation of pharmaceuticals, but not a guide on how to manufacture as there is specific guidance available covering methods of manufacture and associated controls.

It does not cover investigational medicinal products, but competent authorities may refer to pharmacopoeial standards when authorising clinical trials using investigational medicinal products.

DEFINITION

Pharmaceutical preparations are medicinal products generally consisting of active substances that may be combined with excipients, formulated into a dosage form suitable for the intended use, where necessary after reconstitution, presented in a suitable and appropriately labelled container.

Pharmaceutical preparations may be licensed by the competent authority, or unlicensed and made to the specific needs of patients according to legislation. There are 2 categories of unlicensed pharmaceutical preparations:

— extemporaneous preparations, i.e. pharmaceutical preparations individually prepared for a specific patient or patient group, supplied after preparation;

— stock preparations, i.e. pharmaceutical preparations prepared in advance and stored until a request for a supply is received.

In addition to this monograph, pharmaceutical preparations also comply with the General Notices and with the relevant general chapters of the Pharmacopoeia. General chapters are normally given for information and become mandatory when referred to in a general or specific monograph, unless such reference is made in a way that indicates that it is not the intention to make the text referred to mandatory but rather to cite it for information.

Where relevant, pharmaceutical preparations also comply with the dosage form monographs (e.g. *Capsules (0016)*, *Tablets (0478)*) and general monographs relating to pharmaceutical preparations (e.g. *Allergen products (1063)*, *Herbal teas (1435)*, *Homoeopathic preparations (1038)*, *Homoeopathic pillules, coated (2786)*, *Homoeopathic pillules, impregnated (2079)*, *Immunosera for human use, animal (0084)*, *Immunosera for veterinary use (0030)*, *Live biotherapeutic products for human use (3053)*, *Monoclonal antibodies for human use (2031)*, *Radiopharmaceutical preparations (0125)*, *Vaccines for human use (0153)*, *Vaccines for veterinary use (0062)*).

ETHICAL CONSIDERATIONS AND GUIDANCE IN THE PREPARATION OF UNLICENSED PHARMACEUTICAL PREPARATIONS

The underlying principle of legislation for pharmaceutical preparations is that, subject to specific exemptions, no pharmaceutical preparation may be placed on the market without an appropriate marketing authorisation.

The exemptions from the formal licensing requirement allow the supply of unlicensed products to meet the special needs of individual patients. However, when deciding to use an unlicensed preparation all health professionals involved (e.g. the prescribing practitioners and/or the preparing pharmacists) have, within their area of responsibilities, a duty of care to the patient receiving the pharmaceutical preparation.

In considering the preparation of an unlicensed pharmaceutical preparation, a suitable level of risk assessment is undertaken.

The risk assessment identifies:

— the criticality of different parameters (e.g. quality of active substances, excipients and containers; design of the preparation process; extent and significance of testing; stability of the preparation) to the quality of the preparation; and

— the risk that the preparation may present to a particular patient group.

Based on the risk assessment, the person responsible for the preparation must ensure, with a suitable level of assurance, that the pharmaceutical preparation is, throughout its shelf-life, of an appropriate quality and suitable and fit for its purpose. For stock preparations, storage conditions and shelf-life have to be justified on the basis of, for example, analytical data or professional judgement, which may be based on literature references.

PRODUCTION

Manufacture/preparation must take place within the framework of a suitable quality system and be compliant with the standards relevant to the type of product being made. Licensed products must comply with the requirements of their licence. For unlicensed products a risk assessment as outlined in the section 'Ethical considerations and guidance in the preparation of unlicensed pharmaceutical preparations' is of special importance, as these products are not previously assessed by the competent authority.

Where pharmaceutical preparations are manufactured/prepared using materials of human or animal origin, the general requirements of general chapters *5.1.7. Viral safety* and *5.2.6. Evaluation of safety of veterinary vaccines and immunosera* and of the general monograph *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)* apply, where appropriate.

Formulation

During pharmaceutical development or prior to manufacture/preparation, suitable ingredients, processes, tests and specifications are identified and justified in order to ensure the suitability of the product for the intended purpose. This includes consideration of the properties required in order to identify whether specific ingredient properties or process steps are critical to the required quality of the pharmaceutical preparation.

Active substances and excipients

Active substances and excipients used in the formulation of pharmaceutical preparations comply with the requirements of the relevant general monographs, e.g. *Substances for pharmaceutical use (2034)*, *Essential oils (2098)*, *Herbal drug extracts (0765)*, *Herbal drugs (1433)*, *Herbal drug preparations (1434)*, *Herbal drugs for homoeopathic preparations (2045)*, *Mother tinctures for homoeopathic preparations (2029)*, *Methods of preparation of homoeopathic stocks and potentisation (2371)*, *Products of fermentation (1468)*, *Products of recombinant DNA technology (0784)*, *Vegetable fatty oils (1579)*.

In addition, where specific monographs exist, the quality of the active substances and excipients used complies with the corresponding monographs.

www.webofpharma.com

Where no specific monographs exist, the required quality must be defined, taking into account the intended use and the involved risk.

When physicochemical characteristics of active substances and functionality-related characteristics (FRCs) of excipients (e.g. particle-size distribution, viscosity, polymorphism) are critical in relation to their role in the manufacturing process and quality attributes of the pharmaceutical preparation, they must be identified and controlled.

Detailed information on FRCs is given in general chapter *5.15. Functionality-related characteristics of excipients.*

Microbiological quality

The formulation of the pharmaceutical preparation and its container must ensure that the microbiological quality is suitable for the intended use.

During development, it shall be demonstrated that the antimicrobial activity of the preparation as such or, if necessary, with the addition of a suitable preservative or preservatives, or by the selection of an appropriate container, provides adequate protection from adverse effects that may arise from microbial contamination or proliferation during the storage and use of the preparation. A suitable test method together with criteria for evaluating the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

If preparations do not have adequate antimicrobial efficacy and do not contain antimicrobial preservatives they are supplied in single-dose containers, or in multidose containers that prevent microbial contamination of the contents after opening.

In the manufacture/preparation of non-sterile pharmaceutical preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapters *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use* and *5.1.8. Microbiological quality of herbal medicinal products for oral use and extracts used in their preparation.*

Sterile preparations are manufactured/prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

Containers

A suitable container is selected. Consideration is given to the intended use of the preparation, the properties of the container, the required shelf-life, and product/container incompatibilities. Where applicable, containers for pharmaceutical preparations comply with the requirements for containers (*3.2* and subsections) and materials used for the manufacture of containers (*3.1* and subsections).

Stability

Stability requirements of pharmaceutical preparations are dependent on their intended use and on the desired storage time.

Where applicable, the probability and criticality of possible degradation products of the active substance(s) and/or reaction products of the active substance(s) with an excipient and/or the immediate container must be assessed. Depending on the result of this assessment, limits of degradation and/or reaction products are set and monitored in the pharmaceutical preparation. Licensed products require a stability exercise.

Methods used for the purpose of stability testing for all relevant characteristics of the preparation are validated as stability indicating, i.e. the methods allow the quantification of the relevant degradation products and physical characteristic changes.

TESTS

Relevant tests to apply in order to ensure the appropriate quality of a particular dosage form are described in the specific dosage form monographs.

Where it is not practical, for unlicensed pharmaceutical preparations, to carry out the tests (e.g. batch size, time restraints), other suitable methods are implemented to ensure that the appropriate quality is achieved in accordance with the risk assessment carried out and any local guidance or legal requirements.

Stock preparations are normally tested to a greater extent than extemporaneous preparations.

The following tests are applicable to many preparations and are therefore listed here.

Appearance

The appearance (e.g. size, shape and colour) of the pharmaceutical preparation is controlled.

Identity and purity tests

Where applicable, the following tests are carried out on the pharmaceutical preparation:

- identification of the active substance(s);
- identification of specific excipient(s), such as preservatives;
- purity tests (e.g. investigation of degradation products, residual solvents (*2.4.24*) or other related impurities, sterility (*2.6.1*));
- safety tests (e.g. safety tests for biological products).

Elemental impurities

General chapter *5.20. Elemental impurities* applies to pharmaceutical preparations except products for veterinary use, unlicensed preparations and other products that are excluded from the scope of this chapter.

For pharmaceutical preparations outside the scope of general chapter *5.20*, manufacturers of these products remain responsible for controlling the levels of elemental impurities using the principles of risk management.

If appropriate, testing is performed using suitable analytical procedures according to general chapter *2.4.20. Determination of elemental impurities.*

Uniformity (*2.9.40* or *2.9.5*/*2.9.6*)

Pharmaceutical preparations presented in single-dose units comply with the test(s) as prescribed in the relevant specific dosage form monograph. If justified and authorised, general chapter *2.9.40* can be applicable only at the time of release.

Special uniformity requirements apply in the following cases:

- for herbal drugs and herbal drug preparations, compliance with general chapter *2.9.40* is not required;
- for homoeopathic preparations, the provisions of general chapters *2.9.6* and *2.9.40* are normally not appropriate, however in certain circumstances compliance with these chapters may be required by the competent authority;
- for single- and multivitamin and trace-element preparations, compliance with general chapters *2.9.6* and *2.9.40* (*content uniformity only*) is not required;
- in justified and authorised circumstances, for other preparations, compliance with general chapters *2.9.6* and *2.9.40* may not be required by the competent authority.

www.webofpharma.com

Reference standards
Reference standards may be needed at various stages for quality control of pharmaceutical preparations. They are established and monitored taking due account of general chapter *5.12. Reference standards*.

ASSAY
Unless otherwise justified and authorised, contents of active substances and specific excipients such as preservatives are determined in pharmaceutical preparations. Limits must be defined and justified.

Suitable and validated methods are used. If assay methods prescribed in the respective active substance monographs are used, it must be demonstrated that they are not affected by the presence of the excipients and/or by the formulation.

Reference standards
See Tests.

LABELLING AND STORAGE
The relevant labelling requirements given in the general dosage form monographs apply. In addition, relevant European Union or other applicable regulations apply.

GLOSSARY
Formulation
The designing of an appropriate formula (including materials, processes, etc.) that will ensure that the patient receives the suitable pharmaceutical preparation in an appropriate form that has the required quality and that will be stable and effective for the required length of time.

Licensed pharmaceutical preparation
A medicinal product that has been granted a marketing authorisation by a competent authority. Synonym: authorised pharmaceutical preparation.

Manufacture
All operations of purchase of materials and products, Production, Quality Control, release, storage, distribution of medicinal products and the related controls.

Preparation (of an unlicensed pharmaceutical preparation)
The 'manufacture' of unlicensed pharmaceutical preparations by or at the request of pharmacies or other healthcare establishments (the term 'preparation' is used instead of 'manufacture' in order clearly to distinguish it from the industrial manufacture of licensed pharmaceutical preparations).

Reconstitution
Manipulation to enable the use or application of a medicinal product with a marketing authorisation in accordance with the instructions given in the summary of product characteristics or the patient information leaflet.

Risk assessment
The identification of hazards and the analysis and evaluation of risks associated with exposure to those hazards.

Unlicensed pharmaceutical preparation
A medicinal product that is exempt from the need of having a marketing authorisation issued by a competent authority but is made for specific patients' needs according to legislation.

Ph Eur

Glossary

(Ph. Eur. monograph 1502)

A glossary of terms relating to formulated preparations is included in the European Pharmacopoeia. The glossary is reproduced below.

Ph Eur

This glossary provides definitions and/or explanations of terms that may be found in, or used in association with, the general monographs on dosage forms and the corresponding chapters on Pharmaceutical technical procedures (2.9), but that are not defined within them. Where relevant, reference is made to other equivalent terms that may be found in other publications or contexts.

This glossary is published for information.

Active substance
Equivalent terms: active ingredient, drug substance, medicinal substance, active pharmaceutical ingredient.

Basis
Basis is an alternative term for 'vehicle' in a semi-solid or moulded solid preparation. The basis may be single-phase or multiphase.

Conventional-release dosage form
A conventional-release dosage form is a preparation showing a release of the active substance(s) that is not deliberately modified by a special formulation design and/or manufacturing method. In the case of a solid dosage form, the dissolution profile of the active substance depends essentially on its intrinsic properties. Equivalent term: immediate-release dosage form.

Delayed-release dosage form
A delayed-release dosage form is a modified-release dosage form, usually administered orally, where the onset of release of the active substance(s) is adjusted to take place after a specific time or at a specific location in the gastrointestinal tract. Delayed release is achieved by a special formulation design and/or manufacturing method. Delayed-release dosage forms include gastro-resistant preparations as defined in the general monographs on solid oral dosage forms.

Dispersion
From a Ph. Eur. perspective, a dispersion is a system consisting of 2 or more phases.

— *Colloidal dispersion*

A colloidal dispersion is a system in which particles of colloidal size (a nominal diameter between approximately 1 nm and 1 µm) of any nature (solid, liquid or gas, including liposomes and nanosystems) are dispersed in a continuous phase of a different composition and/or state. The use of 'nominal diameter' is intended to convey that not all particles are spherical. Dispersions of particles below 1 µm are considered less likely to undergo sedimentation because of the effect of Brownian motion.

— *Suspension*

A suspension is a dispersed system comprising solid particles of a nominal diameter greater than approximately 1 µm, dispersed in a liquid or semi-solid continuous phase. If the solid particles are of a nominal diameter lower than approximately 1 µm, the system is a colloidal suspension.

— *Emulsion*

An emulsion is a dispersed system consisting of a mixture of at least 2 liquids that are not miscible with each other. One of the liquids is dispersed in the other as droplets of a diameter greater than approximately 1 µm. If the droplets are

www.webofpharma.com

of a nominal diameter lower than approximately 1 µm, the system is a colloidal emulsion.

Large-volume parenteral
A large-volume parenteral is an infusion or injection supplied in a container with a nominal content of more than 100 mL.

Modified-release dosage form
A modified-release dosage form is a preparation where the onset, rate and/or place of release of the active substance(s) is different from that of a conventional-release dosage form administered by the same route. This deliberate modification is achieved by a special formulation design and/or manufacturing method. Modified-release dosage forms include prolonged-release, delayed-release and pulsatile-release dosage forms.

Prolonged-release dosage form
A prolonged-release dosage form is a modified-release dosage form showing a slower release of the active substance(s) than that of a conventional-release dosage form administered by the same route. Prolonged release is achieved by a special formulation design and/or manufacturing method. Equivalent term: extended-release dosage form.

Pulsatile-release dosage form
A pulsatile-release dosage form is a modified-release dosage form showing a sequential, intermittent release of the active substance(s). Pulsatile release is achieved by a special formulation design and/or manufacturing method.

Small-volume parenteral
A small-volume parenteral is an infusion or injection supplied in a container with a nominal content of 100 mL or less.

Solution
A solution is a homogeneous mixture forming a single phase containing one or more dissolved substances, i.e. substances in a molecular or ionic state dispersed in a solvent or in miscible solvents. The dissolved substances can be solids, liquids or gases.

Spheroids
Spheroids are considered to be spherical or approximately spherical granules with a usually increased mechanical resistance compared to conventional *Granules (0499)*. They possess a smooth, uniform surface, with a typical size range of 200 µm to 2.8 mm. Spheroids may be prepared by any suitable method.

Standard Term
Standard Terms are approved terms for describing certain aspects of a medicinal product, namely the dosage form and route or method of administration, and certain important packaging items such as the container, closure and administration device. They are established by the European Pharmacopoeia Commission, which started working on the lists of Standard Terms in response to a request made by the EU Commission for use in the marketing authorisation application (MAA), summary of product characteristics (SmPC), labelling, and electronic communications. Standard Terms have the double purpose of bringing information to the patient/user/prescriber and distinguishing medicinal products having the same trade name, and are published in a specific Standard Terms database.

Vehicle
A vehicle is the carrier, composed of one or more excipients, in which the active substance(s) are contained, usually when referring to a liquid or semi-solid preparation.

Ph Eur

Capsules

(Ph. Eur. monograph 0016)

Capsules comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

The requirements of this monograph do not necessarily apply to preparations that are presented as capsules intended for use other than by oral administration. Requirements for such preparations may be found, where appropriate, in other general monographs, for example Rectal preparations (1145) and Vaginal preparations (1164).

DEFINITION

Capsules are solid preparations with hard or soft shells of various shapes and capacities, containing a single dose of active substance(s). They are usually intended for oral administration.

The capsule shells are made of gelatin or other substances, the consistency of which may be adjusted by the addition of substances such as glycerol or sorbitol. Excipients such as surface-active agents, opaque fillers, antimicrobial preservatives, sweeteners, colouring matter authorised by the competent authority and flavouring substances may be added. The capsules may bear surface markings.

The contents of capsules may be solid, semi-solid or liquid. They consist of one or more active substances with or without excipients such as solvents, diluents, lubricants and disintegrating agents. The contents do not cause deterioration of the shell. The shell, however, is attacked by the digestive fluids and the contents are released.

Where applicable, containers for capsules comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of capsules may be distinguished:
— hard capsules;
— soft capsules;
— gastro-resistant capsules;
— modified-release capsules;
— cachets.

PRODUCTION

In the manufacture, packaging, storage and distribution of capsules, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

TESTS

Uniformity of dosage units
Capsules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, capsules with a content of active substance less than 2 mg or less than 2 per cent of the fill mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those ingredients that correspond to the above conditions.

www.webofpharma.com

Uniformity of mass (*2.9.5*)
Capsules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Dissolution
Unless otherwise justified and authorised, a suitable test is carried out, for example one of the tests described in general chapter *2.9.3. Dissolution test for solid dosage forms.*

Where a dissolution test is prescribed, a disintegration test may not be required.

STORAGE
Store at a temperature not exceeding 30 °C.

LABELLING
The label states the name of any added preservative.

HARD CAPSULES

DEFINITION
Hard capsules are solid single-dose preparations. They consist of a hard shell, the capacity of which can be varied, containing a solid, semi-solid or liquid preparation. The shell is made of gelatin or other substances, and consists of 2 prefabricated cylindrical sections that are open at one end and rounded and closed at the other. The contents are filled into one of the sections and the capsule is closed by slipping the other section over it.

PRODUCTION
The active substance(s), usually in solid form (powder or granules), are filled into one of the sections that is then closed by slipping the other section over it. The security of the closure may be strengthened by suitable means.

TESTS
Disintegration (*2.9.1*)
Hard capsules comply with the test. Use *water R* as the liquid medium. When justified and authorised, *0.1 M hydrochloric acid* or *artificial gastric juice R* may be used as the liquid medium. If the capsules float on the surface of the water, a disc may be added. Operate the apparatus for 30 min, unless otherwise justified and authorised.

SOFT CAPSULES

DEFINITION
Soft capsules are solid single-dose preparations. They consist of a soft shell, the capacity and shape of which can be varied, containing a semi-solid or liquid preparation. The shell is made of gelatin or other substances and may have one or more solid active substances incorporated into it. The shell is usually thicker than that of a hard capsule and consists of one part, as soft capsules are generally formed, filled and sealed in a single operation.

PRODUCTION
Soft capsules are usually formed, filled and sealed in one operation, but for extemporaneous use the shell may be prefabricated. The shell material may contain an active substance.

Liquids may be enclosed directly; solids are usually dissolved or dispersed in a suitable vehicle to give a solution or dispersion of a paste-like consistency.

There may be partial migration of the constituents from the capsule contents into the shell and vice versa because of the nature of the materials and the surfaces in contact.

TESTS
Disintegration (*2.9.1*)
Soft capsules comply with the test. Use *water R* as the liquid medium. When justified and authorised, *0.1 M hydrochloric acid* or *artificial gastric juice R* may be used as the liquid medium. Add a disc to each tube. Liquid active substances dispensed in soft capsules may attack the disc; in such circumstances and where authorised, the disc may be omitted. Operate the apparatus for 30 min, unless otherwise justified and authorised. If the capsules fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 capsules omitting the discs.

MODIFIED-RELEASE CAPSULES

DEFINITION
Modified-release capsules are hard or soft capsules in which the contents or the shell or both contain special excipients or are prepared by a special process designed to modify the rate, the place or the time at which the active substance(s) are released.

Modified-release capsules include prolonged-release capsules, delayed-release capsules and pulsatile-release capsules.

GASTRO-RESISTANT CAPSULES

DEFINITION
Gastro-resistant capsules are delayed-release capsules that are intended to resist the gastric fluid and to release their active substance or substances in the intestinal fluid. Usually they are prepared by filling capsule shells with granules or with particles covered with a gastro-resistant coating. In other cases, the shell of the capsule is covered with a gastro-resistant coating or the shell itself has gastro-resistant properties.

TESTS
Disintegration (*2.9.1*)
Capsules with a gastro-resistant shell comply with the test with the following modifications. Use *0.1 M hydrochloric acid* as the liquid medium and operate the apparatus for 2 h, or other such time as may be authorised, without the discs. Examine the state of the capsules. The time of resistance to the acid medium varies according to the formulation of the capsules to be examined. It is typically 2 h to 3 h but even with authorised deviations it must not be less than 1 h. No capsule shows signs of disintegration or rupture permitting the escape of the contents. Replace the acid by phosphate buffer solution pH 6.8 R. When justified and authorised, a buffer solution of pH 6.8 with added pancreas powder (for example, 0.35 g of *pancreas powder R* per 100 mL of buffer solution) may be used. Add a disc to each tube. Operate the apparatus for 60 min. If the capsules fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 capsules omitting the discs.

CACHETS

DEFINITION
Cachets are solid preparations consisting of a hard shell containing a single dose of one or more active substances. The cachet shell is made of unleavened bread usually from rice flour and consists of 2 prefabricated flat cylindrical sections. Before administration, the cachets are immersed in water for a few seconds, placed on the tongue and swallowed with a draught of water.

www.webofpharma.com

Capsules of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to those capsules that are the subject of an individual monograph in the British Pharmacopoeia.

When presented as granules the contents of the requisite number of capsules should be mixed and powdered before performing the Assay and tests described in the monograph.

Content of active ingredient in capsules

The range for the content of active ingredient stated in the monograph is based on the requirement that 20 capsules, or such other number as may be indicated in the monograph, are used in the Assay. In the circumstances where 20 capsules cannot be obtained, a smaller number, which must not be less than 5, may be used, but to allow for sampling errors the tolerances are widened in accordance with Table I.

Table I

Weight of active ingredient in each capsule	Subtract from the lower limit for samples of			Add to the upper limit for samples of		
	15	10	5	15	10	5
0.12 g or less	0.2	0.7	1.6	0.3	0.8	1.8
More than 0.12 and less than 0.3 g	0.2	0.5	1.2	0.3	0.6	1.5
0.3 g or more	0.1	0.2	0.8	0.2	0.4	1.0

The requirements of Table I apply when the stated limits are 90 to 110%. For limits other than 90 to 110%, proportionately smaller or larger allowances should be made.

Disintegration

Comply with the *disintegration test for tablets and capsules*, Appendix XII A1, unless otherwise stated in the individual monographs.

For those Hard Capsules or Soft Capsules for which a requirement for Dissolution is included in the individual monograph, the requirement for Disintegration does not apply.

Uniformity of content

Details of the analytical method to be employed for determining the content of active ingredient may be included in certain monographs. Unless otherwise stated in the monograph the limits are as given in test B for *uniformity of content*, Appendix XII C3.

Any capsules that, when examined individually, show a gross deviation from the stated content are not official.

Liquids for Cutaneous Application

(Liquid Preparations for Cutaneous Application, Ph. Eur. monograph 0927)

Liquids for Cutaneous Application comply with the requirements of the European Pharmacopoeia monograph for Liquid Preparations for Cutaneous Application. These requirements are reproduced below.

Ph Eur

Where justified and authorised, the requirements of this monograph do not apply to preparations intended for systemic and veterinary use.

DEFINITION

Liquid preparations for cutaneous application are preparations of a variety of viscosities intended for local or transdermal delivery of active ingredients. They are solutions, emulsions or suspensions that may contain 1 or more active substances in a suitable vehicle. They may contain suitable antimicrobial preservatives, antioxidants and other excipients such as stabilisers, emulsifiers and thickeners.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment that is readily dispersed on shaking to give a suspension that is sufficiently stable to enable a homogeneous preparation to be delivered.

Where applicable, containers for liquid preparations for cutaneous application comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

When liquid preparations for cutaneous application are dispensed in pressurised containers, the containers comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

Preparations specifically intended for use on severely injured skin are sterile.

Several categories of liquid preparations for cutaneous application may be distinguished, for example:

— shampoos;

— cutaneous foams.

PRODUCTION

During development of a liquid preparation for cutaneous application whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container of liquid preparations for cutaneous application presented in single-dose containers.

In the manufacture, packaging, storage and distribution of liquid preparations for cutaneous application, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Sterile liquid preparations for cutaneous application are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of liquid preparations for cutaneous application containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Sterility (*2.6.1*)

Where the label indicates that the preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:

— the name of any added antimicrobial preservative;

— where applicable, that the preparation is sterile.

www.webofpharma.com

SHAMPOOS

DEFINITION

Shampoos are liquid or, occasionally, semi-solid preparations intended for application to the scalp and subsequent washing away with water. Upon rubbing with water they usually form a foam.

They are emulsions, suspensions or solutions. Shampoos normally contain surface active agents.

CUTANEOUS FOAMS

DEFINITION

Cutaneous foams comply with the requirements of the monograph on *Medicated foams (1105)*.

Ph Eur

Liquids for Cutaneous Application of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any collodion, liniment, lotion or paint that is the subject of an individual monograph in the British Pharmacopoeia.

COLLODIONS

DEFINITION

Collodions are Liquids for Cutaneous Application, usually containing Pyroxylin in a mixture of Ether and Ethanol. When they are allowed to dry, a flexible film is formed at the site of application.

STORAGE

Collodions should be stored remote from fire.

LINIMENTS

DEFINITION

Liniments are Liquids for Cutaneous Application that are intended to be applied to the unbroken skin with friction.

STORAGE

Certain plastic containers, such as those made from polystyrene, are unsuitable for Liniments.

LABELLING

The label states, if appropriate, that the contents of the container should be shaken before use.

LOTIONS

DEFINITION

Lotions are Liquids for Cutaneous Application that are intended to be applied to the unbroken skin without friction.

LABELLING

The label states that the Lotion should be shaken before use.

POWDERS FOR LOTIONS

DEFINITION

Powders for Lotions are preparations consisting of solid, loose, dry particles containing one or more active substances, with or without excipients, intended for reconstitution using a suitable solvent prior to cutaneous application. They may contain colouring matter if authorised by the competent authority.

Powders for Lotions are presented for use as single-dose or multi-dose preparations.

TESTS

Uniformity of Content

Unless otherwise prescribed or justified and authorised, single-dose Powders for Lotions with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content, Appendix XII C3. If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of Mass

Single-dose Powders for Lotions comply with the test for uniformity of weight (mass), Appendix XII C1. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

PAINTS

DEFINITION

Paints are Liquids for Cutaneous Applications and are solutions or dispersions of one or more active ingredients. They are intended for application to the skin or, in some cases, mucous membranes.

STORAGE

Paints should be kept in airtight containers.

Ear Preparations

(Ph. Eur. monograph 0652)

Ear Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Ear preparations are liquid, semi-solid or solid preparations intended for instillation, for spraying, for insufflation, for application to the auditory meatus or as an ear wash.

Ear preparations usually contain 1 or more active substances in a suitable vehicle. They may contain excipients, for example, to adjust tonicity or viscosity, to adjust or stabilise the pH, to increase the solubility of the active substances, to stabilise the preparation or to provide adequate antimicrobial properties. The excipients do not adversely affect the intended medicinal action of the preparation or, at the concentrations used, cause toxicity or undue local irritation.

Preparations for application to the injured ear, particularly where the eardrum is perforated, or prior to surgery are sterile and, unless otherwise justified and authorised, free from antimicrobial preservatives and supplied in single-dose containers.

Ear preparations are supplied in multidose or single-dose containers, provided, if necessary, with a suitable administration device, which may be designed to avoid the introduction of contaminants.

Unless otherwise justified and authorised, aqueous ear preparations supplied in multidose containers contain a suitable antimicrobial preservative at a suitable concentration, except where the preparation itself has adequate antimicrobial properties.

Where applicable, containers for ear preparations comply with the requirements of chapters *3.1. Materials used for the*

www.webofpharma.com

manufacture of containers (and subsections) and *3.2. Containers* (and subsections).

Several categories of ear preparations may be distinguished:
— ear drops and sprays;
— semi-solid ear preparations;
— ear powders;
— ear washes;
— ear tampons.

PRODUCTION

During development of an ear preparation whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in chapter *5.1.3. Efficacy of antimicrobial preservation.*

During development of ear washes, it must be demonstrated that the nominal content can be withdrawn from the container of preparations presented in single-dose containers.

In the manufacture, packaging, storage and distribution of ear preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Sterile ear preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in chapter *5.1.1. Methods of preparation of sterile products.*

In the manufacture of ear preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units

Single-dose ear preparations comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, single-dose ear preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those ingredients that correspond to the above conditions.

Uniformity of mass (*2.9.5*)

Single-dose ear preparations comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Sterility (*2.6.1*)

Where the label indicates that the ear preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:
— the name of any added antimicrobial preservative;
— where applicable, that the preparation is sterile;
— for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

EAR DROPS AND EAR SPRAYS

DEFINITION

Ear drops and ear sprays are solutions, emulsions or suspensions of one or more active substances in liquids suitable for application to the auditory meatus without exerting harmful pressure on the eardrum (for example, water, glycols or fatty oils). They may also be placed in the auditory meatus by means of a tampon impregnated with the liquid.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment, which is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Ear drops are usually supplied in multidose containers of glass or suitable plastic material that are fitted with an integral dropper or with a screw cap of suitable materials incorporating a dropper and rubber or plastic teat. Alternatively, such a cap assembly is supplied separately.

Ear sprays are usually supplied in multidose containers fitted with an appropriate applicator. When ear sprays are supplied in pressurised containers, these comply with the requirements of the monograph *Pressurised pharmaceutical preparations (0523).*

SEMI-SOLID EAR PREPARATIONS

DEFINITION

Semi-solid ear preparations are intended for application to the external auditory meatus, if necessary by means of a tampon impregnated with the preparation.

Semi-solid ear preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132).*

They are supplied in containers fitted with a suitable applicator.

EAR POWDERS

DEFINITION

Ear powders are intended for application or insufflation into the external auditory meatus. They comply with the requirements of the monograph *Powders for cutaneous application (1166).*

They are supplied in containers fitted with a suitable device for application or insufflation.

EAR WASHES

DEFINITION

Ear washes are preparations intended to cleanse the external auditory meatus. They are usually aqueous solutions with a pH within physiological limits.

Ear washes intended for application to injured parts or prior to a surgical operation are sterile.

EAR TAMPONS

DEFINITION

Ear tampons are intended to be inserted into the external auditory meatus. They comply with the requirements of the monograph *Medicated tampons (1155).*

www.webofpharma.com

Eye Preparations

(Ph. Eur. monograph 1163)

Eye preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Eye preparations are sterile liquid, semi-solid or solid preparations intended for administration upon the eyeball and/or to the conjunctiva, or for insertion in the conjunctival sac.

Where applicable, containers for eye preparations comply with the requirements of materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of eye preparations may be distinguished:
— eye drops;
— eye lotions;
— powders for eye drops and powders for eye lotions;
— semi-solid eye preparations;
— ophthalmic inserts.

PRODUCTION

During the development of an eye preparation whose formulation contains an antimicrobial preservative, the necessity for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in chapter *5.1.3. Efficacy of antimicrobial preservation.*

Eye preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in chapter *5.1.1. Methods of preparation of sterile products.*

In the manufacture of eye preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid eye preparations supplied in single-dose containers.

TESTS

Sterility (*2.6.1*)

Eye preparations comply with the test. Applicators supplied separately also comply with the test. Remove the applicator with aseptic precautions from its package and transfer it to a tube of culture medium so that it is completely immersed. Incubate and interpret the results as described in the test.

STORAGE

Unless otherwise justified and authorised, store in a sterile, tamper-evident container.

LABELLING

The label states the name of any added antimicrobial preservative.

EYE DROPS

DEFINITION

Eye drops are sterile aqueous or oily solutions, emulsions or suspensions of one or more active substances intended for instillation into the eye.

Eye drops may contain excipients, for example, to adjust the tonicity or the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance, or to stabilise the preparation. These substances do not adversely affect the intended medicinal action or, at the concentrations used, cause undue local irritation.

Aqueous preparations supplied in multidose containers contain a suitable antimicrobial preservative in appropriate concentration except when the preparation itself has adequate antimicrobial properties. The antimicrobial preservative chosen must be compatible with the other ingredients of the preparation and must remain effective throughout the period of time during which eye drops are in use.

If eye drops do not contain antimicrobial preservatives they are supplied in single-dose containers or in multidose containers preventing microbial contamination of the contents after opening.

Eye drops intended for use in surgical procedures do not contain antimicrobial preservatives.

Eye drops that are solutions, examined under suitable conditions of visibility, are practically clear and practically free from particles.

Eye drops that are suspensions may show a sediment that is readily redispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered.

Multidose preparations are supplied in containers that allow successive drops of the preparation to be administered. The containers contain at most 10 mL of the preparation, unless otherwise justified and authorised.

TESTS

Particle size

Unless otherwise justified and authorised, eye drops in the form of a suspension comply with the following test: introduce a suitable quantity of the suspension into a counting cell or with a micropipette onto a slide, as appropriate, and scan under a microscope an area corresponding to 10 µg of the solid phase. For practical reasons, it is recommended that the whole sample is first scanned at low magnification (e.g. × 50) and particles greater than 25 µm are identified. These larger particles can then be measured at a larger magnification (e.g. × 200 to × 500). For each 10 µg of solid active substance, not more than 20 particles have a maximum dimension greater than 25 µm, and not more than 2 of these particles have a maximum dimension greater than 50 µm. None of the particles has a maximum dimension greater than 90 µm.

LABELLING

The label states, for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

EYE LOTIONS

DEFINITION

Eye lotions are sterile aqueous solutions intended for use in rinsing or bathing the eye or for impregnating eye dressings.

Eye lotions may contain excipients, for example to adjust the tonicity or the viscosity of the preparation or to adjust or stabilise the pH. These substances do not adversely affect the intended action or, at the concentrations used, cause undue local irritation.

www.webofpharma.com

Eye lotions supplied in multidose containers contain a suitable antimicrobial preservative in appropriate concentration except when the preparation itself has adequate antimicrobial properties. The antimicrobial preservative chosen is compatible with the other ingredients of the preparation and remains effective throughout the period of time during which the eye lotions are in use.

If eye lotions do not contain antimicrobial preservatives, they are supplied in single-dose containers. Eye lotions intended for use in surgical procedures or in first-aid treatment do not contain an antimicrobial preservative and are supplied in single-dose containers.

Eye lotions, examined under suitable conditions of visibility, are practically clear and practically free from particles.

The containers for multidose preparations do not contain more than 200 mL of eye lotion, unless otherwise justified and authorised.

LABELLING

The label states:

— where applicable, that the contents are to be used on one occasion only;

— for multidose containers, the period after opening the container after which the contents must not be used; this period does not exceed 4 weeks, unless otherwise justified and authorised.

POWDERS FOR EYE DROPS AND POWDERS FOR EYE LOTIONS

DEFINITION

Powders for the preparation of eye drops and eye lotions are supplied in a dry, sterile form to be dissolved or suspended in an appropriate liquid vehicle at the time of administration. They may contain excipients to facilitate dissolution or dispersion, to prevent caking, to adjust the tonicity, to adjust or stabilise the pH or to stabilise the preparation.

After dissolution or suspension in the prescribed liquid, they comply with the requirements for eye drops or eye lotions, as appropriate.

TESTS

Uniformity of dosage units *(2.9.40)*

Single-dose powders for eye drops and eye lotions comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content *(2.9.6)*

Unless otherwise prescribed or justified and authorised, single-dose powders for eye drops and eye lotions with a content of active substance less then 2 mg or less than 2 per cent of the total mass comply with test B. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above condition.

Uniformity of mass *(2.9.5)*

Single-dose powders for eye drops and eye lotions comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

SEMI-SOLID EYE PREPARATIONS

DEFINITION

Semi-solid eye preparations are sterile ointments, creams or gels intended for application to the conjunctiva or to the eyelids. They contain one or more active substances dissolved or dispersed in a suitable basis. They have a homogeneous appearance.

Semi-solid eye preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*. The basis is non-irritant to the conjunctiva.

Semi-solid eye preparations are packed in small, sterilised collapsible tubes fitted or provided with a sterilised cannula. The containers contain at most 10 g of the preparation, unless otherwise justified and authorised. The tubes must be well-closed to prevent microbial contamination. Semi-solid eye preparations may also be packed in suitably designed single-dose containers. The containers, or the nozzles of tubes, are of such a shape as to facilitate administration without contamination.

TESTS

Particle size

Semi-solid eye preparations containing dispersed solid particles comply with the following test: spread gently a quantity of the preparation corresponding to at least 10 µg of solid active substance as a thin layer. Scan under a microscope the whole area of the sample. For practical reasons, it is recommended that the whole sample is first scanned at a small magnification (e.g. × 50) and particles greater than 25 µm are identified. These larger particles can then be measured at a larger magnification (e.g. × 200 to × 500). For each 10 µg of solid active substance, not more than 20 particles have a maximum dimension greater than 25 µm, and not more than 2 of these particles have a maximum dimension greater than 50 µm. None of the particles has a maximum dimension greater than 90 µm.

LABELLING

The label states, for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

OPHTHALMIC INSERTS

DEFINITION

Ophthalmic inserts are sterile, solid or semi-solid preparations of suitable size and shape, designed to be inserted in the conjunctival sac, to produce an ocular effect. They generally consist of a reservoir of active substance embedded in a matrix or bounded by a rate-controlling membrane. The active substance, which is more or less soluble in lacrymal liquid, is released over a determined period of time.

Ophthalmic inserts are individually distributed into sterile containers.

PRODUCTION

In the manufacture of ophthalmic inserts, measures are taken to ensure a suitable dissolution behaviour.

TESTS

Uniformity of dosage units *(2.9.40)*

Ophthalmic inserts comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

www.webofpharma.com

Uniformity of content (*2.9.6*)
Ophthalmic inserts comply, where applicable, with test A.

LABELLING
The label states:
— where applicable, the total quantity of active substance per insert;
— where applicable, the dose released per unit time.

Ph Eur

Eye Preparations of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any eye drops or eye ointment that is the subject of an individual monograph in the British Pharmacopoeia.

EYE DROPS

DEFINITION
Definition of particular Eye Drops as a solution or suspension in Purified Water does not preclude the inclusion of suitable additional substances where necessary for the purposes referred to above under the requirements of the European Pharmacopoeia. However, if buffering agents are used in preparations intended for use in surgical procedures, great care should be taken to ensure that the nature and concentration of the chosen agent are suitable.

Where the active ingredient is susceptible to oxidative degradation, appropriate precautions such as the addition of a suitable antioxidant should be taken. If an antioxidant is added, care should be taken to ensure compatibility between the antioxidant and the antimicrobial preservative.

PRODUCTION
Methods of sterilisation that may be used in the manufacture of Eye Drops are described in Appendix XVIII.

STORAGE
Eye Drops are supplied in tamper-evident containers. The compatibility of plastic or rubber components should be confirmed before use.

Containers for multi-dose Eye Drops are fitted with an integral dropper or with a sterile screw cap of suitable materials incorporating a dropper and rubber or plastic teat. Alternatively such a cap assembly is supplied, sterilised, separately.

LABELLING
For multi-dose containers the label states that care should be taken to avoid contamination of the contents during use.

Single-dose containers that because of their size bear only an indication of the active ingredient and the strength of the preparation do so by use of an approved code, Appendix XXI C, together with an expression of the percentage present. When a code is used on the container, the code is also stated on the package.

EYE OINTMENTS

DEFINITION
Eye Ointments of the British Pharmacopoeia that are intended to be used solely or primarily as a suitable eye-ointment basis contain no active ingredient.

PRODUCTION
Methods of sterilisation that may be used in the manufacture of Eye Ointments are described in Appendix XVIII.

In preparing Eye Ointments in tropical or subtropical countries where the prevailing high temperatures otherwise make the basis too soft for convenient use, the proportions of Yellow Soft Paraffin and Liquid Paraffin specified in the individual monograph may be varied, or Hard Paraffin may be added, but the proportions of active ingredients must not be changed.

STORAGE
Single-dose containers for Eye Ointments, or the nozzles of tubes, are of such a shape as to facilitate administration without contamination. The former type of container is individually wrapped. Tubes are tamper-evident.

Medicated Foams

(Ph. Eur. monograph 1105)

Medicated Foams comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Additional requirements for medicated foams may be found, where appropriate, in other general monographs, for example on Rectal preparations (1145), Vaginal preparations (1164) and Liquid preparations for cutaneous application (0927).

DEFINITION
Medicated foams are preparations consisting of large volumes of gas dispersed in a liquid generally containing one or more active substances, a surfactant ensuring their formation and various other excipients. Medicated foams are usually intended for application to the skin or mucous membranes.

Medicated foams are usually formed at the time of administration from a liquid preparation in a pressurised container. The container is equipped with a device consisting of a valve and a push button suitable for the delivery of the foam.

Medicated foams intended for use on severely injured skin and on large open wounds are sterile.

Medicated foams supplied in pressurised containers comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

PRODUCTION
Sterile medicated foams are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

TESTS
Relative foam density
Maintain the container at about 25 °C for at least 24 h. Taking care not to warm the container, fit a rigid tube 70 mm to 100 mm long and about 1 mm in internal diameter onto the push button. Shake the container to homogenise the liquid phase of the contents and dispense 5 mL to 10 mL of foam to waste. Tare a flat-bottomed dish with a volume of about 60 mL and about 35 mm high. Place the end of the rigid tube attached to the push button in the corner of the dish, press the push button and fill the dish uniformly, using a circular motion. After the foam has completely expanded, level off by removing the excess foam

www.webofpharma.com

with a slide. Weigh. Determine the mass of the same volume of *water R* by filling the same dish with *water R*.

The relative foam density is equivalent to the ratio:

$$\frac{m}{e}$$

m = mass of the test sample of foam, in grams;
e = mass of same volume of *water R*, in grams.

Carry out three measurements. None of the individual values deviate by more than 20 per cent from the mean value.

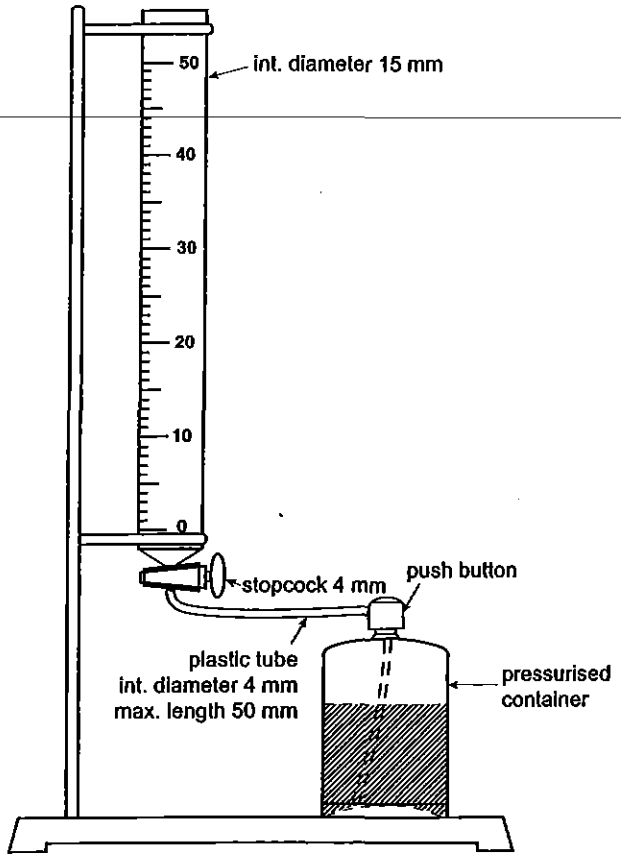

Figure 1105.-1. – *Apparatus for the determination of the duration of expansion*

Duration of expansion

The apparatus (Figure 1105.-1) consists of a 50 mL burette, 15 mm in internal diameter, with 0.1 mL graduations and fitted with a 4 mm single bore stopcock. The graduation corresponding to 30 mL is at least 210 mm from the axis of the stopcock. The lower part of the burette is connected by means of a plastic tube not longer than 50 mm and 4 mm in internal diameter to the foam-generating container equipped with a push button fitted to this connection. Maintain the container at about 25 °C for at least 24 h. Shake the container, taking care not to warm it, to homogenise the liquid phase of the contents and dispense 5 mL to 10 mL of the foam to waste. Connect the push button to the outlet of the burette. Press the button and introduce about 30 mL of foam in a single delivery. Close the stopcock and at the same time start the chronometer and read the volume of foam in the burette. Every 10 s read the growing volume until the maximum volume is reached.

Carry out three measurements. None of the times needed to obtain the maximum volume is more than 5 min.

Sterility (*2.6.1*)

When the label indicates that the preparation is sterile, it complies with the test for sterility.

LABELLING

The label states, where applicable, that the preparation is sterile.

Ph Eur

Granules

(Ph. Eur. monograph 0499)

Granules comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Requirements for granules to be used for the preparation of oral solutions or suspensions are given in the monograph Liquid preparations for oral use (0672). Where justified and authorised, the requirements of this monograph do not apply to granules for veterinary use.

DEFINITION

Granules are preparations consisting of solid, dry aggregates of powder particles sufficiently robust to withstand handling. They are intended for oral administration. Some are swallowed as such, some are chewed and some are dissolved or dispersed in water or another suitable liquid before being administered.

For reasons of patient safety and to ensure the correct administration of the medicinal product, this term may also be used where very small tablets (rather than granules) are presented in a sachet, and where the entire contents of the sachet are intended for oral administration as a single dose.

Granules contain one or more active substances with or without excipients and, if necessary, colouring matter authorised by the competent authority and flavouring substances.

Granules are presented as single-dose or multidose preparations. Each dose of a multidose preparation is administered by means of a device suitable for measuring the quantity prescribed. For single-dose granules, each dose is enclosed in an individual container, for example a sachet or a vial.

Where applicable, containers for granules comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of granules may be distinguished:
— effervescent granules;
— coated granules;
— gastro-resistant granules;
— modified-release granules.

PRODUCTION

In the manufacture, packaging, storage and distribution of granules, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

TESTS

Uniformity of dosage units

Single-dose granules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with

www.webofpharma.com

the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, single-dose granules with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Single-dose granules except for coated granules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*)
Granules supplied in multidose containers comply with the test.

STORAGE
If the preparation contains volatile ingredients or the contents have to be protected, store in an airtight container.

EFFERVESCENT GRANULES

DEFINITION
Effervescent granules are uncoated granules generally containing acid substances and carbonates or hydrogen carbonates which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

TESTS
Disintegration
Place 1 dose of the effervescent granules in a beaker containing 200 mL of *water R* at 15-25 °C; numerous bubbles of gas are evolved. When the evolution of gas around the individual grains ceases, the granules have disintegrated, being either dissolved or dispersed in the water. Repeat the operation on 5 further doses. The preparation complies with the test if each of the 6 doses used disintegrates within 5 min.

STORAGE
In an airtight container.

COATED GRANULES

DEFINITION
Coated granules are usually multidose preparations and consist of granules coated with one or more layers of mixtures of various excipients.

PRODUCTION
The substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs.

TESTS
Dissolution
A suitable test may be carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.3. Dissolution test for solid dosage forms*.

MODIFIED-RELEASE GRANULES

DEFINITION
Modified-release granules are coated or uncoated granules that contain special excipients or that are prepared by special procedures, or both, designed to modify the rate, the place or the time at which the active substance or substances are released.

Modified-release granules include prolonged-release granules and delayed-release granules.

PRODUCTION
A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS
Dissolution
Carry out a suitable test to demonstrate the appropriate release of the active substance(s), for example the test described in general chapter *2.9.3. Dissolution test for solid dosage forms*.

GASTRO-RESISTANT GRANULES

DEFINITION
Gastro-resistant granules are delayed-release granules that are intended to resist the gastric fluid and to release the active substance(s) in the intestinal fluid. These properties are achieved by covering the granules with a gastro-resistant material or by other suitable means.

PRODUCTION
A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS
Dissolution
Carry out a suitable test to demonstrate the appropriate release of the active substance(s), for example the test described in general chapter *2.9.3. Dissolution test for solid dosage forms*.

Ph Eur

Medicated Chewing Gums

(Ph. Eur. monograph 1239)

Medicated chewing gums comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION
Medicated chewing gums are solid, single-dose preparations with a base consisting mainly of gum that are intended to be chewed but not swallowed.

They contain one or more active substances that are released by chewing. After dissolution or dispersion of the active substances in saliva, chewing gums are intended to be used for:
— local treatment of mouth diseases;
— systemic delivery after absorption through the buccal mucosa or from the gastrointestinal tract.

PRODUCTION
Medicated chewing gums are made with a tasteless masticatory gum base that consists of natural or synthetic elastomers. They may contain other excipients such as fillers,

www.webofpharma.com

softeners, sweetening agents, flavouring substances, stabilisers and plasticisers and authorised colouring matter.

Medicated chewing gums are manufactured by compression or by softening or melting the gum bases and adding successively the other substances. In the latter case, chewing gums are then further processed to obtain the desired gum presentation. The medicated chewing gums may be coated, for example, if necessary to protect from humidity and light.

In the manufacture, packaging, storage and distribution of medicated chewing gums, suitable measures must be taken to ensure their microbial quality; recommendations related to this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

TESTS

Uniformity of dosage units

Medicated chewing gums comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, medicated chewing gums with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A for uniformity of content of single-dose preparations. If the preparation contains more than one active substance, the requirement applies only to those active substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)

Uncoated medicated chewing gums and, unless otherwise justified and authorised, coated medicated chewing gums comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Dissolution

Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example the test described in general chapter *2.9.25. Dissolution test for medicated chewing gums.*

STORAGE

Where appropriate, store uncoated medicated chewing gums protected from humidity and light.

Ph Eur

Infusions

DEFINITION

Infusions are dilute solutions containing the readily-soluble constituents of crude drugs. They are usually prepared by diluting one volume of a concentrated Infusion to ten volumes with Water.

For dispensing purposes, Infusions should be used within 12 hours of their preparation.

Preparations for Inhalation

(Ph. Eur. monograph 0671)

Ph Eur

DEFINITION

Preparations for inhalation are preparations intended for administration as vapours or aerosols to the lung in order to deliver active substances for a local or systemic effect.

They are liquid, semi-solid or solid preparations containing one or more active substances that may be dissolved or dispersed in a suitable vehicle. Depending on the type of preparation, they may contain preservatives and other excipients such as propellants, cosolvents, diluents, carriers, solubilising and stabilising agents, etc. The excipients do not adversely affect the functions of the mucosa of the respiratory tract or its cilia.

Preparations for inhalation that are suspensions or emulsions are readily dispersible on shaking and they remain sufficiently stable to enable the correct dose to be delivered.

Preparations for inhalation are supplied in multidose or single-dose containers. When supplied in pressurised containers, they comply with the requirements of the monograph *Pressurised pharmaceutical preparations (0523).*

Preparations for inhalation intended to be administered as aerosols (dispersions of solid or liquid particles in a gas) are administered by means of one of the following devices:
- a nebuliser;
- an inhaler (pressurised metered-dose inhaler, non-pressurised metered-dose inhaler or powder inhaler).

Several categories of preparations for inhalation may be distinguished:
- preparations to be converted into vapour;
- preparations for nebulisation;
- pressurised metered-dose preparations for inhalation;
- non-pressurised metered-dose preparations for inhalation;
- inhalation powders.

PRODUCTION

During the development of preparations for inhalation whose formulation contains a preservative, the need for and effectiveness of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with the criteria for judging the preservative properties of the formulation are described in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

In the manufacture, packaging, storage and distribution of preparations for inhalation, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

During manufacture of preparations for inhalation supplied in multidose inhalers, the uniformity of delivered dose must be ensured within an inhaler (intra-inhaler) and between inhalers (inter-inhaler).

For intra-inhaler testing of the uniformity of delivered dose, a test is given in the Tests sections of the various preparation categories in this monograph.

For inter-inhaler testing of the uniformity of delivered dose, see below.

Uniformity of delivered dose, inter-inhaler testing

Unless otherwise justified and authorised, the test applies. *Prepare and use the inhalers as directed in the instructions to the patient.*

www.webofpharma.com

An example of a suitable procedure is to take 10 inhalers and collect a single dose from each inhaler, collecting the dose at the beginning (from 3 inhalers), middle (from 4 inhalers) and end (from 3 inhalers) of the number of doses stated on the label. Other inter-inhaler testing procedures are possible, where justified.

LABELLING

The label states, where applicable, the name of any added preservative.

For preparations administered by inhaler, the label states:
- the delivered dose or, if justified and authorised (e.g. where the dose has been established as a metered dose or as a pre-metered dose), the metered dose or the pre-metered dose;
- where applicable, the number of deliveries that constitute the minimum recommended dose;
- the number of deliveries per inhaler.

PREPARATIONS TO BE CONVERTED INTO VAPOUR

DEFINITION

Preparations intended to be converted into vapour are liquid, semi-solid or solid preparations for inhalation that are usually added to hot water so that the vapour generated is inhaled.

Liquid preparations may be solutions, suspensions or emulsions.

PREPARATIONS FOR NEBULISATION

DEFINITION

Preparations for nebulisation are preparations for inhalation converted into aerosols by nebulisers.

Nebulisers are devices that convert liquids into aerosols using high-pressure gases, ultrasonic vibration, extrusion through a mesh or other methods. They allow the dose to be inhaled and the active substance to be delivered at an appropriate rate over an extended period of time involving consecutive inhalations and with a particle size (droplet size) that allows deposition of the preparation in the lung.

Nebulisers may be breath-triggered or use other means to synchronise or modify the nebuliser operation with the patient's breathing.

LIQUID PREPARATIONS FOR NEBULISATION

DEFINITION

Liquid preparations for nebulisation are solutions, suspensions or emulsions.

Liquid preparations for nebulisation may be supplied as concentrated preparations to be diluted to the prescribed volume with the prescribed liquid before use.

The pH of liquid preparations for nebulisation is not lower than 3 and not higher than 10.

Liquid preparations for nebulisation supplied in multidose containers may contain a suitable preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties.

Liquid preparations for nebulisation that are supplied in multidose containers but do not contain a preservative and do not have adequate antimicrobial properties are sterile and are supplied in containers preventing microbial contamination of the contents during storage and use.

Liquid preparations for nebulisation supplied in single-dose containers are sterile and preservative-free, unless otherwise justified and authorised.

PRODUCTION

The active substance delivery rate, the total active substance delivered and the particle-/droplet-size distribution are determined using the methods described in general chapter *2.9.44. Preparations for nebulisation: characterisation*. Where justified and authorised, different apparatus and/or procedures may be used.

TESTS

Prepare the liquid preparation for nebulisation as directed in the instructions to the patient.

Uniformity of dosage units (*2.9.40*)

Liquid preparations for nebulisation supplied in single-dose containers comply with the test or, where justified and authorised, with the test for uniformity of content or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, emulsions or suspensions for nebulisation supplied in single-dose containers comply with the following test: after shaking, empty each container as completely as possible and carry out the test on the individual contents; they comply with the requirements under Test B.

Uniformity of mass

Solutions for nebulisation supplied in single-dose containers comply with the following test: weigh individually the contents of 20 containers, emptied as completely as possible, and determine the average mass; not more than 2 of the individual masses deviate by more than 10 per cent from the average mass and none deviates by more than 20 per cent.

Aerodynamic assessment of nebulised aerosols

For suspensions for nebulisation, determine fine-particle mass using an apparatus and procedure described in general chapter *2.9.44. Preparations for nebulisation: characterisation*. Where justified and authorised, a different apparatus and/or procedure may be used.

POWDERS FOR LIQUID PREPARATIONS FOR NEBULISATION

DEFINITION

Powders for liquid preparations for nebulisation are solid preparations for nebulisation intended for administration after reconstitution with the prescribed volume of a prescribed liquid.

They are supplied in their final containers and, when reconstituted, rapidly form either clear solutions or uniform suspensions. After dissolution or dispersion, they comply with the requirements for liquid preparations for nebulisation.

TESTS

Uniformity of dosage units (*2.9.40*)

Powders for liquid preparations for nebulisation supplied in single-dose containers comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, powders for liquid preparations for nebulisation supplied in single-dose containers and having a content of active substance less than 2 mg or less than 2 per cent of the total mass, or having a unit mass equal to or less than 40 mg, comply with the requirements under Test B. If the

www.webofpharma.com

preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass

Powders for liquid preparations for nebulisation supplied in single-dose containers comply with the following test: weigh individually the contents of 20 containers, emptied as completely as possible, and determine the average mass; not more than 2 of the individual masses deviate by more than 10 per cent from the average mass and none deviates by more than 20 per cent.

If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

PRESSURISED METERED-DOSE PREPARATIONS FOR INHALATION

DEFINITION

Pressurised metered-dose preparations for inhalation are solutions, suspensions or emulsions supplied in containers equipped with a metering valve and which are held under pressure with (a) suitable propellant(s), which can act also as a solvent.

The delivered dose is the dose delivered from the inhaler. For some preparations the labelled dose has been established as a metered dose. The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of pressurised metered-dose preparations for inhalation are determined using the method described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles.*

TESTS

For breath-triggered pressurised metered-dose inhalers, the test conditions described below may need to be modified to ensure that actuation occurs for the inhaler under test.

Prepare and use the inhaler as directed in the instructions to the patient.

Uniformity of delivered dose, intra-inhaler testing

Pressurised metered-dose inhalers usually operate in a valve-down position. For inhalers that operate in a valve-up position, an equivalent test is applied using methods that ensure the complete collection of the delivered dose.

Use an apparatus capable of quantitatively retaining the delivered dose.

The following apparatus (Figure 0671.-1) and procedure may be used.

The apparatus consists of a filter-support base with an open-mesh filter-support, such as a stainless steel screen, a collection tube that is clamped or screwed to the filter-support base, and a mouthpiece adapter to ensure an airtight seal between the collection tube and the mouthpiece. Use a mouthpiece adapter that ensures that the front face of the inhaler mouthpiece is flush with the front face or the 2.5 mm indented shoulder of the sample collection tube, as appropriate. The vacuum connector is connected to a system comprising a vacuum source and a flow regulator.
The source is adjusted to draw air through the complete assembly, including the filter and the inhaler to be tested, at 28.3 L/min (± 5 per cent). Air should be drawn continuously through the apparatus to avoid loss of the active substance into the atmosphere. The filter-support base is designed to accommodate 25 mm diameter filter disks. The filter disk and other materials used in the construction of the apparatus must be compatible with the active substance and solvents that are used to extract the active substance from the filter. One end of the collection tube is designed to hold the filter disk tightly against the filter-support base. When assembled, the joints between the components of the apparatus are airtight so that when a vacuum is applied to the base of the filter, all of the air drawn through the collection tube passes through the inhaler.

Unless otherwise prescribed in the instructions to the patient, shake the inhaler for 5 s and discharge 1 delivery to waste. Discharge the inverted inhaler into the apparatus, depressing the valve for a sufficient time to ensure complete discharge, until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste, waiting not less than 5 s between actuations, until $(n/2) + 1$ deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste, waiting not less than 5 s between actuations, until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Fine particle dose

Using an apparatus and procedure described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus C, D or E), calculate the fine particle dose.

Number of deliveries per inhaler

Take 1 inhaler and discharge the contents to waste until empty, actuating the valve at intervals of not less than 5 s. Record the deliveries discharged. The total number of deliveries discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Leak rate

Take a suitable number of inhalers, for example 1 inhaler, remove any labels and record the date and time to the nearest half hour. Weigh the inhaler to the nearest milligram and record the mass (m_1) in milligrams. Allow the inhaler to stand in an upright position at a temperature of 25.0 ± 2.0 °C for not less than 3 days, and again weigh the inhaler, recording the mass (m_2) in milligrams, and recording the date and time to the nearest half hour. Determine the time (t), in hours, during which the inhaler was under test.

www.webofpharma.com

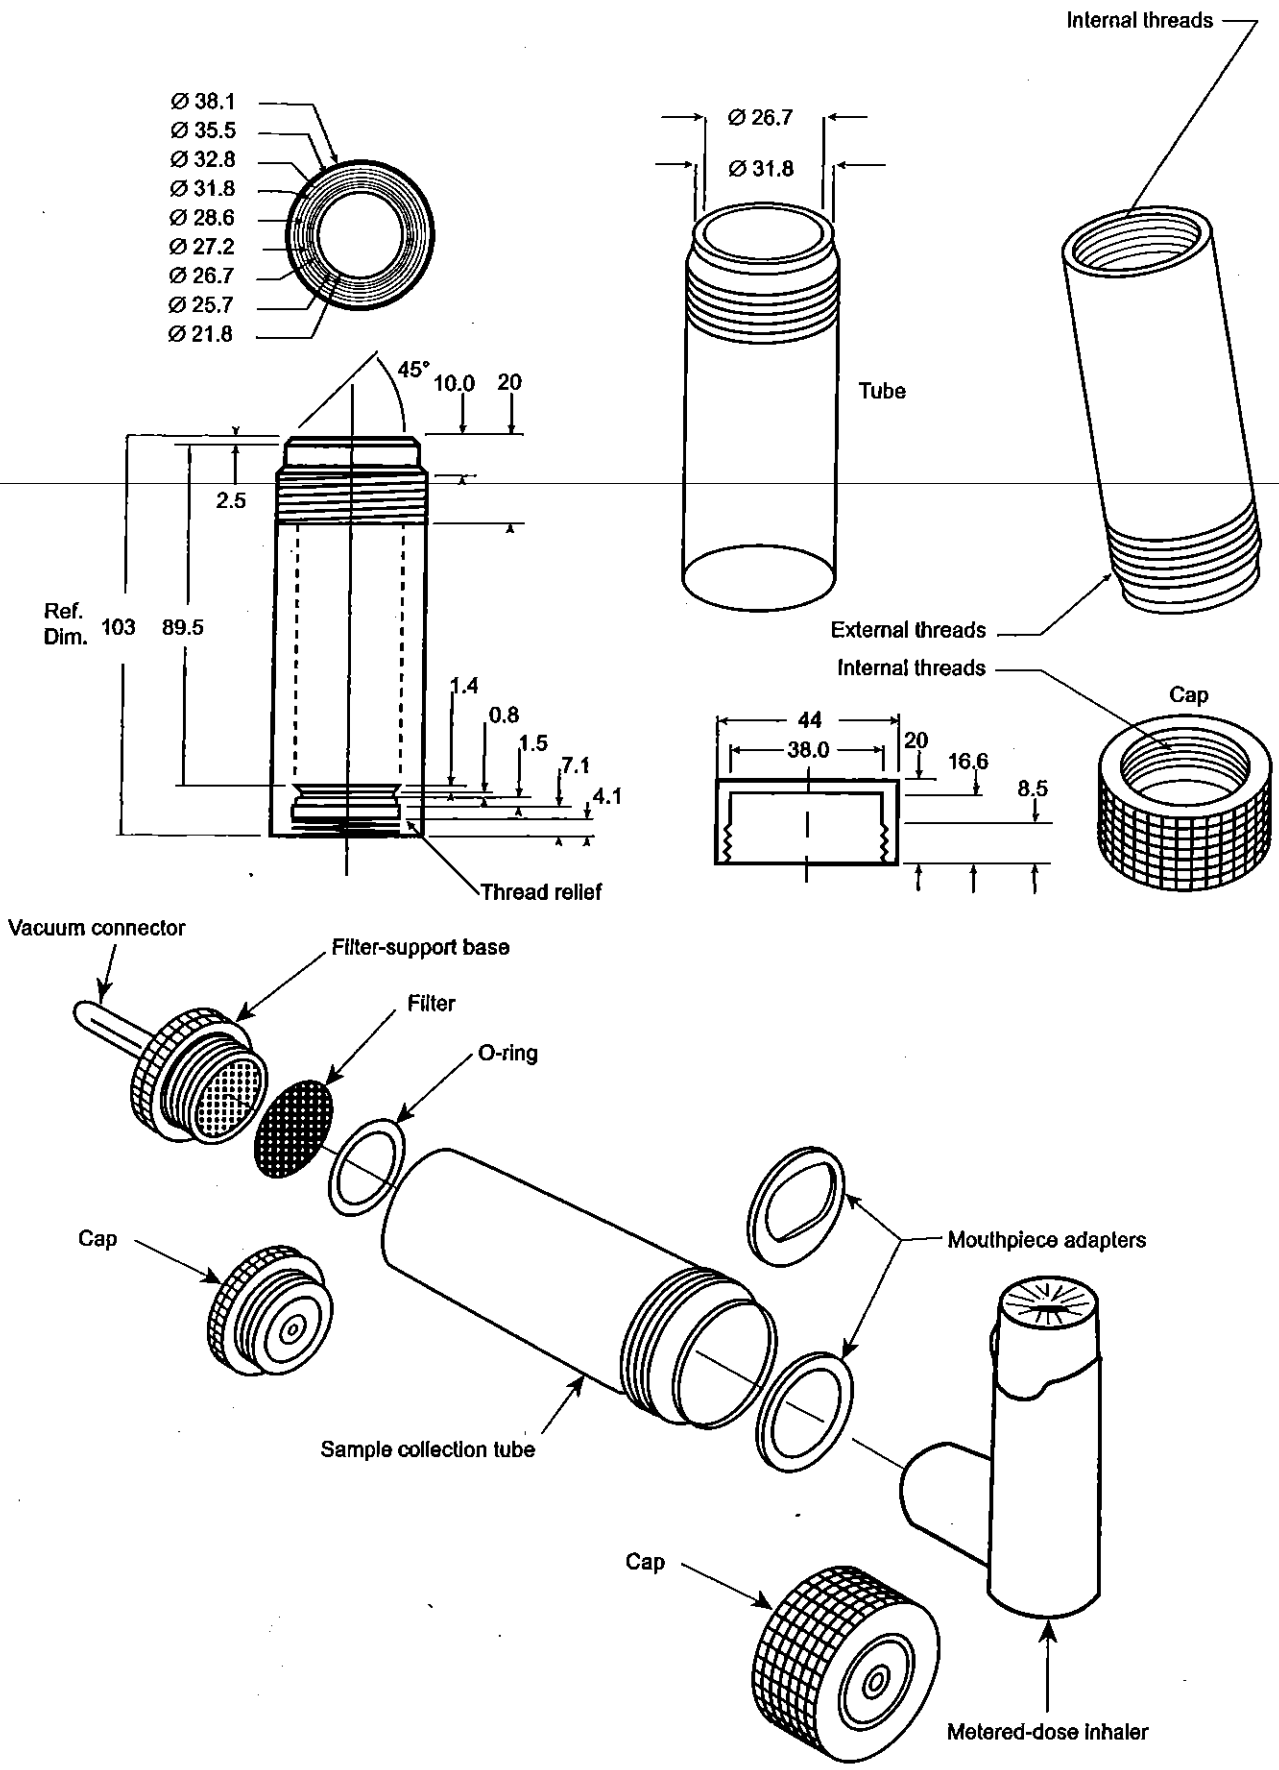

Figure 0671.-1. – *Dose collection apparatus for pressurised metered-dose inhalers*
Dimensions in millimetres

www.webofpharma.com

Calculate the total loss of mass, in milligrams, over the entire shelf life of the inhaler (D), in months, of the container, using the following expression:

$$\frac{m_1 - m_2}{t} \times D \times 730$$

Unless otherwise justified, the preparation complies if the total loss of mass over the entire shelf life is not more than 10 per cent (*m/m*) of the nominal fill mass of the container.

NON-PRESSURISED METERED-DOSE PREPARATIONS FOR INHALATION

DEFINITION

Non-pressurised metered-dose preparations for inhalation are solutions, suspensions or emulsions for use with inhalers that convert liquids into aerosols using single or multiple liquid jets, ultrasonic vibration or other methods. The volume of liquid to be converted into an aerosol is pre-metered or metered by the inhaler so that the dose delivered from the inhaler can be inhaled with 1 or more inspirations.

Non-pressurised metered-dose preparations for inhalation supplied in multidose containers may contain a suitable preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties.

Non-pressurised metered-dose preparations for inhalation that are supplied in multidose containers but do not contain a preservative and do not have adequate antimicrobial properties are sterile and are supplied in containers preventing microbial contamination of the contents during storage and use.

Non-pressurised metered-dose preparations for inhalation supplied in single-dose containers are sterile and preservative-free, unless otherwise justified and authorised.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of non-pressurised metered-dose preparations for inhalation are determined using the method described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles.* Alternatively, laser diffraction analysis may be used, when properly validated against method *2.9.18* (apparatus C, D or E).

TESTS

For breath-triggered non-pressurised metered-dose inhalers, the test conditions described below may need to be modified to ensure that actuation occurs for the inhaler under test.

Prepare and use the inhaler as directed in the instructions to the patient.

Uniformity of delivered dose, intra-inhaler testing

Use an apparatus capable of quantitatively retaining the delivered dose. The apparatus described in the test for uniformity of delivered dose for pressurised metered-dose preparations may be used.

Discharge the inhaler into the apparatus. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Where justified and authorised, another apparatus and procedure may be used.

Fine particle dose

Using an apparatus and procedure described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus C, D or E), calculate the fine particle dose. Use the same procedure as for pressurised inhalers with appropriate adaptation of the methodology to non-pressurised inhalers. Depending on the characteristics of the non-pressurised metered-dose preparations for inhalation, relative humidity and/or temperature may need to be controlled during the test.

Number of deliveries per inhaler

Take 1 inhaler and discharge the contents to waste until empty. Record the deliveries discharged. The total number of deliveries discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

INHALATION POWDERS

DEFINITION

Inhalation powders are solid preparations for inhalation intended for administration by means of a powder inhaler.

They are supplied in single-dose or multidose containers. Pre-metered inhalers are loaded with powders pre-dispensed in capsules or other suitable dosage forms. Device-metered inhalers may use a powder reservoir, where the dose is created by a metering mechanism within the inhaler.

To facilitate the use of inhalation powders, active substances may be combined with suitable excipients, e.g. a carrier substance.

The delivered dose is the dose delivered from the inhaler. For some preparations, the labelled dose has been established as a metered dose or as a pre-metered dose.
The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of powders for inhalation are determined using the method described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles.*

TESTS

Prepare and use the inhaler as directed in the instructions to the patient.

www.webofpharma.com

Uniformity of delivered dose, intra-inhaler testing
Use an apparatus capable of quantitatively retaining the delivered dose. A dose collection apparatus similar to that described for the evaluation of pressurised metered-dose inhalers may be used provided that the dimensions of the tube and the filter can accommodate the measured flow rate. A suitable tube is defined in Table 0671.-1. Connect the tube to a flow system according to the scheme specified in Figure 0671.-2 and Table 0671.-1.

Unless otherwise stated, determine the test flow rate and duration using the dose collection tube, the associated flow system, a suitable differential pressure meter and a suitable volumetric flowmeter, calibrated for the flow leaving the meter, according to the following procedure.

Table 0671.-1. – *Specifications of the apparatus used for powder inhalers described in Figure 0671.-2*

Code	Item	Description
A	Sample collection tube	Capable of quantitatively capturing the delivered dose, e.g. dose collection tube similar to that described in Figure 0671.-1 with dimensions of 34.85 mm ID × 12 cm length (e.g. product number XX40 047 00, Millipore Corporation, Bedford, MA 01732, USA with modified exit tube, ID ≥ 8 mm, fitted with Gelman product number 61631), or equivalent.
B	Filter	47 mm filter, e.g. A/E glass fibre filter (Gelman Sciences, Ann Arbor, MI 48106, USA), or equivalent.
C	Connector	ID ≥ 8 mm, e.g., short metal coupling, with low-diameter branch to P3.
D	Vacuum tubing	A length of suitable tubing having an ID ≥ 8 mm and an internal volume of 25 ± 5 mL.
E	2-way solenoid valve	A 2-way, 2-port solenoid valve having a minimum airflow resistance orifice with ID ≥ 8 mm and an opening time ≤ 100 ms (e.g. type 256-A08, Bürkert GmbH, 74653 Ingelfingen, Deutschland), or equivalent.
F	Vacuum pump	Pump must be capable of drawing the required flow rate through the assembled apparatus with the powder inhaler in the mouthpiece adapter (e.g. product type 1023, 1423 or 2565, Gast Manufacturing Inc., Benton Harbor, MI 49022, USA), or equivalent. Connect the pump to the 2-way solenoid valve using short and/or wide (≥ 10 mm ID) vacuum tubing and connectors to minimise pump capacity requirements.
G	Timer	Timer capable of driving the 2-way solenoid valve for the required time period (e.g. type G814, RS Components International, Corby, NN17 9RS, UK), or equivalent.
P1	Pressure tap	2.2 mm ID, 3.1 mm OD, flush with internal surface of the sample collection tube, centred and burr-free, 59 mm from its inlet. The pressure tap P1 must never be open to the atmosphere. Differential pressure to atmosphere is measured at P1.
P2 P3	Pressure measurements	Absolute pressures.
H	Flow control valve	Adjustable regulating valve with maximum $C_V \geq 1$ (e.g. type 8FV12LNSS, Parker Hannifin plc., Barnstaple, EX31 1NP, UK), or equivalent.

Prepare the inhaler for use and connect it to the inlet of the apparatus using a mouthpiece adapter to ensure an airtight seal. Use a mouthpiece adapter that ensures that the front face of the inhaler mouthpiece is flush with the front face of the sample collection tube. Connect one port of a differential pressure meter to the pressure reading point P1 in Figure 0671.-2, and let the other be open to the atmosphere. Switch on the pump, open the 2-way solenoid valve and adjust the flow control valve until the pressure drop across the inhaler is 4.0 kPa (40.8 cm H_2O) as indicated by the differential pressure meter. Remove the inhaler from the mouthpiece adapter and, without touching the flow control valve, connect a flowmeter to the inlet of the sampling apparatus. Use a flowmeter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

P_0 = atmospheric pressure;
ΔP = pressure drop over the meter.

If the flow rate is above 100 L/min, adjust the flow control valve to obtain a flow rate of 100 L/min (± 5 per cent). Note the volumetric airflow rate exiting the meter and define this as the test flow rate, Q_{out}, in litres per minute. Define the test flow duration, T, in seconds so that a volume of 4 L of air is drawn from the mouthpiece of the inhaler at the test flow rate, Q_{out}.

Ensure that critical flow occurs in the flow control valve by the following procedure: with the inhaler in place and the test flow rate Q_{out}, measure the absolute pressure on both sides of the control valve (pressure reading points P2 and P3 in Figure 0671.-2); a ratio P3/P2 of less than or equal to 0.5 indicates critical flow; switch to a more powerful pump and re-measure the test flow rate if critical flow is not indicated.

Pre-metered inhalers Connect the inhaler to the apparatus using an adapter that ensures a good seal. Draw air through the inhaler using the predetermined conditions. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 9 doses.

Device-metered inhalers Connect the inhaler to the apparatus using an adapter that ensures a good seal. Draw air through the inhaler under the predetermined conditions. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste until $(n/2) + 1$ deliveries remain, where n is the number of deliveries stated on the label. If necessary, store the inhaler to discharge electrostatic charges. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste until 3 doses remain. If necessary, store the inhaler to discharge electrostatic charges. Collect 3 doses using the procedure described above.

www.webofpharma.com

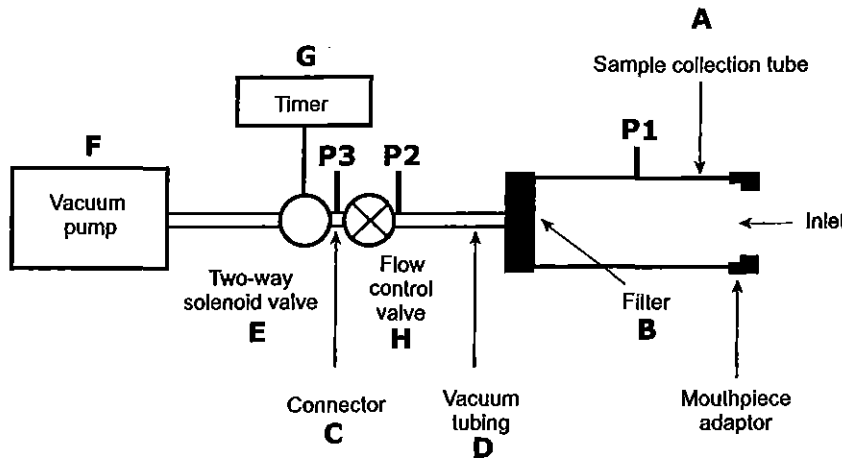

Figure 0671.-2. – *Apparatus suitable for measuring the uniformity of delivered dose for powder inhalers*

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

The preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

In justified and authorised cases, these ranges may be extended but no value may be greater than 150 per cent or less than 50 per cent of the mean value. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Fine particle dose

Using an apparatus and procedure described in general chapter *2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus C, D or E), calculate the fine particle dose.

Number of deliveries per inhaler for multidose inhalers

Take 1 inhaler and discharge the contents to waste until empty, at the predetermined flow rate. Record the deliveries discharged. The total number of deliveries discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Ph Eur

Intravesical Preparations

(Ph. Eur. monograph 2811)

Ph Eur

DEFINITION

Intravesical preparations are aqueous preparations intended for instillation into the urinary bladder. Unless otherwise justified and authorised, they are sterile.

Intravesical preparations are prepared by dissolving or suspending one or more active substances and excipients, as necessary, in *Water for injections (0169)*. Some intravesical solutions, suspensions and emulsions may be prepared from concentrates or powders immediately before use.

Where applicable, the containers for intravesical preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Intravesical preparations are supplied in glass containers (*3.2.1*) or in other containers such as plastic containers (*3.2.2*, *3.2.2.1* and *3.2.9*) and prefilled syringes. The tightness of the container is ensured by suitable means.

Preparations for irrigation of the bladder comply with the monograph *Preparations for irrigation (1116)*.

Several categories of intravesical preparations may be distinguished:
— intravesical solutions, suspensions and emulsions;
— concentrates for intravesical solutions, suspensions or emulsions;
— powders for intravesical solutions or suspensions.

PRODUCTION

Intravesical preparations are prepared using materials and methods designed to ensure sterility, unless otherwise justified and authorised, and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products*.

Water used in the manufacture of intravesical preparations complies with the requirements for water for injections in bulk stated in the monograph *Water for injections (0169)*.

Intravesical solutions, examined under suitable conditions of visibility, are practically free from particles; recommendations on this aspect are provided in general chapter *5.17.2. Recommendations on testing of particulate contamination: visible particles*.

Intravesical preparations are prepared using substances that comply with a test for bacterial endotoxins (*2.6.14*); recommendations on this aspect are provided in general chapter *5.1.10. Guidelines for using the test for bacterial endotoxins*.

During the development of intravesical preparations, it must be demonstrated that the nominal content can be withdrawn from the container.

TESTS

Particulate contamination: visible particles (*2.9.20*)

Intravesical solutions, if applicable after reconstitution, examined under suitable conditions of visibility, are practically free from visible particles; recommendations on this aspect are provided in general chapter *5.17.2*.

www.webofpharma.com

Recommendations on testing of particulate contamination: visible particles.

Sterility (*2.6.1*)
Intravesical preparations comply with the test, unless otherwise justified and authorised.

Bacterial endotoxins - pyrogens
Intravesical preparations, if applicable after reconstitution or dilution, comply with a test for bacterial endotoxins (*2.6.14*) or, where justified and authorised, with the test for pyrogens (*2.6.8*). Recommendations on this aspect are provided in general chapter *5.1.10. Guidelines for using the test for bacterial endotoxins.*

LABELLING
The label states, where applicable, that the preparation is free from bacterial endotoxins or that it is apyrogenic.

INTRAVESICAL SOLUTIONS, SUSPENSIONS AND EMULSIONS

DEFINITION
Intravesical solutions, suspensions and emulsions are liquid intravesical preparations usually intended for administration by means of a suitable applicator. They may also be supplied as single-dose syringes for connection to a catheter.

They usually contain excipients to adjust the tonicity of the preparation relative to blood.

Intravesical solutions, examined under suitable conditions of visibility, are practically free from particles.

Intravesical emulsions do not show any evidence of phase separation. Intravesical suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

TESTS
Uniformity of dosage units (*2.9.40*)
Intravesical suspensions and emulsions supplied in single-dose containers comply with the test or, where justified and authorised, with the test for uniformity of content shown below.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, intravesical suspensions and emulsions supplied in single-dose containers and having a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with the requirements under Test A. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

CONCENTRATES FOR INTRAVESICAL SOLUTIONS, SUSPENSIONS OR EMULSIONS

DEFINITION
Concentrates for intravesical solutions, suspensions or emulsions are liquid intravesical preparations intended for administration after dilution to the prescribed volume with a prescribed liquid.

After dilution, they comply with the requirements for intravesical solutions, suspensions or emulsions.

LABELLING
The label states the instructions for the preparation of the intravesical solution, suspension or emulsion.

POWDERS FOR INTRAVESICAL SOLUTIONS OR SUSPENSIONS

DEFINITION
Powders for intravesical solutions or suspensions are sterile, solid intravesical preparations intended for administration after reconstitution with the prescribed volume of a prescribed sterile liquid.

They are supplied in their final containers and, when reconstituted, rapidly form either practically particle-free solutions or uniform suspensions. After dissolution or dispersion, they comply with the requirements for intravesical solutions or suspensions.

Freeze-dried products for intravesical administration are considered to be powders for intravesical solutions or suspensions.

PRODUCTION
For freeze-dried products for intravesical administration, the uniformity of content and uniformity of mass are ensured by the in-process control of the amount of the solution prior to freeze-drying.

TESTS
Uniformity of dosage units (*2.9.40*)
Powders for intravesical solutions or suspensions comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, powders for intravesical solutions or suspensions having a content of active substance less than 2 mg or less than 2 per cent of the total mass, or with a unit mass equal to or less than 40 mg comply with the requirements under Test B. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Powders for intravesical solutions or suspensions comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

LABELLING
The label states the instructions for the preparation of the intravesical solution or suspension.

Ph Eur

Preparations for Irrigation

(Ph. Eur. monograph 1116)

Preparations for Irrigation comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION
Preparations for irrigation are sterile, aqueous, large-volume preparations intended to be used for irrigation of body cavities, wounds and surfaces, for example during surgical procedures.

Preparations for irrigation are either solutions prepared by dissolving one or more active substances, electrolytes or osmotically active substances in water complying with the

www.webofpharma.com

requirements for *Water for injections (0169)* or they consist of such water alone. In the latter case, the preparation may be labelled as 'water for irrigation'. Irrigation solutions are usually adjusted to make the preparation isotonic with respect to blood.

Examined in suitable conditions of visibility, preparations for irrigation are clear and practically free from particles.

Preparations for irrigation are supplied in single-dose containers. The containers and closures comply with the requirements for containers for preparations for parenteral administration (*3.2.1* and *3.2.2*), but the administration port of the container is incompatible with intravenous administration equipment and does not allow the preparation for irrigation to be administered with such equipment.

PRODUCTION

Preparations for irrigation are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products (5.1.1)*.

During development, it must be demonstrated that the nominal content can be withdrawn from the container.

TESTS

Sterility (*2.6.1*)
Preparations for irrigation comply with the test for sterility.

Bacterial endotoxins (*2.6.14*)
Less than 0.5 IU/mL.

Pyrogens (*2.6.8*)
Preparations for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 mL of the preparation, unless otherwise justified and authorised.

LABELLING

The label states:
— that the preparation is not to be used for injection;
— that the preparation is to be used on one occasion only and that any unused portion of the preparation is to be discarded.

Ph Eur

Oral Liquids

(Liquid Preparations for Oral Use, Ph. Eur. monograph 0672)

Oral Liquids comply with the requirements of the European Pharmacopoeia monograph for Liquid Preparations for Oral Use. These requirements are reproduced below.

Ph Eur

Where justified and authorised, the requirements of this monograph do not apply to liquid preparations for oral use intended for veterinary use.

DEFINITION

Liquid preparations for oral use are usually solutions, emulsions or suspensions containing one or more active substances in a suitable vehicle; they may, however, consist of liquid active substances used as such (oral liquids).

Some preparations for oral use are prepared by dilution of concentrated liquid preparations, or from powders or granules for the preparation of oral solutions or suspensions, for oral drops or for syrups, using a suitable vehicle.

The vehicle for any preparation for oral use is chosen having regard to the nature of the active substance(s) and to provide organoleptic characteristics appropriate to the intended use of the preparation.

Liquid preparations for oral use may contain suitable antimicrobial preservatives, antioxidants and other excipients such as dispersing, suspending, thickening, emulsifying, buffering, wetting, solubilising, stabilising, flavouring and sweetening agents and colouring matter, authorised by the competent authority.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment, which is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Where applicable, containers for liquid preparations for oral use comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of preparations may be distinguished;
— oral solutions, emulsions and suspensions;
— powders and granules for oral solutions and suspensions;
— oral drops;
— powders for oral drops;
— syrups;
— powders and granules for syrups.

PRODUCTION

During development of a preparation for oral use whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

During development, it must be demonstrated that the nominal content can be withdrawn from the container, for liquid preparations for oral use presented in single-dose containers.

In the manufacturing, packaging, storage and distribution of liquid preparations for oral use, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

In the manufacture of liquid preparations for oral use containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units
Solutions, suspensions and emulsions in single-dose containers comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of content or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, single-dose preparations that are suspensions or emulsions comply with the following test. After shaking, empty each container as completely as possible and carry out the test on the individual contents. They comply with test B for uniformity of content of single-dose preparations.

www.webofpharma.com

Uniformity of mass
Single-dose preparations that are solutions comply with the following test: weigh individually the contents of 20 containers, emptied as completely as possible, and determine the average mass. Not more than 2 of the individual masses deviate by more than 10 per cent from the average mass and none deviate by more than 20 per cent.

Dose and uniformity of dose of oral drops
Into a suitable graduated cylinder, introduce by means of the dropping device the number of drops usually prescribed for one dose, or introduce by means of the measuring device the usually prescribed quantity. The dropping speed does not exceed 2 drops per second. Weigh the liquid, repeat the addition, weigh again and carry on repeating the addition and weighing until a total of 10 masses are obtained.
No single mass deviates by more than 10 per cent from the average mass.

If the labelling defines a mass, the total of 10 masses does not differ by more than 15 per cent from the nominal mass of 10 doses defined on the labelling. If the labelling defines a volume, measure the total volume of 10 doses. The volume does not differ by more than 15 per cent from the nominal volume of 10 doses defined on the labelling.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*)
Liquid preparations for oral use supplied in multidose containers comply with the test. Oral drops are not subject to the provisions of this test.

LABELLING
The label states the name of any added preservative.

ORAL SOLUTIONS, EMULSIONS AND SUSPENSIONS

DEFINITION
Oral solutions, emulsions and suspensions are supplied in single-dose or multidose containers. Each dose from a multidose container is administered by means of a device suitable for measuring the prescribed volume. The device is usually a spoon or a cup for volumes of 5 mL or multiples thereof or an oral syringe for other volumes.

POWDERS AND GRANULES FOR ORAL SOLUTIONS AND SUSPENSIONS

DEFINITION
Powders and granules for the preparation of oral solutions or suspensions are intended to be reconstituted with the prescribed liquid to produce a liquid preparation for oral use. They may contain excipients, in particular to facilitate dispersion or dissolution and to prevent caking.

After dissolution or suspension, they comply with the requirements for oral solutions or oral suspensions, as appropriate.

TESTS
Uniformity of dosage units
Single-dose powders and single-dose granules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, single-dose powders and single-dose granules with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Single-dose powders and single-dose granules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

LABELLING
The label states:
— the method of preparation of the solution or suspension;
— the conditions and the duration of storage after reconstitution.

ORAL DROPS

DEFINITION
Oral drops are solutions, emulsions or suspensions that are administered in small volumes such as drops by means of a suitable device.

LABELLING
The label states the number of drops per millilitre of preparation or per gram of preparation if the dose is measured in drops.

POWDERS FOR ORAL DROPS

DEFINITION
Powders for the preparation of oral drops are intended to be reconstituted with the prescribed liquid to produce a liquid preparation for oral use. They may contain excipients to facilitate dissolution or suspension in the prescribed liquid or to prevent caking.

After dissolution or suspension, they comply with the requirements for oral drops.

TESTS
Uniformity of dosage units
Single-dose powders for oral drops comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, single-dose powders for oral drops with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Single-dose powders for oral drops comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

SYRUPS

DEFINITION
Syrups are aqueous preparations characterised by a sweet taste and a viscous consistency. They may contain sucrose at

www.webofpharma.com

a concentration of at least 45 per cent *m/m*. The sweet taste can also be obtained by using other polyols or sweetening agents. Syrups usually contain aromatic or other flavouring agents. Each dose from a multidose container is administered by means of a device suitable for measuring the prescribed volume. The device is usually a spoon or a cup for volumes of 5 mL or multiples thereof.

LABELLING

The label states the name and concentration of the polyol or sweetening agent.

POWDERS AND GRANULES FOR SYRUPS

DEFINITION

Powders and granules for syrups are intended to be reconstituted with the prescribed liquid to produce a liquid preparation for oral use. They may contain excipients to facilitate dissolution.

After dissolution, they comply with the requirements for syrups.

TESTS

Uniformity of dosage units

Single-dose powders and granules for syrups comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, single-dose powders and granules for syrups with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)

Single-dose powders and granules for syrups comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Ph Eur

Oral Liquids of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any elixir, linctus, mixture or oral emulsion that is the subject of an individual monograph in the British Pharmacopoeia.

DEFINITION

Oral Liquids other than Oral Emulsions may be supplied as liquids or prepared just before issue for use by dissolving or dispersing granules or powder in the liquid stated on the label.

LABELLING

The label states for Oral Emulsions, Oral Suspensions and, where appropriate, for Mixtures, that the bottle should be shaken before use.

If the Oral Liquid is supplied as granules or powder to be constituted just before issue for use, the label states that the contents of the container are granules or powder for the preparation of an Oral Liquid.

ELIXIRS

DEFINITION

Elixirs are clear, flavoured Oral Liquids containing one or more active ingredients dissolved in a vehicle that usually contains a high proportion of Sucrose or a suitable polyhydric alcohol or alcohols and may also contain Ethanol (96 per cent) or a Dilute Ethanol.

LINCTUSES

DEFINITION

Linctuses are viscous Oral Liquids that may contain one or more active ingredients in solution. The vehicle usually contains a high proportion of Sucrose, other sugars or a suitable polyhydric alcohol or alcohols. Linctuses are intended for use in the treatment or relief of cough, and are sipped and swallowed slowly without the addition of water.

MIXTURES

DEFINITION

Mixtures are Oral Liquids containing one or more active ingredients dissolved, suspended or dispersed in a suitable vehicle. Suspended solids may separate slowly on standing but are easily redispersed on shaking.

ORAL EMULSIONS

DEFINITION

Oral Emulsions are Oral Liquids containing one or more active ingredients. They are stabilised oil-in-water dispersions, either or both phases of which may contain dissolved solids. Solids may also be suspended in Oral Emulsions.

When issued for use, Oral Emulsions should be supplied in wide-mouthed bottles.

Extemporaneous preparation

In Oral Emulsions prepared according to the formula and directions given for Extemporaneous preparation, the quantity of emulsifying agent specified in individual monographs may be reduced to yield a preparation of suitable consistency provided that by so doing the stability of the preparation is not adversely affected.

Nasal Preparations

(Ph. Eur. monograph 0676)

Ph Eur

DEFINITION

Nasal preparations are preparations intended for administration to the nasal cavities to deliver active substances for a local or systemic effect. They are liquid, semi-solid or solid preparations containing one or more active substances in a suitable vehicle. They may contain excipients, for example to adjust the tonicity or viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substances, to stabilise the preparation or to provide adequate antimicrobial properties.

The excipients do not adversely affect the intended medicinal

www.webofpharma.com

action of the preparation or, at the concentrations used, cause toxicity or undue local irritation.

Nasal preparations are supplied in multidose or single-dose containers, if necessary provided with a suitable administration device that is designed to avoid the introduction of contaminants.

Unless otherwise justified and authorised, aqueous nasal preparations supplied in multidose containers contain a suitable preservative at a suitable concentration, except where the preparation itself has adequate antimicrobial properties.

Preparations for administration to the injured nose, particularly when the mucosa is damaged, or prior to surgery are sterile and, unless otherwise justified and authorised, free from preservatives and supplied in single-dose containers.

Where applicable, containers for nasal preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of nasal preparations may be distinguished:
— nasal drops;
— nasal sprays;
— nasal powders;
— semi-solid nasal preparations;
— nasal washes;
— nasal sticks.

PRODUCTION

During the development of nasal preparations whose formulation contains a preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

In the manufacture, packaging, storage and distribution of nasal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Sterile nasal preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

In the manufacture of nasal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

During manufacture of metered-dose nasal sprays and metered-dose nasal powders supplied in multidose containers, the uniformity of delivered dose must be ensured within a container (intra-container) and between containers (inter-container).

For intra-container testing of the uniformity of delivered dose, a test is given in the Tests section.

For inter-container testing of the uniformity of delivered dose, see below.

Uniformity of delivered dose, inter-container testing
Unless otherwise justified and authorised, the test applies. *Prepare and use the containers as directed in the instructions to the patient.*

An example of a suitable procedure is to take 10 containers and collect a single dose from each container, collecting the dose at the beginning (from 3 containers), middle (from 4 containers) and end (from 3 containers) of the number of doses stated on the label. Other inter-container testing procedures are possible, where justified.

A suitable dose collection apparatus is described in the monograph *Preparations for inhalation (0671).*

TESTS

Sterility (*2.6.1*)
Where the label states that the preparation is sterile, it complies with the test.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:
— the name of any added preservative;
— where applicable, that the preparation is sterile;
— for multidose containers:
  — the period within which the preparation is to be used after opening;
  — where applicable, the number of deliveries per container;
  — where applicable, the delivered dose or, if justified and authorised (e.g. where the dose has been established as a metered dose or as a pre-metered dose), the metered dose or the pre-metered dose.

NASAL DROPS

DEFINITION

Nasal drops are liquid preparations intended for instillation into the nasal cavities. They are solutions, emulsions or suspensions.

Nasal drops that are emulsions may show evidence of phase separation but are readily redispersed on shaking. Nasal drops that are suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Nasal drops are usually supplied in multidose containers of glass or a suitable plastic material that are fitted with an integral dropper or with a screw cap of suitable materials incorporating a dropper and rubber or plastic teat. This cap assembly may also be supplied separately.

PRODUCTION

During the development of nasal drops supplied in single-dose containers, it must be demonstrated that the nominal content can be withdrawn from the container.

TESTS

Unless otherwise prescribed or justified and authorised, nasal drops supplied in single-dose containers comply with the following tests.

Uniformity of dosage units (*2.9.40*)
Nasal drops supplied in single-dose containers comply with the test or, where justified and authorised, with the test for uniformity of mass or uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of mass
Nasal drops that are solutions comply with the following test. Weigh individually the contents of 10 containers emptied as completely as possible, and determine the average mass. Not more than 2 of the individual masses deviate by more

www.webofpharma.com

than 10 per cent from the average mass, and none deviate by more than 20 per cent.

Uniformity of content (*2.9.6*)
Nasal drops that are suspensions or emulsions comply with the requirements under Test B. Empty each container as completely as possible and carry out the test on the individual contents.

NASAL SPRAYS

DEFINITION

Nasal sprays are liquid preparations intended for spraying into the nasal cavities. They are solutions, emulsions or suspensions.

Nasal sprays that are emulsions may show evidence of phase separation but are readily redispersed on shaking. Nasal sprays that are suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Nasal sprays are usually supplied in multidose containers with atomising devices or in pressurised containers fitted with a suitable adapter, with or without a metering dose valve. Pressurised containers comply with the requirements of the monograph *Pressurised pharmaceutical preparations (0523)*.

The size of the droplets generated and the resulting spray pattern are such that spray deposition is localised in the nasal cavity.

TESTS

Unless otherwise prescribed or justified and authorised, metered-dose nasal sprays comply with the following tests.

Prepare and use the container as directed in the instructions to the patient.

Uniformity of delivered dose, intra-container testing
Metered-dose nasal sprays supplied in multidose containers comply with the following test. If justified and authorised, for preparations that are solutions, the test for uniformity of delivered dose can be replaced by the test for uniformity of delivered mass.

Use an apparatus capable of quantitatively retaining the dose leaving the metered-dose container. A suitable apparatus is described in the monograph *Preparations for inhalation (0671)*.

Take 1 container and discharge the contents into the apparatus until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance. Repeat the procedure for a further 2 doses.

Discharge the container to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above. Discharge the container to waste until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than one active substance, carry out the test for uniformity of delivered dose for each active substance.

For pressurised metered-dose nasal sprays, prevent excessive cooling by waiting not less than 5 s between each actuation.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of the 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent.

If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 2 more containers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Uniformity of delivered mass, multidose containers
Metered-dose nasal sprays that are solutions and are supplied in multidose containers comply with the following test.

Take 1 container, weigh and discharge the contents to waste until the number of deliveries that constitute the minimum recommended dose has been discharged. Weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 2 doses.

Discharge the container to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. Determine the mass of 4 doses using the procedure described above.

Discharge the container to waste until 3 doses remain. Determine the mass of these 3 doses using the procedure described above.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of the 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent.

If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 2 more containers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the target delivered mass.

Uniformity of delivered mass, single-dose containers
Metered-dose nasal sprays that are solutions and are supplied in single-dose containers comply with the following test.

Take 1 container, weigh and discharge the contents to waste until the number of deliveries that constitute the minimum recommended dose has been discharged. Weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers.

The preparation complies with the test if 8 out of the 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent of the mean value.

Number of deliveries per container
Nasal sprays supplied in multidose containers comply with the following test.

Take 1 container and discharge the contents to waste until empty. Record the number of deliveries discharged. The total number of deliveries discharged from the container is not less than the number stated on the label.

Leak rate
Metered-dose nasal sprays supplied in pressurised containers comply with the following test.

Take a suitable number of containers, for example 1 container. Remove any labels and record the date and time to the nearest half hour. Weigh the container(s) to the nearest milligram and record the mass (m_1) in milligrams. Allow the container(s) to stand in an upright position at a temperature of 25.0 ± 2.0 °C for not less than 3 days, and

www.webofpharma.com

again weigh the container(s), recording the mass (m_2) in milligrams, and recording the date and time to the nearest half hour. Determine the time (t), in hours, during which the container was under test.

Calculate the total loss of mass, in milligrams, over the entire shelf-life of the container (D), in months, using the following expression:

$$\frac{m_1 - m_2}{t} \times D \times 730$$

where 730 represents the number of hours in a month.

Unless otherwise justified and authorised, the preparation complies with the test if the total loss of mass over the entire shelf-life is not more than 10 per cent (*m/m*) of the nominal fill.

NASAL POWDERS

DEFINITION

Nasal powders are powders intended for insufflation into the nasal cavities. They comply with the requirements of the monograph *Powders for cutaneous application (1166)*.

They are supplied in containers fitted with a suitable device for insufflation.

The size of the particles is such that their deposition is localised in the nasal cavity; it is verified by suitable methods of particle-size determination.

TESTS

Unless otherwise prescribed or justified and authorised, metered-dose nasal powders supplied in multidose containers comply with the following tests.

Prepare and use the container as directed in the instructions to the patient.

Uniformity of delivered dose, intra-container testing

Metered-dose nasal powders supplied in multidose containers comply with the following test.

Use an apparatus capable of quantitatively retaining the dose leaving the metered-dose container. A suitable apparatus is described in the monograph *Preparations for inhalation (0671)*.

Connect the container to the apparatus using an adapter that ensures a good seal. Draw air through the container under the predetermined conditions. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance. Repeat the procedure for a further 2 doses.

Discharge the container to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. If necessary, store the container to discharge electrostatic charges. Collect 4 doses using the procedure described above. Discharge the container to waste until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than one active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of the 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent.

If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 2 more containers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

In justified and authorised cases, these ranges may be extended but no value may be greater than 150 per cent or less than 50 per cent of the mean value. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Number of deliveries per container

Nasal powders supplied in multidose containers comply with the following test.

Take 1 container and discharge the contents to waste until empty. Record the number of deliveries discharged. The total number of deliveries discharged from the container is not less than the number stated on the label.

SEMI-SOLID NASAL PREPARATIONS

DEFINITION

Semi-solid nasal preparations are preparations intended for application to the nasal cavity. They are ointments, creams or gels.

Semi-solid nasal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

They are supplied in containers designed to deliver the product to the site of application.

TESTS

Uniformity of dosage units (*2.9.40*)

Unless otherwise prescribed or justified and authorised, semi-solid nasal preparations that are intended for systemic effect and supplied in single-dose containers representing 1 dose of medicinal product comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Semi-solid nasal preparations that are intended for systemic effect and supplied in single-dose containers representing 1 dose of medicinal product comply with the requirements under Test B. Empty each container as completely as possible and carry out the test on the individual contents.

NASAL WASHES

DEFINITION

Nasal washes are liquid preparations intended for cleansing the nasal cavities. They are generally aqueous isotonic solutions.

PRODUCTION

During development of nasal washes supplied in single-dose containers, it must be demonstrated that the nominal content can be withdrawn from the container.

NASAL STICKS

DEFINITION

Nasal sticks comply with the monograph *Sticks (1154)*.

Ph Eur

www.webofpharma.com

Nasal Preparations of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any intranasal solution, intranasal suspension, nasal drops, nasal ointment or nasal spray that is the subject of an individual monograph in the British Pharmacopoeia.

INTRANASAL SOLUTIONS AND INTRANASAL SUSPENSIONS

DEFINITION

Intranasal Solutions and Intranasal Suspensions are intended for administration to the nostrils for local or systemic effects. When supplied in a container fitted with a spray mechanism, they may be entitled Nasal Spray.

LABELLING

The label states (1) the name and quantity of the active ingredient; (2) the name and quantity of any added substance; (3) that the preparation is for intranasal administration; (4) the date after which the preparation is not intended to be used; (5) the conditions under which the preparation should be stored.

NASAL DROPS

LABELLING

The label states (1) the name and quantity of the active ingredient; (2) the instructions for using the Nasal Drops; (3) the date after which the Nasal Drops are not intended to be used; (4) the conditions under which the Nasal Drops should be stored.

Oromucosal Preparations

(Ph. Eur. monograph 1807)

Oromucosal Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

This monograph does not apply to non-medicated dental preparations or to preparations such as chewable tablets (0478), medicated chewing gums (1239), oral lyophilisates and other solid or semi-solid preparations that are not specifically listed in this monograph. Where justified and authorised, this monograph does not apply to preparations for veterinary use.

DEFINITION

Oromucosal preparations are preparations intended for administration to the oral cavity and/or the throat to deliver active substances for a local or systemic effect. Preparations intended for a local effect are designed to be administered to a specific site within the oral cavity such as the gingivae (gingival preparations), the teeth (dental preparations) or the throat (oropharyngeal preparations). Preparations intended for a systemic effect are designed to be absorbed primarily at one or more sites on the oral mucosa (e.g. sublingual preparations). Mucoadhesive preparations are intended to be retained in the oral cavity by adhesion to the mucosal epithelium and may modify systemic drug absorption at the site of application. For many oromucosal preparations, it is likely that some proportion of the active substance(s) will be swallowed and may be absorbed via the gastrointestinal tract.

Oromucosal preparations are liquid, semi-solid or solid preparations containing one or more active substances in a suitable vehicle. They may contain preservatives and other excipients such as dispersing, suspending, thickening, emulsifying, buffering, wetting, solubilising, stabilising, flavouring and sweetening agents. Solid preparations may in addition contain glidants, lubricants and excipients capable of modifying the release of the active substance(s).

Where applicable, containers for oromucosal preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of oromucosal preparations may be distinguished, for example:

- gargles;
- mouthwashes;
- oromucosal solutions, emulsions and suspensions (e.g. gingival and dental solutions, emulsions and suspensions);
- semi-solid oromucosal preparations (e.g. gingival, dental and oromucosal gels and pastes);
- oromucosal drops;
- oromucosal sprays (e.g. oropharyngeal and sublingual sprays);
- pastilles and lozenges;
- compressed lozenges;
- sublingual tablets and buccal tablets;
- oromucosal capsules;
- mucoadhesive preparations;
- orodispersible films.

PRODUCTION

During the development of oromucosal preparations whose formulation contains a preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with the criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

In the manufacture, packaging, storage and distribution of oromucosal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

In the manufacture of semi-solid and liquid oromucosal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units (*2.9.40*)

Single-dose oromucosal preparations comply with the test or, where justified and authorised, with the test for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, single-dose oromucosal preparations having a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with the requirements under Test A (compressed and moulded dosage forms) or Test B (capsules). If the preparation contains more than one active

www.webofpharma.com

substance, this requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass *(2.9.5)*
Solid single-dose oromucosal preparations comply with the test. If the test for the uniformity of content is prescribed for all active substances, the test for uniformity of mass is not required.

LABELLING
The label states the name of any added preservative.

GARGLES

DEFINITION
Gargles are liquid oromucosal preparations intended for gargling to deliver active substances for a local effect. They are not to be swallowed.

They are aqueous solutions containing one or more active substances. They may contain excipients to adjust the pH, which, as far as possible, is neutral.

Gargles are supplied as ready-to-use solutions or concentrated solutions to be diluted. They may also be prepared from powders or tablets to be dissolved in water before use.

MOUTHWASHES

DEFINITION
Mouthwashes are liquid oromucosal preparations intended for use in contact with the mucous membrane of the oral cavity. They are not to be swallowed.

They are aqueous solutions containing one or more active substances. They may contain excipients to adjust the pH, which, as far as possible, is neutral.

Mouthwashes are supplied as ready-to-use solutions or concentrated solutions to be diluted. They may also be prepared from powders or tablets to be dissolved in water before use.

OROMUCOSAL SOLUTIONS, EMULSIONS AND SUSPENSIONS

DEFINITION
Oromucosal solutions, emulsions and suspensions are liquid preparations intended for administration to the oral cavity or to a specific part of the oral cavity such as the gingivae (gingival solutions, emulsions or suspensions) or the teeth (dental solutions, emulsions or suspensions), by means of a suitable applicator.

Oromucosal emulsions may show evidence of phase separation but are readily redispersed on shaking. Oromucosal suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

SEMI-SOLID OROMUCOSAL PREPARATIONS

DEFINITION
Semi-solid oromucosal preparations are hydrophilic gels, creams, ointments or pastes intended for administration to the oral cavity or to a specific part of the oral cavity such as the gingivae (gingival gels, creams, ointments and pastes) or the teeth (dental gels, creams, ointments and pastes). They may be supplied in single-dose containers.

Semi-solid oromucosal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

OROMUCOSAL DROPS

DEFINITION
Oromucosal drops are liquid preparations intended for instillation into the oral cavity or onto a specific part of the oral cavity to deliver active substances for a local or systemic effect. They are solutions, emulsions or suspensions.

Oromucosal drops that are emulsions may show evidence of phase separation but are readily redispersed on shaking. Oromucosal drops that are suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

TESTS
Unless otherwise prescribed or justified and authorised, oromucosal drops intended for a systemic effect and supplied in single-dose containers comply with the following tests.

Uniformity of dosage units *(2.9.40)*
Oromucosal drops supplied in single-dose containers comply with the test or, where justified and authorised, with the test for uniformity of mass or uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of mass
Oromucosal drops that are solutions comply with the following test Weigh individually the contents of 10 containers emptied as completely as possible, and determine the average mass. Not more than 2 of the individual masses deviate by more than 10 per cent from the average mass, and none deviates by more than 20 per cent.

Uniformity of content *(2.9.6)*
Oromucosal drops that are emulsions or suspensions comply with the requirements under Test B Empty each container as completely as possible and carry out the test on the individual contents.

OROMUCOSAL SPRAYS

DEFINITION
Oromucosal sprays are liquid preparations intended for spraying into the oral cavity or onto a specific part of the oral cavity such as under the tongue (sublingual sprays) or into the throat (oropharyngeal sprays) to deliver active substances for a local or systemic effect. They are solutions, emulsions or suspensions.

Oromucosal sprays that are emulsions may show evidence of phase separation but are readily redispersed on shaking. Oromucosal sprays that are suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Oromucosal sprays are usually supplied in multidose containers with atomising devices or in pressurised containers having a suitable adaptor, with or without a metering dose valve. The containers comply with the requirements of the monograph *Pressurised pharmaceutical preparations (0523)*.

The size of the droplets generated is such that spray deposition is localised in the oral cavity or in the throat as intended.

www.webofpharma.com

TESTS

Unless otherwise prescribed or justified and authorised, metered-dose oromucosal sprays and sublingual sprays intended for a systemic effect comply with the following tests.

Prepare and use the containers as directed in the instructions to the patient.

Uniformity of dosage units (*2.9.40*)

Metered-dose oromucosal sprays and sublingual sprays comply with the test or, where justified and authorised, with the test for uniformity of mass or uniformity of delivered dose shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

In the case of metered-dose oromucosal sprays and sublingual sprays that are solutions, proceed as follows Take 1 container and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat the procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers. Determine the mass variation (*2.9.40*).

Uniformity of mass

Metered-dose oromucosal sprays and sublingual sprays that are solutions comply with the following test.

Take 1 container and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat the procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers.

The preparation complies with the test if not more than 2 of the individual values deviate by more than 25 per cent from the average value and none deviates by more than 35 per cent.

Uniformity of delivered dose

Metered-dose oromucosal sprays and sublingual sprays that are emulsions or suspensions comply with the following test Use an apparatus capable of quantitatively retaining the dose leaving the metered-dose container.

Take 1 container, shake for 5 s and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat the procedure for a further 3 actuations. After 2 s, discharge 1 dose into the collecting vessel. Quantitatively collect the contents of the apparatus by successive rinses and determine the content of active substance in the combined rinses. Repeat the procedure for a further 9 containers.

Unless otherwise justified and authorised, the preparation complies with the test if not more than 1 of the individual contents is outside the limits of 75 per cent to 125 per cent and none is outside the limits of 65 per cent to 135 per cent of the average content.

If 2 or maximum 3 individual contents are outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent of the average content, repeat the test for 20 more containers. The preparation complies with the test if not more than 3 individual contents of the 30 individual contents are outside the limits of 75 per cent to 125 per cent and none is outside the limits of 65 per cent to 135 per cent of the average content.

PASTILLES AND LOZENGES

DEFINITION

Pastilles and lozenges are solid oromucosal preparations intended to be sucked and to dissolve or disintegrate slowly in the mouth to deliver active substances, usually for a local effect in the oral cavity and the throat. They are single-dose preparations containing one or more active substances, usually in a flavoured and sweetened base.

Pastilles are soft, flexible preparations prepared by moulding of mixtures containing natural or synthetic polymers or gums and sweeteners.

Lozenges are hard preparations prepared by moulding.

COMPRESSED LOZENGES

DEFINITION

Compressed lozenges are solid oromucosal preparations intended to be sucked to deliver active substances for a local or systemic effect. They are single-dose preparations, often rhomboid in shape, prepared by compression.

Compressed lozenges comply with the general definition of tablets.

PRODUCTION

In the manufacture of compressed lozenges, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. This may be demonstrated by performing tests described in general chapters *2.9.7. Friability of uncoated tablets* and *2.9.8. Resistance to crushing of tablets.*

TESTS

Dissolution

Unless otherwise justified and authorised, for compressed lozenges intended for a systemic effect, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.3. Dissolution of solid dosage forms.*

SUBLINGUAL TABLETS AND BUCCAL TABLETS

DEFINITION

Sublingual tablets and buccal tablets are solid oromucosal preparations intended for application under the tongue or to the buccal cavity, respectively, to deliver active substances for a systemic effect. They are single-dose preparations prepared by compression of mixtures of powders or granulations into tablets with a shape suitable for the intended use.

Sublingual tablets and buccal tablets comply with the general definition of tablets.

PRODUCTION

In the manufacture of sublingual tablets and buccal tablets, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. This may be demonstrated by performing tests described in general chapters *2.9.7. Friability of uncoated tablets* and *2.9.8. Resistance to crushing of tablets.*

TESTS

Dissolution

Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.3. Dissolution of solid dosage forms.*

www.webofpharma.com

OROMUCOSAL CAPSULES

DEFINITION

Oromucosal capsules are soft capsules intended to be chewed or sucked.

MUCOADHESIVE PREPARATIONS

DEFINITION

Mucoadhesive preparations are oromucosal solid or semi-solid preparations intended for application to the buccal mucosa to deliver active substances for a systemic effect over an extended period of time.

They may be supplied as mucoadhesive buccal tablets, as buccal films or as other solid or semi-solid mucoadhesive preparations. They usually contain hydrophilic polymers, which on wetting with the saliva produce a hydrogel that adheres to the buccal mucosa; in addition, buccal films may dissolve.

Mucoadhesive buccal tablets are prepared by compression and may be single- or multilayer tablets.

Buccal films consist of single- or multilayer sheets of suitable materials.

PRODUCTION

In the manufacture of mucoadhesive buccal tablets and of buccal films, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. For mucoadhesive buccal tablets this may be demonstrated by eperforming tests described in general chapters *2.9.7. Friability of uncoated tablets* and *2.9.8. Resistance to crushing of tablets.*

TESTS

Dissolution

Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.3. Dissolution of solid dosage forms.*

ORODISPERSIBLE FILMS

DEFINITION

Orodispersible films are solid oromucosal preparations intended for administration in the mouth, where they disperse rapidly to deliver active substances. They consist of single- or multilayer sheets of suitable materials.

PRODUCTION

In the manufacture of orodispersible films, measures are taken to ensure that they possess suitable mechanical strength to resist handling without being damaged.

TESTS

Dissolution

Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.3. Dissolution of solid dosage forms.*

Ph Eur

Parenteral Preparations

(Ph. Eur. monograph 0520)

Ph Eur

The requirements of this monograph do not necessarily apply to products derived from human blood, to immunological preparations or to radiopharmaceutical preparations. Special requirements may apply to preparations for veterinary use depending on the animal species for which the preparation is intended.

DEFINITION

Parenteral preparations are sterile preparations intended for administration into the human or animal body. They may be administered by injection, infusion or implantation.

They are liquid, semi-solid or solid preparations containing one or more active substances in a suitable vehicle. Liquid preparations for injection or infusion are solutions, colloidal dispersions, emulsions or suspensions.

Parenteral preparations may contain suitable excipients, for example to adjust the tonicity of the preparation relative to blood, to adjust or stabilise the pH, to increase the solubility of the active substances, to stabilise the preparation or to provide adequate antimicrobial properties. The excipients do not adversely affect the intended medicinal action or, at the concentrations used, cause toxicity or undue local irritation.

Wherever possible, containers for parenteral preparations are made from materials that are sufficiently transparent to permit the visual inspection of the contents, except for implants and in other justified and authorised cases.

Where applicable, containers for parenteral preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections). Parenteral preparations intended for chronic use or total parenteral nutrition should have appropriate limits for specific components or elements, taking long-term toxicity into account.

Parenteral preparations are supplied in glass containers (*3.2.1*) or in other containers such as plastic containers (*3.2.2*, *3.2.2.1* and *3.2.9*) and prefilled syringes.
The tightness of the container is ensured by suitable means. Closures ensure a good seal, prevent micro-organisms and other contaminants from entering the container and closure system and usually permit the withdrawal of a part or all of the contents without the closure being removed. The plastic materials or elastomers (*3.2.9*) used to manufacture the closures are sufficiently firm and elastic to allow the passage of a needle without shedding of particles contaminating the preparation. Closures for multidose containers are sufficiently elastic to ensure that the puncture is resealed when the needle is withdrawn.

Several categories of parenteral preparations may be distinguished:
— injections;
— infusions;
— concentrates for injections or infusions;
— powders for injections or infusions;
— gels for injection;
— implants;
— intravitreal preparations.

PRODUCTION

During the development of parenteral preparations whose formulation contains a preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test

www.webofpharma.com

method together with criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

Parenteral preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

Water used in the manufacture of parenteral preparations complies with the requirements for water for injections in bulk given in the monograph *Water for injections (0169).*

Liquid preparations for injection or infusion, examined under suitable conditions of visibility, are practically free from particles.

Recommendations on testing for visible particles are given in general chapter 5.17.2.

TESTS

Particulate contamination: sub-visible particles *(2.9.19)*

Liquid preparations for injection or infusion, if applicable after reconstitution, comply with the test. Unless otherwise justified and authorised, suspensions, emulsions and gels for injection comply with the test.

In the case of preparations for subcutaneous or intramuscular injection, higher limits may be appropriate.

Radiopharmaceutical preparations are exempt from these requirements. Preparations for which the label states that the product is to be used with a final filter are exempt from these requirements, providing it has been demonstrated that the filtrate complies with the test.

For preparations for veterinary use, when supplied in containers with a nominal content of more than 100 mL and when the content is equivalent to a dose of more than 1.4 mL per kilogram of body mass, liquid preparations for injection or infusion, if applicable after reconstitution, comply with the test for particulate contamination: sub-visible particles.

Particulate contamination: visible particles *(2.9.20)*

Liquid preparations for injection or infusion, if applicable after reconstitution, examined under suitable conditions of visibility, are practically free from visible particles.

Recommendations on testing for visible particles are given in general chapter 5.17.2.

Preparations for which the label states that the product is to be used with a final filter are exempt from these requirements, providing it has been demonstrated that the filtrate complies with the test.

Sterility *(2.6.1)*

Parenteral preparations comply with the test.

Bacterial endotoxins - pyrogens

Parenteral preparations for human use, if applicable after reconstitution or dilution, comply with the test for bacterial endotoxins *(2.6.14)* or, where justified and authorised, with the test for pyrogens *(2.6.8)*. Recommendations on the limits for bacterial endotoxins are given in general chapter *5.1.10.* The limit for intravitreal preparations is expressed per eye.

Where the label states that the preparation is free from bacterial endotoxins or that it is apyrogenic, the preparation complies with the test for bacterial endotoxins *(2.6.14)* or with the test for pyrogens *(2.6.8)*, respectively.

Parenteral preparations for veterinary use comply with the test for bacterial endotoxins *(2.6.14)* or with the test for pyrogens *(2.6.8)* when the volume to be injected in a single dose is 15 mL or more and is equivalent to a dose of 0.2 mL or more per kilogram of body mass.

STORAGE

In a sterile, airtight, tamper-evident container.

LABELLING

The label states:

— the name and concentration of any added preservative;
— where applicable, that the solution is to be used with a final filter;
— where applicable, that the preparation is free from bacterial endotoxins or that it is apyrogenic.

INJECTIONS

DEFINITION

Injections are sterile liquid parenteral preparations usually administered as a bolus injection. They are solutions, colloidal dispersions, emulsions or suspensions containing one or more active substances and any added excipients in water, in a suitable non-aqueous liquid, or in a mixture of these vehicles. The non-aqueous liquid may be non-sterile if justified and authorised.

Solutions for injection, examined under suitable conditions of visibility, are practically free from particles.

Emulsions for injection do not show any evidence of phase separation. Suspensions for injection may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Aqueous injections supplied in multidose containers contain a suitable preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties. When an injection is supplied in a multidose container, the precautions to be taken for its administration and more particularly for its storage between successive withdrawals are stated on the label.

Aqueous injections that are prepared using aseptic precautions and that cannot be terminally sterilised may contain a suitable preservative at a suitable concentration.

No preservative is added when:

— the volume to be injected in a single dose exceeds 15 mL, unless otherwise justified;
— the injection is intended for administration by routes where, for medical reasons, a preservative is not acceptable, such as intracisternally, epidurally, intrathecally or by any route giving access to the cerebrospinal fluid, or intra- or retro-ocularly.

Such preparations are supplied in single-dose containers.

PRODUCTION

In the manufacture of injections containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

For injections supplied in single-dose containers, the volume of the injection in the container is sufficient to permit the withdrawal and administration of the nominal dose *(2.9.17)*.

TESTS

Uniformity of dosage units *(2.9.40)*

Emulsions and suspensions for injection supplied in single-dose containers comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

www.webofpharma.com

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, emulsions and suspensions for injection supplied in single-dose containers and having a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with the requirements under Test A. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

INFUSIONS

DEFINITION

Infusions are sterile liquid parenteral preparations intended for administration in large volumes, usually slowly over a given period of time. They are aqueous solutions, colloidal dispersions or emulsions with an aqueous continuous phase. Their tonicity is usually adjusted relative to blood. They do not contain any added preservatives.

Solutions for infusion, examined under suitable conditions of visibility, are practically free from particles.

Emulsions for infusion do not show any evidence of phase separation.

PRODUCTION

In the manufacture of infusions containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

The volume of the infusion in the container is sufficient to permit the withdrawal and administration of the nominal dose (*2.9.17*).

CONCENTRATES FOR INJECTIONS OR INFUSIONS

DEFINITION

Concentrates for injections or infusions are sterile solutions or dispersions intended for injection or infusion after dilution to the prescribed volume with a prescribed liquid. After dilution, they comply with the requirements for injections or for infusions.

LABELLING

The label states that the preparation must be diluted before injection or infusion.

POWDERS FOR INJECTIONS OR INFUSIONS

DEFINITION

Powders for injections or infusions are sterile parenteral preparations intended for injection or infusion after reconstitution with the prescribed volume of a prescribed sterile liquid. They may be prepared by lyophilisation.

They are supplied in their final containers and, when reconstituted, rapidly form either practically particle-free solutions or uniform dispersions. After dissolution or dispersion, they comply with the requirements for injections or for infusions.

Freeze-dried products for parenteral administration are considered to be powders for injections or infusions.

PRODUCTION

For freeze-dried products for parenteral administration, the uniformity of content and uniformity of mass are ensured by the in-process control of the amount of the solution prior to freeze-drying.

TESTS

Uniformity of dosage units (*2.9.40*)
Powders for injections or infusions comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, powders for injections or infusions having a content of active substance less than 2 mg or less than 2 per cent of the total mass, or with a unit mass equal to or less than 40 mg comply with the requirements under Test A. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Powders for injections or infusions comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

LABELLING

The label states the instructions for the preparation of injections and infusions.

GELS FOR INJECTION

DEFINITION

Gels for injection are sterile viscoelastic parenteral preparations formulated to ensure modified release of the active substance(s) at the site of injection.

TESTS

Release of active substance(s)
A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

IMPLANTS

DEFINITION

Implants are sterile solid preparations of a size and shape suitable for parenteral implantation and release of the active substance(s) over an extended period of time. Each dose is supplied in a sterile container.

TESTS

Release of active substance(s)
A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Uniformity of dosage units (*2.9.40*)
Implants comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, implants having a content of active substance less than 2 mg or less than 2 per cent of the total mass, or with a unit mass equal to or less than 40 mg comply with the requirements under Test A. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Implants comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

www.webofpharma.com

INTRAVITREAL PREPARATIONS

DEFINITION

Intravitreal preparations are sterile parenteral preparations intended for administration or implantation into the vitreous humour. They are solutions, colloidal dispersions, emulsions, suspensions or implants and comply with the requirements for injections or implants, as appropriate. Unless otherwise justified and authorised, they are supplied in single-dose containers and do not contain any preservatives.

Ph Eur

INFUSIONS

LABELLING

The label states that the infusion should not be used if visible particles are present.

CONCENTRATED SOLUTIONS FOR INJECTIONS

LABELLING

The label states that the solution must be diluted before use. Do not use if visible particles are present.

Parenteral Preparations of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any injections, infusions, powders for injections or concentrated solutions for injections that are the subject of an individual monograph in the British Pharmacopoeia.

DEFINITION

Definition of a particular Parenteral Preparation as a solution, emulsion or suspension in Water for Injections does not preclude the inclusion of suitable excipients where necessary for the purposes referred to in the requirements of the European Pharmacopoeia above. In particular, aqueous Parenteral Preparations for administration by the subcutaneous, intradermal, intramuscular, or, in the case of larger volumes, intravenous route, should if possible be made isotonic with blood by the addition of Sodium Chloride or other suitable substances. However if buffering agents are used in preparations intended for intraocular or intracardiac injection, or in preparations that may gain access to the cerebrospinal fluid, great care should be taken to ensure that the nature and concentration of the chosen agent are suitable for the intended route of administration.

Where the active ingredient is susceptible to oxidative degradation appropriate precautions, such as the addition of a suitable antioxidant or storage under oxygen-free nitrogen or other suitable inert gas, should be taken.

PRODUCTION

Methods of sterilisation that may be used in the manufacture of Parenteral Preparations are described in Appendix XVIII.

Where a direction is given to use Water for Injections in the manufacture of a Parenteral Preparation, Water for Injections in bulk is used. Where the use of Water for Injections free from dissolved air or Water for Injections free from dissolved carbon dioxide is specified, water freshly prepared by the process described under Water for Injections is boiled for at least 10 minutes with as little exposure to air as possible, cooled with precautions to exclude air and carbon dioxide, and sterilised by *heating in an autoclave.*

STORAGE

Closures used for containers of oily parenteral preparations should be made of oil-resistant materials.

INJECTIONS

LABELLING

The label states that the injection should not be used if visible particles are present.

Oral Powders

(Ph. Eur. monograph 1165)

Oral Powders comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Requirements for powders to be used for the preparation of oral solutions or suspensions are given in the monograph Liquid preparations for oral use (0672). Where justified and authorised, the requirements of this monograph do not apply to oral powders intended for veterinary use.

DEFINITION

Oral powders are preparations consisting of solid, loose, dry particles of varying degrees of fineness. They contain one or more active substances, with or without excipients and, if necessary, colouring matter authorised by the competent authority and flavouring substances. They are generally administered in or with water or another suitable liquid. They may also be swallowed directly. They are presented as single-dose or multidose preparations.

Where applicable, containers for oral powders comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Multidose oral powders require the provision of a measuring device capable of delivering the quantity prescribed. Each dose of a single-dose powder is enclosed in an individual container, for example a sachet or a vial.

PRODUCTION

In the manufacture of oral powders, measures are taken to ensure a suitable particle size with regard to the intended use.

In the manufacture, packaging, storage and distribution of oral powders, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

TESTS

Uniformity of dosage units

Single-dose oral powders comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, single-dose oral powders with a content of active substance less than 2 mg or less than 2 per cent of the total mass

www.webofpharma.com

comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Single-dose oral powders comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*)
Oral powders supplied in multidose containers comply with the test.

STORAGE
If the preparation contains volatile ingredients, or the contents have to be protected, store in an airtight container.

EFFERVESCENT POWDERS

DEFINITION
Effervescent powders are presented as single-dose or multidose preparations and generally contain acid substances and carbonates or hydrogen carbonates that react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

TESTS
Unless otherwise justified and authorised, the preparation complies with the following test.

Disintegration
Place 1 dose of the effervescent powder in a beaker containing 200 mL of *water R* at 15-25 °C; numerous bubbles of gas are evolved. When the evolution of gas around the particles ceases, the powder has disintegrated, being either dissolved or dispersed in the water. Repeat the operation on 5 further doses. The preparation complies with the test if each of the 6 doses used disintegrates within 5 min.

STORAGE
In an airtight container.

Ph Eur

Topical Powders

(Powders for Cutaneous Application, Ph. Eur. monograph 1166)

Topical Powders comply with the requirements of the European Pharmacopoeia monograph for Powders for Cutaneous Application. These requirements are reproduced below.

Ph Eur

Where justified and authorised, the requirements of this monograph do not apply to powders for cutaneous application intended for veterinary use.

DEFINITION
Powders for cutaneous application are preparations consisting of solid, loose, dry particles of varying degrees of fineness. They contain one or more active substances, with or without excipients and, if necessary, colouring matter authorised by the competent authority.

Powders for cutaneous application are presented as single-dose powders or multidose powders. They are free from grittiness. Powders specifically intended for use on large open wounds or on severely injured skin are sterile.

Multidose powders for cutaneous application may be dispensed in sifter-top containers, containers equipped with a mechanical spraying device or in pressurised containers.

Powders dispensed in pressurised containers comply with the requirements of *Pressurised pharmaceutical preparations (0523)*.

Where applicable, containers for powders comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

PRODUCTION
In the manufacture of powders for cutaneous application, measures are taken to ensure a suitable particle size with regard to the intended use.

In the manufacture, packaging, storage and distribution of powders for cutaneous application, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Sterile powders for cutaneous application are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

TESTS
Fineness
If prescribed, the fineness of a powder is determined by the sieve test (*2.9.35*) or another appropriate method.

Uniformity of dosage units
Single-dose powders for cutaneous application comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Unless otherwise prescribed or justified and authorised, single-dose powders for cutaneous application with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*)
Single-dose powders for cutaneous application comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Sterility (*2.6.1*)
Where the label indicates that the preparation is sterile, it complies with the test for sterility.

LABELLING
The label states, where applicable, that the preparation is sterile.

Ph Eur

www.webofpharma.com

Topical Powders of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to those dusting powders that are the subject of an individual monograph in the British Pharmacopoeia.

DUSTING POWDERS

DEFINITION

Dusting Powders are finely divided powders that are intended to be applied to the skin for therapeutic, prophylactic or lubricant purposes.

STORAGE

Dusting Powders should be stored in a dry place.

Pressurised Pharmaceutical Preparations

(Ph. Eur. monograph 0523)

Pressurised Pharmaceutical Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Additional requirements for preparations presented in pressurised containers may be found, where appropriate, in other general monographs, for example Preparations for inhalation (0671), Liquid preparations for cutaneous application (0927), Powders for cutaneous application (1166), Nasal preparations (0676) and Ear preparations (0652).

DEFINITION

Pressurised pharmaceutical preparations are usually multidose preparations presented in special containers under pressure of a gas and often fitted with a metering valve, and contain one or more active substances. The preparations are released from the container, upon actuation of an appropriate valve, in the form of an aerosol (dispersion of solid or liquid particles in a gas, the size of the particles being adapted to the intended use) or of a liquid or semisolid jet such as a foam. The pressure for the release is generated by suitable propellants.

The preparations are intended for local application to the skin or to mucous membranes of various body orifices, or for inhalation. Pressurised pharmaceutical preparations are provided with a delivery device appropriate for the intended application. Pressurised pharmaceutical preparations intended to be used on severely injured skin or large open wounds are sterile and comply with the test for sterility. Suitable excipients may also be used, for example solvents, solubilisers, emulsifying agents, suspending agents and lubricants for the valve to prevent clogging.

Pressurised pharmaceutical preparations may have the following components.

Propellants The propellants are either gases liquefied under pressure or compressed gases or low-boiling liquids. Liquefied gases are, for example, fluorinated hydrocarbons and low-molecular-mass hydrocarbons (such as propane and butane). Compressed gases are, for example, carbon dioxide, nitrogen and nitrous oxide.

Mixtures of these propellants may be used to obtain optimal solution properties and desirable pressure, delivery and spray characteristics.

Containers The containers are tight and resistant to the internal pressure and may be made of metal, glass, plastic or combinations of these materials. They are compatible with their contents. Glass containers are protected with a plastic coating.

Spraying device The valve keeps the container tightly closed when not in use and regulates the delivery of the contents during use. The spray characteristics are influenced by the type of spraying device, in particular by the dimensions, number and location of orifices. Some valves provide a continuous release, others (metering valves) deliver a defined quantity of product upon each valve actuation.

The various valve materials in contact with the contents are compatible with them.

PRODUCTION

Special requirements may be necessary regarding the selection of propellants, the particle size and the dose delivered by the metering valve, depending on the intended application. Sterile pressurised preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

TESTS

Sterility *(2.6.1)*

Where the label indicates that the preparation is sterile, it complies with the test for sterility.

LABELLING

The label states:

— where applicable, that the preparation is sterile;
— the method of use;
— any precautions to be taken;
— for a container with a metering valve, the quantity of active substance delivered per actuation.

Ph Eur

Medicated Plasters

(Ph. Eur. monograph 3032)

Ph Eur

DEFINITION

Medicated plasters are flexible preparations intended for application to the skin (both unbroken and injured), usually for a local effect, over a certain period of time. They are designed to maintain the active substance(s) in close contact with the skin to allow them to be absorbed slowly and act as protective, keratolytic or antimicrobial agents. By prolonged contact with the site of application, they provide protection, support or occlusion.

Medicated plasters are single-dose or multidose preparations, presented in a range of sizes directly adapted to their intended use or as larger sheets to be cut before use.

They consist of an adhesive substrate, possibly coloured, containing one or more active substances in a suitable basis. This substrate is spread as a uniform layer on an appropriate support and is covered by a suitable protective liner, which is removed before the plaster is applied to the skin.

The protective liner does not detach the active substance-adhesive layer from the outer backing layer when removed.

www.webofpharma.com

Medicated plasters adhere firmly to the skin when applied with gentle pressure and can be peeled off without causing appreciable injury to the skin or detachment of the active substance-adhesive layer from the backing layer. They do not cause undue skin irritation or sensitisation.

Medicated plasters intended for use on severely injured skin are sterile.

PRODUCTION

During the development of medicated plasters whose formulation contains a preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

In the manufacture, packaging, storage and distribution of medicated plasters, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

In the manufacture of medicated plasters containing one or more active substances that are not dissolved in the adhesive layer, measures are taken to ensure appropriate homogeneity of the preparation as well as a suitable and controlled particle size with regard to the intended use.

Sterile medicated plasters are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

A suitable test may be required during manufacture to demonstrate the appropriate release of the active substance(s).

TESTS

Uniformity of dosage units *(2.9.40)*

Single-dose medicated plasters intended for a systemic effect comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content *(2.9.6)*

Unless otherwise prescribed or justified and authorised, single-dose medicated plasters intended for a systemic effect comply with the requirements under Test C.

Dissolution

A suitable test may be required to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.4. Dissolution test for patches.*

Sterility *(2.6.1)*

Where the label states that the preparation is sterile, it complies with the test.

STORAGE

If the preparation contains water or other volatile ingredients, store in an airtight container. If the preparation is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:

— the name of any added preservative;

— where applicable, that the preparation is sterile.

Ph Eur

Rectal Preparations

(Ph. Eur. monograph 1145)

Rectal Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Rectal preparations are intended for rectal use in order to obtain a systemic or local effect, or they may be intended for diagnostic purposes.

Where applicable, containers for rectal preparations comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of rectal preparations may be distinguished:

— suppositories;

— rectal capsules;

— rectal solutions, emulsions and suspensions;

— powders and tablets for rectal solutions and suspensions;

— semi-solid rectal preparations;

— rectal foams;

— rectal tampons.

PRODUCTION

During the development of a rectal preparation whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in chapter *5.1.3. Efficacy of antimicrobial preservation.*

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid rectal preparations presented in single-dose containers.

In the manufacture, packaging, storage and distribution of rectal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

In the manufacture of semi-solid and liquid rectal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units *(2.9.40)*

Liquid and semi-solid single-dose rectal preparations comply with the test. Solid single-dose rectal preparations comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content *(2.9.6)*

Unless otherwise prescribed or justified and authorised, solid single-dose rectal preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (tablets) or test B (suppositories, rectal capsules). If the preparation contains more than one active substance, this requirement applies only to those substances that correspond to the above conditions.

www.webofpharma.com

Uniformity of mass (*2.9.5*)
Solid single-dose rectal preparations comply with the test. If the test for uniformity of content is prescribed for all active substances, the test for uniformity of mass is not required.

Dissolution
A suitable test may be required to demonstrate the appropriate release of the active substance(s) from solid single-dose rectal preparations, for example *2.9.42. Dissolution test for lipophilic solid dosage forms*.

Where a dissolution test is prescribed, a disintegration test may not be required.

LABELLING
The label states the name of any added antimicrobial preservative.

SUPPOSITORIES

DEFINITION
Suppositories are solid, single-dose preparations. The shape, volume and consistency of suppositories are suitable for rectal administration.

They contain 1 or more active substances dispersed or dissolved in a suitable basis that may be soluble or dispersible in water or may melt at body temperature. Excipients such as diluents, adsorbents, surface-active agents, lubricants, antimicrobial preservatives and colouring matter, authorised by the competent authority, may be added if necessary.

PRODUCTION
Suppositories are prepared by compression or moulding. If necessary, the active substance(s) are previously ground and sieved through a suitable sieve. When prepared by moulding, the medicated mass, sufficiently liquefied by heating, is poured into suitable moulds. The suppository solidifies on cooling. Various excipients are available for this process, such as hard fat, macrogols, cocoa butter, and various gelatinous mixtures consisting of, for example, gelatin, water and glycerol. The determination of the softening time of lipophilic suppositories (*2.9.22*) is carried out.

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from suppositories intended for modified release or for prolonged local action.

In the manufacture of suppositories containing dispersed active substances, measures are taken to ensure a suitable and controlled particle size.

TESTS
Disintegration (*2.9.2*)
Unless intended for modified release or for prolonged local action, they comply with the test. For suppositories with a fatty base, examine after 30 min, and for suppositories with a water-soluble base, examine after 60 min, unless otherwise justified and authorised.

RECTAL CAPSULES

DEFINITION
Rectal capsules (shell suppositories) are solid, single-dose preparations generally similar to soft capsules as defined in the monograph *Capsules (0016)* except that they may have lubricating coatings. They are of elongated shape, are smooth and have a uniform external appearance.

PRODUCTION
A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from rectal capsules intended for modified release or for prolonged local action.

TESTS
Disintegration (*2.9.2*)
Unless intended for modified release or for prolonged local action, they comply with the test. Examine the state of the capsules after 30 min, unless otherwise justified and authorised.

RECTAL SOLUTIONS, EMULSIONS AND SUSPENSIONS

DEFINITION
Rectal solutions, emulsions and suspensions are liquid preparations intended for rectal use in order to obtain a systemic or local effect, or they may be intended for diagnostic purposes.

Rectal solutions, emulsions and suspensions are supplied in single-dose containers and contain 1 or more active substances dissolved or dispersed in water, glycerol or macrogols or other suitable solvents. Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment that is readily dispersible on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Rectal solutions, emulsions and suspensions may contain excipients, for example to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance(s) or to stabilise the preparation. These substances do not adversely affect the intended medical action or, at the concentrations used, cause undue local irritation.

Rectal solutions, emulsions and suspensions are supplied in containers containing a volume in the range of 2.5 mL to 2000 mL. The container is adapted to deliver the preparation to the rectum or is accompanied by a suitable applicator.

POWDERS AND TABLETS FOR RECTAL SOLUTIONS AND SUSPENSIONS

DEFINITION
Powders and tablets intended for the preparation of rectal solutions or suspensions are single-dose preparations that are dissolved or dispersed in water or other suitable solvents at the time of administration. They may contain excipients to facilitate dissolution or dispersion or to prevent aggregation of the particles.

After dissolution or suspension, they comply with the requirements for rectal solutions or rectal suspensions, as appropriate.

TESTS
Disintegration (*2.9.1*)
Tablets for rectal solutions or suspensions disintegrate within 3 min, using *water R* at 15-25 °C as the liquid medium.

LABELLING
The label states:
- the method of preparation of the rectal solution or suspension;
- the conditions and duration of storage of the solution or suspension after constitution.

www.webofpharma.com

SEMI-SOLID RECTAL PREPARATIONS

DEFINITION

Semi-solid rectal preparations are ointments, creams or gels.

They are often supplied as single-dose preparations in containers provided with a suitable applicator.

Semi-solid rectal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

RECTAL FOAMS

DEFINITION

Rectal foams comply with the requirements of the monograph *Medicated foams (1105)*.

RECTAL TAMPONS

DEFINITION

Rectal tampons are solid, single-dose preparations intended to be inserted into the lower part of the rectum for a limited time.

They comply with the requirements of the monograph *Medicated tampons (1155)*.

Ph Eur

Topical Semi-solid Preparations

(Semi-solid Preparations for Cutaneous Application, Ph. Eur. monograph 0132)

Topical Semi-solid Preparations comply with the requirements of the European Pharmacopoeia monograph for Semi-solid Preparations for Cutaneous Application. These requirements are reproduced below.

Ph Eur

The requirements of this monograph apply to all semi-solid preparations for cutaneous application. Where appropriate, additional requirements specific to semi-solid preparations intended to be applied to particular surfaces or mucous membranes may be found in other general monographs, for example Ear preparations (0652), Nasal preparations (0676), Rectal preparations (1145), Eye preparations (1163), and Vaginal preparations (1164).

DEFINITION

Semi-solid preparations for cutaneous application are preparations intended for application to the skin to deliver active substances for a local or systemic effect, or to exert an emollient or protective action. They are of homogeneous appearance.

Semi-solid preparations for cutaneous application consist of a simple or compound basis in which, usually, one or more active substances are dissolved or dispersed. Depending on its composition, the basis may influence the activity of the preparation.

The basis may be single-phase or multiphase. Depending on the nature of the basis, the preparation may have hydrophilic or hydrophobic properties. It may contain preservatives and other excipients such as, antioxidants, stabilisers, emulsifiers, thickeners and penetration enhancers. The excipients do not adversely affect the intended medicinal action of the preparation or, at the concentrations used, cause toxicity or undue local irritation.

Semi-solid preparations for cutaneous application intended for use on severely injured skin are sterile.

Where applicable, containers for semi-solid preparations for cutaneous application comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of semi-solid preparations for cutaneous application may be distinguished:
— ointments;
— creams;
— gels;
— pastes;
— poultices.

Depending on their structure, ointments, creams and gels generally show viscoelastic behaviour and are non-Newtonian in character, e.g. plastic, pseudoplastic or thixotropic type flow at high shear rates. Pastes frequently exhibit dilatancy.

PRODUCTION

During the development of semi-solid preparations for cutaneous application whose formulations contain a preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in general chapter *5.1.3. Efficacy of antimicrobial preservation.*

In the manufacture, packaging, storage and distribution of semi-solid preparations for cutaneous application, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Sterile semi-solid preparations for cutaneous application are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

During the development of semi-solid preparations for cutaneous application supplied in single-dose containers it must be demonstrated that the nominal content can be withdrawn from the container.

In the manufacture of semi-solid preparations for cutaneous application, suitable measures are taken to ensure that the expected rheological properties are obtained. Where appropriate, the following non-mandatory tests may be carried out: measurement of consistency by penetrometry (*2.9.9*), viscosity (apparent viscosity) (*2.2.10*); a suitable test may also be carried out to demonstrate the appropriate release of the active substance(s).

In the manufacture of semi-solid preparations for cutaneous application containing dispersed particles, measures are taken to ensure that the homogeneity of the preparation is appropriate and to ensure a suitable and controlled particle size with regard to the intended use.

During the manufacture of metered-dose semi-solid preparations for cutaneous application supplied in multi-dose containers that are intended for a systemic effect, the uniformity of delivered dose must be ensured within a container (intra-container) and between containers (inter-container).

For intra-container testing of the uniformity of delivered dose, a test is given in the Tests section.

www.webofpharma.com

For inter-container testing of the uniformity of delivered dose, see below.

Uniformity of delivered dose, inter-container testing
Unless otherwise justified and authorised, the test applies. *Prepare and use the container as directed in the instructions to the patient.*

An example of a suitable procedure is to take 10 containers and collect a single dose from each container, collecting the dose at the beginning (from 3 containers), middle (from 4 containers) and end (from 3 containers) of the number of doses stated on the label. Other inter-container testing procedures are possible, where justified.

TESTS

Sterility (*2.6.1*)
Where the label states that the preparation is sterile, it complies with the test.

For the following tests, prepare and use the container as directed in the instructions to the patient.

Uniformity of dosage units (*2.9.40*)
Unless otherwise prescribed or justified and authorised, semi-solid preparations for cutaneous application intended for systemic effect that are supplied in single-dose containers representing 1 dose of medicinal product comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)
Carry out the assay on the amount of well-mixed material that is removed from each of 10 individual containers under conditions of normal use. Express the results with reference to the delivered dose. They comply with the requirements under Test B.

Uniformity of delivered dose, intra-container testing
Metered-dose semi-solid preparations for cutaneous application supplied in multi-dose containers that are intended for a systemic effect comply with the following test. If justified and authorised, for preparations consisting of a single-phase basis in which active substance(s) are dissolved, the test for uniformity of delivered dose may be replaced by the test for uniformity of delivered mass.

Use an apparatus capable of quantitatively retaining the dose leaving the metered-dose container.

Discharge the container into the apparatus until the number of deliveries that constitute the minimum recommended dose has been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance. Repeat the procedure for a further 2 doses.

Discharge the container to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the container to waste until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than one active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 2 more containers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Other intra-container testing procedures are possible, where justified.

Uniformity of delivered mass
Metered-dose semi-solid preparations for cutaneous application consisting of a single-phase basis in which the active substance(s) are dissolved and are supplied in multi-dose containers comply with the following test.

Take 1 container, weigh and discharge the contents to waste until the number of deliveries that constitute the minimum recommended dose has been discharged. Weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 2 doses.

Discharge the container to waste until ($n/2$) + 1 deliveries remain, where n is the number of deliveries stated on the label. Determine the mass of 4 doses using the procedure described above.

Discharge the container to waste until 3 doses remain. Determine the mass of these 3 doses using the procedure described above.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the mean value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 2 more containers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the target delivered mass.

Other testing procedures are possible, where justified.

Number of deliveries per container
Metered-dose semi-solid preparations for cutaneous application supplied in multi-dose containers comply with the following test.

Take 1 container and discharge the contents to waste until empty, actuating the device at intervals of not less than 5 s. Record the number of deliveries discharged. The total number of deliveries discharged from the container is not less than the number stated on the label.

STORAGE

If the preparation contains water or other volatile ingredients, store in an airtight container. If the preparation is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:
- the name of any added preservative;
- where applicable, that the preparation is sterile;
- for multidose containers, the period after opening the container after which the contents must not be used.

OINTMENTS

DEFINITION

Ointments are semi-solid preparations for cutaneous application consisting of a single-phase basis in which solids or liquids may be dispersed. They are supplied in single-dose or multidose containers.

www.webofpharma.com

Hydrophobic ointments

Hydrophobic ointments can absorb only small amounts of water. Typical bases used for their formulation are hard, liquid and light liquid paraffins, vegetable oils, animal fats, synthetic glycerides, waxes and liquid polyalkylsiloxanes.

Water-emulsifying ointments

Water-emulsifying ointments can absorb larger amounts of water and thereby produce water-in-oil or oil-in-water emulsions after homogenisation, depending on the nature of the emulsifiers: water-in-oil emulsifiers (such as wool alcohols, sorbitan esters, monoglycerides and fatty alcohols), or oil-in-water emulsifiers (such as sulfated fatty alcohols, polysorbates, macrogol cetostearyl ether or esters of fatty acids with macrogols) may be used for this purpose. Their bases are those of the hydrophobic ointments.

Hydrophilic ointments

Hydrophilic ointments are preparations consisting of a basis that is miscible with water and that usually consists of a mixture of liquid and solid macrogols (polyethylene glycols). They may contain appropriate amounts of water.

CREAMS

DEFINITION

Creams are semi-solid preparations of homogeneous appearance typically consisting of a lipophilic phase and an aqueous phase, one of which is finely dispersed in the other. They are supplied in single-dose or multidose containers.

Lipophilic creams

In lipophilic creams, the continuous phase is the lipophilic phase. They usually contain water-in-oil emulsifiers (such as wool alcohols, sorbitan esters and monoglycerides).

Hydrophilic creams

In hydrophilic creams, the continuous phase is the aqueous phase. They contain oil-in-water emulsifiers (such as sodium or trolamine soaps, sulfated fatty alcohols, polysorbates and polyoxyl fatty acid and fatty alcohol esters) combined, if necessary, with water-in-oil emulsifiers.

GELS

DEFINITION

Gels are semi-solid preparations for cutaneous application consisting of a single-phase liquid basis gelled by a suitable gelling agent. Active substance(s) are dissolved or dispersed in the basis. Gels are supplied in single-dose or multidose containers.

Lipophilic gels

Lipophilic gels (oleogels) are preparations whose bases usually consist of liquid paraffin with polyethylene or fatty oils gelled with colloidal silica or aluminium or zinc soaps.

Hydrophilic gels

Hydrophilic gels (hydrogels) are preparations whose bases usually consist of water, glycerol or propylene glycol gelled with suitable gelling agents (such as poloxamers, starch, cellulose derivatives, carbomers and magnesium-aluminium silicates).

PASTES

DEFINITION

Pastes are semi-solid preparations containing a large proportion of finely or very finely (*2.9.35*) divided solids dispersed in the basis. They are supplied in single-dose or multidose containers.

POULTICES

DEFINITION

Poultices are semi-solid preparations for cutaneous application consisting of a hydrophilic heat-retentive basis in which solid or liquid active substances are dispersed. They are usually spread thickly on a suitable dressing and heated before application to the skin.

Ph Eur

Topical Semi-solid Preparations of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to any cream, gel, ointment or paste that is the subject of an individual monograph in the British Pharmacopoeia. Eye ointments are described in the monograph for Eye Preparations.

CREAMS

DEFINITION

Creams are formulated to provide preparations that are essentially miscible with the skin secretion. They are intended to be applied to the skin or certain mucous membranes for protective, therapeutic or prophylactic purposes especially where an occlusive effect is not necessary.

Creams should not normally be diluted. However, should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing. Excessive dilution may affect the stability of some creams. If diluted, creams should normally be used within two weeks of their preparation.

STORAGE

Creams should not be allowed to freeze.

GELS

STORAGE

Gels should not be allowed to freeze.

OINTMENTS

DEFINITION

Ointments are formulated to provide preparations that are immiscible, miscible or emulsifiable with the skin secretion. Hydrophobic ointments and water-emulsifying ointments are intended to be applied to the skin or certain mucous membranes for emollient, protective, therapeutic or prophylactic purposes where a degree of occlusion is desired. Hydrophilic ointments are miscible with the skin secretion and are less emollient as a consequence.

In tropical and subtropical countries varying quantities of Arachis Oil, White Beeswax, Wool Fat, Hard Paraffin, White Soft Paraffin, Yellow Soft Paraffin or Liquid Paraffin may be used in the preparation of the Ointments of the Pharmacopoeia when prevailing high temperatures otherwise make them too soft for convenient use, but the specified proportions of the active ingredients must be maintained.

Ointments should not normally be diluted. However, should dilution be necessary care should be taken in the selection of diluents to avoid risk of incompatibility or instability.

www.webofpharma.com

PASTES

DEFINITION

Pastes are usually intended to be applied to small, localised areas of the skin.

Spirits

DEFINITION

Spirits are solutions of one or more substances in Ethanol (96 %) or a Dilute Ethanol. They may contain a proportion of Water.

STORAGE

Spirits should be kept in well-closed containers of glass or other suitable materials.

Sticks

(Ph. Eur. monograph 1154)

Sticks comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Additional requirements for sticks may be found, where appropriate, in other general monographs, for example Nasal preparations (0676).

DEFINITION

Sticks are solid preparations intended for local application. They may be single-dose or multidose preparations. They are rod-shaped or conical preparations consisting of one or more active substances, either alone or dissolved or dispersed in a suitable basis, and are usually intended to dissolve or melt at body temperature. They may be inserted into a body cavity or wound, or be applied cutaneously.

Urethral sticks and sticks for insertion into wounds are sterile.

PRODUCTION

In the manufacture, packaging, storage and distribution of sticks, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Urethral sticks and other sterile sticks are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter *5.1.1. Methods of preparation of sterile products.*

TESTS

Uniformity of dosage units *(2.9.40)*

Single-dose sticks comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content *(2.9.6)*

Unless otherwise prescribed or justified and authorised, single-dose sticks with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B. If the preparation contains more than one active substance, this requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass *(2.9.5)*

Single-dose sticks comply with the test. If the test for uniformity of content is prescribed for all active substances, the test for uniformity of mass is not required.

Sterility *(2.6.1)*

Urethral sticks and sticks for insertion into wounds comply with the test for sterility.

LABELLING

The label states, for urethral sticks and sticks to be inserted into wounds, that they are sterile.

Ph Eur

Tablets

(Ph. Eur. monograph 0478)

Tablets comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

The requirements of this monograph do not necessarily apply to preparations that are presented as tablets intended for use other than by oral administration. Requirements for such preparations may be found, where appropriate, in other general monographs; for example Rectal preparations (1145), Vaginal preparations (1164) and Oromucosal preparations (1807). This monograph does not apply to lozenges, oral pastes and oral gums. Where justified and authorised, the requirements of this monograph do not apply to tablets for veterinary use. Tablets for use in the mouth comply with the requirements of the monograph Oromucosal preparations (1807).

DEFINITION

Tablets are solid preparations each containing a single dose of one or more active substances. They are obtained by compressing uniform volumes of particles or by another suitable manufacturing technique, such as extrusion, moulding or freeze-drying (lyophilisation). Tablets are intended for oral administration. Some are swallowed whole, some after being chewed, some are dissolved or dispersed in water before being administered and some are retained in the mouth where the active substance is liberated.

The particles consist of one or more active substances with or without excipients such as diluents, binders, disintegrating agents, glidants, lubricants, substances capable of modifying the behaviour of the preparation in the digestive tract, colouring matter authorised by the competent authority and flavouring substances.

Tablets are usually straight, solid cylinders, the end surfaces of which are flat or convex and the edges of which may be bevelled. They may have break-marks and may bear a symbol or other markings. Tablets may be coated.

Where applicable, containers for tablets comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of tablets for oral use may be distinguished:

— uncoated tablets;

— coated tablets;

— gastro-resistant tablets;

www.webofpharma.com

— modified-release tablets;
— effervescent tablets;
— soluble tablets;
— dispersible tablets;
— orodispersible tablets;
— chewable tablets;
— oral lyophilisates.

PRODUCTION

Tablets are usually prepared by compressing uniform volumes of particles or particle aggregates produced by granulation methods. In the manufacture of tablets, measures are taken to ensure that they possess a suitable mechanical strength to avoid crumbling or breaking on handling or subsequent processing. This may be demonstrated using the tests described in general chapters *2.9.7. Friability of uncoated tablets* and *2.9.8. Resistance to crushing of tablets.*

In the manufacture, packaging, storage and distribution of tablets, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

Subdivision of tablets Tablets may bear a break-mark or break-marks for the purpose of being subdivided into parts, either to ease the intake of the medicinal product or to deliver fractional doses. In cases where fractions of tablets are necessary to deliver the intended dose stated on the label, the efficacy of the breakmark is assessed during product development or for validation purposes by determining the uniformity of mass of the sub-divided parts using the following test.

Take 30 tablets at random, break them by hand and, from all the parts obtained from 1 tablet, take 1 part for the test and reject the other part(s). Weigh each of the 30 parts individually and calculate the average mass. The tablets comply with the test if not more than 1 individual mass is outside the limits of 85 per cent to 115 per cent of the average mass. The tablets fail to comply with the test if more than 1 individual mass is outside these limits, or if 1 individual mass is outside the limits of 75 per cent to 125 per cent of the average mass.

TESTS

Uniformity of dosage units *(2.9.40)*

Tablets comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content *(2.9.6)*

Unless otherwise prescribed or justified and authorised, tablets with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A. If the preparation has more than 1 active substance, the requirement applies only to those substances that correspond to the above conditions.

Unless otherwise justified and authorised, coated tablets other than film-coated tablets comply with test A irrespective of their content of active substance(s).

Uniformity of mass *(2.9.5)*

Uncoated tablets and, unless otherwise justified and authorised, film-coated tablets comply with the test. If the test for uniformity of content is prescribed or justified and authorised for all the active substances, the test for uniformity of mass is not required.

Dissolution

Unless otherwise justified and authorised, a suitable test is carried out, for example one of the tests described in general chapter *2.9.3. Dissolution test for solid dosage forms.*

Where a dissolution test is prescribed, a disintegration test may not be required.

UNCOATED TABLETS

DEFINITION

Uncoated tablets include single-layer tablets resulting from a single compression of particles and multi-layer tablets consisting of concentric or parallel layers obtained by successive compression of particles of different composition. The excipients used are not specifically intended to modify the release of the active substance in the digestive fluids.

Uncoated tablets conform to the general definition of tablets. A broken section, when examined under a lens, shows either a relatively uniform texture (single-layer tablets) or a stratified texture (multi-layer tablets) but no signs of coating.

TESTS

Disintegration *(2.9.1)*

Uncoated tablets comply with the test using *water R* as the liquid medium. Add a disc to each tube. Operate the apparatus for 15 min, unless otherwise justified and authorised, and examine the state of the tablets. If the tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets, omitting the discs.

COATED TABLETS

DEFINITION

Coated tablets are tablets covered with one or more layers of mixtures of various substances such as natural or synthetic resins, gums, gelatin, inactive and insoluble fillers, sugars, plasticisers, polyols, waxes, colouring matter authorised by the competent authority and sometimes flavouring substances and active substances. The substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs. When the coating is a very thin polymeric coating, the tablets are known as film-coated tablets.

Coated tablets have a smooth surface, which is often coloured and may be polished; a broken section, when examined under a lens, shows a core surrounded by one or more continuous layers with a different texture.

PRODUCTION

Where justified, uniformity of mass or uniformity of content of coated tablets other than film-coated tablets may be ensured by control of the cores.

TESTS

Disintegration *(2.9.1)*

Coated tablets other than film-coated tablets comply with the test using *water R* as the liquid medium. Add a disc to each tube. Operate the apparatus for 60 min, unless otherwise justified and authorised, and examine the state of the tablets. If any of the tablets has not disintegrated, repeat the test on a further 6 tablets, replacing *water R* with *0.1 M hydrochloric acid.* If 1 or 2 tablets fail to disintegrate, repeat the test on 12 additional tablets.

The requirements of the test are met if not fewer than 16 of the 18 tablets tested have disintegrated.

www.webofpharma.com

Film-coated tablets comply with the disintegration test prescribed above except that the apparatus is operated for 30 min, unless otherwise justified and authorised.

If coated tablets or film-coated tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets, omitting the discs.

GASTRO-RESISTANT TABLETS

DEFINITION

Gastro-resistant tablets are delayed-release tablets that are intended to resist the gastric fluid and to release their active substance(s) in the intestinal fluid. Usually they are prepared by covering tablets with a gastro-resistant coating or from granules or particles already covered with a gastro-resistant coating.

Tablets covered with a gastro-resistant coating conform to the definition of coated tablets.

TESTS

Disintegration (*2.9.1*)

Tablets covered with a gastro-resistant coating comply with the test with the following modifications. Use *0.1 M hydrochloric acid* as the liquid medium. Operate the apparatus for 2 h, or another such time as may be justified and authorised, without the discs, and examine the state of the tablets. The time of resistance to the acid medium varies according to the formulation of the tablets to be examined. It is typically 2 h to 3 h but even with authorised deviations is not less than 1 h. No tablet shows signs of either disintegration (apart from fragments of coating) or cracks that would allow the escape of the contents. Replace the acid by phosphate buffer solution pH 6.8 R and add a disc to each tube. Operate the apparatus for 60 min and examine the state of the tablets. If the tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets, omitting the discs.

MODIFIED-RELEASE TABLETS

DEFINITION

Modified-release tablets are coated or uncoated tablets that contain special excipients or are prepared by special procedures, or both, designed to modify the rate, the place or the time at which the active substance(s) are released.

Modified-release tablets include prolonged-release tablets, delayed-release tablets and pulsatile-release tablets.

EFFERVESCENT TABLETS

DEFINITION

Effervescent tablets are uncoated tablets generally containing acid substances and carbonates or hydrogen carbonates, which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

TESTS

Disintegration

Place 1 tablet in a beaker containing 200 mL of *water R* at 15-25 °C; numerous bubbles of gas are evolved. When the evolution of gas around the tablet or its fragments ceases the tablet has disintegrated, being either dissolved or dispersed in the water so that no agglomerates of particles remain. Repeat the operation on 5 other tablets. The tablets comply with the test if each of the 6 tablets used disintegrates in the manner prescribed within 5 min, unless otherwise justified and authorised.

SOLUBLE TABLETS

DEFINITION

Soluble tablets are uncoated or film-coated tablets. They are intended to be dissolved in water before administration. The solution produced may be slightly opalescent due to the added excipients used in the manufacture of the tablets.

TESTS

Disintegration (*2.9.1*)

Soluble tablets disintegrate within 3 min, using *water R* at 15-25 °C as the liquid medium.

DISPERSIBLE TABLETS

DEFINITION

Dispersible tablets are uncoated or film-coated tablets intended to be dispersed in water before administration, giving a homogeneous dispersion.

TESTS

Disintegration (*2.9.1*)

Dispersible tablets disintegrate within 3 min, using *water R* at 15-25 °C as the liquid medium.

Fineness of dispersion

Place 2 tablets in 100 mL of *water R* and stir until completely dispersed. A smooth dispersion is produced, which passes through a sieve screen with a nominal mesh aperture of 710 µm.

ORODISPERSIBLE TABLETS

DEFINITION

Orodispersible tablets are uncoated tablets intended to be placed in the mouth where they disperse rapidly before being swallowed.

TESTS

Disintegration (*2.9.1*)

Orodispersible tablets disintegrate within 3 min, using *water R* as the liquid medium.

CHEWABLE TABLETS

DEFINITION

Chewable tablets are intended to be chewed before being swallowed.

PRODUCTION

Chewable tablets are prepared to ensure that they are easily crushed by chewing.

ORAL LYOPHILISATES

DEFINITION

Oral lyophilisates are solid single-dose preparations made by freeze-drying of a liquid or semi-solid preparation. These fast-releasing preparations are intended to be placed in the mouth where their contents are released in saliva and swallowed or, alternatively, are intended to be dissolved or dispersed in water before oral administration.

PRODUCTION

Oral lyophilisates are obtained by freeze-drying (lyophilisation), involving division into single doses, freezing, sublimation and drying of usually aqueous, liquid or semi-solid preparations.

www.webofpharma.com

TESTS

Disintegration

Place 1 oral lyophilisate in a beaker containing 200 mL of *water R* at 15-25 °C. It disintegrates within 3 min. Repeat the test on 5 other oral lyophilisates. They comply with the test if all 6 have disintegrated.

Water (*2.5.12*)

Oral lyophilisates comply with the test; the limits are approved by the competent authority.

Ph Eur

Tablets of the British Pharmacopoeia

In addition to the above requirements of the European Pharmacopoeia, the following statements apply to those tablets that are the subject of an individual monograph in the British Pharmacopoeia.

DEFINITION

Tablets of the British Pharmacopoeia may contain flavouring only when indicated in the individual monograph.

Tablets that are the subject of individual monographs in the British Pharmacopoeia may be uncoated, compression-coated, film-coated or sugar-coated unless otherwise indicated in the monograph. Tablets for which the monograph states 'They are coated' are compression-coated or film-coated or sugar-coated. Tablets may be made gastro-resistant by enteric-coating or by other means only where this is specifically indicated in the monograph.

When presented as coated formulations, where justified and authorised, it may be necessary to remove the coating before performing a test described in a monograph. Removal of a coating is not permitted where it affects the functionality of the product, for example in dissolution or disintegration tests.

In preparing Tablets for which Chocolate Basis is specified, the active ingredient may be incorporated with a mixture of 15 parts of non-alkalinised cocoa powder of commerce, 15 parts of Sucrose and 70 parts of Lactose Monohydrate.

Content of active ingredient of tablets

The range for the content of active ingredient stated in the monograph is based on the requirement that 20 tablets, or such other number as may be indicated in the monograph, are used in the Assay. In circumstances where 20 tablets cannot be obtained, a smaller number, which must not be less than five, may be used, but to allow for sampling errors the tolerances are widened in accordance with Table I.

The requirements of Table I apply when the stated limits are 90 to 110%. For limits other than 90 to 110%, proportionately smaller or larger allowances should be made.

Table I

Weight of active ingredients in each tablet	Subtract from the lower limit for samples of			Add to the upper limit for samples of		
	15	10	5	15	10	5
0.12 g or less	0.2	0.7	1.6	0.3	0.8	1.8
More than 0.12 g and less than 0.3 g	0.2	0.5	1.2	0.3	0.6	1.5
0.3 g or more	0.1	0.2	0.8	0.2	0.4	1.0

Disintegration

Comply with the *disintegration test for tablets and capsules*, Appendix XII A1, unless otherwise stated in the individual monographs.

For those Uncoated or Coated Tablets for which a requirement for Dissolution is included in the individual monograph, the requirement for Disintegration does not apply.

Uniformity of content

Details of the analytical method to be employed for determining the content of active ingredient may be included in certain monographs. Unless otherwise stated in the monograph the limits are as given in test A for *Uniformity of content*, Appendix XII C3.

Any tablets that, when examined individually, show a gross deviation from the stated content are not official.

Medicated Tampons

(Ph. Eur. monograph 1155)

Medicated Tampons comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

Additional requirements for medicated tampons may be found, where appropriate, in other general monographs, for example Rectal preparations (1145), Vaginal preparations (1164) and Ear preparations (0652).

DEFINITION

Medicated tampons are solid, single-dose preparations intended to be inserted into the body cavities for a limited period of time, usually to obtain a local effect. They consist of a suitable material such as cellulose, collagen or silicone impregnated with one or more active substances.

PRODUCTION

In the manufacture, packaging, storage and distribution of medicated tampons, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

LABELLING

The label states the quantity of active substance(s) per tampon.

Ph Eur

Patches

Transdermal Patches

(Ph. Eur. monograph 1011)

Patches comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Patches are flexible preparations intended for application to unbroken skin to deliver active substances to or through the skin for a local or systemic effect over an extended period of time.

www.webofpharma.com

They are single-dose preparations, presented in a range of sizes adapted to their intended use.

Patches consist of a backing layer, a reservoir or a matrix containing the active substance(s) in the form of a solution or solid dispersion, and a pressure-sensitive adhesive, which ensures that the patch adheres to the skin. Reservoir-type patches include a rate-controlling membrane; for matrix systems, the rate and extent of diffusion into the skin are controlled by the matrix properties. The backing layer is impermeable to the active substance(s) and, typically, to water. The release surface of the patch is covered by a protective liner to be removed before the patch is applied to the skin.

Patches must be applied to dry, clean, unbroken skin. They adhere firmly to the skin by gentle pressure and can be peeled off without causing appreciable injury to the skin or detachment of the active substance layer from the backing layer. They do not cause undue skin irritation or sensitisation, even after repeated applications.

Patches are normally individually packaged in sealed sachets.

2 categories of patches may be distinguished:
— cutaneous patches;
— transdermal patches.

PRODUCTION

In the manufacture, packaging, storage and distribution of patches, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

TESTS

Dissolution

A suitable test may be required to demonstrate the appropriate release of the active substance(s), for example one of the tests described in general chapter *2.9.4. Dissolution test for patches.*

The test conditions and the requirements are to be authorised by the competent authority.

STORAGE

Store in a well-closed container at room temperature, unless otherwise indicated.

LABELLING

The label states, where applicable:
— the total quantity of active substance(s) per patch;
— the dose released per unit time;
— the area of the releasing surface.

CUTANEOUS PATCHES

Cutaneous patches are designed to provide a local effect by penetration of the active substance(s) into the skin.

TRANSDERMAL PATCHES

Transdermal patches are designed to provide a systemic effect by penetration of the active substance(s) through the skin.

They comply with the following tests.

TESTS

Uniformity of dosage units (*2.9.40*)

Transdermal patches comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, transdermal patches comply with the requirements under Test C.

Ph Eur

Unlicensed Medicines

This monograph describes the minimum quality standards required for Unlicensed Medicines for human use. The statements in this monograph are intended to be read in conjunction with individual monographs for unlicensed medicines or formulated preparations in the Pharmacopoeia, together with relevant General Notices, Appendices and Supplementary Chapters.

Individual monographs are intended to apply throughout the period for which the formulation is expected to be satisfactory for use.

DEFINITION

An unlicensed medicine is one which is prepared, at the request of an authorised healthcare professional, to address patient medicinal requirements, unmet by current licensed medicines, according to the Human Medicines Regulations 2012 (see Supplementary Chapter V). Such products will be manufactured under a Manufacturer's 'Specials' Licence or prepared extemporaneously under the supervision of a pharmacist.

SCOPE

This general monograph applies to those dosage forms that are routinely manufactured or prepared as unlicensed medicines and are usually presented as conventional-release formulations. These include:
— Capsules
— Liquids for Cutaneous Application
— Ear Drops and Lotions
— Eye Drops
— Preparations for Irrigation
— Nasal Preparations
— Oral Liquids
— Oral Powders
— Parenteral Preparations
— Rectal Preparations
— Tablets
— Topical Semi-solid Preparations
— Vaginal Preparations

PRODUCTION

The production of unlicensed medicines should only be undertaken by competent staff, within suitable facilities and using equipment appropriate for the scale of manufacture and the specific dosage form.

In the UK, batch manufacture should be undertaken in facilities holding a UK Manufacturer's 'Specials' Licence in compliance with the standards of Good Manufacturing Practice.

LABELLING

The following requirements are applicable to unlicensed medicines manufactured or prepared in accordance with medicines legislation. They are not intended to apply to repackaging and assembly activities. The requirements were previously included as guidance in Supplementary Chapter V of the British Pharmacopoeia 2007.

www.webofpharma.com

Best practice guidance on the labelling and packaging of medicines advises that certain items of information are deemed critical for the safe use of the medicine (see "Best Practice Guidance on the Labelling and Packaging of Medicines"; MHRA, 2012). These critical items of information, which should be located together on the pack and appear in the same field of view, are: name, strength, route of administration, dosage and warnings (highlighted in bold).

1. The common name of the product.

2. A statement of the active ingredients expressed qualitatively and quantitatively per dosage unit or for a given volume or weight.

3. Route of administration.

4. Instructions for use, including any special warnings.

5. The pharmaceutical form.

6. The contents of the container by weight, volume or by number of doses.

7. Excipients of known effect. For injectable, topical (including inhalation products) and ophthalmic medicines, all excipients.

8. 'Keep out of reach and sight of children'. [Note 1]

9. The expiry date expressed in unambiguous terms (dd/mm/yy).

10. Any special storage precautions.

11. The manufacturer's MS number, where appropriate.

12. The manufacturer's name and address.

13. The batch number.

14. Statutory warnings required by The Human Medicines Regulations 2012 for particular actives, e.g. paracetamol (Schedule 25, Part 4 of the 2012 Regulations).

For small containers certain details may be omitted, but the label should contain, as a minimum, the following information:

1. The common name of the product.

2. A statement of the active ingredients expressed qualitatively and quantitatively per dosage unit or for a given volume or weight.

3. Route of administration.

6. The contents of the container by weight, volume or by number of doses.

9. The expiry date expressed in unambiguous terms (dd/mm/yy).

13. The batch number.

In such cases, the label for the outer packaging should contain all the relevant label information.

Note 1: This is a statutory requirement for relevant medicinal products.

MEDICINAL SUBSTANCES AND EXCIPIENTS

Where such a monograph is available, the medicinal substance and any excipients must comply with the specific monograph requirements of the Pharmacopoeia.

The medicinal substance and any excipients must also comply with the General Monograph for Substances for Pharmaceutical Use and, where appropriate, the provisions of Supplementary Chapter IV J on the Control of Impurities in Substances for Pharmaceutical Use and the General Monograph for Products with Risk of Transmitting Agents of Animal Spongiform Encephalopathies.

FORMULATED PREPARATIONS

Unlicensed medicines must comply with the requirements of the General Monograph for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and with the requirements of the relevant General Monograph for the specific dosage form.

While it is required that the formulated preparation will demonstrate compliance with the Pharmacopoeia when tested, it is recognised that it might not be practicable to carry out the pharmacopoeial tests routinely. In such instances other suitable methods may be used to provide assurance that the preparation is of the appropriate quality.

Where a BP monograph for a formulated preparation is available, the product must comply. In addition, where specified, the product must comply with the following tests.

Sterility

All batches of aseptically prepared unlicensed medicines should undergo a sterility test. In cases where the in-use period is before the expectation of the sterility test result, then the test will be retrospective and become a developing and continuing assurance of the process and batches produced. The test should not delay the release of product(s) with a short shelf-life (less than 90 days).

Where an aseptic preparation has been prepared individually by aseptic manipulation, the batch size is effectively one. However, since a sterility test on a batch of one is not manageable, a batch for this purpose is defined as "all preparations prepared during one session". A "session" is defined as "a continuous period with the same operators, environment, equipment and materials".

Batch samples may be represented by (i) dummy samples, of the same form and size as the batch items, that have been introduced at the end of the session, (ii) returned items (unused) and (iii) direct samples from the session, where the batch allows.

Further guidance can be found in the MHRA Question and Answers document for holders of a Manufacturer's 'Specials' Licence[1]. This guidance states that "The minimum expectation is one sterility sample per operational work station per week." In addition, the guidance states "The use of a suitably designed 'end of session media fill simulation' may be considered as an alternative to sterility testing of the finished product as part of an on-going monitoring programme."

ORAL LIQUIDS

PRODUCTION

In the manufacturing, packaging and storage of oral liquids, suitable measures are taken to ensure their microbial quality complies with Pharmacopoeial requirements throughout shelf-life; recommendations for microbial limits are provided in the section on *Microbiological Quality of Pharmaceutical Preparations (Appendix XVI D)*. If necessary, an antimicrobial preservative may be added unless the formulation is required to be preservative-free.

During the preparation, storage and use of preservative-free oral liquids, due consideration should be given to the additional risks of microbial contamination that exist for such preparations. Numbers of viable organisms in starting materials and primary packaging materials should be

[1] *MHRA Guidance for 'Specials' Manufacturers, January 2015 (sections 3.6.2 and 3.6.3).*

www.webofpharma.com

minimised. Storage conditions of the finished product should prevent contamination and inhibit microbiological proliferation. The product shelf life during storage and use should be based on the risk and probability that the product may fail to meet the requirements of Appendix XVI D.

Acidity or alkalinity
A test to determine the pH of the oral solution or oral suspension may be applied. As the pH may be formulation dependant, limits are only included in specific monographs in cases where the stability of the active substance is affected by pH.

ORAL SUSPENSIONS

Dissolution
Carry out the test for dissolution described under *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Unless otherwise stated in the individual monograph use 900 mL of an appropriate dissolution medium (as suggested in Supplementary Chapter I E) and rotate the paddle at 50 rpm.

Shake the container containing the oral suspension being examined for 30 seconds and accurately remove, by syringe, a volume containing one dose at a depth of 1 cm below the meniscus. Introduce the dose by placing the syringe vertically into the dissolution medium as low as possible, not less than 1 cm from the vessel wall, and allow the sample to reach the bottom of the vessel. If sink conditions cannot be obtained, testing a partial dose of the suspension (10% to 20% of the usual dose) is preferable to using a surfactant.

Operate the apparatus at the specified rate. Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the dissolution medium and the top of the rotating paddle, not less than 1 cm from the vessel wall. Where multiple sampling times are specified, replace the aliquots withdrawn for analysis with equal volumes of fresh dissolution medium at 37° or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test and verify the temperature of the medium at suitable times. Perform the analysis using a suitable assay method. Repeat the test with a further five additional doses.

Unless otherwise specified in the individual monograph, the value of Q is 75% of the stated amount at 45 minutes.

Homogeneity of Suspension
Allow a suitable volume of the oral suspension being examined to settle, undisturbed, for 24 hours. Shake the container for 30 seconds and accurately remove one dose (usually 5 to 10 mL) at a depth of 1 cm below the meniscus. Shake the container again for 10 seconds and remove another dose. Repeat this procedure until 10 doses of the suspension have been removed. Assay the 10 doses individually according to the method specified in the individual monograph.

The preparation complies with the test if the content of each individual dose is between 85% and 115% of the average content. The preparation fails to comply with the test if the content of more than one individual dose is outside these limits or if the content of one individual dose is outside the limits of 75% to 125% of the average content.

INTRAOCULAR INJECTIONS

DEFINITION
Intraocular injections are sterile preparations intended for administration by injection into the eye.

Several categories of intraocular injection may be distinguished. The requirements of this monograph apply to the most commonly used intraocular injections: intracameral injections (administered into the anterior chamber of the eye) and intravitreal injections (administered into the vitreous chamber of the eye).

Intraocular injections are supplied either in a glass vial or ampoule that allows the contents to be drawn up into a sterile syringe, in pre-filled syringes with a luer lock connector and a blind hub or in pre-filled syringes with a luer slip connector.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

TESTS

Acidity or alkalinity
A test to determine the pH of the injection is carried out, Appendix V L.

Osmolality
A test to determine the osmolality of the injection is carried out, Appendix V N.

Bacterial endotoxins
A test for *bacterial endotoxins* is carried out, Appendix XIV C. Recommendations on the limits for bacterial endotoxins are given in Supplementary Chapter I C.

ASSAY
A suitable procedure to determine the amount of active ingredient(s) is carried out.

STORAGE
Intraocular injections should be stored in a sterile, airtight, tamper-evident container. The containers and closures comply with the requirements for Containers, Appendix XIX A.

LABELLING
The label states (1) the quantity of active ingredient in a suitable dose-volume; (2) the route of administration; (3) for pre-filled syringes, whether the outside surface of the syringe is sterile.

Annex
This section is non-mandatory; it provides guidance on typical limits for Content, pH and Osmolality in Intraocular Injections.

Content
95.0 to 105.0% of the stated amount of the active ingredient, unless otherwise justified.

Acidity or alkalinity
For intracameral injections
pH, 6.8 to 8.2, Appendix V L.
For intravitreal injections
pH, 3.0 to 8.0, Appendix V L.

Osmolality
For intracameral injections
250 to 350 mosmol/kg, Appendix V N.
For intravitreal injections
270 to 330 mosmol/kg, Appendix V N.

www.webofpharma.com

Vaginal Preparations

(Ph. Eur. monograph 1164)

Ph Eur

DEFINITION

Vaginal preparations are liquid, semi-solid or solid preparations intended for administration to the vagina usually in order to obtain a local effect. They contain 1 or more active substances in a suitable basis.

Where appropriate, containers for vaginal preparations comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of vaginal preparations may be distinguished:

— pessaries;
— vaginal tablets;
— vaginal capsules;
— vaginal solutions, emulsions and suspensions;
— tablets for vaginal solutions and suspensions;
— semi-solid vaginal preparations;
— vaginal foams;
— medicated vaginal tampons.

PRODUCTION

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid vaginal preparations presented in single-dose containers.

In the manufacturing, packaging, storage and distribution of vaginal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use*.

TESTS

Uniformity of dosage units (*2.9.40*)

Liquid and semi-solid single-dose vaginal preparations comply with the test. Solid single-dose vaginal preparations comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*)

Unless otherwise prescribed or justified and authorised, solid single-dose vaginal preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (vaginal tablets) or test B (pessaries, vaginal capsules). If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*)

Solid single-dose vaginal preparations comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Dissolution

A suitable test may be carried out to demonstrate the appropriate release of the active substance(s) from solid single-dose vaginal preparations, for example one of the tests described in chapter *2.9.3. Dissolution test for solid dosage forms* or in *2.9.42. Dissolution test for lipophilic solid dosage forms*.

When a dissolution test is prescribed, a disintegration test may not be required.

PESSARIES

DEFINITION

Pessaries are solid, single-dose preparations. They have various shapes, usually ovoid, with a volume and consistency suitable for insertion into the vagina. They contain 1 or more active substances dispersed or dissolved in a suitable basis that may be soluble or dispersible in water or may melt at body temperature. Excipients such as diluents, adsorbents, surface-active agents, lubricants, antimicrobial preservatives and colouring matter authorised by the competent authority may be added, if necessary.

PRODUCTION

Pessaries are usually prepared by moulding. Where appropriate in the manufacture of pessaries, measures are taken to ensure a suitable and controlled particle size of the active substance(s). If necessary, the active substance(s) are previously ground and sieved through a suitable sieve.

When prepared by moulding, the medicated mass, sufficiently liquefied by heating, is poured into suitable moulds. The pessary solidifies on cooling. Various excipients are available for this process, such as hard fat, macrogols, cocoa butter, and various gelatinous mixtures consisting, for example, of gelatin, water and glycerol.

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from pessaries intended for prolonged local action.

TESTS

Disintegration (*2.9.2*)

Unless intended for prolonged local action, they comply with the test. Examine the state of the pessaries after 60 min, unless otherwise justified and authorised.

VAGINAL TABLETS

DEFINITION

Vaginal tablets are solid, single-dose preparations. They generally conform to the definitions of uncoated or film-coated tablets given in the monograph *Tablets (0478)*.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from vaginal tablets intended for prolonged local action.

TESTS

Disintegration (*2.9.2*)

Unless intended for prolonged local action, they comply with the test (special method for vaginal tablets). Examine the state of the tablets after 30 min, unless otherwise justified and authorised.

VAGINAL CAPSULES

DEFINITION

Vaginal capsules (shell pessaries) are solid, single-dose preparations. They are generally similar to soft capsules as defined in the monograph *Capsules (0016)*, differing only in their shape and size. Vaginal capsules have various shapes, usually ovoid. They are smooth and have a uniform external appearance.

www.webofpharma.com

PRODUCTION
A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from vaginal capsules intended for prolonged local action.

TESTS
Disintegration *(2.9.2)*
Unless intended for prolonged local action, they comply with the test. Examine the state of the capsules after 30 min, unless otherwise justified and authorised.

VAGINAL SOLUTIONS, EMULSIONS AND SUSPENSIONS

DEFINITION
Vaginal solutions, emulsions and suspensions are liquid preparations intended for a local effect, for irrigation or for diagnostic purposes. They may contain excipients, for example to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance(s) or to stabilise the preparation. The excipients do not adversely affect the intended medical action or, at the concentrations used, cause undue local irritation.

Vaginal emulsions may show evidence of phase separation but are readily redispersed on shaking. Vaginal suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable a homogeneous preparation to be delivered.

They are supplied in single-dose containers. The container is adapted to deliver the preparation to the vagina or it is accompanied by a suitable applicator.

PRODUCTION
In the manufacture of vaginal suspensions measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TABLETS FOR VAGINAL SOLUTIONS AND SUSPENSIONS

DEFINITION
Tablets intended for the preparation of vaginal solutions and suspensions are single-dose preparations that are dissolved or dispersed in water at the time of administration. They may contain excipients to facilitate dissolution or dispersion or to prevent caking.

Apart from the test for disintegration, tablets for vaginal solutions or suspensions conform with the definition for *Tablets (0478)*.

After dissolution or dispersion, they comply with the requirements for vaginal solutions or vaginal suspensions, as appropriate.

TESTS
Disintegration *(2.9.1)*
Tablets for vaginal solutions or suspensions disintegrate within 3 min, using *water R* at 15-25 °C as the liquid medium.

LABELLING
The label states:
— the method of preparation of the vaginal solution or suspension;
— the conditions and duration of storage of the solution or suspension after constitution.

SEMI-SOLID VAGINAL PREPARATIONS

DEFINITION
Semi-solid vaginal preparations are ointments, creams or gels.

They are often supplied in single-dose containers.
The container is provided with a suitable applicator.

Semi-solid vaginal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

VAGINAL FOAMS

DEFINITION
Vaginal foams comply with the requirements of the monograph *Medicated foams (1105)*.

MEDICATED VAGINAL TAMPONS

DEFINITION
Medicated vaginal tampons are solid, single-dose preparations intended to be inserted in the vagina for a limited time.

They comply with the requirements of the monograph *Medicated tampons (1155)*.

Ph Eur

Aromatic Waters

DEFINITION
Aromatic Waters are saturated solutions of volatile oils or other aromatic substances in water, usually employed for their flavouring rather than their medicinal properties. Aromatic Waters prepared as described below contain a small amount of Ethanol.

PRODUCTION
Aromatic Waters are normally prepared by diluting a concentrated, ethanolic solution of the aromatic substance with Water.

www.webofpharma.com

Formulated Preparations: Specific Monographs

www.webofpharma.com

www.webofpharma.com

Abacavir Oral Solution

Action and use
Nucleoside reverse transcriptase inhibitor; antiviral (HIV).

DEFINITION
Abacavir Oral Solution is a solution containing Abacavir Sulfate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of abacavir, $C_{28}H_{36}N_{12}O_2$
92.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol (50%)*.

(1) Dilute the oral solution to produce a solution containing the equivalent of 0.2% w/v of abacavir and filter if necessary.

(2) 0.23% w/v of *abacavir sulfate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} HPTLC plates are suitable). Before use, stand the plate in *methanol*, allowing the solvent front to ascend to the top of the plate, remove and heat the plate at 105° for 1 hour.

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *methanol*, 6 volumes of 13.5M *ammonia*, 34 volumes of *dichloromethane* and 55 volumes of *acetone*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to abacavir in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 3.8 to 4.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.1% v/v of *orthophosphoric acid*.

(1) Dilute the oral solution to produce a solution containing the equivalent of 0.02% w/v of abacavir and filter if necessary.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 5 volumes.

(4) Dissolve 2.5 mg of *abacavir for peak identification EPCRS* (containing impurities B and D) in 10.0 mL.

(5) 0.02% w/v of *abacavir impurity standard BPCRS*.

(6) 0.0001% w/v of *abacavir impurity 1 BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry Shield C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.05% v/v of *trifluoroacetic acid*.

Mobile phase B *methanol (85%)*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	95→70	5→30	linear gradient
20-35	70→10	30→90	linear gradient
35-40	10	90	isocratic
40-41	10→0	90→100	column wash
41-50	0	100	column wash
50-51	0→95	100→5	column wash
51-55	95	5	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the chromatogram closely resembles the reference chromatogram supplied with *abacavir for peak identification EPCRS*;

the *resolution* between the peaks due to abacavir and abacavir impurity D is at least 1.5.

LIMITS

Identify any peak in the chromatogram obtained with solution (1) corresponding to impurity C using the chromatogram obtained with solution (5) and the chromatogram supplied with *abacavir impurity standard BPCRS*.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to abacavir impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to abacavir impurity 1 is not greater than the area of the peak in the chromatogram obtained with solution (6) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of all secondary peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.1% v/v of *orthophosphoric acid*.

(1) Dilute the oral solution to produce a solution containing the equivalent of 0.02% w/v of abacavir and filter if necessary.

(2) 0.023% w/v of *abacavir sulfate BPCRS*.

(3) Dissolve 2.5 mg of *abacavir for peak identification EPCRS* (containing impurities B and D) in 10.0 mL.

www.webofpharma.com

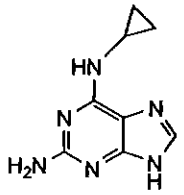
SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to abacavir and abacavir impurity D is at least 1.5.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT



Calculate the content of $C_{28}H_{36}N_{12}O_2$ in the oral solution from the chromatograms obtained using the declared content of $C_{28}H_{36}N_{12}O_2$ in *abacavir sulfate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of abacavir.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Abacavir Sulfate and the following.

1. N^6-cyclopropyl-1*H*-purine-2,6-diamine.

Abacavir Tablets

Action and use

Nucleoside reverse transcriptase inhibitor; antiviral (HIV).

DEFINITION

Abacavir Tablets contain Abacavir Sulfate. They may be coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of abacavir, $C_{14}H_{18}N_6O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Shake a quantity of powdered tablets containing the equivalent of 0.2 g of abacavir with 100 mL, filter and use the filtrate.

(2) 0.23% w/v of *abacavir sulfate BPCRS*.

(3) 0.23% w/v of *abacavir sulfate BPCRS* and 0.2% w/v of *zidovudine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use precoated *silica gel F_{254}* plates (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry it in air and immediately examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

3 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The chromatogram obtained with solution (1) shows a principal spot corresponding in position and size to the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 75 revolutions per minute.

(b) Use 900 mL of *0.1M hydrochloric acid* as the medium at a temperature of 37°.

PROCEDURE

(1) After 45 minutes withdraw a 10-mL sample of the medium and filter. Measure the *absorbance* of the filtered medium, diluted if necessary with 0.1M *hydrochloric acid*, at the maximum at 254 nm using *0.1M hydrochloric acid* in the reference cell, Appendix II B.

(2) Measure the *absorbance* of a solution containing 0.039% w/v of *abacavir sulfate BPCRS* in *0.1M hydrochloric acid* at the maximum at 254 nm using *0.1M hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of abacavir, $C_{14}H_{18}N_6O$, in the medium using the declared content of $C_{14}H_{18}N_6O$ in *abacavir sulfate BPCRS*.

LIMITS

The amount of abacavir released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.1% v/v of *orthophosphoric acid*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.3 g of abacavir with 70 mL for 30 minutes, mix with the aid of ultrasound for 5 minutes; dilute to 100 mL and filter through a 0.45-µm filter (polyvinylidene fluoride is suitable). Dilute 1 volume of the filtrate to 20 volumes.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume of the resulting solution to 5 volumes.

(3) Dissolve 2.5 mg of *abacavir for peak identification EPCRS* in 10.0 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry Shield C18 is suitable).

www.webofpharma.com

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.05% v/v of *trifluoroacetic acid.*

Mobile phase B *methanol (85%).*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	95→70	5→30	linear gradient
20-35	70→10	30→90	linear gradient
35-40	10	90	isocratic
40-41	10→0	90→100	column wash
41-50	0	100	column wash
50-51	0→95	100→5	column wash
51-55	95	5	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the chromatogram closely resembles the reference chromatogram supplied with *abacavir for peak identification EPCRS*;

the *resolution* between the peaks due to abacavir and abacavir impurity D is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 8 times the area of the principle peak in the chromatogram obtained with solution (2) (1.6%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, in 0.1% v/v of *orthophosphoric acid.*

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of abacavir with 70 mL for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume of the filtrate to 5 volumes.

(2) 0.023% w/v of *abacavir sulfate BPCRS.*

(3) Dissolve 2.5 mg of *abacavir for peak identification EPCRS* in 10 mL.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to abacavir and abacavir impurity D is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{18}N_6O$ in the tablets from the chromatograms obtained using the declared content of $C_{14}H_{18}N_6O$ in *abacavir sulfate BPCRS.*

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of abacavir.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Abacavir Sulfate.

Abacavir and Lamivudine Tablets

Action and use

Nucleoside reverse transcriptase inhibitor; antiviral (HIV).

DEFINITION

Abacavir and Lamivudine Tablets contain Abacavir Sulfate and Lamivudine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of abacavir, $C_{14}H_{18}N_6O$

95.0 to 105.0% of the stated amount.

Content of lamivudine, $C_8H_{11}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of powdered tablets containing the equivalent of 0.2 g of abacavir with 50 mL of *water*, filter and use the filtrate.

(2) 0.23% w/v of *abacavir sulfate BPCRS* in *water.*

(3) 0.1% w/v of *lamivudine BPCRS* in *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry it in air and immediately examine under *ultraviolet light (254 nm).*

MOBILE PHASE

3 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 90 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (1) shows two clearly separated spots.

CONFIRMATION

The chromatogram obtained with solution (1) shows two principal spots corresponding in position and size to the principal spots in the chromatograms obtained with solutions (2) and (3).

B. In the Assay, the chromatogram obtained with solution (1) shows principal peaks with the same retention time as the principal peaks due to abacavir and lamivudine in the chromatograms obtained with solutions (2) and (3) respectively.

www.webofpharma.com

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: Dissolve 1.9 g of *ammonium acetate* in 900 mL of *water*, adjust the pH to 3.9 with *glacial acetic acid* and dilute to 1000 mL.

(1) After 45 minutes withdraw a sample of the medium and filter. Dilute with the dissolution medium, if necessary, to produce a solution containing the equivalent of 0.067% w/v of abacavir.

(2) 0.078% w/v of *abacavir sulfate BPCRS* and 0.033% w/v of *lamivudine BPCRS* in solution A.

(3) 0.01% w/v of *lamivudine impurity standard BPCRS* and 0.016% w/v of *abacavir sulfate BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the total content of abacavir, $C_{14}H_{18}N_6O$, and lamivudine, $C_8H_{11}N_3O_3S$, in the medium using the declared contents of $C_{14}H_{18}N_6O$, in *abacavir sulfate BPCRS* and of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *lamivudine impurity standard BPCRS* and the retention of abacavir relative to lamivudine is about 2.6;

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0.

LIMITS

The amounts of abacavir and lamivudine released are not less than 75% (Q) of the stated amounts.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solution A.

Solution A: Dissolve 1.9 g of *ammonium acetate* in 900 mL of *water*, adjust the pH to 3.9 with *glacial acetic acid* and dilute to 1000 mL.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of abacavir in 60 mL with the aid of ultrasound for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume of the filtrate to 5 volumes.

(2) Dilute 1 volume of solution (1) to 50 volumes. Further dilute 1 volume to 10 volumes.

(3) 0.01% w/v of *lamivudine impurity standard BPCRS* and 0.016% w/v of *abacavir sulfate BPCRS*.

(4) 0.0001% w/v each of *salicylic acid BPCRS* (lamivudine impurity C) and *cytosine* (lamivudine impurity E).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (YMC ODS-A is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 270 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.025M *ammonium acetate*, adjusted to pH 3.9 with *glacial acetic acid*.

Mobile phase B *methanol*.

Mobile phase C *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Mobile phase C (% v/v)	Comment
0-15	95	5	0	isocratic
15-30	95→70	5→30	0	linear gradient
30-38	70	30	0	isocratic
38-60	70→0	30→0	0→100	linear gradient
60-65	0	0	100	column wash
65-66	0→95	0→5	100→0	linear gradient
66-75	95	5	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retentions with reference to lamivudine (retention time about 15 minutes) are lamivudine impurity E, about 0.2; lamivudine impurity F, about 0.3; lamivudine impurity A, about 0.35; lamivudine impurity H, about 0.37; lamivudine impurity C, about 0.39; lamivudine impurity G, about 0.4; lamivudine impurity B, about 0.9; lamivudine impurity J, about 1.5 and abacavir, about 2.6.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *lamivudine impurity standard BPCRS* and the retention of abacavir relative to lamivudine is about 2.6;

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0.

LIMITS

Using the chromatogram obtained with solutions (3) and (4), the reference chromatogram supplied with *lamivudine impurity standard BPCRS* and the relative retentions identify any peaks in solution (1) corresponding to the named lamivudine impurities. Multiply any peaks areas corresponding to lamivudine impurity C and lamivudine impurity E by the following correction factors; impurity C, 1.3; impurity E, 0.6.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to lamivudine impurity J is not greater than 2.5 times the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.5%);

www.webofpharma.com

the area of any peak corresponding to lamivudine impurity A is not greater than 1.5 times the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.3%);

the area of any peak corresponding to lamivudine impurities B, C, E, F, G and H is not greater than the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the peak due to abacavir in the chromatogram obtained with solution (2) (0.2%).

The total impurity content is not greater than 2.2%.

Disregard:

any peak corresponding to a lamivudine impurity with an area less than half the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.1%);

any other peak with an area less than half the area of the peak due to abacavir in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in solution A.

Solution A: Dissolve 1.9 g of *ammonium acetate* in 900 mL of *water*, adjust the pH to 3.9 with *glacial acetic acid* and dilute to 1000 mL.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.2 g of abacavir with 60 mL of solution A in a 100-mL amber volumetric flask for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume to 5 volumes.

(2) 0.046% w/v of *abacavir sulfate BPCRS*

(3) 0.02% w/v of *lamivudine BPCRS*.

(4) 0.01% w/v of *lamivudine impurity standard BPCRS* and 0.016% w/v of *abacavir sulfate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the chromatogram obtained with solution (4) closely resembles the reference chromatogram supplied with *lamivudine impurity standard BPCRS* and the retention of abacavir relative to lamivudine is about 2.6;

the *resolution* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0.

DETERMINATION OF CONTENT

Using solutions (1) and (2), calculate the content of $C_{14}H_{18}N_6O$ in the tablets from the chromatograms obtained using the declared content of $C_{14}H_{18}N_6O$ in *abacavir sulfate BPCRS*.

Using solutions (1) and (3) calculate the content $C_8H_{11}N_3O_3S$ in the tablets from the chromatograms obtained using the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Abacavir Sulfate, excluding impurity A, and Lamivudine.

Abacavir, Zidovudine and Lamivudine Tablets

Action and use

Nucleoside reverse transcriptase inhibitor; antiviral (HIV).

DEFINITION

Abacavir, Zidovudine and Lamivudine Tablets contain Abacavir Sulfate, Zidovudine and Lamivudine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of abacavir, $C_{14}H_{18}N_6O$

95.0 to 105.0% of the stated amount.

Content of zidovudine, $C_{10}H_{13}N_5O_4$

95.0 to 105.0% of the stated amount.

Content of lamivudine, $C_8H_{11}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of powdered tablets containing the equivalent of 0.2 g of abacavir with 50 mL of *water*, filter and use the filtrate.

(2) 0.2% w/v of *zidovudine BPCRS* in *water*.

(3) 0.23% w/v of *abacavir sulfate BPCRS* in *water*.

(4) 0.1% w/v of *lamivudine BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use precoated *silica gel F_{254}* plates (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry it in air and immediately examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

3 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (1) shows three clearly separated spots.

CONFIRMATION

The chromatogram obtained with solution (1) shows three spots corresponding in position, colour and size to the spots in the chromatograms obtained with solutions (2), (3) and (4).

B. In the Assay, the chromatogram obtained with solution (1) shows principal peaks with the same retention time as the principal peaks due to abacavir, zidovudine and lamivudine in the chromatograms obtained with solutions (2), (3) and (4) respectively.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

www.webofpharma.com

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 10 mL sample of the medium and filter.

(2) Dissolve suitable quantities of *abacavir sulfate BPCRS*, *zidovudine BPCRS* and *lamivudine BPCRS* in solvent A, described under Related substances, to produce the same concentrations as that expected for solution (1).

(3) 0.075% w/v of *zidovudine and lamivudine impurity standard BPCRS* and 0.025% w/v of *abacavir sulfate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the total content of abacavir, $C_{14}H_{18}N_6O$, zidovudine, $C_{10}H_{13}N_5O_4$, and lamivudine, $C_8H_{11}N_3O_3S$, in the medium using the declared content of $C_{14}H_{18}N_6O$ *abacavir sulfate BPCRS*, the declared content of $C_{10}H_{13}N_5O_4$ in *zidovudine BPCRS* and the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

LIMITS

The amounts of abacavir, zidovudine and lamivudine released are not less than 75% (Q) of the stated amounts.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solvent A.

SOLVENT A

Dissolve 1.9 g of *ammonium acetate* in 900 mL of *water*, adjust the pH to 3.9 with *glacial acetic acid* and dilute to 1000 mL.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.1g of abacavir in 60 mL with the aid of ultrasound for 30 minutes, dilute to 100 mL and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 10 volumes.

(4) 0.002% w/v of *thymine*.

(5) 0.075% w/v of *zidovudine and lamivudine impurity standard BPCRS* and 0.025% w/v of *abacavir sulfate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (YMC ODS-A is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 270 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.025M *ammonium acetate*, the pH adjusted to 3.9 with *glacial acetic acid*.

Mobile phase B *methanol*.

Mobile phase C *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Mobile phase C (% v/v)	Comment
0-15	95	5	0	isocratic
15-30	95→70	5→30	0	linear gradient
30-38	70	30	0	isocratic
38-60	70→0	30→0	0→100	change of solvent
60-65	0	0	100	washing column
65-66	0→95	0→5	100→0	change in solvent
66-75	95	5	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (5) closely resembles the reference chromatogram supplied with *zidovudine and lamivudine impurity standard BPCRS* and the retention of abacavir relative to zidovudine is about 1.2;

the *resolution* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0;

the *resolution* between the peaks due to lamivudine and thymidine is at least 2.0;

the *resolution* between the peaks due to zidovudine and zidovudine impurity B is at least 4.0;

the *resolution* between the peaks due to zidovudine and abacavir is at least 1.5.

LIMITS

Using the chromatogram obtained with solution (5) and the reference chromatogram supplied with *zidovudine and lamivudine impurity standard BPCRS* identify any peaks in solution (1) corresponding to the named lamivudine and zidovudine impurities.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to thymine (zidovudine impurity C) is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (2.0%);

the area of any peak corresponding to zidovudine impurity B is not greater than the area of the peak due to zidovudine in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to zidovudine impurity G (retention relative to zidovudine about 1.4) is not greater than 0.5 times the area of the peak due to zidovudine in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to zidovudine impurity I (eluting between lamivudine impurity G and zidovudine impurity C) is not greater than 0.4 times the area of the peak due to zidovudine in the chromatogram obtained with solution (2) (0.4%);

the area of any peak corresponding to lamivudine impurity A is not greater than 3 times the area of the peak due to lamivudine in the chromatogram obtained with solution (3) (0.3%);

the area of any peak corresponding to a named lamivudine impurity is not greater than 0.2 times the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.2%);

the area of any peak corresponding to a named zidovudine impurity is not greater than 0.2 times the area of the peak due to zidovudine in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than 0.2 times the area of the peak due to abacavir in the chromatogram obtained with solution (2) (0.2%);

www.webofpharma.com

the sum of the areas of all the named zidovudine impurities is not greater than 4 times the area of the peak due to zidovudine in the chromatogram obtained with solution (2) (4.0%);

the sum of the areas of all the named lamivudine impurities is not greater than the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (1.0%);

the sum any other *secondary peaks* is not greater than the area of the peak due to abacavir in the chromatogram obtained with solution (2) (1.0%);

Disregard any peak with an area less than the area of the peak due to abacavir in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions dissolved in solvent A described under Related substances.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of abacavir with 50 mL of solvent A in a 100 mL amber volumetric flask for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume to 5 volumes.

(2) 0.023% w/v of *abacavir sulfate BPCRS*

(3) 0.02% w/v of *zidovudine BPCRS*.

(4) 0.01% w/v of *lamivudine BPCRS*.

(5) 0.075% w/v of *zidovudine and lamivudine impurity standard BPCRS* and 0.025% w/v of *abacavir sulfate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (5) closely resembles the reference chromatogram supplied with *zidovudine and lamivudine impurity standard BPCRS* and the retention of abacavir relative to Zidovudine is about 1.2;

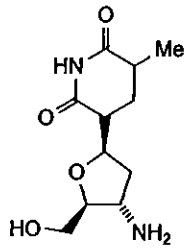
the *resolution* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0;

the *resolution* between the peaks due to lamivudine and thymidine is at least 2.0;

the *resolution* between the peaks due to zidovudine and zidovudine impurity B is at least 4.0;

the *resolution* between the peaks due to zidovudine and abacavir is at least 1.5.

DETERMINATION OF CONTENT



Using solutions (1) and (2), calculate the total content of $C_{14}H_{18}N_6O$ in the tablets from the chromatograms obtained using the declared content of $C_{14}H_{18}N_6O$ in *abacavir sulfate BPCRS*.

Using solutions (1) and (3), calculate the total content of $C_{10}H_{13}N_5O_4$ in the tablets from the chromatograms obtained using the declared content of $C_{10}H_{13}N_5O_4$ in *zidovudine BPCRS*.

Using solutions (1) and (4) calculate the total content $C_8H_{11}N_3O_3S$ in the tablets from the chromatograms obtained using the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities, A, B, C, E, F, G, H and J listed under Lamivudine, impurities B, C, E and G listed under Zidovudine and the following:

1. 1-[(2*R*,4*S*,5*S*)-4-amino-5-(hydroxymethyl)oxolan-2-yl]-5-methylpyrimidin-2,4(1*H*,3*H*)-dione.

Acamprosate Gastro-resistant Tablets

Gastro-resistant Acamprosate Tablets

Action and use

Treatment of alcoholism.

DEFINITION

Acamprosate Gastro-resistant Tablets contain Acamprosate Calcium. They are covered with a gastro-resistant coating or prepared from granules or particles covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of acamprosate calcium, $C_{10}H_{20}CaN_2O_8S_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

B. The powdered tablets yield reaction A characteristic of *calcium salts*, Appendix VI.

TESTS

Dissolution

Carry out the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

First stage

(a) Use Apparatus 1, rotating the basket at 180 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 2 hours, withdraw a 20-mL sample of the medium, filter through a 0.45-µm filter and dilute, if necessary, to produce a solution expected to contain 0.037% w/v of Acamprosate Calcium.

(2) 0.00185% w/v of *acamprosate calcium BPCRS* in 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Synergi Hydro RP is suitable).

(b) Use isocratic elution using the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

To 850 mL of a solution containing 140.5 mg of *sodium perchlorate* and 170.95 mg of *tetrabutylammonium perchlorate* add 100 mL of *methanol R2* and dilute to 1000 mL with *water.*

DETERMINATION OF CONTENT

Calculate the total content of $C_{10}H_{20}CaN_2O_8S_2$ in the medium using the declared content of $C_{10}H_{20}CaN_2O_8S_2$ in *acamprosate calcium BPCRS.*

LIMITS

The amount of Acamprosate Calcium released is not more than 5% of the stated amount.

Final stage

Buffer pH 6.8 Add 150 mL of 2M *sodium hydroxide* in sufficient 0.1M *citric acid* to produce 1000 mL, adjust the pH to 6.8, if necessary, with 0.5M *citric acid.*

(a) Use Apparatus 1, rotating the basket at 180 revolutions per minute.

(b) Replace the 0.1M *hydrochloric acid* in the vessel with 900 mL of buffer pH 6.8, previously held and maintained at 37°.

PROCEDURE

(1) After 2 hours, withdraw a 20-mL sample of the medium, filter through a 0.45-µm filter and dilute, if necessary, to produce a solution expected to contain 0.037% w/v of Acamprosate Calcium.

(2) 0.037% w/v of *acamprosate calcium BPCRS* in buffer pH 6.8.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the first stage may be used.

DETERMINATION OF CONTENT

Calculate the total content of $C_{10}H_{20}CaN_2O_8S_2$ in the medium using the declared content of $C_{10}H_{20}CaN_2O_8S_2$ in *acamprosate calcium BPCRS.*

LIMITS

The amount of Acamprosate Calcium released is not less than 75% (Q) of the stated amount.

Impurity A (homotaurine)

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Remove the tablet coating from 5 tablets by stirring with three 50-mL quantities of *acetone.* Allow the cores to dry at room temperature. Stir a quantity of the powdered tablets containing 333 mg of Acamprosate Calcium with 50 mL of *borate buffer solution pH 10.4* for 10 minutes and filter through a 0.45-µm filter. Dilute 3 mL of this solution to 20 mL with *borate buffer solution pH 10.4.* Place 3.0 mL of the solution obtained in a 25-mL ground-glass-stoppered tube. Add 0.15 mL of a freshly prepared 0.5% w/v solution of *fluorescamine* in *acetonitrile.* Shake immediately and vigorously for 30 seconds. Place in a water-bath at 50° for 30 min. Cool under a stream of cold water. Filter the supernatant liquid through a suitable filter.

(2) Dissolve 10 mg of *acamprosate impurity A EPCRS* in *borate buffer solution pH 10.4* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL *with borate buffer solution pH 10.4.* Treat 3.0 mL of this solution in the same way as solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) with a stainless steel pre-column (7.5 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 261 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 6 times the retention time of impurity A.

MOBILE PHASE

10 volumes of *acetonitrile,* 10 mL of *methanol* and 80 volumes of *0.1M phosphate buffer solution pH 6.5.*

When the chromatograms are recorded under the prescribed conditions the retention time of fluorescamine is about 4 minutes and impurity A is about 8 minutes. Acamprosate is not detected.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Weigh and powder 20 tablets. Shake, with the aid of ultrasound, a quantity of the powdered tablets containing 333 mg of Acamprosate Calcium with 150 mL of mobile phase, dilute to 200 mL and filter through a 0.45-µm filter. Dilute 1 volume of the resulting solution to 5 volumes.

(2) 0.033% w/v of *acamprosate calcium BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) with a stainless steel pre-column (7.5 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

To 850 mL of a solution containing 140.5 mg of *sodium perchlorate* and 342 mg of *tetrabutylammonium perchlorate* add 100 mL of *methanol R2* and dilute to 1000 mL with *water.*

SYSTEM SUITABILITY

Inject solution (2) five times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 2.0%.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{20}CaN_2O_8S_2$ in the tablets from the chromatogram obtained and using the declared content of $C_{10}H_{20}CaN_2O_8S_2$ in *acamprosate calcium BPCRS*.

Acebutolol Capsules

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Acebutolol Capsules contain Acebutolol Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of acebutolol, $C_{18}H_{28}N_2O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum* of a 0.7% w/w dispersion of the contents of the capsules in *potassium chloride*, Appendix II A, is concordant with the *reference spectrum* of Acebutolol hydrochloride *(RS 380)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add to a quantity of the contents of the capsules containing the equivalent of 0.4 g of Acebutolol 20 mL of a mixture of equal volumes of *chloroform* and *methanol*, shake for 2 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 3 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *chloroform* and *methanol* and further dilute 1 volume of this solution to 10 volumes with the same mixture of solvents.

(3) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *chloroform* and *methanol* and further dilute 1 volume of this solution to 10 volumes with the same mixture of solvents.

CHROMATOGRAPHIC CONDITIONS

(a) Use a precoated silica gel F_{254} plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *dimethylformamide* and 60 volumes of *chloroform*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

Disregard any spot remaining on the line of application.

ASSAY

To a quantity of the mixed contents of 20 capsules containing the equivalent of 0.15 g of Acebutolol add 150 mL of *water*, shake for 10 minutes, add sufficient *water* to produce 250 mL, centrifuge and dilute 10 mL of the supernatant liquid to 100 mL with *water*. To 10 mL of this solution add 10 mL of 0.1M *hydrochloric acid* and sufficient *water* to produce 100 mL. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 233 nm and calculate the content of $C_{18}H_{28}N_2O_4$ in the capsules taking 643 as the value of A(1%, 1 cm) at the maximum at 233 nm.

STORAGE

Acebutolol Capsules should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of acebutolol.

Acebutolol Tablets

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Acebutolol Tablets contain Acebutolol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of acebutolol, $C_{18}H_{28}N_2O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum* of a 0.7% w/w dispersion of the powdered tablets in *potassium bromide*, Appendix II A, is concordant with the *reference spectrum* of acebutolol hydrochloride *(RS 380)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a solvent mixture of equal volumes of *chloroform* and *methanol*.

(1) A quantity of the powdered tablets containing the equivalent of 0.4 g of Acebutolol in 20 mL of the solvent mixture, shaken for 2 minutes and centrifuged. Use the supernatant liquid.

(2) Dilute 3 volumes of solution (1) to 100 volumes with the solvent mixture. Further dilute 1 volume of the resulting solution to 10 volumes with the solvent mixture.

(3) Dilute 1 volume of solution (1) to 100 volumes with the solvent mixture. Further dilute 1 volume of the resulting solution to 10 volumes with the solvent mixture.

CHROMATOGRAPHIC CONDITIONS

(a) Use a precoated *silica gel F_{254}* plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *dimethylformamide* and 60 volumes of *chloroform*.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

Disregard any spot remaining on the line of application.

ASSAY

Shake a number of whole tablets containing the equivalent of 4 g of Acebutolol with 250 mL of *water* until completely disintegrated, add sufficient *water* to produce 1000 mL, filter and dilute 10 mL of the filtrate to 250 mL with *water*. To 10 mL of this solution add 20 mL of 0.1M *hydrochloric acid* and sufficient *water* to produce 200 mL. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 233 nm and calculate the content of $C_{18}H_{28}N_2O_4$ in the tablets taking 643 as the value of A(1%, 1 cm) at the maximum at 233 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of Acebutolol.

Acenocoumarol Tablets

Action and use

Vitamin K epoxide reductase inhibitor; oral anticoagulant.

DEFINITION

Acenocoumarol Tablets contain Acenocoumarol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of acenocoumarol, $C_{19}H_{15}NO_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Heat a quantity of the powdered tablets containing 50 mg of Acenocoumarol with 30 mL of *acetone* under a reflux condenser for 5 minutes, filter and wash the residue with two 10 mL quantities of *acetone*. Evaporate the combined filtrate and washings to 5 mL, add *water* drop wise until the solution becomes turbid, heat on a water bath until the solution is clear and allow to stand. Filter, wash the crystals with a mixture of equal volumes of *acetone* and *water* and dry at 100° at a pressure of 2 kPa for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of acenocoumarol *(RS 001)*.

B. The *light absorption*, Appendix II B, of the final solution obtained in the Assay exhibits maxima at 283 nm and 306 nm.

C. Heat 25 mg of the residue obtained in test A with 2.5 mL of *glacial acetic acid*, 0.5 mL of *hydrochloric acid* and 0.2 g of *zinc powder* on a water bath for 5 minutes, cool and filter. To the filtrate add 0.05 mL of *sodium nitrite solution* and add the mixture to 10 mL of a 1% w/v solution of *2-naphthol* containing 3 mL of 5M *sodium hydroxide*. A bright red precipitate is produced.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Acenocoumarol with 5 mL of *acetone*, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 200 volumes with *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and immediately examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 50 volumes of *chloroform* and 50 volumes of *cyclohexane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Acenocoumarol comply with the requirements stated under Tablets using the following method of analysis. Finely crush one tablet, add 30 mL of *methanol*, stir the mixture for 30 minutes and filter through sintered glass, washing the residue with three 15 mL quantities of *methanol*. To the combined filtrate and washings add 10 mL of 1M *hydrochloric acid* and sufficient *methanol* to produce 100 mL. If necessary dilute further with a solvent prepared by diluting 1 volume of 1M *hydrochloric acid* to 10 volumes with *methanol* to produce a solution containing about 0.001% w/v of Acenocoumarol. Measure the *absorbance* of the resulting solution at the maximum at 306 nm, Appendix II B. Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the value of A(1%, 1 cm) at the maximum at 306 nm.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 1 mg of Acenocoumarol add 30 mL of *methanol*, stir the mixture for 30 minutes and filter through sintered glass, washing the residue with three 15 mL quantities of *methanol*. To the combined filtrate and washings add 10 mL of 1M *hydrochloric acid* and sufficient *methanol* to produce 100 mL and measure the *absorbance* of the resulting solution at the maximum at 306 nm, Appendix II B. Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the value of A(1%, 1 cm) at the maximum at 306 nm.

Acetazolamide Oral Suspension

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Carbonic anhydrase inhibitor; diuretic; treatment of glaucoma and ocular hypertension; treatment of mountain sickness.

DEFINITION

Acetazolamide Oral Suspension is a suspension containing Acetazolamide in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

www.webofpharma.com

Content of acetazolamide, $C_4H_6N_4O_3S_2$
95.0 to 105.0% of the stated amount.

Shake the oral suspension vigorously before carrying out the following tests.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. To a quantity of the oral suspension containing 25 mg of Acetazolamide add 5 mL of *water*, 0.15 mL of 1M *sodium hydroxide* and 0.1 mL of *weak copper sulfate solution*. A greenish blue colour or precipitate is produced.

TESTS

Acidity
pH, 4.0 to 5.0, Appendix V L.

Dissolution
Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions, using 900 mL of 0.01M *hydrochloric acid* as the dissolution medium and rotating the paddle at 50 revolutions per minute. Use a volume of the oral suspension containing one dose.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the oral suspension containing 50 mg of Acetazolamide for 20 minutes with 10 mL of a mixture of equal volumes of *ethanol (96%)* and *ethyl acetate* and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *ethanol (96%)* and *ethyl acetate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below. Use the tank without lining the walls and allow to saturate for 1 hour before development.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

A freshly prepared mixture of 20 volumes of 13.5M *ammonia*, 30 volumes of *ethyl acetate* and 50 volumes of *propan-2-ol*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a weighed quantity of the oral suspension containing 0.25 g of Acetazolamide add 50 mL of *methanol* and mix with the aid of ultrasound for 5 minutes. Add sufficient 0.01M *sodium hydroxide* to produce 200 mL and mix with the aid of shaking for 15 minutes; dilute 10 mL of the resulting solution to 100 mL with *water* and filter through a 0.45-µm filter.

(2) To 0.25 g of *acetazolamide BPCRS* add 50 mL of *methanol* and mix with the aid of ultrasound for 5 minutes. Add sufficient 0.01M *sodium hydroxide* to produce 200 mL and mix with the aid of shaking for 15 minutes; dilute 10 mL of the resulting solution to 100 mL with *water* and filter through a 0.45-µm filter.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *aminopropylsilyl silica gel for chromatography* (2.7 µm) (Ascentis Express RP-Amide is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of a 0.0631% w/v solution of *ammonium formate*, adjusted to pH 3.5 with *formic acid*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_4H_6N_4O_3S_2$, weight in volume, using the declared content of $C_4H_6N_4O_3S_2$ in *acetazolamide BPCRS*.

STORAGE

Acetazolamide Oral Suspension should be protected from light.

Acetazolamide Tablets

Action and use
Carbonic anhydrase inhibitor; diuretic; treatment of glaucoma, ocular hypertension, mountain sickness.

DEFINITION

Acetazolamide Tablets contain Acetazolamide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of acetazolamide, $C_4H_6N_4O_3S_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.5 g of Acetazolamide with 2 mL of 1M *sodium hydroxide* and filter. Neutralise the filtrate with *glacial acetic acid*, filter and dry the resulting precipitate at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of acetazolamide *(RS 002)*.

B. Triturate a quantity of the powdered tablets containing 0.5 g of Acetazolamide with a mixture of 5 mL of *water* and 1 mL of 1M *sodium hydroxide*, transfer to a test tube, add 0.2 g of *zinc powder* and 0.5 mL of *hydrochloric acid* and immediately place a piece of *lead acetate paper* over the mouth of the tube. The paper exhibits a brownish black colour.

C. To a quantity of the powdered tablets containing 25 mg of Acetazolamide add 5 mL of *water*, 0.15 mL of 1M *sodium hydroxide* and 0.1 mL of *weak copper sulfate solution*. A greenish blue colour or precipitate is produced.

TESTS

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Acetazolamide for 20 minutes with 10 mL of a

www.webofpharma.com

mixture of equal volumes of *ethanol (96%)* and *ethyl acetate* and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the same solvent mixture as for solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use a mobile phase freshly prepared as described below. Use the tank without lining the walls and allow to saturate for 1 hour before development.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of 13.5M *ammonia*, 30 volumes of *ethyl acetate* and 50 volumes of *propan-2-ol*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.4 g of Acetazolamide add 90 mL of *dimethylformamide* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using 0.1M *tetrabutylammonium hydroxide VS* as titrant and determining the end point potentiometrically. Each mL of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 22.22 mg of $C_4H_6N_4O_3S_2$.

Acetylcysteine Eye Drops

Action and use

Sulfydryl donor; mucolytic; treatment of dry eye syndrome.

DEFINITION

Acetylcysteine Eye Drops are a sterile solution of Acetylcysteine in Purified Water containing Sodium Hydroxide.

The eye drops comply with the requirements stated under Eye Preparations, and with the following requirements.

Content of acetylcysteine, $C_5H_9NO_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a volume containing 0.8 g of Acetylcysteine add *3M hydrochloric acid* until the pH of the solution is 2.0. Add, while stirring continuously, two 200-mg portions of finely powdered *sodium chloride* followed, if necessary, by further 25-mg portions of *sodium chloride* until a precipitate begins to appear. Allow to stand for 15 minutes, filter and dry the residue at 70° at a pressure not exceeding 0.7 kPa for 2 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of acetylcysteine *(RS 003)*. Examine as discs prepared using *potassium bromide*.

TESTS

Acidity

pH, 5.5 to 6.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. With the exception of solution (3), the solutions should be prepared immediately before use.

(1) Dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing 0.2% w/v of Acetylcysteine.

(2) 0.2% w/v of *acetylcysteine BPCRS* in the mobile phase.

(3) 0.2% w/v of *acetylcysteine BPCRS* in the mobile phase, stored at room temperature for at least 2 hours before use.

(4) Dissolve 20 mg of L-*cysteine* and 20 mg of L-*cystine* in 10 mL of 1M *hydrochloric acid*, add 40 mg of *acetylcysteine BPCRS* and immediately dilute to 100 mL with the mobile phase. Dilute 10 mL of the resulting solution to 200 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

(g) Inject solutions (2) and (3) and allow the chromatography to proceed for three times the retention time of acetylcysteine.

When recorded under the prescribed conditions, the chromatogram obtained with solution (4) shows three peaks with retention times of about 3.6 minutes (cystine), about 4 minutes (cysteine) and about 6 minutes (acetylcysteine).

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of a 0.5% w/v solution of *ammonium sulfate* containing 0.02M *sodium pentanesulfonate*, the solution being adjusted to pH 2.0 using 2M *hydrochloric acid*.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the height of the trough separating the peaks corresponding to cysteine and cystine is less than one quarter of the height of the peak corresponding to cysteine;

in the chromatogram obtained with solution (3) a peak corresponding to *N,N'*-diacetyl-L-cystine appears which has a retention time of about 13 minutes. The area of this peak is greater than the area of any corresponding peak in the chromatogram obtained with solution (2).

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to *N,N'*-diacetyl-L-cystine is not greater than the area of the peak corresponding to acetylcysteine in the chromatogram obtained with solution (4) (1%);

the area of any peak corresponding to cysteine or cystine is not greater than the area of the corresponding peak in the chromatogram obtained with solution (4) (0.5%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the peak corresponding to acetylcysteine in the chromatogram obtained with solution (4) (1%).

www.webofpharma.com

Disregard any peak with an area less than 0.05 times that of the peak corresponding to acetylcysteine in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use.

(1) Dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing 0.2% w/v of Acetylcysteine.

(2) 0.2% w/v of *acetylcysteine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_5H_9NO_3S$ in the eye drops using the declared content of $C_5H_9NO_3S$ in *acetylcysteine BPCRS*.

STORAGE

Acetylcysteine Eye Drops should be protected from light and stored at a temperature of 2° to 8°.

IMPURITIES

The impurities limited by the requirements of this monograph include; L-cysteine, L-cystine and *N,N'*-diacetyl-L-cystine which correspond to impurities A, B and C of the European Pharmacopoeia monograph respectively.

Acetylcysteine Injection

Action and use

Sulfydryl donor; antidote to paracetamol poisoning; mucolytic.

DEFINITION

Acetylcysteine Injection is a sterile solution in Water for Injections of acetylcysteine sodium, prepared by the interaction of Acetylcysteine with Sodium Hydroxide.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of acetylcysteine, $C_5H_9NO_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a volume containing the equivalent of 0.8 g of acetylcysteine add *3M hydrochloric acid* until the pH of the solution is 2. Add, while stirring continuously, two 200 mg portions of finely powdered *sodium chloride* followed, if necessary, by further 25mg portions of *sodium chloride* until a precipitate begins to appear. Allow to stand for 15 minutes, filter and dry the residue at 70° at a pressure not exceeding 0.7 kPa for 2 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of acetylcysteine *(RS 003)*. Examine as discs prepared using *potassium bromide*.

TESTS

Acidity or alkalinity

pH, 6.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. With the exception of solution (3), the solutions should be prepared immediately before use.

(1) Dilute the injection with the mobile phase to produce a solution containing the equivalent of 0.2% w/v of Acetylcysteine.

(2) 0.2% w/v solution of N-*acetyl*-L-*cysteine* in the mobile phase.

(3) 0.2% w/v solution of N-*acetyl*-L-*cysteine* in the mobile phase and store at room temperature for at least 2 hours before use.

(4) Dissolve 20 mg of L-*cysteine* and 20 mg of L-*cystine* in 10 mL of 1M *hydrochloric acid*, add 40 mg of N-*acetyl*-L-*cysteine* and immediately dilute to 100 mL with the mobile phase. Dilute 10 mL of the resulting solution to 200 mL with the mobile phase.

(5) Dilute 1 volume of solution (4) to 10 volumes with mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for three times the retention time of acetylcysteine.

The retention times of cystine, cysteine and acetylcysteine are about 3.6 minutes, 4 minutes and 6 minutes respectively.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of a 0.5% w/v solution of *ammonium sulfate* containing 0.02M *sodium pentanesulfonate*, the mixture being adjusted to pH 2.0 using 2M *hydrochloric acid*.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the height of the trough separating the peaks due to cysteine and cystine is less than one quarter of the height of the peak due to cysteine;

in the chromatogram obtained with solution (3), a peak due to *N,N'*-diacetylcystine appears which has a retention time of about 13 minutes. The area of this peak is greater than the area of any corresponding peak in the chromatogram obtained with solution (2).

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to *N,N'*-diacetylcystine is not greater than the area of the peak due to acetylcysteine in the chromatogram obtained with solution (4) (1%);

the area of any peak due to cysteine or cystine is not greater than the corresponding peak in the chromatogram obtained with solution (4) (0.5%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the peak due to acetylcysteine in the chromatogram obtained with solution (4) (1%).

Disregard any peak with an area less than the area of the peak due to acetylcysteine in the chromatogram obtained with solution (5) (0.1%).

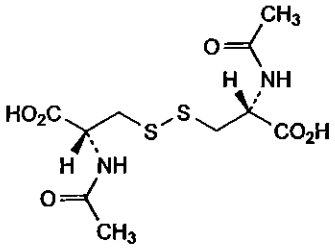
www.webofpharma.com

Hydrogen sulfide
Place a quantity of the injection containing the equivalent of 0.4 g of Acetylcysteine in a round-bottomed, three-necked flask containing 40 mL of *water*. The flask is fitted with a gas inlet tube which reaches nearly to the bottom of the flask, a dropping funnel containing *hydrochloric acid* and an outlet tube leading to a 100 mL graduated flask containing a mixture of 1 mL of 5M *sodium hydroxide* and 50 mL of *water*. Pass through the flask a steady current of nitrogen and add 10 mL of *hydrochloric acid* from the dropping funnel. Maintain the current of nitrogen for 30 minutes and then disconnect the absorption flask. Add to the flask 10 mL of a solution prepared by dissolving 0.1 g of N,N-*dimethyl*-p-*phenylenediamine dihydrochloride* in a mixture of 45 mL of *hydrochloric acid* and 55 mL of *water* decolourised with *activated charcoal* before use, if necessary, and 5 mL of a 5% w/v solution of *iron(III) chloride hexahydrate* in 1M *hydrochloric acid* and allow to stand for 20 minutes protected from light. Add sufficient *water* to produce 100 mL and measure the *absorbance* of the solution, Appendix II B, at 665 nm using a 4 cm pathlength and using in the reference cell a solution prepared in the same manner but without the injection being examined.

Prepare a 0.4% w/v solution of *sodium sulfide*. Standardise this solution in the following manner. To 25 mL of *0.05M iodine VS* add 8 mL of *hydrochloric acid* and 25 mL of the sodium sulfide solution. Titrate with 0.1M *sodium thiosulfate solution VS* using *starch solution*, added towards the end point, as indicator. Repeat the operation without the sodium sulfide solution. The concentration of the sodium sulfide solution expressed in parts per million of hydrogen sulfide is the difference between the titrations multiplied by 68.16. Prepare a solution containing the equivalent of 20 ppm of hydrogen sulfide by appropriate dilution of the sodium sulfide solution with *water*.

Repeat the procedure carried out on the injection using 2 mL of the 20ppm hydrogen sulfide solution in place of the injection being examined. The *absorbance* of the solution obtained from the injection is not greater than the absorbance of the solution obtained from the standard (100 ppm with reference to the content of acetylcysteine).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. If necessary, dilute the injection with *water BET* to give a solution containing 10 mg per mL (solution A).
The endotoxin limit concentration of solution A is not more than 0.3 IU per mL.



ASSAY
Add 20 mL of *glacial acetic acid* to a volume containing the equivalent of 0.4 g of Acetylcysteine and titrate with *0.05M iodine VS* until a permanent pale yellow colour is obtained. Each mL of *0.05M iodine VS* is equivalent to 16.23 mg of $C_5H_9NO_3S$.

STORAGE
Acetylcysteine Injection should be protected from light.

LABELLING
The strength is stated in terms of the equivalent amount of Acetylcysteine in a suitable dose-volume.

IMPURITIES
The impurities limited by the requirements of this monograph include:

1. L-cystine,
2. L-cysteine,

3. *N,N'*-diacetyl-l-cystine.

Aciclovir Cream

Action and use
Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION
Aciclovir Cream contains Aciclovir in a suitable basis.
The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the well-mixed cream containing about 7.5 mg of Aciclovir with 50 mL of 0.5M *sulfuric acid*. Shake well with 50 mL of *ethyl acetate*, allow to separate and collect the clear lower aqueous layer. Wash the organic layer with 20 mL of 0.5M *sulfuric acid* and dilute the combined washings and the aqueous layer to 100 mL with 0.5M *sulfuric acid*. Mix well and filter (Whatman GF/F is suitable). Discard the first few mL of the filtrate and to 10 mL of the filtrate add sufficient *water* to produce 50 mL. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak due to aciclovir in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.
Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) Mix with the aid of ultrasound a quantity of the well-mixed cream containing 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide*, dilute to 25 mL with solution A and filter through a 0.2-µm nylon filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water*.

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Phosphate buffer solution pH 3.1 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 3.1 with *orthophosphoric acid.*

Phosphate buffer solution pH 2.5 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 2.5 with *orthophosphoric acid.*

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of phosphate buffer solution pH 3.1.

Mobile phase B 50 volumes of *acetonitrile* and 50 volumes of phosphate buffer solution pH 2.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	100	0	isocratic
5-27	100→80	0→20	linear gradient
27-40	80	20	isocratic
40-46	80→100	20→0	linear gradient

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity K and impurity G is at least 1.5.

LIMITS

Identify any peak in solution (1) corresponding to impurity C using the chromatogram obtained with solution (4) and multiply the area of this peak by a correction factor of 2.2.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water.*

(1) Mix with the aid of ultrasound a quantity of the well-mixed cream containing 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide,* dilute to 25 mL with solution A and filter through a 0.2-µm nylon filter. Further dilute 1 volume to 10 volumes with solution A.

(2) Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide.* Dilute 2 volumes to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(3) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water.* Prepare the solution immediately before use.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity C and aciclovir is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_5O_3$ in the cream using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

Aciclovir Eye Ointment

Action and use

Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Aciclovir Eye Ointment is a sterile preparation containing Aciclovir in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the eye ointment containing 10 mg of Aciclovir in 60 mL of *hexane.* Extract with three 30-mL quantities of 0.1M *sodium hydroxide,* add sufficient 0.1M *sodium hydroxide* to produce 100 mL and filter. To 15 mL of this solution add 5 mL of 2M *hydrochloric acid* and sufficient *water* to produce 100 mL. The *light absorption,* Appendix II B, in the range 230 to 350 nm exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak due to aciclovir in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water.*

(1) Disperse a quantity of the eye ointment containing 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide* dilute to 25 mL with solution A and filter through a 0.2-µm nylon filter.

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water*.

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

CHROMATOGRAPHIC CONDITIONS

(1) Disperse a quantity of the eye ointment containing 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide* dilute to 25 mL with solution A and filter through a 0.2-µm nylon filter. Further dilute 1 volume to 10 volumes with solution A.

(2) Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide*. Dilute 2 volumes to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(3) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity C and aciclovir is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_5O_3$ in the eye ointment using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

Aciclovir Infusion

Aciclovir Intravenous Infusion

Action and use

Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Aciclovir Infusion is a sterile solution containing aciclovir sodium. It is prepared by dissolving Aciclovir Sodium for Infusion with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

TESTS

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration of the infusion, diluted, if necessary, with *water BET* to give a solution containing the equivalent of 25 mg of Aciclovir per mL is 4.37 IU per mL.

STORAGE

Aciclovir Infusion should be used within the period recommended by the manufacturer when prepared and

www.webofpharma.com

stored strictly in accordance with the manufacturer's instructions.

LABELLING

The strength is stated in terms of the equivalent amount of Aciclovir in a suitable dose-volume.

ACICLOVIR SODIUM FOR INFUSION

DEFINITION

Aciclovir Sodium for Infusion is a sterile material prepared from Aciclovir with the aid of a suitable alkali. It may contain excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve the total contents of 10 containers in sufficient 0.1M *hydrochloric acid* to produce 500 mL. Dilute 3 mL of the resulting solution to 100 mL with 0.1M *hydrochloric acid* and dilute 5 mL of the resulting solution with the same solvent to produce a solution containing the equivalent of 0.0015% w/v of Aciclovir. The *light absorption*, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Assay, the retention time of the principal peak in chromatogram obtained with solution (1) is similar to that of the principal peak due to aciclovir in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Alkalinity

Dissolve the contents of a sealed container in sufficient *water for injections* to produce a solution containing the equivalent of 2.5% w/v of Aciclovir (solution A). The pH of solution A is 10.7 to 11.7, Appendix V L.

Clarity and colour of solution

Solution A is not more opalescent than *reference suspension II*, Appendix IV A, and not more intensely coloured than *reference solution* Y_6, Appendix IV B, Method II.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) Dissolve the contents of a sealed container in sufficient *dimethyl sulfoxide* to produce a solution containing the equivalent of 2.5% w/v of Aciclovir. Dilute 1 volume of the resulting solution to 25 volumes with solution A.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water*.

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Phosphate buffer solution pH 3.1 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 3.1 with *orthophosphoric acid*.

Phosphate buffer solution pH 2.5 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 2.5 with *orthophosphoric acid*.

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of phosphate buffer solution pH 3.1.

Mobile phase B 50 volumes of *acetonitrile* and 50 volumes of phosphate buffer solution pH 2.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	100	0	isocratic
5-27	100→80	0→20	linear gradient
27-40	80	20	isocratic
40-46	80→100	20→0	linear gradient

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity K and impurity G is at least 1.5.

LIMITS

Identify any peak in solution (1) corresponding to impurity C using the chromatogram obtained with solution (4) and multiply the area of this peak by a correction factor of 2.2.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B (guanine) is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) Shake a quantity of the powder containing the equivalent of 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide*. Dilute 2 volumes of the filtrate to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(2) Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide*. Dilute 2 volumes to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(3) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_5O_3$ in the powder using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

LABELLING

The label of the sealed container states the quantity of aciclovir sodium in terms of the equivalent amount of Aciclovir.

Aciclovir Oral Suspension

Action and use

Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Aciclovir Oral Suspension is a suspension of Aciclovir in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 250 nm of the solution prepared in the Assay before the final dilution exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Related substances test, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak due to aciclovir in the chromatogram obtained with a solution prepared as follows. Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide* and dilute 2 volumes of the resulting solution to 5 volumes with the solvent mixture used in the Related substances test.

TESTS

Acidity

pH, 4.0 to 7.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) To a quantity of the oral suspension containing 0.5 g of Aciclovir add 20 mL of *dimethyl sulfoxide*, shake to disperse and add sufficient solvent mixture to produce 100 mL and filter through a 0.2-µm nylon filter. Dilute 1 volume of the filtrate to 5 volumes with solution A.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water*.

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Phosphate buffer solution pH 3.1 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 3.1 with *orthophosphoric acid*.

Phosphate buffer solution pH 2.5 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 2.5 with *orthophosphoric acid*.

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of phosphate buffer solution pH 3.1.

Mobile phase B 50 volumes of *acetonitrile* and 50 volumes of phosphate buffer solution pH 2.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	100	0	isocratic
5-27	100→80	0→20	linear gradient
27-40	80	20	isocratic
40-46	80→100	20→0	linear gradient

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity K and impurity G is at least 1.5.

www.webofpharma.com

LIMITS

Identify any peak in solution (1) corresponding to impurity C using the chromatogram obtained with solution (4) and multiply the area of this peak by a correction factor of 2.2.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

To a weighed quantity containing 0.4 g of Aciclovir add 400 mL of *water* and 25 mL of 1M *sulfuric acid*, shake well, disperse with the aid of ultrasound for 10 minutes and add sufficient *water* to produce 500 mL. Filter the resulting solution, discard the first few mL of filtrate and dilute 5 mL of the filtrate to 200 mL with 0.05M *sulfuric acid*. Add 10 mL of the resulting solution to 5 mL of a 0.01% w/v solution of *cetrimide* in 0.05M *sulfuric acid*, add sufficient 0.05M *sulfuric acid* to produce 100 mL and measure the *fluorescence*, Appendix II E, using an excitation wavelength of 308 nm and an emission wavelength of 415 nm. Set the instrument to zero using a 0.0005% w/v solution of *cetrimide* in 0.05M *sulfuric acid*. Calculate the content of $C_8H_{11}N_5O_3$ in the oral suspension from the *fluorescence* obtained by carrying out the operation at the same time using a mixture prepared by adding 10 mL of a 0.002% w/v solution of *aciclovir BPCRS* in 0.05M *sulfuric acid* and beginning at the words '... to 5 mL of a 0.01% w/v solution of *cetrimide* ...'. Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_8H_{11}N_5O_3$, weight in volume, using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

Aciclovir Tablets

Action and use

Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Aciclovir Tablets contain Aciclovir.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 0.1 g of Aciclovir add 60 mL of 0.1M *sodium hydroxide* and disperse with the aid of ultrasound for 15 minutes. Add a sufficient quantity of 0.1M *sodium hydroxide* to produce 100 mL, mix well and filter. To 15 mL of the filtrate add 50 mL of *water* and 5.8 mL of 2M *hydrochloric acid* and sufficient *water* to produce 100 mL. To 5 mL of the solution add sufficient 0.1M *hydrochloric acid* to produce 50 mL and mix well. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak due to aciclovir in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes, withdraw a 25 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 255 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of aciclovir, $C_8H_{11}N_5O_3$, in the medium from the absorbance obtained and taking 560 as the value of A(1%, 1 cm) at the maximum at 255 nm.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) Shake a quantity of the powdered tablets containing 25 mg of Aciclovir with 10 mL of *dimethyl sulfoxide* for 15 minutes and filter. Dilute 2 volumes of the filtrate to 5 volumes with solution A.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water*.

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

www.webofpharma.com

MOBILE PHASE

Phosphate buffer solution pH 3.1 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 3.1 with *orthophosphoric acid.*

Phosphate buffer solution pH 2.5 Dissolve 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water* and adjust to pH 2.5 with *orthophosphoric acid.*

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of phosphate buffer solution pH 3.1.

Mobile phase B 50 volumes of *acetonitrile* and 50 volumes of phosphate buffer solution pH 2.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	100	0	isocratic
5-27	100→80	0→20	linear gradient
27-40	80	20	isocratic
40-46	80→100	20→0	linear gradient

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity K and impurity G is at least 1.5.

LIMITS

Identify any peak in solution (1) corresponding to impurity C using the chromatogram obtained with solution (4) and multiply the area of this peak by a correction factor of 2.2.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and finely powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water.*

(1) Shake a quantity of the powdered tablets containing the equivalent of 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide* and filter. Dilute 2 volumes of the filtrate to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(2) Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide*. Dilute 2 volumes to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(3) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_5O_3$ in the tablets using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

Aciclovir Dispersible Tablets

Dispersible Aciclovir Tablets

Action and use

Purine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Aciclovir Dispersible Tablets contain Aciclovir in a suitable dispersible basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aciclovir, $C_8H_{11}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 0.1 g of Aciclovir add 60 mL of 0.1M *sodium hydroxide* and disperse with the aid of ultrasound for 15 minutes. Add sufficient 0.1M *sodium hydroxide* to produce 100 mL, mix well and filter. To 15 mL of the filtrate add 50 mL of *water*, 5.8 mL of 2M *hydrochloric acid* and sufficient *water* to produce 100 mL. To 5 mL of the resulting solution add sufficient 0.1M *hydrochloric acid* to produce 50 mL and mix well. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution exhibits a maximum at 255 nm and a broad shoulder at about 274 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the peak due to aciclovir in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water.*

(1) Shake a quantity of the powdered tablets containing 25 mg of Aciclovir with 10 mL of *dimethyl sulfoxide* for 15 minutes and filter. Dilute 2 volumes of the filtrate to 5 volumes with solution A.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and dilute 1 volume of this solution to 5 volumes with solution A.

(3) Dissolve 5 mg of *aciclovir for system suitability A EPCRS* in 1 mL of *dimethyl sulfoxide* and dilute to 5 mL with *water.*

www.webofpharma.com

(4) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

(5) Dissolve the contents of a vial of *aciclovir for impurity G identification EPCRS* in 1 mL of solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity K and impurity G is at least 1.5.

LIMITS

Identify any peak in solution (1) corresponding to impurity C using the chromatogram obtained with solution (4) and multiply the area of this peak by a correction factor of 2.2.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and finely powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A: 1 volume of *dimethyl sulfoxide* and 4 volumes of *water*.

(1) Shake a quantity of the powdered tablets containing 25 mg of Aciclovir in 10 mL of *dimethyl sulfoxide* and filter. Dilute 2 volumes of the filtrate to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(2) Dissolve 25 mg of *aciclovir BPCRS* in 10 mL of *dimethyl sulfoxide*. Dilute 2 volumes to 5 volumes with solution A and dilute 1 volume of this solution to 10 volumes with solution A.

(3) Dissolve the contents of a vial of *aciclovir for impurity C identification EPCRS* in 200 µL of *dimethyl sulfoxide* and dilute to 1 mL with *water*. Prepare the solution immediately before use.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity C and aciclovir is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_5O_3$ in the tablets using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aciclovir.

Acitretin Capsules

Action and use

Vitamin A analogue (retinoid); treatment of psoriasis; ichthyosis; Darier's disease.

DEFINITION

Acitretin Capsules contain Acitretin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Carry out the following tests avoiding exposure to actinic light and using freshly prepared solutions.

Content of acitretin, $C_{21}H_{26}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the capsule contents containing 25 mg of Acitretin with sufficient *methanol* to produce 250 mL, filter and dilute 1 volume of the filtrate to 20 volumes with *methanol*. The *light absorption* spectra, Appendix II B, in the range 300 nm to 400 nm is concordant with a 0.0005% w/v solution of *acitretin BPCRS* in *methanol*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of a 3% w/v solution of *sodium lauryl sulfate* adjusted to pH 9.5 with 0.01M *hydrochloric acid* or 0.01M *sodium hydroxide*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a sample of the medium, filter through a 10-µm filter and measure the *absorbance* of the filtrate, suitably diluted with sufficient dissolution medium to give a solution expected to contain about 0.0005% w/v of Acitretin, at the maximum at about 348 nm, Appendix II B, using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of acitretin, $C_{21}H_{26}O_3$, in the medium taking 1373 as the value of A(1%, 1 cm) at the maximum at 348 nm.

LIMITS

The amount of Acitretin released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 10 volumes of *tetrahydrofuran* and 13 volumes of *methanol* (solvent A).

(1) Shake a quantity of the capsule contents containing 25 mg of Acitretin with 8 mL of *water* in a water bath at 45° for 10 minutes. Mix with the aid of ultrasound for 15 minutes, add sufficient solvent A to produce 100 mL and mix with the aid of ultrasound for a further 5 minutes. Filter through a 0.45-µm filter (PTFE is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A. Further dilute 4 volumes of this solution to 10 volumes with solvent A.

(3) 0.00025% w/v each of *tretinoin EPCRS* and *acitretin BPCRS* in solvent A.

(4) Dilute 1 volume of solution (2) to 4 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 365 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.5 volume of *glacial acetic acid*, 5 volumes of *absolute ethanol*, 21 volumes of *water* and 74 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to acitretin and tretinoin is at least 3.0;

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of not more than one *secondary peak* is greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 10 volumes of *tetrahydrofuran* and 13 volumes of *methanol* (solvent A).

(1) Shake a quantity of the mixed contents of 20 capsules containing 25 mg of Acitretin with 8 mL of *water* in a water bath at 45° for 10 minutes. Mix with the aid of ultrasound for 15 minutes, add sufficient solvent A to produce 100 mL and mix with the aid of ultrasound for a further 5 minutes. Filter through a 0.45-µm filter (PTFE is suitable) and dilute 5 mL of the filtrate to 25 mL with solvent A.

(2) 0.005% w/v of *acitretin BPCRS* in solvent A.

(3) 0.00025% w/v each of *acitretin BPCRS* and *tretinoin EPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to tretinoin and acitretin is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of acitretin, $C_{21}H_{26}O_3$, in the capsules using the declared content of $C_{21}H_{26}O_3$ in *acitretin BPCRS*.

STORAGE

Acitretin Capsules should be protected from light.

Adapalene Cream

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Adapalene Cream contains Adapalene in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of adapalene, $C_{28}H_{28}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Add 10 mL of *stabiliser-free tetrahydrofuran* to a quantity of cream containing 5 mg of Adapalene and shake to disperse. Add sufficient *methanol* to produce a solution containing 0.025% w/v of Adapalene and filter (a 0.2-µm Dynagard PP filter is suitable).

(2) 0.025% w/v of *adapalene BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *octadecylsilyl silica gel* F_{254} (Merck silica gel 60 RP-18 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

18 volumes of *stabiliser-free tetrahydrofuran* and 82 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent A 2 volumes of *trifluoroacetic acid* and 100 volumes of *water*.

Solvent B 10 volumes of solvent A, 25 volumes of *acetonitrile*, 30 volumes of *propan-2-ol* and 35 volumes of *stabiliser-free tetrahydrofuran*.

(1) To a quantity of the cream containing 1 mg of Adapalene, add 7 mL of *stabiliser-free tetrahydrofuran* and mix with the aid of ultrasound. Add 6 mL of *propan-2-ol*, shake, add 2 mL of solvent A and dilute to 20 mL with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent B.

(3) 0.005% w/v of *adapalene impurity standard BPCRS* in a mixture of equal volumes of *stabiliser-free tetrahydrofuran* and *water*.

(4) Dilute 1 volume of solution (2) to 20 volumes with solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 RP 18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a fluorimetric detector with the following programme.

Time (Minutes)	Excitation wavelength (nm)	Emission wavelength (nm)
0 - 11	260	380
11 - 30	260	347

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.2 volume of *trifluoroacetic acid* and 100 volumes of *water*.

Mobile phase B 40 volumes *stabiliser-free tetrahydrofuran* and 60 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	40→17	60→83	linear gradient
3-30	17	83	isocratic
30-31	17→40	83→60	linear gradient
31-40	40	60	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to adapalene (retention time about 6.5 minutes) are: impurity A, about 0.5 and impurity D, about 3.1.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles the chromatogram provided with *adapalene impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A or impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the impurities is not greater than 1.0%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent C 21 volumes of *water*, 36 volumes of *stabiliser-free tetrahydrofuran* and 43 volumes of *acetonitrile*.

(1) Disperse a quantity of the cream containing 1 mg of Adapalene in 10 mL of *stabiliser-free tetrahydrofuran* and shake with the aid of ultrasound for 5 minutes, dilute to 50 mL with solvent C and filter (a 0.2-µm Dynagard filter is suitable).

(2) Dilute 1 volume of a 0.01% w/v of *adapalene BPCRS* in *stabiliser-free tetrahydrofuran* to 5 volumes with solvent C.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) with a stainless steel pre-column (4 mm × 4 mm) both packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

www.webofpharma.com

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

0.02 volume of *trifluoroacetic acid*, 21 volumes of *water*, 36 volumes of *stabiliser-free tetrahydrofuran* and 43 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to adapalene, is at least 4500 *theoretical plates* per metre.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{28}O_3$ in the cream using the declared content of $C_{28}H_{28}O_3$ in *adapalene BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A and D listed under Adapalene.

Adapalene Gel

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Adapalene Gel contains Adapalene in a suitable basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of adapalene, $C_{28}H_{28}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of gel containing 5 mg of Adapalene, add 10 mL of *stabiliser-free tetrahydrofuran* and shake to disperse. Add *methanol* to produce a solution containing 0.025% w/v of Adapalene and filter (a 0.2-µm Dynagard PP filter is suitable).

(2) 0.025% w/v of *adapalene BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *octadecylsilyl silica gel F_{254}* (Merck silica gel 60 RP-18 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

18 volumes of *stabiliser-free tetrahydrofuran* and 82 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent A 2 volumes of *trifluoroacetic acid* and 100 volumes of *water*.

Solvent B 10 volumes of solvent A, 25 volumes of *acetonitrile*, 30 volumes of *propan-2-ol* and 35 volumes of *stabiliser-free tetrahydrofuran*.

(1) To a quantity of the gel containing 1 mg of Adapalene add 7 mL of *stabiliser-free tetrahydrofuran* and mix with the aid of ultrasound. Add 6 mL of *propan-2-ol*, shake, add 2 mL of solvent A and dilute to 20 mL with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent B.

(3) 0.005% w/v of *adapalene impurity standard BPCRS* in a mixture of equal volumes of *stabiliser-free tetrahydrofuran* and *water*.

(4) Dilute 1 volume of solution (2) to 20 volumes with solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 RP 18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a fluorimetric detector with the following programme.

Time (Minutes)	Excitation wavelength (nm)	Emission wavelength (nm)
0 - 11	260	380
11 - 30	260	347

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.2 volume of *trifluoroacetic acid* and 100 volumes of *water*.

Mobile phase B 40 volumes *stabiliser-free tetrahydrofuran* and 60 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	40→17	60→83	linear gradient
3-30	17	83	isocratic
30-31	17→40	83→60	linear gradient
31-40	40	60	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to adapalene (retention time about 6.5 minutes) are: impurity A, about 0.5 and impurity D, about 3.1.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles the chromatogram provided with *adapalene impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A or impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the impurities is not greater than 1.0%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent C 21 volumes of *water*, 36 volumes of *stabiliser-free tetrahydrofuran* and 43 volumes of *acetonitrile*.

(1) Disperse a quantity of the gel containing 1 mg of Adapalene in 10 mL of *stabiliser-free tetrahydrofuran* and shake with the aid of ultrasound for 5 minutes, dilute to 50 mL with solvent C and filter (a 0.2-µm Dynagard PP filter is suitable).

(2) Dilute 1 volumes of a 0.01% w/v solution of *adapalene BPCRS* in *stabiliser-free tetrahydrofuran* to 5 volumes with solvent C.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) with a stainless steel pre-column (4 mm × 4 mm) both packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

0.02 volume of *trifluoroacetic acid*, 21 volumes of *water*, 36 volumes of *stabiliser-free tetrahydrofuran* and 43 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to adapalene, is at least 4500 *theoretical plates* per metre.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{28}O_3$ in the gel using the declared content of $C_{28}H_{28}O_3$ in *adapalene BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A and D listed under Adapalene.

Adrenaline Eye Drops / Epinephrine Eye Drops

Neutral Adrenaline Eye Drops

Neutral Epinephrine Eye Drops

Action and use

Adrenoceptor agonist; treatment of glaucoma.

DEFINITION

Adrenaline Eye Drops are a sterile solution of Adrenaline in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of adrenaline, $C_9H_{13}NO_3$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

B. Dilute the eye drops to contain 0.1% w/v of Adrenaline and adjust the pH, if necessary, to neutral or slightly acidic. To 1 mL of this solution add, drop wise, a 0.25% w/v solution of *iron (III) chloride hexahydrate* until a green colour is produced. On the gradual addition of *sodium hydrogen carbonate solution*, the solution changes first to blue and then to red.

C. Dilute the eye drops to contain 0.1% w/v of Adrenaline. To 1 mL of this solution add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a brown colour. Remove excess iodine by adding 0.2M *sodium thiosulfate* drop wise; a red colour is produced.

TESTS

Acidity or alkalinity

pH, 5.5 to 7.6, Appendix V L.

Noradrenaline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the eye drops to produce a solution containing 0.10% w/v of Adrenaline.

(2) 0.0018% w/v of *noradrenaline acid tartrate*.

(3) 0.0018% w/v of *noradrenaline acid tartrate* and 0.0018% w/v of *adrenaline acid tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution containing 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* in a mixture of 950 mL of *water* and

www.webofpharma.com

50 mL of *methanol*, the pH of the mixture being adjusted to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to noradrenaline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the eye drops with sufficient mobile phase to produce a solution containing 0.1% w/v of Adrenaline.

(2) 0.2% w/v of *adrenaline acid tartrate BPCRS* in the mobile phase.

(3) 0.2% w/v of *adrenaline acid tartrate BPCRS* and 0.2% w/v of *noradrenaline acid tartrate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution prepared by adding 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* to a mixture of 950 mL of *water* and 50 mL of *methanol*, the pH of the mixture being adjusted to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ in the eye drops using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

STORAGE

Adrenaline Eye Drops should be protected from light.

Adrenaline Injection/Epinephrine Injection

Action and use

Adrenoceptor agonist.

DEFINITION

Adrenaline Injection is a sterile, isotonic solution containing either 0.18% w/v of Adrenaline Acid Tartrate or 0.1% w/v of Adrenaline in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of adrenaline, $C_9H_{13}NO_3$

0.0900 to 0.1150% w/v, of which at least 0.0850% w/v is L-adrenaline.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

B. To 10 mL of the injection add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a brown colour and remove excess iodine by adding 0.1M *sodium thiosulfate* drop wise. A red colour is produced.

TESTS

Acidity

pH, 2.8 to 4.0, Appendix V L.

Related substances

The total of all impurities from methods A and B is not more than 19.0%.

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. Prepare the solutions immediately before use and protect from light. Store and inject the solutions at 4°, using a cooled autosampler.

(1) Dilute the injection to produce a solution containing the equivalent of 0.005% w/v of Adrenaline.

(2) Dilute 3 volumes of solution (1) to 20 volumes.

(3) 0.005% w/v of *(±)-adrenaline hydrochloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *β-cyclodextrin hydroxypropyl ether derivative for chiral chromatography* (3 µm) (ORpak CDBS-453 Chiral is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.7 mL per minute.

(d) Use a column temperature of 10°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of a solution containing 0.2M *potassium chloride* and 0.4% v/v of *glacial acetic acid*, 3 volumes of *acetonitrile* and 96 volumes of 0.2M *potassium chloride*.

When the chromatograms are recorded under the prescribed conditions, the retention time of D-adrenaline (impurity 1) relative to L-adrenaline (retention time about 13 minutes) is about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak corresponding to D-adrenaline (impurity 1) is not greater than the sum of the areas of the peaks due to L-adrenaline and D-adrenaline in the chromatogram obtained with solution (2) (15%).

www.webofpharma.com

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared protected from light.

(1) The preparation being examined.

(2) Dilute 1 volume of solution (1) to 10 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

(4) 0.1% w/v of *adrenaline impurity standard BPCRS* in the mobile phase.

(5) Dilute 1 volume of solution (3) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax Eclipse Plus C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 4 times the retention time of adrenaline.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of a solution containing 0.2mM *disodium edetate*, 5.4mM *sodium heptanesulfonate monohydrate* and 23mM *tetramethylammonium hydrogen sulfate*, adjusted to pH 3.5 with 1M *sodium hydroxide*.

When the chromatograms are recorded under the prescribed conditions the retentions relative to adrenaline (retention time about 18 minutes) are: impurity F, about 0.1; impurity 2, about 0.2; impurity B, about 0.6 and impurity C, about 2.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity F and impurity 2 is at least 10.0.

LIMITS

Identify any peaks corresponding to impurities F, 2 and C in the chromatogram obtained with solution (1), using the chromatogram obtained with solution (4), and multiply the area of these peaks by the following correction factors: impurity F, 1.3; impurity 2, 0.7 and impurity C, 0.3.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity F is not greater than 1.8 times the area of the principal peak in the chromatogram obtained with solution (2) (18%);

the area of any peak corresponding to impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the sum of the areas of any *secondary peaks*, excluding any peak corresponding to impurity F, is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase, prepared protected from light.

(1) Dilute 1 volume of the injection to 10 volumes.

(2) 0.02% w/v of *adrenaline acid tartrate BPCRS*.

(3) 0.02% w/v of *adrenaline acid tartrate BPCRS* and 0.02% w/v of *noradrenaline acid tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *methanol R1* and 95 volumes of a solution containing 0.2mM *disodium edetate*, 5.4mM *sodium heptanesulfonate monohydrate* and 23mM *tetramethylammonium hydrogen sulfate*, adjusted to pH 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

Calculate the L-adrenaline content using the following equation:

$$C_{LA} = C_A \times \left(\frac{PA_{LA}}{PA_A}\right)$$

where:

C_{LA} = content of L-adrenaline in % w/v

C_A = content of $C_9H_{13}NO_3$ in % w/v, determined in the Assay

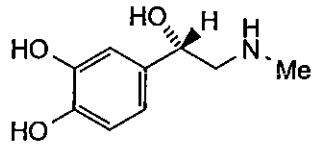
PA_{LA} = the area of the peak corresponding to L-adrenaline in the chromatogram obtained with solution (1) of Related substances test A

PA_A = the sum of the areas of the peaks corresponding to L-adrenaline and D-adrenaline in the chromatogram obtained with solution (1) of Related substances test A

STORAGE

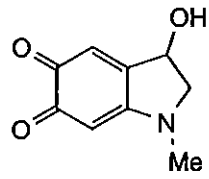
Adrenaline Injection should be protected from light and stored at a temperature not exceeding 25°.

LABELLING



The quantity of active ingredient is stated in terms of the equivalent amount of adrenaline (epinephrine).

Adrenaline Injection contains the equivalent of adrenaline (epinephrine), 1 in 1000 (1 mg in 1 mL).



IMPURITIES

The impurities limited by the requirements of this monograph include impurities B and C listed under Adrenaline Acid Tartrate/Epinephrine Acid Tartrate, impurity F listed under Adrenaline/Epinephrine and:

www.webofpharma.com

1. (1*S*)-1-(3,4-dihydroxyphenyl)-2-(methylamino)ethan-1-ol (D-adrenaline)

2. 3-hydroxy-2,3-dihydro1*H*-indole-5,6-dione (adrenochrome)

Dilute Adrenaline Injection 1 in 10,000/Dilute Epinephrine Injection 1 in 10,000

Action and use
Adrenoceptor agonist.

DEFINITION
Dilute Adrenaline Injection 1 in 10,000 is a sterile, isotonic solution containing either 0.018% w/v of Adrenaline Acid Tartrate or 0.01% w/v of Adrenaline in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of adrenaline, $C_9H_{13}NO_3$
0.00900 to 0.01150% w/v, of which at least 0.00850% w/v is L-adrenaline.

CHARACTERISTICS
A colourless or almost colourless solution.

IDENTIFICATION
A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. To 10 mL of the injection add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a brown colour. Remove excess iodine by adding 0.1M *sodium thiosulfate* drop wise. A red or pink colour is produced.

TESTS
Acidity
pH, 2.8 to 4.0, Appendix V L.

Related substances
The total of all impurities from methods A and B is not more than 19.0%.

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. Prepare the solutions immediately before use and protect from light. Store and inject the solutions at 4°, using a cooled autosampler.

(1) Dilute the injection to produce a solution containing the equivalent of 0.005% w/v of Adrenaline.

(2) Dilute 3 volumes of solution (1) to 20 volumes.

(3) 0.005% w/v of *(±)-adrenaline hydrochloride.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *β-cyclodextrin hydroxypropyl ether derivative for chiral chromatography* (3 µm) (ORpak CDBS-453 Chiral is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.7 mL per minute.

(d) Use a column temperature of 10°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of a solution containing 0.2M *potassium chloride* and 0.4% v/v of *glacial acetic acid*, 3 volumes of *acetonitrile* and 96 volumes of 0.2M *potassium chloride.*

When the chromatograms are recorded under the prescribed conditions, the retention time of D-adrenaline (impurity 1) relative to L-adrenaline (retention time about 13 minutes) is about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks in the chromatogram is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak corresponding to D-adrenaline (impurity 1) is not greater than the sum of the areas of the peaks due to L-adrenaline and D-adrenaline in the chromatogram obtained with solution (2) (15%).

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared protected from light.

(1) The preparation being examined.

(2) Dilute 1 volume of solution (1) to 10 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

(4) 0.01% w/v of *adrenaline impurity standard BPCRS* in the mobile phase.

(5) Dilute 1 volume of solution (3) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax Eclipse Plus C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 4 times the retention time of adrenaline.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of a solution containing 0.2mM *disodium edetate*, 5.4mM *sodium heptanesulfonate monohydrate* and 23mM *tetramethylammonium hydrogen sulfate*, adjusted to pH 3.5 with 1M *sodium hydroxide.*

www.webofpharma.com

When the chromatograms are recorded under the prescribed conditions the retentions relative to adrenaline (retention time about 18 minutes) are: impurity F, about 0.1; impurity 2, about 0.2; impurity B, about 0.6 and impurity C, about 2.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity F and impurity 2 is at least 10.0.

LIMITS

Identify any peaks corresponding to impurities F, 2 and C in the chromatogram obtained with solution (1), using the chromatogram obtained with solution (4), and multiply the area of these peaks by the following correction factors: impurity F, 1.3; impurity 2, 0.7 and impurity C, 0.3.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity F is not greater than 1.8 times the area of the principal peak in the chromatogram obtained with solution (2) (18%);

the area of any peak corresponding to impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the sum of the areas of any *secondary peaks*, excluding any peak corresponding to impurity F, is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase, prepared protected from light.

(1) The preparation being examined.

(2) 0.02% w/v of *adrenaline acid tartrate BPCRS*.

(3) 0.02% w/v of *adrenaline acid tartrate BPCRS* and 0.02% w/v of *noradrenaline acid tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *methanol R1* and 95 volumes of a solution containing 0.2mM *disodium edetate*, 5.4mM *sodium heptanesulfonate monohydrate* and 23mM *tetramethylammonium hydrogen sulfate*, adjusted to pH 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ in the injection using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

Calculate the L-adrenaline content using the following equation:

$$C_{LA} = C_A \times \left(\frac{PA_{LA}}{PA_A}\right)$$

where:

C_{LA} = content of L-adrenaline in % w/v

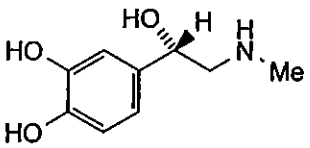
C_A = content of $C_9H_{13}NO_3$ in % w/v, determined in the Assay

PA_{LA} = the area of the peak corresponding to L-adrenaline in the chromatogram obtained with solution (1) of Related substances test A

PA_A = the sum of the areas of the peaks corresponding to L-adrenaline and D-adrenaline in the chromatogram obtained with solution (1) of Related substances test A

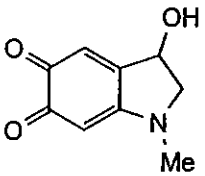
STORAGE

Dilute Adrenaline Injection 1 in 10,000 should be protected from light and stored at a temperature not exceeding 25°.



LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of adrenaline (epinephrine).



Dilute Adrenaline Injection contains the equivalent of adrenaline (epinephrine), 1 in 10,000 (100 µg in 1 mL).

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B and C listed under Adrenaline Acid Tartrate/Epinephrine Acid Tartrate, impurity F listed under Adrenaline/Epinephrine and:

1. (1*S*)-1-(3,4-dihydroxyphenyl)-2-(methylamino)ethan-1-ol (D-adrenaline)

2. 3-hydroxy-2,3-dihydro1*H*-indole-5,6-dione (adrenochrome)

www.webofpharma.com

Adrenaline Solution / Epinephrine Solution

Adrenaline Tartrate Solution

Epinephrine Tartrate Solution

Action and use
Adrenoceptor agonist.

DEFINITION

Adrenaline Solution is an isotonic *cutaneous solution* containing 0.18% w/v of Adrenaline Acid Tartrate with a suitable combination of an antioxidant and an antimicrobial preservative in Purified Water.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements. Where appropriate, the solution also complies with the requirements stated under Unlicensed Medicine.

Content of adrenaline, $C_9H_{13}NO_3$
0.09 to 0.11% w/v.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

B. To 1 mL add a 0.25% w/v solution of *iron (III) chloride hexahydrate* drop wise until a green colour is produced. On the gradual addition of *sodium hydrogen carbonate solution*, the solution changes first to blue and then to red.

C. To 10 mL add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a brown colour. Remove excess iodine by adding 0.1M *sodium thiosulfate* drop wise; a red colour is produced.

TESTS

Acidity
pH, 2.7 to 3.6, Appendix V L.

Noradrenaline
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) The preparation being examined.

(2) 0.0018% w/v of *noradrenaline acid tartrate*.

(3) 0.0018% w/v of *noradrenaline acid tartrate* and 0.0018% w/v of *adrenaline acid tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution containing 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* in a mixture of 950 mL of *water* and 50 mL of *methanol*, the pH of the mixture being adjusted to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to noradrenaline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute 1 volume of the preparation being examined to 10 volumes.

(2) 0.02% w/v of *adrenaline acid tartrate BPCRS*.

(3) 0.02% w/v of *adrenaline acid tartrate BPCRS* and 0.02% w/v of *noradrenaline acid tartrate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Add 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* to a mixture of 50 mL of *methanol* and 950 mL of *water* and adjust the pH of the mixture to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ in the preparation being examined using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

STORAGE

Adrenaline Solution should be kept in a well-filled glass container suitable for parenteral preparations, Appendix XIX B, and should be protected from light.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

The quantity of active ingredient is stated in terms of the equivalent amount of adrenaline (epinephrine).

The label indicates the pharmaceutical form as 'cutaneous solution'.

Adrenaline Solution contains the equivalent of adrenaline (epinephrine), 1 in 1000 (1 mg in 1 mL).

www.webofpharma.com

When a solution of adrenaline hydrochloride is prescribed or demanded, a solution complying with the requirements of this monograph may be dispensed or supplied.

Adrenaline and Cocaine Intranasal Solution / Epinephrine and Cocaine Intranasal Solution

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Adrenoceptor agonist + local anaesthetic.

DEFINITION
Adrenaline and Cocaine Intranasal Solution contains Adrenaline Acid Tartrate and Cocaine Hydrochloride in a suitable vehicle.

The intranasal solution complies with the requirements stated under Nasal Preparations and with the following requirements. Where appropriate, the intranasal solution also complies with the requirements stated under Unlicensed Medicines.

Content of adrenaline, $C_9H_{13}NO_3$
95.0 to 105.0% of the stated amount.

Content of cocaine hydrochloride, $C_{17}H_{21}NO_4$,HCl
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. In the Assay for adrenaline, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

B. In the Assay for cocaine hydrochloride, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

C. To 10 ml of the intranasal solution add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a brown colour and remove excess iodine by adding 0.1M *sodium thiosulfate* drop wise. A red colour is produced.

D. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS
Acidity
pH, 2.0 to 4.0, Appendix V L.

Related substances (for cocaine hydrochloride)
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the intranasal solution with sufficient mobile phase to produce a solution containing 0.04% w/v of Cocaine Hydrochloride.

(2) 0.0008% w/v of *benzoylecgonine hydrate* in the mobile phase.

(3) 0.0008% w/v of *benzoic acid* in the mobile phase.

(4) 0.0008% w/v of each of *benzoylecgonine hydrate* and *benzoic acid* in solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil 10 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of 9M *perchloric acid*, 35 volumes of *methanol* and 64 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to benzoylecgonine and benzoic acid is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to benzoylecgonine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peak corresponding to benzoic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2%).

The total impurity content is not greater than 2%.

ASSAY
For adrenaline
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a suitable volume of the intranasal solution with sufficient mobile phase to produce a solution containing the equivalent of 0.011% w/v of adrenaline.

(2) 0.02% w/v of *adrenaline acid tartrate BPCRS* in the mobile phase.

(3) 0.02% w/v of *adrenaline acid tartrate BPCRS* and 0.02% w/v of *noradrenaline acid tartrate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* in a mixture of 950 mL of *water* and 50 mL of *methanol* and adjust the pH to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ in the intranasal solution from the chromatograms obtained and using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

www.webofpharma.com

For cocaine hydrochloride
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the intranasal solution containing 40 mg of Cocaine Hydrochloride with sufficient *water* to produce 100 mL.

(2) 0.04% w/v of *cocaine hydrochloride BPCRS* in *water*.

(3) 0.0008% w/v of each of *benzoylecgonine hydrate* and *benzoic acid* in solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil 10 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of 9M *perchloric acid*, 35 volumes of *methanol* and 64 volumes of *water*.

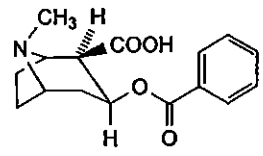
SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to benzoylecgonine and benzoic acid is at least 2.0.

DETERMINATION OF CONTENT

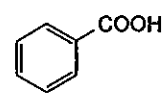
Calculate the content of $C_{17}H_{21}NO_4$,HCl in the intranasal solution from the chromatograms obtained and using the declared content of $C_{17}H_{21}NO_4$,HCl in *cocaine hydrochloride BPCRS*.

STORAGE



Adrenaline and Cocaine Intranasal Solution should be protected from light.

LABELLING



The quantity of adrenaline acid tartrate is stated in terms of the equivalent amount of adrenaline (epinephrine).

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. Benzoylecgonine,

2. Benzoic acid.

Alendronic Acid Tablets

Sodium Alendronate Tablets

Action and use

Bisphosphonate; treatment of osteoporosis.

DEFINITION

Alendronic Acid Tablets contain Sodium Alendronate Trihydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of alendronic acid, $C_4H_{13}NO_7P_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mix a quantity of the powdered tablets containing the equivalent of 76 mg of alendronic acid with 50 mL of *water* for 30 minutes with the aid of ultrasound and occasional shaking, and filter.

(2) 0.2% w/v of *sodium alendronate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *cellulose*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of warm air, spray with *ninhydrin solution*, heat at 100° to 105° for 15 minutes and examine.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 8 volumes of 2.5% v/v *trichloroacetic acid* and 11 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes, withdraw a sample of the medium and filter (Whatman GF/C is suitable). Use the filtered sample diluted with the dissolution medium, if necessary, to produce a solution expected to contain the equivalent of 0.00084% w/v of alendronic acid.

(2) 0.0011% w/v of *sodium alendronate BPCRS* in *water*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *anion exchange resin* (7 µm) (Allsep Anion is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a refractive index detector, maintained at 40°.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.02% v/v of *formic acid*, pH adjusted to 3.5 with *2M sodium hydroxide*.

DETERMINATION OF CONTENT

Calculate the total content of $C_4H_{13}NO_7P_2$ in the medium using the declared content of $C_4H_{12}NNaO_7P_2$ in *sodium alendronate BPCRS*. Each mg of $C_4H_{12}NNaO_7P_2$ is equivalent to 0.9189 mg of $C_4H_{13}NO_7P_2$.

LIMITS

The amount of alendronic acid released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Buffer solution Prepare a solution containing 0.294% w/v of *sodium citrate* and 0.142% w/v of *anhydrous disodium hydrogen orthophosphate*, adjusted to pH 8.0 using *orthophosphoric acid* and filter.

Solution A 2.94% w/v of *sodium citrate* in *water*.

Solution B 1.91% w/v of *sodium borate* in *water*.

Solution C 0.02% w/v of *(9-fluorenyl)methyl chloroformate* in *acetonitrile*. Prepare immediately before use.

(1) Mix a quantity of the powdered tablets containing the equivalent of 23 mg of alendronic acid with solution A and make up to 50 mL with the same solvent. Mix and filter (Whatman GF/C is suitable), discarding the first 5 mL of filtrate. To 5 mL of the filtrate in a screw cap centrifuge tube add 5 mL of solution B and 10 mL of solution C, shake for 1 minute and allow to stand at room temperature for 30 minutes, add 20 mL of *dichloromethane* and shake vigorously for 1 minute; centrifuge and use the aqueous layer.

(2) To 5 mL of a 0.0003% w/v solution of *4-aminobutanoic acid* in solution A in a screw cap centrifuge tube, add 5 mL of solution B and 10 mL of solution C, shake for 45 seconds and allow to stand at room temperature for 30 minutes, add 20 mL of *dichloromethane* and shake vigorously for 1 minute, centrifuge and use the aqueous layer.

(3) To 5 mL of a solution containing 0.06% w/v of *sodium alendronate BPCRS* and 0.01% w/v of *4-aminobutanoic acid* in solution A in a screw cap centrifuge tube add 5 mL of solution B and 10 mL of solution C, shake for 45 seconds and allow to stand at room temperature for 30 minutes, add 20 mL of *dichloromethane* and shake vigorously for 1 minute; centrifuge and use the aqueous layer.

(4) To 5 mL of a solution containing 0.00012% of *sodium alendronate BPCRS* in solution A in a screw cap centrifuge tube, add 5 mL of solution B and 10 mL of solution C, shake for 45 seconds and allow to stand at room temperature for 30 minutes. Add 20 mL of *dichloromethane* and shake vigorously for 1 minute, centrifuge and use the aqueous layer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.1 mm) packed with *styrene-divinylbenzene copolymer* (10 µm) (Hamilton PRP-1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.8 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 266 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 3 volumes of *acetonitrile* and 17 volumes of buffer solution.

Mobile phase B 3 volumes of buffer solution and 7 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-15	100	0	isocratic
15-25	100→50	0→50	linear gradient
25-27	50→0	50→100	linear gradient
27-32	0→100	100→0	linear gradient
32-40	100	0	re-equilibration

The retention time of the peaks due to alendronic acid and aminobutanoic acid, as their derivatives, are about 5 minutes and about 9.5 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 10.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminobutanoic acid is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

Impurities B and C

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing the equivalent of 0.1 g of alendronic acid, add 20 mL of *water* and mix with the aid of ultrasound for 30 minutes. Add sufficient *water* to produce 25 mL and filter (Whatman GF/C is suitable).

(2) 0.0024% w/v of *orthophosphoric acid* (impurity B) and 0.002% w/v of *phosphorous acid* (impurity C).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used. Allow the chromatography to proceed for twice the retention time of the principal peak.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to alendronic acid (retention time, about 17 minutes) are: impurity B, about 1.3 and impurity C, about 1.6.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *signal-to-noise* ratios of the peaks due to impurity B and impurity C are at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B or impurity C is not greater than the area of any corresponding peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the powdered tablets containing the equivalent of 50 mg of alendronic acid with 20 mL of *water* for 30 minutes with the aid of ultrasound and occasional shaking, and agitate until cool, add sufficient *water* to produce 25 mL, mix and filter (Whatman GF/C is suitable).

(2) 0.22% w/v of *sodium alendronate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_4H_{13}NO_7P_2$ in the tablets using the declared content of $C_4H_{12}NNaO_7P_2$ in *sodium alendronate BPCRS*. Each mg of $C_4H_{12}NNaO_7P_2$ is equivalent to 0.9189 mg of $C_4H_{13}NO_7P_2$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of alendronic acid.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and C listed under Sodium Alendronate Trihydrate.

Alendronic Acid and Colecalciferol Tablets

Sodium Alendronate and Colecalciferol Tablets

Action and use

Bisphosphonate + Vitamin D3 analogue.

DEFINITION

Alendronic Acid and Colecalciferol Tablets contain Sodium Alendronate Trihydrate and Colecalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of alendronic acid, $C_4H_{13}NO_7P_2$

92.5 to 105.0% of the stated amount.

Content of colecalciferol, $C_{27}H_{44}O$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing the equivalent of 70 mg of alendronic acid with 50 mL of *water* for 30 minutes and filter.

(2) 0.2% w/v of *sodium alendronate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *cellulose*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of warm air, spray with *ninhydrin solution*, heat at 105° and examine in daylight.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 8 volumes of 2.5% v/v *trichloroacetic acid* and 11 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in size, position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay for alendronic acid, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions. *Prepare the solutions immediately before use.*

Solution A A solution containing 1% w/v of *squalane* and 0.01% w/v of *butylated hydroxytoluene* in *ethylene chloride*.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing 1 mg of Colecalciferol with 20 mL of *methanol*, centrifuge and filter. Evaporate the filtrate to dryness and dissolve the residue immediately in 0.4 mL of solution A.

(2) 0.25% w/v of *colecalciferol BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in current of warm air, and spray with *sulfuric acid*.

MOBILE PHASE

0.01% w/v of *butylated hydroxytoluene* in a mixture of equal volumes of *cyclohexane* and *peroxide-free ether*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in size, position and colour to that in the chromatogram obtained with solution (2).

D. In the Assay for colecalciferol, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

For alendronic acid

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

www.webofpharma.com

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 15 minutes withdraw a sample of the medium and filter (Whatman GF/C is suitable). Use the filtered dissolution medium diluted, if necessary, to produce a solution expected to contain the equivalent of 0.0078% w/v of alendronic acid.

(2) 0.01% w/v of *sodium alendronate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *anion exchange resin* (Waters IC PAK Anion HC is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a conductivity detector, maintained at 35°.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.59% w/v of *succinic acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to alendronic acid is about 7 minutes.

DETERMINATION OF CONTENT

Calculate the total content of alendronic acid, $C_4H_{13}NO_7P_2$ in the medium using the declared content of $C_4H_{12}NNaO_7P_2$ in *sodium alendronate BPCRS* and the peak heights in the chromatograms obtained. Each mg of $C_4H_{12}NNaO_7P_2$ is equivalent to 0.9189 mg of $C_4H_{13}NO_7P_2$.

LIMITS

The amount of alendronic acid released is not less than 75% (Q) of the stated amount.

For colecalciferol

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 500 mL of a mixture of 3% w/v of *sodium lauryl sulfate* and 0.9% w/v of *sodium chloride*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 15 minutes withdraw a sample of the medium and filter (Whatman GF/C is suitable). Use the filtered dissolution medium diluted with medium, if necessary, to produce a solution expected to contain 0.000014% w/v of colecalciferol.

(2) Dilute 1 volume of a solution containing 0.0014% w/v of *colecalciferol BPCRS* in *methanol* to 100 volumes with the dissolution medium.

(3) Heat an aliquot of solution (2) on a water bath at 50° for 2 hours (generation of pre-colecalciferol).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (4 µm) (Phenomenex Synergi-Hydro RP is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 269 nm.

(f) Inject 150 µL of each solution.

MOBILE PHASE

methanol (96%).

When the chromatograms are recorded under the prescribed conditions the retention times of pre-colecalciferol and colecalciferol are about 11 minutes and 12 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to colecalciferol and pre-colecalciferol is at least 1.2.

DETERMINATION OF CONTENT

Use the sum of the peak areas of colecalciferol and pre-colecalciferol. Calculate the total content of colecalciferol, $C_{27}H_{44}O$, in the medium using the declared content of $C_{27}H_{44}O$, in *colecalciferol BPCRS*.

LIMITS

The amount of colecalciferol released is not less than 75% (Q) of the stated amount.

Related substances

For alendronic acid

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Derivatise each solution prior to analysis.

Solution A A solution containing 0.294% w/v of *sodium citrate* and 0.142% w/v of *anhydrous disodium hydrogen orthophosphate*, adjusted to pH 8.0 with *orthophosphoric acid*.

(1) Mix a quantity of the powdered tablets containing the equivalent of 30 mg of alendronic acid with a 2.94% w/v solution of *sodium citrate*, dilute to 50 mL with the same solvent and filter.

(2) 0.00012% w/v of 4-aminobutanoic acid in 2.94% w/v *sodium citrate*.

(3) Dilute 1 volume of solution (1) to 100 volumes with a 2.94% w/v solution of *sodium citrate*, further dilute 1 volume of this solution to 5 volumes with the same solvent.

(4) 0.06% w/v of *sodium alendronate BPCRS* and 0.01% w/v of *4-aminobutanoic acid*(impurity A) in 2.94% w/v *sodium citrate*.

(5) 0.000065% w/v of *sodium alendronate BPCRS* in 2.94% w/v of *sodium citrate*.

Derivatisation procedure Transfer 5 mL of solutions (1) to (5) separately into screw-cap centrifuge tubes, add 5 mL of a 1.91% w/v solution of sodium tetrahydroborate, 10 mL of a 0.2% w/v solution of *(9-fluorenyl)methyl chloroformate* in *acetonitrile*, shake for 1 minute and allow to stand at room temperature for 30 minutes, add 20 mL of *dichloromethane* and shake vigorously for 1 minute; centrifuge and use the aqueous layer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.1 mm) packed with *styrene-divinylbenzene copolymer* (10 µm) (Hamilton PRP-1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 45°.

www.webofpharma.com

(e) Use a detection wavelength of 266 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 85 volumes of solution A and 15 volumes of *acetonitrile*.

Mobile phase B 30 volumes of solution A and 70 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-15	100	0	isocratic
15-25	100→50	0→50	linear gradient
25-27	50→0	50→100	linear gradient
27-32	0→100	100→0	linear gradient
32-40	100	0	re-equilibration

The retention time of the peaks due to alendronic acid and 4-aminobutanoic acid, as their derivatives, are about 4 minutes and about 9 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the two principal peaks is at least 10.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminobutanoic acid is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of all impurities is not more than 0.5%.

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

Related substances

For colecalciferol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing 0.56 mg of Colecalciferol with 5 mL of *water*. Add 25 mL of *ethanol*, stir for 30 minutes, add sufficient *methanol* to produce 50 mL and centrifuge.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Heat 10 mL of a 0.00112% w/v solution of *colecalciferol BPCRS* in *methanol* in a capped vessel to 50° for two hours (generation of pre-colecalciferol).

(4) Dilute 1 volume of solution (2) to 10 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Supelco Discovery HS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use an auto-sampler temperature of 5°.

(f) Use a detection wavelength of 266 nm.

(g) Inject 20 µL of each solution.

(h) For solution (1), allow the chromatography to proceed for 2.5 times the retention time of colecalciferol

MOBILE PHASE

methanol (96%).

The retention time of the peaks due to pre-colecalciferol and colecalciferol are about 12 and 13 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the sum of the areas of the peaks due to pre-colecalciferol and colecalciferol in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the sum of the areas of the peaks due to pre-colecalciferol and colecalciferol in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak due to pre-colecalciferol and any peak with an area less than the sum of the areas of the peaks due to pre-colecalciferol and colecalciferol in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

For colecalciferol

For tablets containing less than 2 mg and/or less than 2% w/w of colecalciferol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse one whole tablet in 5 mL of *water*, add 25 mL of *ethanol* and stir for 30 minutes, add sufficient *methanol* to produce 0.00014% w/v of Colecalciferol and filter (Whatman GF/C is suitable).

(2) 0.00014% w/v of *colecalciferol BPCRS* in *methanol*.

(3) Heat 10 mL solution of a 0.00112% w/v of *colecalciferol BPCRS* in *methanol* in a capped vessel to 50° for two hours (generation of pre-colecalciferol).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances (for colecalciferol) may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 1.0.

DETERMINATION OF CONTENT

Combine the peak areas of colecalciferol and pre-colecalciferol. Calculate the total content of colecalciferol, $C_{27}H_{44}O$, in the tablets using the declared content of $C_{27}H_{44}O$, in *colecalciferol BPCRS*.

ASSAY

For alendronic acid

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the powdered tablets containing the equivalent of 0.1 g of alendronic acid with 200 mL of *water* for 30 minutes with the aid of ultrasound and occasional

www.webofpharma.com

shaking, add sufficient *water* to produce 250 mL and centrifuge.

(2) 0.052% w/v of *sodium alendronate BPCRS* in *water*.

(3) 0.02% w/v of *sodium alendronate BPCRS* and 0.01% w/v of *sodium dihydrogen orthophosphate* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.1 mm) packed with *styrene-divinylbenzene copolymer for chromatography* (10 µm) (Hamilton PRP-X100 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

(g) The method is validated to measure the drop in absorbance due to alendronic acid and an inverted peak will be observed.

MOBILE PHASE

0.007M *nitric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of the inverted peak due to alendronic acid is about 3.5 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of alendronic acid, $C_4H_{13}NO_7P_2$ in the tablets using the declared content of $C_4H_{12}NNaO_7P_2$ in *sodium alendronate BPCRS* and the peak depth in the chromatograms obtained. Each mg of $C_4H_{12}NNaO_7P_2$ is equivalent to 0.9189 mg of $C_4H_{13}NO_7P_2$.

For colecalciferol

Use the average of the individual results obtained in the test for Uniformity of content.

LABELLING

The quantity of sodium alendronate is stated in terms of the equivalent amount of alendronic acid.

The quantity of Colecalciferol is expressed in terms of both mg and IU.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Colecalciferol and impurities A and D listed under *Sodium Alendronate Trihydrate*.

Alfuzosin Tablets

Action and use

Alpha$_1$-adrenoceptor antagonist.

DEFINITION

Alfuzosin Tablets contain Alfuzosin Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of alfuzosin hydrochloride, $C_{19}H_{27}N_5O_4$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 30 mg of Alfuzosin Hydrochloride with 50 mL of *water* for 5 minutes and filter. Adjust the pH of the filtrate to 12.5 with 18M *ammonia* extract with two 25-mL quantities of *dichloromethane*, wash the combined extracts with 10 mL of *water*, dry over *sodium sulfate* and evaporate to dryness. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of alfuzosin *(RS 446)*.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with mobile phase if necessary, to produce a solution expected to contain 0.0001% w/v of Alfuzosin Hydrochloride.

(2) 0.0001% w/v of *alfuzosin hydrochloride BPCRS*.

(3) 0.01% w/v of *alfuzosin impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used. Inject 100 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *alfuzosin impurity standard BPCRS*;

the *resolution* between the peaks due to impurity D and impurity E is at least 2.0;

the *resolution* between the peaks due to alfuzosin and impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the total content of alfuzosin hydrochloride, $C_{19}H_{27}N_5O_4$,HCl, in the medium from the chromatograms obtained and using the declared content of $C_{19}H_{27}N_5O_4$,HCl in *alfuzosin hydrochloride BPCRS*.

LIMITS

The amount of alfuzosin hydrochloride released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 15 mg of Alfuzosin Hydrochloride in 70 mL of *methanol* for 30 minutes, add 10 mL of 0.01M *hydrochloric acid*, cool, dilute to 100 mL with *methanol* and filter. Dilute 1 volume of the solution to 5 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dilute 2 volumes of solution (2) to 5 volumes with the mobile phase.

www.webofpharma.com

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

(5) 0.01% w/v of *alfuzosin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

1 volume of *tetrahydrofuran*, 20 volumes of *acetonitrile* and 80 volumes of *sodium perchlorate solution* prepared in the following manner. Add 5 mL of *perchloric acid* to 900 mL of *water*, adjust to pH 3.5 with 2M *sodium hydroxide* and add sufficient *water* to produce 1000 mL.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (5) closely resembles the reference chromatogram supplied with *alfuzosin impurity standard BPCRS*;

the *resolution* between the peaks due to impurity D and impurity E is at least 2.0;

the *resolution* between the peaks due to alfuzosin and impurity A is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D (the first eluting peak in the chromatogram obtained with solution (5)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity E (the second eluting peak in the chromatogram obtained with solution (5)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh and powder 20 tablets. Shake a quantity of powdered tablets containing 10 mg of Alfuzosin Hydrochloride in 70 mL of *methanol* for 30 minutes, add 10 mL of 0.01M *hydrochloric acid*, cool, dilute to 100 mL with *methanol* and filter. Dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(2) 0.001% w/v of *alfuzosin hydrochloride BPCRS* in the mobile phase.

(3) 0.01% w/v of *alfuzosin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless:

the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *alfuzosin impurity standard BPCRS*;

the *resolution* between the peaks due to impurity D and impurity E is at least 2.0;

the *resolution* between the peaks due to alfuzosin and impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{27}N_5O_4$,HCl in the tablets from the chromatograms obtained and using the declared content of $C_{19}H_{27}N_5O_4$,HCl in *alfuzosin hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Alfuzosin Hydrochloride.

Alfuzosin Prolonged-release Tablets

Prolonged-release Alfuzosin Tablets

Alfuzosin Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Alpha$_1$-adrenoceptor antagonist.

DEFINITION

Alfuzosin Prolonged-release Tablets contain Alfuzosin Hydrochloride. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of alfuzosin hydrochloride.

The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of alfuzosin hydrochloride, $C_{19}H_{27}N_5O_4$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 30 mg of Alfuzosin Hydrochloride with 250 mL of *water* for 5 minutes and filter. Adjust the pH of the filtrate to pH 12.5 with 18M *ammonia*, extract with two 25-mL quantities of *dichloromethane*, wash the combined extracts with 10 mL of *water*, dry over *sodium sulfate* and evaporate to dryness.

The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of alfuzosin *(RS 446)*.

www.webofpharma.com

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 15 mg of Alfuzosin Hydrochloride in 70 mL of *methanol* for 30 minutes, add 10 mL of 0.01M *hydrochloric acid*, cool, dilute to 100 mL with *methanol* and filter. Dilute 1 volume of the solution to 5 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dilute 2 volumes of solution (2) to 5 volumes with the mobile phase.

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

(5) 0.01% w/v of *alfuzosin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

1 volume of *tetrahydrofuran*, 20 volumes of *acetonitrile* and 80 volumes of *sodium perchlorate solution* prepared in the following manner. Add 5 mL of *perchloric acid* to 900 mL of *water*, adjust to pH 3.5 with 2M *sodium hydroxide* and add sufficient *water* to produce 1000 mL.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (5) closely resembles the reference chromatogram supplied with *alfuzosin impurity standard BPCRS*;

the *resolution* between the peaks due to impurity D and impurity E is at least 2.0;

the *resolution* between the peaks due to alfuzosin and impurity A is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D (the first eluting peak in the chromatogram obtained with solution (5)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity E (the second eluting peak in the chromatogram obtained with solution (5)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D using the following solutions in the mobile phase.

(1) Weigh and powder 20 tablets. Shake a quantity of powdered tablets containing 10 mg of Alfuzosin Hydrochloride in 70 mL of *methanol* for 30 minutes, add 10 mL of 0.01M *hydrochloric acid*, cool, dilute to 100 mL with *methanol* and filter. Dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(2) 0.001% w/v of *alfuzosin hydrochloride BPCRS*.

(3) 0.01% w/v of *alfuzosin impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless:

the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *alfuzosin impurity standard BPCRS*;

the *resolution* between the peaks due to impurity D and impurity E is at least 2.0;

the *resolution* between the peaks due to alfuzosin and impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{27}N_5O_4$,HCl in the tablets from the chromatograms obtained and using the declared content of $C_{19}H_{27}N_5O_4$,HCl in *alfuzosin hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Alfuzosin Hydrochloride.

Compound Alginate Antacid Oral Suspension

DEFINITION

Compound Alginate Antacid Oral Suspension is a suspension containing an alginate in a suitable flavoured vehicle. It may be coloured. The suspension has an acid neutralising capacity.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of aluminium, Al; calcium, Ca; magnesium, Mg; potassium, K; sodium, Na, as appropriate

84.0 to 116.0% of the requisite amount, this being calculated from the stated amounts of the relevant constituents.

IDENTIFICATION

Evaporate to dryness on a water bath a quantity of the oral suspension containing the equivalent of 1 g of the alginate component. The residue complies with the following tests.

A. Shake 0.2 g in 20 mL of *water*. To 5 mL of this solution add 1 mL of *calcium chloride solution*. A voluminous gelatinous mass is formed.

www.webofpharma.com

B. To 10 mL of the solution prepared in Identification test A add 1 mL of *dilute sulfuric acid*. A gelatinous mass is formed.

C. It complies with the appropriate assays (see Assay).

TESTS

Alkalinity
pH, 7.5 to 9.5, Appendix V L.

Weight per mL
1.04 to 1.14 g/mL, Appendix V G.

Raft-forming ability
Introduce 150 mL of *0.1M hydrochloric acid* into a 250 mL beaker having an internal diameter of 60 to 70 mm. Place in a water bath such that the volume of water in the bath is level with the top of the acid in the beaker and allow to equilibrate to 36.5° to 37.5°. Using a syringe (without needle), remove a quantity of suspension, previously shaken, equivalent to one dose. Where a dosage range is specified, use the maximum dose. Wipe the outside of the syringe and add the suspension evenly into the centre of the beaker (the time taken to add the entire dose is approximately 5 seconds). After 30 minutes, remove the beaker from the water bath, dry the outside of the beaker and examine the contents. A mass is formed.

Neutralising capacity
Not less than 30 mL of *0.1M hydrochloric acid VS* is required to neutralise 5 mL of the oral suspension when determined by the following method.

To 5 mL of the oral suspension, accurately weighed in a 500 mL conical flask, add 250 mL of *0.1M hydrochloric acid VS* and mix well. Place the flask in a water bath maintained at 36.5° to 37.5° for 1 hour, swirling frequently. Allow to cool and filter. Collect the filtrate in a clean dry flask and titrate to pH 4.0 using *0.5M sodium hydroxide VS*. Calculate the neutralising capacity using the following expression:

$$\left[\left(250 \times \frac{C_1}{0.100}\right) - \left(T \times \frac{C_2}{0.500} \times 5\right)\right] \times \frac{W_m \times 5}{W}$$

where

C_1 = the concentration of *0.1M hydrochloric acid VS* in moles per litre,
T = the volume of 0.5M *sodium hydroxide VS* in mL,
C_2 = the concentration of *0.5M sodium hydroxide VS* in moles per litre,
W_m = the weight per mL of the suspension in g/mL,
W = the weight of the suspension in g.

ASSAY

For aluminium
Dilute a quantity of the suspension containing the equivalent of 125 mg of Al, based on the labelled amount, in *water* to produce 500 mL and filter. Dilute a suitable volume of the filtrate with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 396 nm. Use *aluminium standard solution* (*200 ppm Al*), suitably diluted with the strontium chloride solution, for the standard solutions.

For calcium
Dilute a quantity of the suspension containing the equivalent of 120 mg of Ca, based on the labelled amount, in *water* to produce 500 mL and filter. Dilute a suitable volume of the filtrate with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 393 nm. Use *calcium standard solution* (*400 ppm Ca*), suitably diluted with the strontium chloride solution, for the standard solutions.

For magnesium
Dilute a quantity of the suspension containing the equivalent of 125 mg of Mg, based on the labelled amount, in *water* to produce 500 mL and filter. Dilute a suitable volume of the filtrate with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 285 nm. Use *magnesium standard solution* (*100 ppm Mg*), suitably diluted with the strontium chloride solution, for the standard solutions.

For potassium
Dilute a quantity of the suspension containing the equivalent of 120 mg of K, based on the labelled amount, in *water* to produce 250 mL and filter. Dilute a suitable volume of the filtrate with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm. Use *potassium standard solution* (*600 ppm K*), suitably diluted with the strontium chloride solution, for the standard solutions.

For sodium
Dilute a quantity of the suspension containing the equivalent of 125 mg of Na, based on the labelled amount, in *water* to produce 500 mL and filter. Dilute a suitable volume of the filtrate with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 589 nm. Use *sodium standard solution* (*200 ppm Na*), suitably diluted with the strontium chloride solution, for the standard solutions.

LABELLING
The label states (1) the sodium content of the suspension and (2) the potassium content of the suspension, as applicable.

Alginate Raft-forming Oral Suspension

DEFINITION
Alginate Raft-forming Oral Suspension is a suspension containing Sodium Alginate, Sodium Bicarbonate and Calcium Carbonate in a suitable flavoured vehicle. It may be coloured. The suspension forms a raft.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of active constituents
90.0 to 110.0 % of the stated amount of sodium alginate.

PRODUCTION
The content of the active constituents in the oral suspension is measured using suitably validated methods.

IDENTIFICATION
A. Dilute a quantity of the oral suspension containing 0.25 g of Sodium Alginate, accurately weighed, in sufficient *water* to produce 200 mL. Filter and dilute a portion of this solution with sufficient *water* to produce a solution containing 0.0125% w/v of Sodium Alginate. To 1 mL of this solution,

www.webofpharma.com

add 1 mL of a freshly prepared 4% w/v solution of *resorcinol* and 6 mL of *sulfuric acid*. An orange-pink colour is produced.

B. Evaporate to dryness a quantity of the oral suspension containing 1 g of Sodium Alginate on a water bath. Shake 0.2 g of the residue with 20 mL of *water*. To 5 mL of this solution add 1 mL of *calcium chloride solution*. A voluminous gelatinous mass is formed.

C. Evaporate to dryness a quantity of the oral suspension containing 1 g of Sodium Alginate on a water bath. The residue yields the reactions characteristic of *sodium*, Appendix VI.

TESTS

Alkalinity

pH, 7.0 to 9.5, Appendix V L.

Relative density

1.03 to 1.07 g/mL, Appendix V G.

Raft strength

The mean raft strength is not less than 7.5 g, determined by the following method. Carry out the method for *texture analysis of semi-solids or gels*, Appendix XVII F. Introduce 150 mL of *0.1M hydrochloric acid* into a 250 mL beaker having an internal diameter of 60 to 70 mm. Place in a water bath such that the volume of water in the bath is level with the top of the acid in the beaker and allow to equilibrate to 36.5° to 37.5°. Suspend an L-shaped probe comprising 1 mm diameter 316 gauge stainless steel having a 90 mm vertical arm with a hook at the top and a 20 mm horizontal arm such that the vertical arm of the probe hangs down the centre axis of the beaker and the horizontal arm is in the lower third of the acid.

Using a syringe (without needle), remove a quantity of suspension, previously shaken, equivalent to one dose. Where a dosage range is specified, use the maximum dose. Wipe the outside of the syringe and add the suspension evenly into the medium (the time taken to add the entire dose is approximately 5 seconds).

After 30 minutes, remove the beaker from the water bath, dry the outside of the beaker and transfer to a suitable texture analyser. Attach the probe to the arm of the texture analyser, and lift the arm so that the probe is lifted through the raft at a speed of 5 mm/sec. Record the peak raft strength in g.

LABELLING

The label states the sodium content of the suspension.

Paediatric Alimemazine Oral Solution

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Paediatric Alimemazine Oral Solution is a solution containing 0.15% w/v of Alimemazine Tartrate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of alimemazine tartrate, $C_{36}H_{44}N_4S_2,C_4H_6O_6$

0.135 to 0.165% w/v.

IDENTIFICATION

Dilute 50 mL of the oral solution with 175 mL of *water* and add 7 mL of 1M *sodium hydroxide*. Extract with 100 mL of *ether*, wash the ether layer with 15 mL of *water* and dry over *anhydrous sodium sulfate* (solution A). Evaporate 30 mL of solution A to dryness and dissolve the residue in 0.2 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of alimemazine *(RS 005)*.

TESTS

Related substances

Complies with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and the following freshly prepared solutions. For solution (1) dilute 15 mL with an equal volume of *water*, add 2 mL of 1M *sodium hydroxide* and extract with two 15-mL quantities of *chloroform*. Dry the chloroform extracts with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the residue as completely as possible in 1 mL of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*. For solution (2) dilute 1 volume of solution (1) to 50 volumes with the same solvent mixture.

ASSAY

Carry out the following procedure protected from light. To a weighed quantity containing 15 mg of Alimemazine Tartrate add 25 mL of *water* and 5 mL of a 5% w/v solution of *sodium hydroxide*. Extract the mixture with two 50 mL quantities of *chloroform*, shaking vigorously for 1 minute each time, evaporate the combined extracts to dryness at about 30° at a pressure of 2 kPa and dissolve the residue in sufficient *0.1M hydrochloric acid* to produce 50 mL (solution B). Dilute 10 mL of solution B to 50 mL with *water* (solution C). To a further 10 mL of solution B add 5 mL of *peroxyacetic acid solution*, allow to stand for 10 minutes and add sufficient *water* to produce 50 mL (solution D). Measure the *absorbance* of solution D at the maximum at 342 nm, Appendix II B, using solution C in the reference cell and measure the *absorbance* of solution C at the same wavelength using *water* in the reference cell. Repeat the procedure using a 0.03% w/v solution of *alimemazine tartrate BPCRS* in *0.1M hydrochloric acid* in place of solution B and beginning at the words 'Dilute 10 mL of ...'. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{36}H_{44}N_4S_2,C_4H_6O_6$, weight in volume, using the declared content of $C_{36}H_{44}N_4S_2,C_4H_6O_6$ in *alimemazine tartrate BPCRS*. The result is not valid if the absorbance of solution C is more than 0.10.

STORAGE

Paediatric Alimemazine Oral Solution should be protected from light.

Paediatric Alimemazine Oral Solution contains 7.5 mg of Alimemazine Tartrate in 5 mL.

Strong Paediatric Alimemazine Oral Solution

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Strong Paediatric Alimemazine Oral Solution is a solution containing 0.6% w/v of Alimemazine Tartrate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of alimemazine tartrate, $C_{36}H_{44}N_4S_2,C_4H_6O_6$

0.54 to 0.66% w/v.

www.webofpharma.com

IDENTIFICATION

Dilute 15 mL of the oral solution with 175 mL of *water* and add 7 mL of 1M *sodium hydroxide*. Extract with 100 mL of *ether*, wash the ether layer with 15 mL of *water* and dry over *anhydrous sodium sulfate* (solution A). Evaporate 30 mL of solution A to dryness and dissolve the residue in 0.2 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of alimemazine *(RS 005)*.

TESTS

Related substances

Complies with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and the following freshly prepared solutions. For solution (1) dilute 5 mL with 15 mL of *water*, add 2 mL of 1M *sodium hydroxide* and extract with two 15-mL quantities of *chloroform*. Dry the chloroform extracts with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the residue as completely as possible in 1 mL of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*. For solution (2) dilute 1 volume of solution (1) to 50 volumes with the same solvent mixture.

ASSAY

Carry out the following procedure protected from light. To a weighed quantity containing 30 mg of Alimemazine Tartrate add 25 mL of *water* and 5 mL of a 5% w/v solution of *sodium hydroxide*. Extract the mixture with two 50-mL quantities of *chloroform*, shaking vigorously for 1 minute each time, evaporate the combined extracts to dryness at about 30° at a pressure of 2 kPa and dissolve the residue in sufficient *0.1M hydrochloric acid* to produce 100 mL (solution B). Dilute 10 mL of solution B to 50 mL with *water* (solution C). To a further 10 mL of solution B add 5 mL of *peroxyacetic acid solution*, allow to stand for 10 minutes and add sufficient *water* to produce 50 mL (solution D). Measure the *absorbance* of solution D at the maximum at 342 nm, Appendix II B, using solution C in the reference cell and measure the *absorbance* of solution C at the same wavelength using *water* in the reference cell. Repeat the procedure using a 0.03% w/v solution of *alimemazine tartrate BPCRS* in *0.1M hydrochloric acid* in place of solution B and beginning at the words 'Dilute 10 mL of ...'. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{36}H_{44}N_4S_2,C_4H_6O_6$, weight in volume, using the declared content of $C_{36}H_{44}N_4S_2,C_4H_6O_6$ in *alimemazine tartrate BPCRS*. The result is not valid if the absorbance of solution C is more than 0.10.

STORAGE

Strong Paediatric Alimemazine Oral Solution should be protected from light.

Strong Paediatric Alimemazine Oral Solution contains 30 mg of Alimemazine Tartrate in 5 mL.

Alimemazine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Alimemazine Tablets contain Alimemazine Tartrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of alimemazine tartrate, $C_{36}H_{44}N_4S_2,C_4H_6O_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 40 mg of Alimemazine Tartrate add 10 mL of *water* and 2 mL of 1M *sodium hydroxide*, shake and extract with 15 mL of *ether*. Wash the ether layer with 5 mL of *water*, dry with *anhydrous sodium sulfate* and evaporate the ether to dryness. Dissolve the residue in 0.4 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of alimemazine *(RS 005)*.

B. To a quantity of the powdered tablets containing 1 mg of Alimemazine Tartrate add 1 mL of a mixture of equal volumes of *formaldehyde solution* and *sulfuric acid*. A purple colour is produced.

TESTS

Related substances

Comply with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and applying separately to the plate 20 µL of each of the following freshly prepared solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Alimemazine Tartrate with 10 mL of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent mixture.

ASSAY

Carry out the following procedure protected from light. Add 150 mL of *0.1M hydrochloric acid* to 10 tablets, shake for 10 minutes, mix with the aid of ultrasound for 1 minute, dilute with *0.1M hydrochloric acid* to produce a solution containing 0.050% w/v of Alimemazine Tartrate and filter (solution A). Dilute 10 mL of solution A to 100 mL with *water* (solution B). To a further 10 mL of solution A add 2 mL of *peroxyacetic acid solution*, mix, allow to stand for 5 minutes and add sufficient *water* to produce 100 mL (solution C). Measure the *absorbance* of solution C at the maximum at 342 nm, Appendix II B, using solution B in the reference cell and measure the *absorbance* of solution B at the same wavelength using *water* in the reference cell. Repeat the procedure using a 0.05% w/v solution of *alimemazine tartrate BPCRS* in *0.1M hydrochloric acid* in place of solution A, beginning at the words 'Dilute 10 mL of solution A ...' and calculate the content of $C_{36}H_{44}N_4S_2$, C_4H_6O using the declared content of $C_{36}H_{44}N_4S_2,C_4H_6O$ in *alimemazine tartrate BPCRS*. The test is not valid if the absorbance of solution B is more than 0.10.

Allopurinol Oral Suspension

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Xanthine oxidase inhibitor; treatment of gout and hyperuricaemia.

DEFINITION

Allopurinol Oral Suspension is a suspension of Allopurinol in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

Content of allopurinol, $C_5H_4N_4O$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of solution (2) obtained in the Assay is concordant with that of solution (3).

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as that in the chromatogram obtained with solution (3).

TESTS

Acidity

pH, 2.5 to 4.5, Appendix V L.

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions, using 900 mL of 0.01M *hydrochloric acid* as the dissolution medium and rotating the paddle at 75 revolutions per minute. Use a volume of the oral suspension containing one dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) 0.92% w/v solution of *sulfanilamide* in *methanol* (internal standard solution).

(2) To a quantity of the oral suspension containing 0.1 g of Allopurinol add 30 mL of a solution containing 10% w/v of *sodium chloride* in 0.1M *sodium hydroxide*. Add 10 mL of the internal standard solution and sufficient *methanol* to produce 100 mL; mix and filter through glass wool. Dilute 25 volumes of the resulting solution to 100 volumes with a 1% w/v solution of *anhydrous potassium dihydrogen orthophosphate*, mix and filter through a 0.45-µm membrane filter.

(3) Dissolve 0.1 g of *allopurinol BPCRS* in 30 mL of a solution containing 10% w/v of *sodium chloride* in 0.1M *sodium hydroxide*. Add 10 mL of the internal standard solution and sufficient *methanol* to produce 100 mL; mix. Dilute 25 mL of the resulting solution to 100 mL with a 1% w/v solution of *anhydrous potassium dihydrogen orthophosphate*, mix and filter through a 0.45-µm membrane filter.

(4) Dilute 10 volumes of solution (3) to 100 volumes with the mobile phase; further dilute 10 volumes to 100 volumes and then dilute 5 volumes to 100 volumes with the mobile phase; mix and filter through a 0.45-µm membrane filter.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Develosil RP-aqueous is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 250 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

2 volumes of *methanol* and 98 volumes of a 2% w/v solution of *anhydrous potassium dihydrogen orthophosphate*.

SYSTEM SUITABILITY

The chromatogram obtained with solution (3) shows a peak due to allopurinol (retention time about 11 minutes) and a peak with a retention relative to allopurinol of about 0.5 (sulfanilamide).

LIMITS

Using the chromatogram obtained with solution (4), calculate the ratio of the area of the peak due to allopurinol to the area of the peak due to the internal standard (*R*).

In the chromatogram obtained with solution (2):

the ratio of the area of any *secondary peak* to the area of the peak due to the internal standard is not greater than 0.04*R* (0.2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) 0.92% w/v solution of *sulfanilamide* in *methanol* (internal standard solution).

(2) To a weighed quantity of the oral suspension containing 0.1 g of Allopurinol add 30 mL of a solution containing 10% w/v of *sodium chloride* in 0.1M *sodium hydroxide*. Add 10 mL of the internal standard solution and sufficient *methanol* to produce 100 mL; mix and filter through glass wool. Dilute 25 volumes of the resulting solution to 100 volumes with a 1% w/v solution of *anhydrous potassium dihydrogen orthophosphate*, mix and filter through a 0.45-µm membrane filter.

(3) Dissolve 0.1 g of *allopurinol BPCRS* in 30 mL of a solution containing 10% w/v of *sodium chloride* in 0.1M *sodium hydroxide*. Add 10 mL of the internal standard solution and sufficient *methanol* to produce 100 mL; mix. Dilute 25 volumes of the resulting solution to 100 volumes with a 1% w/v solution of *anhydrous potassium dihydrogen orthophosphate*, mix and filter through a 0.45-µm membrane filter.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Develosil RP-aqueous is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 250 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

2 volumes of *methanol* and 98 volumes of a 2% w/v solution of *anhydrous potassium dihydrogen orthophosphate*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_5H_4N_4O$, weight in volume, using the declared content of $C_5H_4N_4O$ in *allopurinol BPCRS*.

Impurities

The impurities limited by the requirements of this monograph include impurities A, B, C, D and E listed under Allopurinol.

www.webofpharma.com

Allopurinol Tablets

Action and use
Xanthine oxidase inhibitor; treatment of gout and hyperuricaemia.

DEFINITION
Allopurinol Tablets contain Allopurinol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of allopurinol, $C_5H_4N_4O$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 250 nm.

B. Shake a quantity of the powdered tablets containing 0.1 g of Allopurinol with 5 mL of 1.25M *sodium hydroxide* and add 3 mL of *phosphomolybdotungstic reagent* and 5 mL of a 20% w/v solution of *sodium carbonate*. A greyish blue colour is produced.

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Allopurinol with 10 mL of 0.1M *sodium hydroxide* for about 1 minute, immediately dilute to 200 mL with mobile phase A and filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A and further dilute 1 volume to 10 volumes with mobile phase A.

(3) Dissolve 10 mg of *allopurinol impurity A BPCRS* and 5 mg each of *allopurinol impurity B BPCRS, allopurinol impurity C BPCRS, allopurinol impurity D BPCRS* and *allopurinol impurity E BPCRS* in mobile phase A. Add 20 mL of solution (1) and immediately dilute to 100 mL with mobile phase A. Dilute 1 mL of the resulting solution to 100 mL with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 5µ is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A A mixture of 1 volume of *methanol* and 9 volumes of a 0.125% w/v solution of *potassium dihydrogen orthophosphate*.

Mobile phase B A mixture of 3 volumes of *methanol* with 7 volumes of a 0.125% w/v solution of *potassium dihydrogen orthophosphate*.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-30	100→0	0→100	linear gradient
30-40	0	100	isocratic

SYSTEM SUITABILITY
The test is not valid unless in solution (3) the *resolution factor* between the peaks corresponding to impurity A and allopurinol is at least 3.

Inject solution (3). When the chromatogram is recorded in the prescribed conditions, the retention times are: impurity A, about 4.2 minutes; impurities B and C, about 6.1 minutes; allopurinol, about 7.7 minutes; impurity D, about 26.1 minutes; impurity E, about 27.8 minutes. Inject solution (1) and solution (2). Continue the chromatography of solution (1) for 5 times the retention time of allopurinol.

LIMITS
In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.2%);

the area of any unresolved double peak corresponding to impurities B and C is not greater than the area of the corresponding double peak in the chromatogram obtained with solution (3) (0.2%);

the area of any peaks corresponding to impurity D or impurity E is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.1%);

the area of any other *secondary peak* is not greater than the area of the peak due to allopurinol in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any other *secondary peaks* is not greater than 3 times the area of the peak due to allopurinol in the chromatogram obtained with solution (2) (0.3%).

Disregard any peak with an area less than 0.2 times that of the peak due to allopurinol in the chromatogram obtained with solution (2) (0.02%).

ASSAY
Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of Allopurinol with 20 mL of 0.05M *sodium hydroxide* for 20 minutes, add 80 mL of 0.1M *hydrochloric acid*, shake for 10 minutes, add sufficient 0.1M *hydrochloric acid* to produce 250 mL, filter and dilute 10 mL of the filtrate to 250 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 250 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the content of $C_5H_4N_4O$ taking 563 as the value of A(1%, 1 cm) at the maximum at 250 nm.

Almond Oil Ear Drops

DEFINITION
Almond Oil Ear Drops are Virgin Almond Oil in a suitable container.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

IDENTIFICATION
Carry out the test for the *identification of fatty oils by thin-layer chromatography*, Appendix X N. The chromatogram obtained from the oil being examined shows spots corresponding to those in the *typical chromatogram* for almond oil.

TESTS
Acid value
Not more than 2.0, Appendix X B. Use 5 g dissolved in 50 mL of the prescribed mixture of solvents.

www.webofpharma.com

Peroxide value
Not more than 10, Appendix X F.

Relative density
0.911 to 0.920, Appendix V G.

Unsaponifiable matter
Not more than 0.7% w/w, Appendix X H, Method II. Use 5 g.

Apricot-kernel oil and peach-kernel oil
Shake 2 mL for 5 minutes with a mixture of 1 mL of *fuming nitric acid* and 1 mL of *water* and allow to separate. No pink or brown colour develops in either layer.

Foreign fixed oils
Carry out the test for *composition of fatty acids by gas chromatography*, Appendix X N. The fatty-acid fraction of the oil has the following composition.

Saturated fatty acids of chain length less than C_{16} Not more than 0.1%.

Palmitic acid 4.0 to 9.0%.

Palmitoleic acid (equivalent chain length on polyethylene glycol adipate, 16.3) Not more than 0.6%.

Margaric acid Not more than 0.2%.

Stearic acid Not more than 3.0%.

Oleic acid (equivalent chain length on polyethylene glycol adipate, 18.3) 62.0 to 86.0%.

Linoleic acid (equivalent chain length on polyethylene glycol adipate, 18.9) 20.0 to 30.0%.

Linolenic acid (equivalent chain length on polyethylene glycol adipate, 19.7) Not more than 0.4%.

Arachidic acid Not more than 0.1%.

Gadoleic acid (equivalent chain length on polyethylene glycol adipate, 20.3) Not more than 0.1%.

Behenic acid Not more than 0.1%.

Erucic acid (equivalent chain length on polyethylene glycol adipate, 22.3) Not more than 0.1%.

Sterols
Carry out the test for *sterols in fatty oils*, Appendix X N. The sterol fraction of the oil has the following composition.

Cholesterol Not more than 0.7%.

Campesterol Not more than 4.0%.

Stigmasterol Not more than 3.0%.

β-*Sitosterol* 73.0% to 87.0%.

Δ^5-*Avenasterol* At least 10.0%.

Δ^7-*Avenasterol* Not more than 3.0%.

Δ^7-*Stigmastenol* Not more than 3.0%.

Fucosterol Not more than 2.0%.

Brassicasterol Not more than 0.3%.

Sesame oil
Shake 10 mL with 5 mL of a mixture of 0.5 volume of a 0.35% v/v solution of *furfuraldehyde* in *acetic anhydride* and 4.5 volumes of *acetic anhydride* for 1 minute, filter through a filter paper impregnated with *acetic anhydride* and add 0.2 mL of *sulfuric acid*. No bluish green colour develops.

STORAGE
Almond Oil Ear Drops should be kept in a well-filled container and protected from light.

Compound Aluminium Paste

Baltimore Paste

DEFINITION
Compound Aluminium Paste contains 20% w/w of Aluminium Powder and 40% w/w of Zinc Oxide in a suitable hydrophobic liquid basis.

Extemporaneous preparation
The following formula and directions apply.

Aluminium Powder	200 g
Zinc Oxide	400 g
Liquid Paraffin	400 g

Mix the Aluminium Powder and the Zinc Oxide with the Liquid Paraffin until smooth.

The paste complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of aluminium, Al
15.8 to 20.0% w/w.

Content of zinc oxide, ZnO
37.0 to 42.0% w/w.

IDENTIFICATION
A. To 5 mL of solution A prepared in the Assay for aluminium add 2 mL of *ammonia buffer pH 10.9*, centrifuge and reserve the supernatant liquid. Dissolve the residue in the minimum quantity of 2M *hydrochloric acid* and add 0.25 mL of *ammonium acetate solution* and 0.25 mL of a 0.1% w/v solution of *mordant blue 3*. An intense purple colour is produced.

B. Add 2 mL of *sodium sulfide solution* to the supernatant liquid reserved in test A, centrifuge, dissolve the sediment in the minimum volume of 1M *sulfuric acid* and add 0.05 mL of a 0.1% w/v solution of *copper(II) sulfate* and 2 mL of *ammonium mercurithiocyanate reagent*. A violet precipitate is produced.

ASSAY
For aluminium
Disperse 1 g in a mixture of 20 mL of *hydrochloric acid* and 20 mL of *water* with the aid of gentle heat, filter, wash the filter with *water*, cool the combined filtrate and washings and dilute to 100 mL with *water* (solution A). Neutralise 10 mL of solution A to *congo red paper* with 5M *sodium hydroxide*, add 50 mL of 0.05M *disodium edetate VS*, heat on a water bath for 30 minutes, cool, add 3 g of *hexamine* and titrate the excess of disodium edetate with 0.05M *lead nitrate VS*, using *xylenol orange solution* as indicator, to a purplish red colour. Add 1 g of *sodium fluoride* to the resulting solution, heat on a water bath for 15 minutes, cool and continue the titration to a purplish red colour. The volume of 0.05M *lead nitrate VS* used in the second titration represents the amount of disodium edetate liberated from the complex. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.349 mg of Al.

For zinc oxide
The difference between the volume of 0.05M *disodium edetate VS* added in the Assay for aluminium and the total volume of 0.05M *lead nitrate VS* used represents the amount of zinc present. Each mL of 0.05M *disodium edetate VS* is equivalent to 4.068 mg of ZnO.

www.webofpharma.com

Aluminium Acetate Ear Drops

DEFINITION

Aluminium Sulfate	225 g
Calcium Carbonate	100 g
Tartaric Acid	45 g
Acetic Acid (33 per cent)	250 mL
Purified Water	750 mL

Extemporaneous preparation
The following directions apply.

Dissolve the Aluminium Sulfate in 600 mL of the Purified Water, add the Acetic Acid and then the Calcium Carbonate mixed with the remainder of the Purified Water and allow to stand for not less than 24 hours in a cool place, stirring occasionally. Filter, add the Tartaric Acid to the filtrate and mix.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of aluminium, Al
1.7 to 1.9% w/v.

CHARACTERISTICS
A clear liquid.

Weight per mL
1.06 to 1.08 g, Appendix V G.

ASSAY
Dilute 10 mL to 100 mL with *water*. To 10 mL of the resulting solution add 40 mL of 0.05M *disodium edetate VS*, 90 mL of *water* and 0.15 mL of *methyl red solution*. Neutralise by the drop wise addition of 1M *sodium hydroxide* and warm on a water bath for 30 minutes. Cool, add 1 mL of 2M *nitric acid* and 5 g of *hexamine* and titrate with 0.05M *lead nitrate VS* using 0.5 mL of *xylenol orange solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.349 mg of Al.

STORAGE
Aluminium Acetate Ear Drops should be kept in a well-filled container.

When aluminium acetate solution or Burow's Solution is prescribed or demanded a solution complying with the requirements of this monograph shall be dispensed or supplied.

Aluminium Chloride Solution
Aluminium Chloride Cutaneous Solution

DEFINITION
Aluminium Chloride Solution is a *cutaneous solution*. It contains Aluminium Chloride Hexahydrate in a suitable ethanolic vehicle.

PRODUCTION
In making Aluminium Chloride Solution, Industrial Methylated Spirits may be used provided that the law and the statutory regulations governing the use of Industrial Methylated Spirits are observed.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of aluminium chloride hexahydrate, $AlCl_3,6H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Dilute the solution with *water* to produce a solution containing 2% w/v of Aluminium Chloride Hexahydrate. The solution yields reaction A characteristic of *aluminium salts* and reaction A characteristic of *chlorides*, Appendix VI.

TESTS
Iron
Dilute the solution being examined with *water* to produce a solution containing 10.0% w/v of Aluminium Chloride Hexahydrate. 10 mL of this solution complies with the *limit test for iron*, Appendix VII (10 ppm, determined with respect to the content of aluminium chloride hexahydrate).

Ethanol
Not less than 70.0% v/v, Appendix VIII F.

ASSAY
To a weighed quantity containing about 0.4 g of Aluminium Chloride Hexahydrate add 25 mL of *water* and carry out the *complexometric titration of aluminium*, Appendix VIII D. Each mL of 0.1M *disodium edetate VS* is equivalent to 24.14 mg of $AlCl_3,6H_2O$.

If the declared content is in terms of weight in volume, determine the *weight per mL* of the solution, Appendix V G, and hence calculate the content of $AlCl_3,6H_2O$, weight in volume.

STORAGE
Aluminium Chloride Solution should be stored upright.

LABELLING
The label states that the solution is flammable.

Aluminium Hydroxide Oral Suspension

DEFINITION
Aluminium Hydroxide Oral Suspension is an aqueous suspension of Dried Aluminium Oxide together with varying quantities of basic aluminium carbonate. It contains the equivalent of 4% w/w of aluminium oxide and has a peppermint flavour.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of aluminium oxide, Al_2O_3
The equivalent of 3.5 to 4.4% w/w.

CHARACTERISTICS
A white suspension from which small amounts of clear liquid may separate on standing. It may exhibit thixotropic properties.

IDENTIFICATION
A solution in 2M *hydrochloric acid* yields the reaction characteristic of *aluminium salts*, Appendix VI.

TESTS
Alkalinity
pH, when diluted with an equal volume of *carbon dioxide-free water*, not more than 7.5, Appendix V L.

Neutralising capacity
Disperse 5 g in 100 mL of *water*, heat to 37°, add 100 mL of *0.1M hydrochloric acid VS* previously heated to 37° and stir continuously, maintaining the temperature at 37°. The pH of the solution, at 37°, after 10, 15 and 20 minutes, is not less than 1.8, 2.3 and 3.0 respectively and at no time during this period is it more than 4.0. Add 10 mL of *0.5M hydrochloric acid VS* previously heated to 37°, stir continuously for 1 hour

www.webofpharma.com

maintaining the temperature at 37° and titrate the solution with *0.1M sodium hydroxide VS* to pH 3.5. Not more than 50 mL of *0.1M sodium hydroxide VS* is required.

Ammonium salts
To 25 g in an ammonia-distillation apparatus add 25 mL of 5M *sodium hydroxide* and 250 mL of *water*, distil about 100 mL, collecting the distillate in 25 mL of *0.1M hydrochloric acid VS*, and titrate the excess of acid with *0.1M sodium hydroxide VS* using *methyl red solution* as indicator. Not less than 20.0 mL of *0.1M sodium hydroxide VS* is required.

Arsenic
Dissolve 2.0 g in 18 mL of *brominated hydrochloric acid* and 32 mL of *water*. 25 mL of the resulting solution complies with the *limit test for arsenic*, Appendix VII (1 ppm).

Chloride
Dissolve 0.30 g in 2 mL of 2M *nitric acid*, boil, cool, dilute to 250 mL with *water* and filter. 15 mL of the filtrate complies with the *limit test for chlorides*, Appendix VII (0.3%).

Sulfate
Dissolve 0.50 g in 5 mL of 2M *hydrochloric acid*, boil, cool, dilute to 200 mL with *water* and filter. 12.5 mL of the filtrate, diluted to 15 mL with 2M *hydrochloric acid*, complies with the *limit test for sulfates*, Appendix VII (0.5%).

Microbial contamination
Carry out a quantitative evaluation for Enterobacteria and certain other Gram-negative bacteria, Appendix XVI B1. 0.01 mL of the preparation gives a negative result, Table I (most probable number of bacteria per gram fewer than 10^2).

ASSAY
Dissolve 5 g in 3 mL of *hydrochloric acid* by warming on a water bath, cool to below 20° and dilute to 100 mL with *water*. To 20 mL of this solution add 40 mL of 0.05M *disodium edetate VS*, 80 mL of *water* and 0.15 mL of *methyl red solution* and neutralise by the drop wise addition of 1M *sodium hydroxide*. Heat on a water bath for 30 minutes, add 3 g of *hexamine* and titrate with 0.05M *lead nitrate VS* using 0.5 mL of *xylenol orange solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.549 mg of Al_2O_3.

STORAGE
Aluminium Hydroxide Oral Suspension should be kept at a temperature not exceeding 30°. It should not be allowed to freeze.

Aluminium Hydroxide Chewable Tablets

Chewable Aluminium Hydroxide Tablets

Aluminium Hydroxide Tablets

DEFINITION
Aluminium Hydroxide Chewable Tablets contain, in each, 500 mg of Dried Aluminium Hydroxide in a suitable basis with a peppermint flavour.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aluminium oxide, Al_2O_3
Not less than the equivalent of 0.225 g.

IDENTIFICATION
The powdered tablets yield the reaction characteristic of *aluminium salts*, Appendix VI.

TESTS
Disintegration
The requirement for Disintegration does not apply to Aluminium Hydroxide Chewable Tablets.

Neutralising capacity
Pass a sufficient quantity of the powder prepared for use in the Assay through a sieve with a nominal mesh aperture of 150 µm. Mix a quantity of the powder containing 0.5 g of Dried Aluminium Hydroxide with a small quantity of *water* to give a smooth paste and slowly add further quantities of *water* to a total volume of 100 mL. Warm to 37°, add 100 mL of *0.1M hydrochloric acid VS* previously heated to 37° and stir continuously, maintaining the temperature at 37°. The pH of the solution at 37° after 10, 15 and 20 minutes is not less than 1.6, 1.8 and 2.2 respectively and at no time during this period is it more than 4.0. Add 10 mL of *0.5M hydrochloric acid VS* previously heated to 37°, stir continuously for 1 hour maintaining the temperature at 37° and titrate the solution with *0.1M sodium hydroxide VS* to pH 3.5. Subtract the volume of *0.1M sodium hydroxide VS* from 150 to obtain the number of mL of *0.1M hydrochloric acid VS* required for the neutralisation. Calculate the number of mL of *0.1M hydrochloric acid VS* required for the total weight of the tablets taken for the Assay and divide by the number of tablets. The result is not less than 115.

ASSAY
Weigh and powder 20 tablets, avoiding frictional heating. Dissolve a quantity of the powder containing 0.4 g of Dried Aluminium Hydroxide as completely as possible in a mixture of 3 mL of *hydrochloric acid* and 3 mL of *water* by warming on a water bath, cool to below 20° and dilute to 100 mL with *water*. To 20 mL of this solution add 40 mL of 0.05M *disodium edetate VS*, 80 mL of *water* and 0.15 mL of *methyl red solution* and neutralise by the drop wise addition of *1M sodium hydroxide VS*. Heat on a water bath for 30 minutes, add 3 g of *hexamine* and titrate with 0.05M *lead nitrate VS* using 0.5 mL of *xylenol orange solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.549 mg of Al_2O_3.

Alverine Capsules

Action and use
Smooth muscle relaxant; antispasmodic.

DEFINITION
Alverine Capsules contain Alverine Citrate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of alverine citrate, $C_{20}H_{27}N,C_6H_8O_7$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of the capsules containing 0.12 g of Alverine Citrate with 5 mL of *methanol* for 5 minutes, filter through a 0.45-µm PTFE filter, evaporate the filtrate to dryness under a stream of nitrogen using a warm water bath and dry the residue for 1 hour at 50° under vacuum. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of alverine citrate (*RS 409*).

www.webofpharma.com

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 20-mL sample of the medium and filter through a 0.45-µm filter, discarding the first 10 mL of the filtrate. Dilute, if necessary, with 0.1M *hydrochloric acid* to produce a solution expected to contain about 0.006% w/v of Alverine Citrate.

(2) 0.006% w/v of *alverine citrate BPCRS* in 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the total content of alverine citrate, $C_{20}H_{27}N$, $C_6H_8O_7$, in the medium from the chromatograms obtained and using the declared content of $C_{20}H_{27}N,C_6H_8O_7$ in *alverine citrate BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of *methanol* to a quantity of the mixed contents of the capsules containing 0.6 g of Alverine Citrate. Mix with the aid of ultrasound for 1 hour, allow to cool to room temperature, add sufficient *methanol* to produce 100 mL, mix and filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 1 volume of the resulting solution to 5 volumes with *methanol*.

(3) *alverine citrate impurity standard solution BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 4 times the retention time of alverine.

MOBILE PHASE

0.01M *sodium dodecyl sulfate* in a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile*, adjusting the pH of the mixture to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *alverine citrate impurity standard solution BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to alverine citrate impurity A, is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.2%);

the area of any peak corresponding to alverine citrate impurity C is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.5%);

the area of any peak corresponding to alverine citrate impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (2) (1.4%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the mixed contents of the capsules containing 0.6 g Alverine Citrate add 100 mL of *methanol*, mix with the aid of ultrasound for 1 hour and add sufficient *methanol* to produce 500 mL. Stir vigorously for 10 minutes and filter (Cellulose nitrate filter 0.45 µm is suitable). Dilute 1 volume of the filtrate to 2 volumes with *water*.

(2) Dilute 1 volume of a 0.6% w/v solution of *alverine citrate BPCRS* in *methanol* to 10 volumes with *water*.

(3) *alverine citrate impurity standard solution BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained closely resembles the reference chromatogram supplied with *alverine citrate impurity standard solution BPCRS*.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{27}N,C_6H_8O_7$ in the capsules using the declared content of $C_{20}H_{27}N,C_6H_8O_7$ in *alverine citrate BPCRS*.

STORAGE

Alverine Capsules should be stored in a dry place and not above 25°.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, C and D listed under Alverine Citrate.

www.webofpharma.com

Amantadine Capsules

Action and use
Viral replication inhibitor (influenza A); dopamine receptor agonist; treatment of influenza and Parkinson's disease.

DEFINITION
Amantadine Capsules contain Amantadine Hydrochloride.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of amantadine hydrochloride, $C_{10}H_{17}N,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of the capsules containing 0.2 g of Amantadine Hydrochloride in 10 mL of 0.1M *hydrochloric acid* on a water bath and filter. Add 1 mL of 5M *sodium hydroxide* to the filtrate and extract with 5 mL of *dichloromethane*. Filter the lower layer through *anhydrous sodium sulfate*, wash the sodium sulfate with 2 mL of *dichloromethane* and evaporate the solution to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of amantadine *(RS 006)*.

TESTS

Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Prepare a 0.6% w/v solution of *naphthalene* (internal standard) in *toluene* (solution A).

(1) After 45 minutes withdraw a sample of the medium and filter. Transfer 3 mL to a centrifuge tube. Add 1 mL of 5M *sodium hydroxide* and 2 mL of solution A. Shake the tube for approximately 10 minutes and allow the layers to separate. Use the top layer for injection.

(2) To 60 mL of a 1.2% w/v solution of *amantadine hydrochloride BPCRS* in the medium, add 20 mL of 5M *sodium hydroxide* and 40 mL of solution A. Shake the flask for approximately 10 minutes, and allow the layers to separate. Use the top layer for injection.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (30 m × 0.25 mm) bonded with a 0.25-µm layer of *methylpolysiloxane* (Agilent DB-1 is suitable).

(b) Use *helium* as the carrier gas at 1 mL per minute.

(c) Use the gradient conditions described below.

(d) Use an inlet temperature of 180°.

(e) Use a flame ionisation detector at a temperature of 250°.

(f) Inject 1 µL of each solution

(g) Use a split ratio of 1:10.

Time (Minutes)	Temperature	Comment
0-16	100°→200°	linear gradient
16-20	200°	isothermal

DETERMINATION OF CONTENT

Calculate the total content of amantadine hydrochloride, $C_{10}H_{17}N,HCl$, in the medium using the ratios of the area of the peak corresponding to amantadine to the area of the peak due to the internal standard in the chromatograms obtained with solutions (1) and (2), and using the declared content of $C_{10}H_{17}N,HCl$ in *amantadine hydrochloride BPCRS*.

LIMITS

The amount of amantadine hydrochloride released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *gas chromatography*, Appendix III B using the following solutions.

(1) Dissolve a quantity of the contents of the capsules containing 0.1 g of Amantadine Hydrochloride in 2 mL of *water*, add 2 mL of a 20% w/v solution of *sodium hydroxide* and 10 mL of *toluene* and shake for 10 minutes. Separate the upper layer, dry over *anhydrous sodium sulfate* and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with *toluene*. Further dilute 1 volume to 10 volumes with *toluene*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

When the chromatograms are recorded under the prescribed conditions, the retention time of amantadine is about 7 minutes.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.2% by *normalisation*;

the sum of the areas of any *secondary peaks* is not greater than 1.0% by *normalisation*.

Disregard any peak with an area less than 0.1% by *normalisation*.

ASSAY
Weigh the contents of 20 capsules. Mix and powder if necessary. Carry out the method for *gas chromatography*, Appendix III B. Prepare a 0.6% w/v solution of *naphthalene* (internal standard) in *toluene* (solution A).

(1) Dissolve a quantity of the contents of the capsules containing 0.1 g of Amantadine Hydrochloride in 2 mL of *water*, add 2 mL of a 20% w/v solution of *sodium hydroxide* and 10 mL of solution A and shake for 10 minutes. Separate the upper layer, dry over *anhydrous sodium sulfate* and filter.

(2) Prepare the solution in the same manner as for solution (1) but using 0.1 g of *amantadine hydrochloride BPCRS* in 10 mL of *water* in place of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{17}N,HCl$ in the capsules using the ratios of the area of the peak corresponding to amantadine to the area of the peak due to the internal standard in the chromatograms obtained with solutions (1) and (2), and using the declared content of $C_{10}H_{17}N,HCl$ in *amantadine hydrochloride BPCRS*.

www.webofpharma.com

Amantadine Oral Solution

Action and use
Viral replication inhibitor (influenza A); dopamine receptor agonist; treatment of influenza and Parkinson's disease.

DEFINITION
Amantadine Oral Solution is a solution of Amantadine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of amantadine hydrochloride, $C_{10}H_{17}N,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Acidify a volume of the oral solution containing 0.1 g of Amantadine Hydrochloride with 1M *hydrochloric acid* and extract with three 15-mL quantities of *ether*. Discard the upper layer, add 2M *sodium hydroxide* to the retained lower layer until it is just alkaline and extract with two 10-mL quantities of *dichloromethane*. Filter the combined lower layers through *anhydrous sodium sulfate* and evaporate the filtrate to dryness under reduced pressure. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of amantadine *(RS 006)*.

TESTS
Related substances
Carry out the method for *gas chromatography*, Appendix III B using the following solutions.

(1) Mix, with swirling, a volume of the oral solution containing 0.1 g of Amantadine Hydrochloride with 4 mL of a 20% w/v solution of *sodium hydroxide*, add 10 mL of *toluene*, shake the mixture for 10 minutes, allow the layers to separate and use the upper layer.

(2) Dilute 1 volume of solution (1) to 100 volumes with *toluene*. Further dilute 1 volume to 10 volumes with *toluene*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (30 m × 0.25 mm) bonded with a 0.25-µm layer of *methylpolysiloxane* (Agilent DB-1 is suitable).

(b) Use *helium* as the carrier gas at 1 mL per minute.

(c) Use the gradient conditions described below.

(d) Use an inlet temperature of 180°.

(e) Use a flame ionisation detector at a temperature of 250°.

(f) Inject 1 µL of each solution

(g) Use a split ratio of 1:10.

Time (Minutes)	Temperature	Comment
0-16	100°→200°	linear gradient
16-20	200°	isothermal

When the chromatograms are recorded under the prescribed conditions, the retention time of amantadine is about 7 minutes.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.2% by *normalisation*;

the sum of the areas of any *secondary peaks* is not greater than 1.0% by *normalisation*.

Disregard any peak with an area less than 0.1% by *normalisation*.

ASSAY
Carry out the method for *gas chromatography*, Appendix III B. Prepare a 0.6% w/v solution of *naphthalene* (internal standard) in *toluene* (solution A).

(1) Mix, with swirling, a weighed quantity of the oral solution containing 0.1 g of Amantadine Hydrochloride with 4 mL of a 20% w/v solution of *sodium hydroxide* and add 10 mL of solution A. Shake the mixture for 10 minutes, allow the layers to separate and use the upper layer.

(2) Prepare the solution in the same manner as solution (1) using 0.1 g of *amantadine hydrochloride BPCRS* in 10 mL of water in place of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{17}N,HCl$ in the oral solution using the ratios of the area of the peak corresponding to amantadine to the area of the peak due to the internal standard in the chromatograms obtained with solutions (1) and (2) and using the declared content of $C_{10}H_{17}N,HCl$ in *amantadine hydrochloride BPCRS*.

STORAGE
Amantadine Oral Solution should be protected from light.

Amikacin Injection

Action and use
Aminoglycoside antibacterial.

DEFINITION
Amikacin Injection is a sterile solution of Amikacin Sulfate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of amikacin, $C_{22}H_{43}N_5O_{13}$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
In the test for Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

Acidity
pH, 3.5 to 5.5, Appendix V L.

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a volume of the injection, if necessary, to produce a solution containing the equivalent of 1.0% w/v of amikacin.

(2) 0.013% w/v of *amikacin sulfate BPCRS*.

(3) 1.0% w/v of *amikacin for system suitability EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

(5) *Water* (blank solution).

Derivatise the solutions prior to analysis using the following method.

Transfer 0.2 mL of the solution being examined to a ground glass stoppered vial. Add 2 mL of a 1.0% w/v solution of *2,4,6-trinitrobenzenesulfonic acid*. To this solution add 3 mL of *pyridine* and close the vial tightly. Shake vigorously for

www.webofpharma.com

30 seconds and heat on a water bath at 75° for 2 hours. Cool in cold water for 2 minutes and add 2 mL of *glacial acetic acid*. Shake vigorously for 30 seconds. Store the derivatised solutions at 10° prior to and during analysis.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 340 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 4 times the retention time of amikacin.

MOBILE PHASE

30 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 6.5 with a 2.2% w/v solution of *potassium hydroxide*, and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the relative retention of amikacin impurity A with reference to that of amikacin (retention time, about 12 minutes), is about 1.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to amikacin and impurity A is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the sum of the areas of all secondary peaks is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peaks corresponding to the peaks in the chromatogram obtained with solution (5), any peak eluting before the principal peak, and any peak with an area of less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing the equivalent of 10 mg per mL of amikacin (solution A). The endotoxin limit concentration of solution A is 3.3 IU of endotoxin per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the injection containing the equivalent of 37 mg of amikacin to 10 mL.

(2) 0.50% w/v of *amikacin sulfate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Supelco Discovery C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 200 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.18% w/v of *sodium octanesulfonate* and 2.00% w/v *sodium sulfate* in a mixture of 68 volumes of *acetonitrile R1*, 40 volumes of 0.2M potassium dihydrogen phosphate adjusted to pH 3.0 with *dilute phosphoric acid*, and 936 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{43}N_5O_{13}$ in the injection using the declared content of $C_{22}H_{43}N_5O_{13},2H_2SO_4$ in *amikacin sulfate BPCRS*. Each mg of $C_{22}H_{43}N_5O_{13},2H_2SO_4$ is equivalent to 0.7488 mg of $C_{22}H_{43}N_5O_{13}$.

LABELLING

The strength is stated in terms of the equivalent amount of amikacin in a suitable dose-volume.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Amikacin Sulfate.

Amiloride Tablets

Action and use

Sodium channel blocker; potassium-sparing diuretic.

DEFINITION

Amiloride Tablets contain Amiloride Hydrochloride Dihydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous amiloride hydrochloride, $C_6H_8ClN_7O,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing the equivalent of 0.5 mg of anhydrous amiloride hydrochloride with 100 mL of *0.1M hydrochloric acid* and filter. The *light absorption* of the filtrate, Appendix II B, in the range 230 to 380 nm exhibits two maxima, at 285 nm and at 361 nm.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (5).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *acetonitrile* and 3 volumes of *water*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 17.5 mg of anhydrous amiloride hydrochloride with 10 mL of a mixture of 1 volume of *acetonitrile* and 3 volumes of *water*, disperse with the aid of ultrasound for 5 minutes and centrifuge.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 10 volumes.

(4) 0.0010% w/v of *methyl 3,5-diamino-6-chloropyrazine-2-carboxylate BPCRS*.

(5) 0.175% w/v of *amiloride hydrochloride BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 5 times the retention time of the peak due to amiloride.

MOBILE PHASE

5 volumes of *tetramethylammonium hydroxide solution*, 250 volumes of *acetonitrile* and 745 volumes of *water*, the pH of the mixture being adjusted to 7.0 using a mixture of 1 volume of *orthophosphoric acid* and 9 volumes of *water*.

Adjust the concentration of *acetonitrile* so that, in the chromatogram obtained with solution (4), the retention time of methyl 3,5-diamino-6-chloropyrazine-2-carboxylate is 5 to 6 minutes (an increase in the concentration of *acetonitrile* reduces the retention time). Adjust the concentrations of tetramethylammonium hydroxide and orthophosphoric acid so that, in the chromatogram obtained with solution (2), the retention time of amiloride is 9 to 12 minutes keeping the pH at 7.0 (an increase in the concentrations reduces the retention time).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *signal-to-noise ratio* of the peak due to amiloride in the chromatogram obtained is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than the area of the peak due to methyl 3,5-diamino-6-chloropyrazine-2-carboxylate in the chromatogram obtained with solution (4) (0.6%).

Disregard any peak with an area less than 0.1 times the area of the peak due to methyl 3,5-diamino-6-chloropyrazine-2-carboxylate in the chromatogram obtained with solution (4) (0.06%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 10 mg of anhydrous amiloride hydrochloride add 10 mL of *methanol* and shake for 10 minutes. Add 60 mL of 0.1M *sodium hydroxide*, shake for 30 minutes and dilute to 100 mL with 0.1M *sodium hydroxide*. Immediately transfer 4 mL of the resulting solution to a stoppered centrifuge tube and add 10 mL of 0.1M *sodium hydroxide* and 20 mL of *tributyl orthophosphate* that has been washed with *water* before use. Shake vigorously for 2 minutes and centrifuge for 5 minutes. Remove the upper layer and repeat the extraction with a further 20 mL of the water-washed tributyl orthophosphate. To the combined extracts add 2 mL of *methanol* and sufficient of the water-washed tributyl orthophosphate to produce 50 mL and centrifuge to remove traces of water. Measure the *absorbance* of the resulting solution at the maximum at 363 nm, Appendix II B, using in the reference cell a mixture of 48 volumes of the water-washed tributyl orthophosphate and 2 volumes of *methanol*. Calculate the content of $C_6H_8ClN_7O$, HCl taking 692 as the value of A(1%, 1 cm) at the maximum at 363 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrousamiloride hydrochloride.

Aminophylline Injection

Action and use

Non-selective phosphodiesterase inhibitor; treatment of reversible airways obstruction.

DEFINITION

Aminophylline Injection is a solution of Aminophylline or Aminophylline Hydrate in Water for Injections free from carbon dioxide.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of theophylline, $C_7H_8N_4O_2$

81.4 to 90.0% of the stated amount of aminophylline.

Content of ethylenediamine, $C_2H_8N_2$

Not more than 29.5% of the amount of anhydrous theophylline determined in the Assay for theophylline.

IDENTIFICATION

A. To a volume containing the equivalent of 0.1 g of aminophylline add 0.5 mL of 2M *hydrochloric acid* with constant stirring, allow to stand for a few minutes and filter. Wash the residue with small quantities of cold *water*, recrystallise from hot *water* and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of theophylline *(RS 333)*.

B. To a volume containing the equivalent of 0.1 g of Aminophylline add 2 mL of a 1% w/v solution of *copper(II) sulfate* and shake. A purplish blue colour is produced.

C. Evaporate a volume containing the equivalent of 60 mg of aminophylline to dryness in a porcelain dish. To the residue add 1 mL of *hydrochloric acid* and 0.1 g of *potassium chlorate* and evaporate to dryness. A reddish residue is produced, which becomes purple on exposure to the vapour of 5M *ammonia*.

TESTS

Alkalinity

pH, 8.8 to 10.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (80%)*.

(1) Dilute the injection, if necessary, to produce a solution containing the equivalent of 0.01% w/v of aminophylline.

(2) Dilute 1 volume of solution (1) to 100 volumes. Further dilute 1 volume of this solution to 5 volumes.

(3) Dissolve 80 mg of *theobromine* (impurity G) in 5 mL of 0.2M *sodium hydroxide*, and dilute to 100 mL with *methanol (80%)*. Dilute 1 volume of the resulting solution and 1 volume of 0.08% w/v of *theophylline BPCRS* to 10 volumes, and further dilute 4 volumes to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Waters Spherisorb ODS2 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 25°.

(e) Use a detection wavelength of 272 nm.

(f) Inject 10 µL of each solution.

(g) Allow the chromatography to proceed for 4 times the retention time of theophylline.

MOBILE PHASE

70 volumes of *acetonitrile* and 930 volumes of *sodium acetate buffer.*

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to theophylline (retention time about 7 minutes) are: impurity C, about 0.2; impurity B, about 0.39; impurity D, about 0.45; impurity E, about 0.54; impurity G, about 0.6; impurity F, about 1.4; impurity A, about 2.2.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to theophylline and impurity G is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

For theophylline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (80%)*.

(1) Dilute the injection, if necessary, to produce a solution containing the equivalent of 0.01% w/v of aminophylline.

(2) 0.008% w/v of *theophylline BPCRS*.

(3) Dissolve 80 mg of *theobromine* (impurity G) in 5 mL of 0.2M *sodium hydroxide* and dilute to 100 mL with *methanol (80%)*. Dilute 1 volume of the resulting solution and 1 volume of 0.08% w/v of *theophylline BPCRS* to 10 volumes, and further dilute 4 volumes to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_7H_8N_4O_2$ in the injection using the declared content of $C_7H_8N_4O_2$ in *theophylline BPCRS*.

For ethylenediamine

To a volume containing the equivalent of 0.5 g of aminophylline add, if necessary, sufficient *water* to produce 20 mL and titrate with *0.05M sulfuric acid VS*, using *bromocresol green solution* as indicator, until the colour changes from blue to green. Each mL of *0.05M sulfuric acid VS* is equivalent to 3.005 mg of $C_2H_8N_2$. Calculate the weight of $C_2H_8N_2$ present for each g of $C_7H_8N_4O_2$ found.

LABELLING

When the injection is prepared from Aminophylline Hydrate, Theophylline or Theophylline Hydrate the strength is stated in terms of the equivalent amount of aminophylline in a suitable dose-volume.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aminophylline Hydrate.

Aminophylline Tablets

Action and use

Non-selective phosphodiesterase inhibitor; treatment of reversible airways obstruction.

DEFINITION

Aminophylline Tablets contain Aminophylline or Aminophylline Hydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of theophylline, $C_7H_8N_4O_2$

81.4 to 90.0% of the stated amount of aminophylline.

Content of ethylenediamine, $C_2H_8N_2$

13.5 to 15.0% of the stated amount of aminophylline.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 0.5 g of aminophylline with 20 mL of *water*, filter, add to the filtrate with constant stirring 1 mL of *2M hydrochloric acid*, allow to stand for a few minutes and again filter. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of theophylline *(RS 333)*.

B. Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of aminophylline with 5 mL of *water* and filter. To 2 mL of the filtrate add 2 mL of a 1% w/v solution of *copper(II) sulfate* and shake. A purplish blue colour is produced.

TESTS

Dissolution of theophylline

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 7.0*, at a temperature of 37°, as the medium.

PROCEDURE

Withdraw a sample of 10 mL of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 7.0*, if necessary to produce a solution expected to contain 0.001% w/v of theophylline.

(2) 0.001% w/v solution of *theophylline BPCRS* in *phosphate buffer pH 7.0*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with particles of silica the surface of which has been modified with chemically-bonded phenyl groups (5 µm) (Apex Phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *methanol* and 55 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the total content of theophylline, $C_7H_8N_4O_2$, in the medium using the declared content of $C_7H_8N_4O_2$ in *theophylline BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of aminophylline with 50 mL of the mobile phase and add sufficient of the mobile phase to produce 100 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Further dilute 1 volume of this solution to 5 volumes with the mobile phase.

(3) Dissolve 10 mg of *theobromine* (impurity G) in the mobile phase, add 5 mL of solution (1) and dilute to 100 mL with the mobile phase. Dilute 1 volume of this solution to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (7 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3.5 times the retention time of theophylline.

MOBILE PHASE

7 volumes of *acetonitrile* and 93 volumes of a 0.136% w/v solution of *sodium acetate* containing 0.50% v/v of *glacial acetic acid*.

When the chromatograms are recorded under the prescribed conditions the retention time relative to theophylline (about 6 minutes) is: impurity G, about 0.6.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity G and theophylline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

For theophylline

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 80 mg of aminophylline with a mixture of 20 mL of 0.1M *sodium hydroxide* and 60 mL of *water* for 10 minutes, add sufficient *water* to produce 200 mL, mix and filter. Dilute 5 mL of the filtrate to 250 mL with 0.01M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_7H_8N_4O_2$ taking 650 as the value of A(1%, 1 cm) at the maximum at 275 nm.

For ethylenediamine

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 0.3 g of aminophylline with 20 mL of *water*, heat to 50° for 30 minutes and titrate with *0.05M sulfuric acid VS*, using *bromocresol green solution* as indicator, until the colour changes from blue to green. Each mL of *0.05M sulfuric acid VS* is equivalent to 3.005 mg of $C_2H_8N_2$.

STORAGE

Aminophylline Tablets should be kept in an airtight container and protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous aminophylline.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aminophylline.

Aminophylline Prolonged-release Tablets

Prolonged-release Aminophylline Tablets

Aminophylline Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Non-selective phosphodiesterase inhibitor; treatment of reversible airways obstruction.

DEFINITION

Aminophylline Prolonged-release Tablets contain Aminophylline or Aminophylline Hydrate. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Aminophylline. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of theophylline, $C_7H_8N_4O_2$

81.4 to 90.0% of the stated amount of aminophylline.

Content of ethylenediamine, $C_2H_8N_2$

13.5 to 15.0% of the stated amount of aminophylline.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 0.5 g of aminophylline with 20 mL of *water*, filter, add to the filtrate with constant stirring 1 mL of 2M *hydrochloric acid*, allow to stand for a few minutes and again filter. The *infrared absorption spectrum* of the residue,

www.webofpharma.com

Appendix II A, is concordant with the *reference spectrum* of theophylline *(RS 333)*.

B. Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of aminophylline with 5 mL of *water* and filter. To 2 mL of the filtrate add 2 mL of a 1% w/v solution of *copper(II) sulfate* and shake. A purplish blue colour is produced.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of aminophylline with 50 mL of the mobile phase and add sufficient of the mobile phase to produce 100 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Further dilute 1 volume of this solution to 5 volumes with the mobile phase.

(3) Dissolve 10 mg of *theobromine* (impurity G) in the mobile phase, add 5 mL of solution (1) and dilute to 100 mL with the mobile phase. Dilute 1 volume of this solution to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (7 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3.5 times the retention time of theophylline.

MOBILE PHASE

7 volumes of *acetonitrile* and 93 volumes of a 0.136% w/v solution of *sodium acetate* containing 0.50% v/v of *glacial acetic acid*.

When the chromatograms are recorded under the prescribed conditions the retention time relative to theophylline (about 6 minutes) is: impurity G, about 0.6.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity G and theophylline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

Disregard any peak with an area less than half times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

For theophylline

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 80 mg of aminophylline with a mixture of 20 mL of 0.1M *sodium hydroxide* and 60 mL of *water* for 10 minutes, add sufficient *water* to produce 200 mL, mix and filter. Dilute 5 mL of the filtrate to 250 mL with 0.01M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_7H_8N_4O_2$ taking 650 as the value of A(1%, 1 cm) at the maximum at 275 nm.

For ethylenediamine

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 0.3 g of aminophylline with 20 mL of *water*, heat to 50° for 30 minutes and titrate with *0.05M sulfuric acid VS*, using *bromocresol green solution* as indicator, until the colour changes from blue to green. Each mL of *0.05M sulfuric acid VS* is equivalent to 3.005 mg of $C_2H_8N_2$.

STORAGE

Aminophylline Prolonged-release Tablets should be kept in an airtight container and protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous aminophylline.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aminophylline.

Amiodarone Infusion

Amiodarone Intravenous Infusion

Action and use

Potassium channel blocker; class III antiarrhythmic.

DEFINITION

Amiodarone Infusion is a sterile solution containing Amiodarone Hydrochloride. It is prepared by diluting Amiodarone Sterile Concentrate with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations.

AMIODARONE STERILE CONCENTRATE

DEFINITION

Amiodarone Sterile Concentrate is a sterile solution of Amiodarone Hydrochloride in a suitable diluent.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of amiodarone hydrochloride, $C_{25}H_{29}I_2NO_3,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a volume of the concentrate containing 0.3 g of Amiodarone Hydrochloride with three 25-mL quantities of *dichloromethane*. Dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to dryness. To the residue add 2 mL of 1M *sodium hydroxide* and extract with 25 mL of *ether*. Dry the extract over *anhydrous sodium sulfate*, filter and evaporate to dryness. Dry the residue obtained under reduced pressure over *phosphorus pentoxide* and dissolve in 2.5 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of amiodarone *(RS 008)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Colour of solution

Not more intense than *reference solution BY_4* or *GY_4*, Appendix IV B, Method II.

Iodides

Prepare a solution containing 1 volume *nitric acid*, 20 volumes of *water* and 80 volumes of *methanol* (solution A).

(1) Add 5.0 mL of a solution containing 0.0052% w/v of *potassium iodide* to a volume of the sterile concentrate containing 0.40 g of Amiodarone Hydrochloride and dilute to 50 mL with solution A.

(2) Dilute 10.0 mL of a solution containing 0.0052% w/v of *potassium iodide* to 50 mL with solution A.

Titrate solutions (1) and (2) with *0.001M silver nitrate VS* and determine the end point for each potentiometrically using a combined silver electrode. The volume used for the titration of solution (1) is not more than the volume required for the titration of solution (2) (500 ppm).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *acetonitrile (50%)*.

(1) Dilute a volume of the concentrate containing 50 mg of Amiodarone Hydrochloride to 20 mL.

(2) Dilute 1 volume of solution (1) to 500 volumes.

(3) 0.004% w/v of *amiodarone impurity D BPCRS*.

(4) 0.0005% w/v each of *amiodarone impurity D BPCRS* and *amiodarone impurity E EPCRS*.

(5) 0.1% w/v of *benzyl alcohol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 1.5 times the retention time of amiodarone.

MOBILE PHASE

Buffer solution pH 4.9. To 800 mL of *water*, add 3 mL of *glacial acetic acid*, adjust to pH 4.9 with *dilute ammonia R1* and dilute to 1000 mL with *water*.

30 volumes of *methanol*, 40 volumes of *acetonitrile* and 30 volumes of buffer solution pH 4.9.

When the chromatograms are recorded under the prescribed conditions the retention times relative to amiodarone (retention time about 24 minutes) are impurity D, about 0.3 and impurity E, about 0.4.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity D and impurity E is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1.6%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak due to benzyl alcohol and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *acetonitrile (50%)*.

(1) Dilute a volume of the concentrate containing 50 mg of Amiodarone Hydrochloride to 100 mL.

(2) 0.05% w/v of *amiodarone hydrochloride BPCRS*.

(3) 0.0005% w/v each of *amiodarone impurity D BPCRS* and *amiodarone impurity E EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and impurity E is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{29}I_2NO_3,HCl$ in the infusion using the declared content of $C_{25}H_{29}I_2NO_3,HCl$ in *amiodarone hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those under Amiodarone Hydrochloride.

STORAGE

Amiodarone Sterile Concentrate should be protected from light.

Amiodarone Oral Suspension

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Potassium channel blocker; class III antiarrhythmic.

DEFINITION

Amiodarone Oral Suspension is a suspension of Amiodarone Hydrochloride in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

Content of amiodarone hydrochloride, $C_{25}H_{29}I_2NO_3,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a volume of the oral suspension containing 0.3 g of Amiodarone Hydrochloride with three 25-mL quantities of

www.webofpharma.com

dichloromethane. Dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to dryness. To the residue add 2 mL of 1M *sodium hydroxide* and extract with 25 mL of *ether*. Dry the extract over *anhydrous sodium sulfate*, filter and evaporate to dryness. Dry the residue obtained under reduced pressure over *phosphorus pentoxide* for about 2 hours and dissolve in 2 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of amiodarone *(RS 008)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions. Use a volume of the oral suspension containing one dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of *methanol* to a quantity of the oral suspension containing 50 mg of Amiodarone Hydrochloride; shake for 15 minutes, cool, add sufficient *methanol* to produce 50 mL, mix well and filter through a 0.45-µm nylon filter. Dilute 1 volume of the filtrate to 2 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume of the resulting solution to 10 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(3) Dilute 1 volume of solution (2) to 4 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(4) Dissolve 5 mg of *amiodarone impurity D BPCRS* and 5 mg of *amiodarone impurity E EPCRS* in *methanol* and dilute to 25 mL with the same solvent. Dilute 1 volume of the solution to 200 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS-2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of the peak due to amiodarone.

MOBILE PHASE

30 volumes of *methanol*, 40 volumes of *acetonitrile* and 30 volumes of a mixture prepared in the following manner: to 800 mL of *water*, add 3 mL of *glacial acetic acid*, adjust to pH 4.9 with *dilute ammonia R1* and dilute to 1000 mL with *water*.

When the chromatograms are recorded under the prescribed conditions, the retention time of amiodarone is about 24 minutes. The retention times relative to amiodarone are: impurity A, about 0.26; impurity D, about 0.29; impurity E, about 0.37; impurity B, about 0.49; impurity C, about 0.55; impurity G, about 0.62; impurity F, about 0.69.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity D and impurity E is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D is not greater than 2.5 times the area of the peak due to impurity D in the chromatogram obtained with solution (4) (0.5%);

the area of any other *secondary peak* is not greater than the area of the peak due to amiodarone in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 5 times the area of the peak due to amiodarone in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the peak due to amiodarone in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral suspension containing 10 mg of Amiodarone Hydrochloride with sufficient mobile phase to produce 50 mL. Dilute 1 volume of this solution to 2 volumes with the mobile phase.

(2) 0.01% w/v of *amiodarone hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Spherisorb CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 244 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of 0.01M *sodium perchlorate* and 55 volumes of *acetonitrile*, adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{25}H_{29}I_2NO_3$, HCl, weight in volume, using the declared content of $C_{25}H_{29}I_2NO_3$,HCl in *amiodarone hydrochloride BPCRS*.

STORAGE

Amiodarone Oral Suspension should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A to G listed under Amiodarone Hydrochloride.

www.webofpharma.com

Amiodarone Tablets

Action and use
Potassium channel blocker; class III antiarrhythmic.

DEFINITION
Amiodarone Tablets contain Amiodarone Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of amiodarone hydrochloride, $C_{25}H_{29}I_2NO_3$,HCl
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.3 g of Amiodarone Hydrochloride with 25 mL of *dichloromethane*, filter and evaporate the filtrate to dryness. To the residue add 2 mL of 1M *sodium hydroxide* and extract with 25 mL of *ether*. Dry the extract over *anhydrous sodium sulfate*, filter and evaporate to dryness. Dry the residue obtained under reduced pressure over *phosphorus pentoxide* and dissolve in 2.5 mL of *dichloromethane*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of amiodarone *(RS 008)*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 50 mg of Amiodarone Hydrochloride with 50 mL of *methanol*, allow to cool and filter through a 0.45-µm PTFE filter. Dilute 1 volume of the solution to 2 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume of the resulting solution to 10 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(3) Dilute 1 volume of solution (2) to 4 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(4) Dissolve 10 mg each of *amiodarone impurity D BPCRS* and *amiodarone impurity E EPCRS* in *methanol* and dilute to 50 mL with the same solvent. Dilute 1 volume of the solution to 200 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS(2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature maintained at 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *methanol*, 40 volumes of *acetonitrile* and 30 volumes of a mixture prepared in the following manner: to 800 mL of *water*, add 3 mL of *glacial acetic acid*, adjust to pH 4.9 with *dilute ammonia R1* and dilute to 1000 mL with *water*.

SYSTEM SUITABILITY

The relative retention times with reference to amiodarone (retention time about 24 minutes) are: impurity A, about 0.26; impurity D, about 0.29; impurity E, about 0.37; impurity B, about 0.49; impurity C, about 0.55; impurity G, about 0.62; impurity F, about 0.69.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity D and impurity E is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D is not greater than 2.5 times the area of the peak due to impurity D in the chromatogram obtained with solution (4) (0.5%);

the area of any other *secondary peak* is not greater than the peak due to amiodarone in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 5 times the area of the peak due to Amiodarone in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the peak due to amiodarone in the chromatogram obtained with solution (3) (0.05%).

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 50 mg of Amiodarone Hydrochloride with 100 mL of *methanol*, allow to cool and filter through a 0.45-µm PTFE filter. Dilute 1 volume of the solution to 5 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(2) Dilute 1 volume of a 0.05% w/v solution of *amiodarone hydrochloride BPCRS* in *methanol* to 5 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(3) Dissolve 10 mg each of *amiodarone impurity D BPCRS* and *amiodarone impurity E EPCRS* in *methanol* and dilute to 50 mL with the same solvent. Dilute 1 mL of the solution to 200 mL with a mixture of equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and impurity E is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{29}I_2NO_3$,HCl in the tablets using the declared content of $C_{25}H_{29}I_2NO_3$,HCl in *amiodarone hydrochloride BPCRS*.

STORAGE
Amiodarone Tablets should be protected from light.

www.webofpharma.com

Amisulpride Oral Solution

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Amisulpride Oral Solution contains Amisulpride.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of amisulpride, $C_{17}H_{27}N_3O_4S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral solution with sufficient *methanol* to produce a solution containing 0.5% w/v of Amisulpride.

(2) 0.5% w/v of *amisulpride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 4 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

Shake 10 volumes of 6M *ammonia*, 25 volumes of *ethanol* and 65 volumes of *di-isopropyl ether*, allow to separate and use the upper layer.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 4.5 to 6.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution to produce a solution containing 0.1% w/v of Amisulpride.

(2) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of this solution to 5 volumes.

(3) 0.1% w/v of *amisulpride for system suitability BPCRS*.

(4) Dilute 1 volume of solution (2) to 4 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octylsilyl amorphous organosilica polymer* (5 µm) (Waters XTerra RP8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3 times the retention time of amisulpride.

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of a solution containing 0.68% w/v of *potassium dihydrogen phosphate* previously adjusted to pH 8.0 with 6M *ammonia*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to amisulpride (retention time about 10 minutes) are impurity E, about 0.2; impurity B, about 0.3; impurity F1, about 0.5 and impurity F2, about 0.6.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity E and impurity B is at least 2.0;

the *resolution* between the peaks due to impurity F1 and impurity F2 is at least 1.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurity B, impurity F1 and impurity F2 using the chromatogram obtained with solution (3) and the chromatogram supplied with *amisulpride for system suitability BPCRS*. Multiply the area of any peak corresponding to impurity B by a correction factor of 0.28. Combine the areas of the peaks corresponding to impurity F1 and impurity F2 (impurity F) and multiply by a correction factor of 1.45.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity E, impurity B and impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the oral solution with sufficient mobile phase to produce a solution containing 0.01% w/v of Amisulpride.

(2) 0.01% w/v of *amisulpride BPCRS* in the mobile phase.

(3) 0.1% w/v of *amisulpride for system suitability BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity E and impurity B is at least 2.0;

www.webofpharma.com

the *resolution* between the peaks due to impurity F isomer 1 and impurity F isomer 2 is at least 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{17}H_{27}N_3O_4S$, weight in volume, using the declared content of amisulpride in *amisulpride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

B. 4-amino-*N*-[(1-ethylpyrrolidin-2-yl)methyl]-5-(ethylsulfonyl)-2-hydroxybenzamide;

E. 4-amino-5-(ethylsulfonyl)-2-methoxybenzoic acid;

F. 4-amino-*N*-[(2*RS*)-1-ethyl-1-oxidopyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-methoxybenzamide (observed as two peaks due to enantiomers F1 and F2).

Amisulpride Tablets

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Amisulpride Tablets contain Amisulpride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of amisulpride, $C_{17}H_{27}N_3O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 100 mg of Amisulpride with 10 mL of *dichloromethane*, mix with the aid of ultrasound and filter. Evaporate the filtrate to dryness at a temperature not exceeding 30°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of amisulpride (*RS 462*).

TESTS

Dissolution

Complies with the dissolution test for tablets and capsules, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, diluted with the dissolution medium if necessary to produce a solution containing 0.0011% w/v of Amisulpride, at the maximum at about 280 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a 0.0011% w/v solution of *amisulpride BPCRS* in 0.1M *hydrochloric acid* using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of amisulpride, $C_{17}H_{27}N_3O_4S$, in the medium from the absorbances obtained and using the declared content of $C_{17}H_{27}N_3O_4S$, in *amisulpride BPCRS*.

LIMITS

The amount of amisulpride released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of powdered tablets containing 0.4 g of Amisulpride with 90 mL of the mobile phase, add sufficient mobile phase to produce 100 mL and filter (using an ash-free filter paper). Dilute 1 volume of the filtrate to 4 volumes.

(2) Dilute 1 volume of solution (1) to 100 volumes, and dilute 1 volume of this solution to 5 volumes.

(3) 0.1% w/v of *amisulpride for system suitability BPCRS*.

(4) Dilute 1 volume of solution (2) to 4 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octylsilyl amorphous organosilica polymer* (5 µm) (Waters XTerra RP8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3 times the retention time of amisulpride.

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of a solution containing 0.68% w/v of *potassium dihydrogen orthophosphate* previously adjusted to pH 8.0 with 6M *ammonia*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to amisulpride (retention time about 10 minutes) are impurity E, about 0.2; impurity B, about 0.3; impurity F1, about 0.5 and impurity F2, about 0.6.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity E and impurity B is at least 2.0;

the *resolution* between the peaks due to impurity F isomer 1 and impurity F isomer 2 is at least 1.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurity B, impurity F1 and impurity F2 using the chromatogram obtained with solution (3) and the chromatogram supplied with *amisulpride for system suitability BPCRS*. Multiply the area of any peak corresponding to impurity B by a correction factor of 0.28. Combine the areas of the 2 isomer peaks corresponding to impurity F1 and impurity F2 (impurity F) and multiply by a correction factor of 1.45.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity E, impurity B and impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

www.webofpharma.com

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) Shake a quantity of powdered tablets containing 0.4 g of Amisulpride with 90 mL of the mobile phase, add sufficient mobile phase to produce 100 mL and filter (using an ash-free filter paper). Dilute 1 volume of filtrate to 40 volumes.

(2) 0.01% w/v of *amisulpride BPCRS*.

(3) 0.1% w/v of *amisulpride for system suitability BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity E and impurity B is at least 2.0;

the *resolution* between the peaks due to impurity F isomer 1 and impurity F isomer 2 is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{27}N_3O_4S$ in the tablets using the declared content of amisulpride in *amisulpride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

B. 4-amino-*N*-[(1-ethylpyrrolidin-2-yl)methyl]-5-(ethylsulfonyl)-2-hydroxybenzamide;

E. 4-amino-5-(ethylsulfonyl)-2-methoxybenzoic acid;

F. 4-amino-*N*-[[(2*RS*)-1-ethyl-1-oxidopyrrolidin-2-yl] methyl]-5-(ethylsulfonyl)-2-methoxybenzamide (observed as two peaks due to enantiomers F1 and F2).

Amitriptyline Oral Solution

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Amitriptyline Oral Solution is a solution of Amitriptyline Hydrochloride in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of amitriptyline hydrochloride, $C_{20}H_{23}N,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in 1 volume of 2M *hydrochloric acid* and 9 volumes of *ethanol (96%)*.

(1) Dilute a quantity of the oral solution containing 50 mg of Amitriptyline Hydrochloride to 25 mL.

(2) 0.2% w/v of *amitriptyline hydrochloride BPCRS*.

(3) 0.4% w/v each of *amitriptyline hydrochloride BPCRS* and *nortriptyline hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine immediately under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *diethylamine*, 15 volumes of *ethyl acetate* and 85 volumes of *cyclohexane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and colour to that of the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS

ACIDITY

pH, 2.5 to 3.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a quantity of the oral solution containing 50 mg of Amitriptyline Hydrochloride to 50 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes, further dilut1 2 volume of this solution to 5 volumes.

(3) 0.001% w/v of *amitriptyline hydrochloride BPCRS*, 0.001% w/v of *cyclobenzaprine hydrochloride BPCRS* (impurity B) and 0.0002% w/v of *dibenzosuberone BPCRS* (impurity A).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped polar embedded octadecylsilyl amorphous organosilica polymer for chromatography* (5 µm) (Waters X-Terra RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 3.5 times the retention time of amitriptyline.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of a 0.523% w/v solution of *dipotassium hydrogen orthophosphate*, previously adjusted to pH 7.0 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to

www.webofpharma.com

amitriptyline (retention time about 12 minutes) are: impurity B, about 0.9 and impurity A, about 2.7.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between cyclobenzaprine and amitriptyline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to dibenzosuberone is not greater than the area of the peak due to dibenzosuberone in the chromatogram obtained with solution (3) (0.2%);

the area of any peak corresponding to cyclobenzaprine is not greater than 0.2 times the area of the peak due cyclobenzaprine in the chromatogram obtained with solution (3) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of impurities is not greater than 0.50%;

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution containing 10 mg of Amitriptyline Hydrochloride to 100 mL.

(2) 0.01% w/v of *amitriptyline hydrochloride BPCRS*.

(3) 0.001% w/v of *amitriptyline hydrochloride BPCRS*, 0.001% w/v of *cyclobenzaprine hydrochloride BPCRS* and 0.0002% w/v of *dibenzosuberone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between cyclobenzaprine and amitriptyline is at least 2.0.

DETERMINATION OF CONTENT

Determine the weight per mL of the Oral Solution, Appendix V G, and calculate the content of $C_{20}H_{23}N$,HCl, weight in volume, using the declared content of $C_{20}H_{23}N$, HCl in *amitriptyline hydrochloride BPCRS*.

STORAGE

Amitriptyline Oral Solution should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under *Amitriptyline Hydrochloride*.

Amitriptyline Tablets

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Amitriptyline Tablets contain Amitriptyline Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of amitriptyline hydrochloride, $C_{20}H_{23}N$,HCl

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 20 mg of Amitriptyline Hydrochloride with 10 mL of *acetone*, filter and evaporate to dryness. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of amitriptyline hydrochloride *(RS 501)*.

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules, Appendix XII B1*.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography, Appendix III D*, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with the dissolution medium if necessary, to produce a solution expected to contain 0.0011% w/v of Amitriptyline Hydrochloride.

(2) 0.0011% w/v of *amitriptyline hydrochloride BPCRS* in the dissolution medium.

(3) 0.001% w/v each of *amitriptyline hydrochloride BPCRS* and *cyclobenzaprine hydrochloride BPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer for chromatography* (5µm) (Waters X-Terra RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of a 0.523% w/v solution of *dipotassium hydrogen orthophosphate*, previously adjusted to pH 7.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cyclobenzaprine hydrochloride and amitriptyline hydrochloride is at least 2.0.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the total content of $C_{20}H_{23}N$,HCl in the medium using the declared content of $C_{20}H_{23}N$,HCl in *amitriptyline hydrochloride BPCRS*.

LIMITS

The amount of $C_{20}H_{23}N$,HCl released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the powdered tablets containing 50 mg of Amitriptyline Hydrochloride with 25 mL of the mobile phase, dilute to 50 mL with the same solvent and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes, further dilute 1 volume of this solution to 5 volumes.

(3) 0.001% w/v of *amitriptyline hydrochloride BPCRS*, 0.001% w/v of *cyclobenzaprine hydrochloride BPCRS* (impurity B) and 0.00025% w/v of *dibenzosuberone BPCRS* (impurity A).

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Dissolution may be used with an injection volume of 10 µL and, for solution (1), a run time of 3 times the retention time of the peak due to amitriptyline.

When the chromatograms are recorded under the prescribed conditions the retention times relative to amitriptyline (retention time about 12 minutes) are; impurity B, about 0.9 and impurity A, about 2.7.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and amitriptyline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to dibenzosuberone is not greater than the area of the peak due to dibenzosuberone in the chromatogram obtained with solution (3) (0.25%);

the area of any peak corresponding to cyclobenzaprine hydrochloride is not greater than 0.2 times the area of the peak due to cyclobenzaprine hydrochloride in the chromatogram obtained with solution (3) (0.2%);

the area of any other *secondary peak* is not more than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of impurities is not greater than 0.50%;

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) *For film-coated tablets* Add 50 mL of 0.1M *hydrochloric acid* to 10 tablets, shake vigorously until the tablets are completely disintegrated, add 100 mL of *methanol* and shake for 30 minutes. Dilute the suspension to 200 mL with *methanol*, centrifuge and dilute a volume of the supernatant liquid containing 25 mg of Amitriptyline Hydrochloride to 100 mL with *methanol (50%)*.

For sugar-coated tablets Weigh and powder 20 tablets. Shake a quantity of the powder containing 50 mg of Amitriptyline Hydrochloride with 50 mL of 0.1M *hydrochloric acid* for 30 minutes, add 100 mL of *methanol* and shake for 30 minutes. Dilute the suspension to 200 mL with *water*, centrifuge and use the supernatant liquid.

(2) Dissolve 50 mg of *amitriptyline hydrochloride BPCRS* in 10 mL of *methanol* and dilute to 200 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.03M *sodium hexanesulfonate* in a mixture of equal volumes of *water* and *acetonitrile*, adjusted to pH 4.5 by the addition of *glacial acetic acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{23}N$,HCl in the tablets using the declared content of $C_{20}H_{23}N$,HCl in *amitriptyline hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Amitriptyline Hydrochloride.

Amlodipine Oral Solution

Action and use

Calcium channel blocker.

DEFINITION

Amlodipine Oral Solution contains Amlodipine Besilate in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of amlodipine, $C_{20}H_{25}ClN_2O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the oral solution containing the equivalent of 5 mg of amlodipine with 20 mL of *dichloromethane* for 30 minutes. Centrifuge, allow to separate and use the lower layer.

(2) 0.035% w/v of *amlodipine besilate BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *octadecylsilyl silica gel* (Macherey Nagel RP-18 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

www.webofpharma.com

(e) After removal of the plate, dry in air and examine under *ultraviolet light (366 nm)*.

MOBILE PHASE

2 volumes of a 10% w/v solution of *ammonia*, 4 volumes of *methanol* and 17 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position to the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in a mixture of 45 volumes of 0.03M *potassium dihydrogen orthophosphate* and 55 volumes of *methanol*.

(1) Dilute a quantity of the oral solution to produce a solution containing the equivalent of 0.025% w/v of amlodipine.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 5 volumes.

(3) 0.025% w/v of *amlodipine for peak identification EPCRS*.

(4) 0.00025% w/v of *amlodipine impurity 1 BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (2.6 µm) (Kinetex C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 10 µL of each solution.

Mobile phase A 45 volumes of 0.03M *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*, and 55 volumes of *methanol*.

Mobile phase B 30 volumes of 0.03M *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*, and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the relative retentions with reference to amlodipine (retention time about 8 minutes) are: impurity D, about 0.5; impurity F, about 0.7; impurity E, about 1.5, impurity G, about 1.7, impurity B, about 2.0, impurity 1, about 2.1 and impurity A, about 3.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-8	100	0	isocratic
8-13	100→0	0→100	linear gradient
13-34	0	100	isocratic
34-35	0→100	100→0	linear gradient
35-45	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity F and amlodipine is at least 5.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) due to impurities D, E and F using the chromatogram obtained with solution (3) and identify any peak due to impurity 1 using the chromatogram obtained with solution (4). Multiply the area of any peaks corresponding to impurity D and impurity 1 by a correction factor of 2.9 and any peak corresponding to impurity E by a correction factor of 1.3.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to impurity E or F is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5% of each);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in a mixture of 45 volumes of 0.03M *potassium dihydrogen orthophosphate* and 55 volumes of *methanol*.

(1) Dilute a weighed quantity of the oral solution to produce a solution containing the equivalent of 0.005% w/v of amlodipine.

(2) 0.0069% w/v of *amlodipine besilate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (2.6 µm) (Kinetex C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

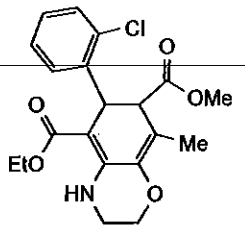
45 volumes of 0.03M *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*, and 55 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to amlodipine is less than 2.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of amlodipine,



www.webofpharma.com

$C_{20}H_{25}ClN_2O_5$, weight in volume using the declared content of $C_{20}H_{25}ClN_2O_5$ in *amlodipine besilate BPCRS*.

STORAGE
Amlodipine Oral Solution should be stored at a temperature of 2° to 8°.

LABELLING
The quantity of the active ingredient is stated in terms of the equivalent amount of amlodipine.

IMPURITIES
The impurities limited by the requirements of this monograph include A, B, D, E, F and G listed under Amlodipine Besilate and:

1. 5-ethyl 7-methyl 6-(2-chlorophenyl)-8-methyl-3,4,6,7-tetrahydro-2*H*-1,4-benzoxazine-5,7-dicarboxylate

Amlodipine Besilate Tablets

Action and use
Calcium channel blocker.

DEFINITION
Amlodipine Besilate Tablets contain Amlodipine Besilate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of amlodipine, $C_{20}H_{25}ClN_2O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing the equivalent of 50 mg of amlodipine with 10 mL of *methanol*, filter and evaporate to dryness. Dry the residue at 40° to 60°. The infrared absorption spectrum of the residue, Appendix II A, is concordant with the *reference spectrum* of amlodipine besilate *(RS 489)*. The absence of peaks at about 1570 cm^{-1}, 1345 cm^{-1} and 875 cm^{-1} distinguishes between amlodipine maleate *(RS 491)*. The presence of peaks at about 995 cm^{-1}, and 730 cm^{-1}, and the absence of a peak at about 780 cm^{-1}, distinguishes between amlodipine mesilate *(RS 490)*.

TESTS

Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 with a PTFE-coated or non-metallic paddle, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.01M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 20 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, diluted with the dissolution medium if necessary, to produce a solution expected to contain the equivalent of 0.00056% w/v of amlodipine, at 238 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a 0.00078% w/v solution of *amlodipine besilate BPCRS* in dissolution medium using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of amlodipine, $C_{20}H_{25}ClN_2O_5$, in the medium from the absorbances obtained and using the declared content of $C_{20}H_{25}ClN_2O_5$ in *amlodipine besilate BPCRS*.

LIMITS

The amount of amlodipine released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in a mixture of 45 volumes of 0.03M *potassium dihydrogen orthophosphate* and 55 volumes of *methanol* (solution A).

(1) Disperse a quantity of the powdered tablets containing the equivalent of 25 mg of amlodipine in 10 mL of *water*. Add 50 mL of solution A and mix with the aid of ultrasound for at least 20 minutes. Allow to cool, and dilute to 100 mL with solution A. Centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 5 volumes.

(3) 0.025% w/v of *amlodipine for peak identification EPCRS*.

(4) 0.00025% w/v of *amlodipine impurity 1 BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (2.6 µm) (Kinetex C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 10 µL of each solution.

Mobile phase A 45 volumes of 0.03M *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*, and 55 volumes of *methanol*.

Mobile phase B 30 volumes of 0.03M *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*, and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retentions relative to amlodipine (retention time about 8 minutes) are: impurity D, about 0.5; impurity F, about 0.7; impurity E, about 1.5; impurity G, about 1.7; impurity B, about 2.0; impurity 1, about 2.1 and impurity A, about 3.5.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-8	100	0	isocratic
8-13	100→0	0→100	linear gradient
13-34	0	100	isocratic
34-35	0→100	100→0	linear gradient
35-45	100	0	re-equilibration

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity F and amlodipine is at least 5.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) due to impurities D and E using the chromatogram obtained with solution (3) and identify any peak due to impurity 1 using the chromatogram obtained with solution (4). Multiply the area of any peaks corresponding to impurity D and impurity 1 by a correction factor of 2.9 and any peak corresponding to impurity E by a correction factor of 1.3.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D or impurity 1 is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5% of each);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution B 15 volumes of *acetonitrile*, 35 volumes of *methanol* and 50 volumes of 0.7% v/v of *triethylamine* in *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

(1) Disperse with the aid of ultrasound 10 whole tablets in 150 mL of solution B and dilute to produce 500 mL with the same solution. Filter through a 0.45-µm nylon filter and dilute the filtrate with sufficient solution B to produce a solution containing 0.0012% w/v of amlodipine.

(2) 0.0017% w/v of *amlodipine besilate BPCRS* in solution B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

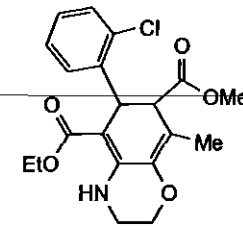
MOBILE PHASE

30 volumes of 0.7% v/v of *triethylamine* in *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 35 volumes of *acetonitrile* and 35 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to amlodipine is less than 2.5.

DETERMINATION OF CONTENT



Calculate the content of amlodipine, $C_{20}H_{25}ClN_2O_5$, in the tablets using the declared content of $C_{20}H_{25}ClN_2O_5$ in *amlodipine besilate BPCRS*.

LABELLING

The quantity of the active ingredient is stated in terms of the equivalent amount of amlodipine.

IMPURITIES

The impurities limited by the requirements of this monograph include A, B, D, E, F and G listed under Amlodipine Besilate and:

1. 5-ethyl 7-methyl 6-(2-chlorophenyl)-8-methyl-3,4,6,7-tetrahydro-2*H*-1,4-benzoxazine-5,7-dicarboxylate

Aromatic Ammonia Solution

Sal Volatile Solution

DEFINITION

Ammonium Bicarbonate	25 g
Nutmeg Oil	0.3 mL
Lemon Oil	0.5 mL
Ethanol (90 per cent)	37.5 mL
Strong Ammonia Solution	67.5 mL
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation

The following directions apply.

Dissolve the Ammonium Bicarbonate in 800 mL of the Purified Water. Separately dissolve the Lemon Oil and the Nutmeg Oil in the Ethanol (90 per cent). Add the ethanolic solution to the aqueous solution and add the Strong Ammonia Solution and sufficient Purified Water to produce 1000 mL. Add 25 g of previously sterilised Purified Talc, shake, allow to stand for a few hours, shaking occasionally, and filter.

Content of free ammonia, NH_3

1.12 to 1.25% w/v.

Content of ammonium carbonate, $(NH_4)_2CO_3$

2.76 to 3.24% w/v.

TESTS

Ethanol content

2.6 to 3.5% v/v when determined by the following method.

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions:

(1) 1.5% v/v of *absolute ethanol* and 1.5% v/v of *propan-1-ol* (internal standard).

(2) Dilute a volume of the preparation being examined with *water* to contain between 1.0% and 2.0% v/v of ethanol.

(3) Prepare solution in the same manner as solution (2) but adding sufficient of the internal standard to produce a final concentration of 1.5% v/v.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a column (1.5 m × 4 mm) packed with porous polymer beads (100 to 120 mesh) (Porapak Q and Chromosorb 101 are suitable).

(b) Use *helium* as the carrier gas at 1.7 mL per minute.

(c) Use isothermal conditions maintained at 150°.

(d) Use an inlet temperature of 170°.

(e) Use a flame ionisation detector at a temperature of 170°.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the percentage content of ethanol in the solution from the areas of the peaks due to ethanol in the chromatograms obtained with solutions (1) and (3).

Weight per mL

0.980 to 1.005 g, Appendix V G.

ASSAY

For free ammonia

To 20 mL add 50 mL of *1M hydrochloric acid VS*, boil, cool and titrate the excess of acid with *1M sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of *1M hydrochloric acid VS*, after subtraction of the volume of *1M sodium hydroxide VS* required in the Assay for ammonium carbonate, is equivalent to 17.03 mg of NH_3.

For ammonium carbonate

To 20 mL add 25 mL of *1M sodium hydroxide VS* and 40 mL of *barium chloride solution*, heat on a water bath for 15 minutes, cool, add 10 mL of *formaldehyde solution* previously neutralised to *thymol blue solution* and titrate the excess of alkali with *1M hydrochloric acid VS*, using *thymol blue solution* as indicator, to the grey colour indicative of pH 8.8. Each mL of *1M sodium hydroxide VS* is equivalent to 48.04 mg of $(NH_4)_2CO_3$.

Dilute Ammonia Solution

DEFINITION

Dilute Ammonia Solution contains 10% w/w of ammonia. It is prepared by diluting Strong Ammonia Solution with freshly boiled and cooled Purified Water.

Content of ammonia, NH_3

9.5 to 10.5% w/w.

TESTS

Relative density

0.958 to 0.962, Appendix V G.

ASSAY

Weigh 6 g into 50 mL of *1M hydrochloric acid VS* and titrate the excess of acid with *1M sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of *1M hydrochloric acid VS* is equivalent to 17.03 mg of NH_3.

When ammonia solution is prescribed or demanded, Dilute Ammonia Solution shall be dispensed or supplied.

Aromatic Ammonia Spirit

Sal Volatile Spirit

DEFINITION

Nutmeg Oil	3 mL
Lemon Oil	5 mL
Ethanol (90 per cent)	750 mL
Ammonium Bicarbonate	25 g
Strong Ammonia Solution	67.5 mL
Purified Water	Sufficient to produce 1000 mL

Extemporaneous preparation

The following directions apply.

Distil a mixture of the Lemon Oil, the Nutmeg Oil, the Ethanol (90 per cent) and 375 mL of Purified Water. Reserve the first 875 mL of distillate. Distil a further 55 mL and add the Ammonium Bicarbonate and the Strong Ammonia Solution to the distillate. Heat on a water bath to 60° in a sealed bottle of not less than 120 mL capacity, shaking occasionally, until solution is complete, cool, filter through absorbent cotton, mix the filtrate with the reserved distillate, add sufficient Purified Water to produce 1000 mL and mix.

The spirit complies with the requirements stated under Spirits and with the following requirements.

Content of free ammonia, NH_3

1.12 to 1.30% w/v.

Content of ammonium carbonate, $(NH_4)_2CO_3$

2.76 to 3.24% w/v.

TESTS

Ethanol content

64 to 70% v/v, Appendix VIII F.

Weight per mL

0.880 to 0.893 g, Appendix V G.

ASSAY

For free ammonia

To 20 mL add 50 mL of *1M hydrochloric acid VS*, boil, cool and titrate the excess of acid with *1M sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of *1M hydrochloric acid VS*, after subtraction of the volume of *1M sodium hydroxide VS* required in the Assay for ammonium carbonate, is equivalent to 17.03 mg of NH_3.

For ammonium carbonate

To 20 mL add 25 mL of *1M sodium hydroxide VS* and 40 mL of *barium chloride solution*, heat on a water bath for 15 minutes, cool, add 10 mL of *formaldehyde solution* previously neutralised to *thymol blue solution* and titrate the excess of alkali with *1M hydrochloric acid VS*, using *thymol blue solution* as indicator, to the grey colour indicative of pH 8.8. Each mL of *1M sodium hydroxide VS* is equivalent to 48.04 mg of $(NH_4)_2CO_3$.

www.webofpharma.com

Strong Ammonium Acetate Solution

DEFINITION

Ammonium Bicarbonate	470 g
Glacial Acetic Acid	453 g
Strong Ammonia Solution	A sufficient quantity
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.

Dissolve the Ammonium Bicarbonate by adding gradually to the Glacial Acetic Acid diluted with 350 mL of Purified Water. Add Strong Ammonia Solution until 0.05 mL of the resulting solution diluted with 0.5 mL of *water* gives a full blue colour with 0.05 mL of *bromothymol blue solution R3* and a full yellow colour with 0.05 mL of *thymol blue solution*; about 100 mL of Strong Ammonia Solution is required. Add sufficient Purified Water to produce 1000 mL.

Content of ammonium acetate, $C_2H_7NO_2$
55.0 to 60.0% w/v.

TESTS

Acidity or alkalinity
pH of a 10% v/v solution, 7.0 to 8.0, Appendix V L.

Weight per mL
1.085 to 1.095 g, Appendix V G.

ASSAY
To 5 mL add 50 mL of *water* and 12 mL of *formaldehyde solution* previously neutralised to *phenolphthalein solution R1* and titrate with *1M sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of *1M sodium hydroxide VS* is equivalent to 77.08 mg of $C_2H_7NO_2$.

STORAGE
Strong Ammonium Acetate Solution should be kept in lead-free glass containers.

LABELLING
When ammonium acetate solution or dilute ammonium acetate solution is prescribed or demanded, Strong Ammonium Acetate Solution diluted to eight times its volume with freshly boiled and cooled Purified Water, shall be dispensed or supplied.

Ammonium Chloride Mixture

Ammonium Chloride Oral Solution

DEFINITION
Ammonium Chloride Mixture is an *oral solution* containing 10% w/v of Ammonium Chloride in a suitable vehicle containing Aromatic Ammonia Solution and Liquorice Liquid Extract.

Extemporaneous preparation
It is recently prepared according to the following formula.

Ammonium Chloride	100 g
Aromatic Ammonia Solution	50 mL
Liquorice Liquid Extract	100 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ammonium chloride, NH_4Cl
9.50 to 10.66% w/v.

ASSAY
To 1 mL add 20 mL of *water* and titrate with *0.1M silver nitrate VS* determining the end point potentiometrically. Each mL of *0.1M silver nitrate VS* is equivalent to 5.349 mg of NH_4Cl.

Amoxicillin Capsules

Action and use
Penicillin antibacterial.

DEFINITION
Amoxicillin Capsules contain Amoxicillin Trihydrate.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of amoxicillin, $C_{16}H_{19}N_3O_5S$
92.5 to 110.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of the capsules containing the equivalent of 0.5 g of amoxicillin with 5 mL of *water* for 5 minutes, filter, wash the residue first with *absolute ethanol* and then with *ether* and dry at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of amoxicillin trihydrate *(RS 011)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the residue in sufficient *sodium hydrogen carbonate solution* to produce a solution containing the equivalent of 0.25% w/v of amoxicillin.

(2) 0.25% w/v of *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

(3) 0.25% w/v of each of *amoxicillin trihydrate BPCRS* and *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of mobile phase A to a quantity of the mixed capsule contents containing the equivalent of 0.15 g of amoxicillin and shake for 15 minutes. Mix with the aid of ultrasound for 1 minute, add sufficient mobile phase A to produce 100 mL, mix and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) 0.0004% w/v of *cefadroxil BPCRS* and 0.003% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of a pH 5.0 buffer solution prepared in the following manner. To 250 mL of 0.2M *potassium dihydrogen orthophosphate* add 2M *sodium hydroxide* until the pH reaches 5.0 and add sufficient *water* to produce 1000 mL.

Mobile phase B 20 volumes of *acetonitrile* and 80 volumes of the pH 5.0 buffer solution.

Equilibrate the column with a mobile phase ratio A:B of 92:8. Inject solutions (1) and (2) and start the elution isocratically with the chosen mobile phase. Immediately after elution of the amoxicillin peak start a linear gradient elution to reach a mobile phase ratio A:B of 0:100 over a period of 25 minutes. Continue the chromatography with mobile phase B for 15 minutes then equilibrate the column for 15 minutes with the mobile phase chosen originally. Inject mobile phase A and use the same elution gradient to obtain a blank.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to amoxicillin and cefadroxil is at least 2.0. If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of not more than one *secondary peak* is greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of mobile phase A to a quantity of the mixed contents of 20 capsules containing the equivalent of 60 mg of amoxicillin and shake for 15 minutes. Mix with the aid of ultrasound for 1 minute, add sufficient mobile phase A to produce 100 mL, mix and filter (Whatman GF/C filter paper is suitable).

(2) 0.070% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

(3) 0.0004% w/v of *cefadroxil BPCRS* and 0.003% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

8 volumes of mobile phase B and 92 volumes of mobile phase A.

Mobile phase A 1 volume of *acetonitrile* and 99 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide*.

Mobile phase B 20 volumes of *acetonitrile* and 80 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to amoxicillin and cefadroxil is at least 2.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{19}N_3O_5S$ in the capsules from the chromatograms obtained and from the declared content of $C_{16}H_{19}N_3O_5S$ in *amoxicillin trihydrate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of amoxicillin.

Amoxicillin Injection

Action and use

Penicillin antibacterial.

DEFINITION

Amoxicillin Injection is a sterile solution of Amoxicillin Sodium in Water for Injections. It is prepared by dissolving Amoxicillin Sodium for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Amoxicillin Injection should be used immediately after preparation.

www.webofpharma.com

AMOXICILLIN SODIUM FOR INJECTION

DEFINITION

Amoxicillin Sodium for Injection is a sterile material consisting of Amoxicillin Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of amoxicillin, $C_{16}H_{19}N_3O_5S$
90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of amoxicillin sodium *(RS 010)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient *sodium hydrogen carbonate solution* to produce a solution containing the equivalent of 0.25% w/v of amoxicillin.

(2) 0.25% w/v of *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

(3) 0.25% w/v of each of *amoxicillin trihydrate BPCRS* and *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose it to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

C. Yields reaction B characteristic of *sodium salts*, Appendix VI.

TESTS

Alkalinity
pH of a solution containing the equivalent of 10% w/v of amoxicillin, 8.0 to 10.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of mobile phase A to a quantity of the contents of a sealed container containing the equivalent of 0.15 g of amoxicillin and shake for 15 minutes. Mix with the aid of ultrasound for 1 minute, add sufficient mobile phase A to produce 100 mL, mix and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Add 1 mL of *water* to 0.2 g of *amoxicillin trihydrate BPCRS*, shake and add, dropwise, *dilute sodium hydroxide solution* to obtain a solution. (The pH of the solution is about 8.5.) Store the solution at room temperature for 4 hours and dilute 0.5 mL to 50 mL with mobile phase A.

(4) 0.0004% w/v of *cefadroxil BPCRS* and 0.003% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A Mix 1 volume of *acetonitrile* and 99 volumes of a pH 5.0 buffer solution prepared in the following manner. To 250 mL of 0.2M *potassium dihydrogen orthophosphate* add 2M *sodium hydroxide* until the pH reaches 5.0 and add sufficient *water* to produce 1000 mL.

Mobile phase B Mix 20 volumes of *acetonitrile* and 80 volumes of the pH 5.0 buffer solution.

Equilibrate the column with a mobile phase ratio A:B of 92:8. Inject solutions (1) and (2) and start the elution isocratically with the chosen mobile phase. Immediately after elution of the amoxicillin peak start a linear gradient elution to reach a mobile phase ratio A:B of 1:100 over a period of 25 minutes. Continue the chromatography with mobile phase B for 15 minutes then equilibrate the column for 15 minutes with the mobile phase chosen originally. Inject mobile phase A and use the same elution gradient to obtain a blank.

Inject solution (3). The three main peaks eluted after the principal peak correspond to amoxicillin diketopiperazine, amoxicillin dimer and amoxicillin trimer. The retention times of these peaks relative to that of the principal peak are about 3.4, 4.1 and 4.5 respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to amoxicillin and cefadroxil is at least 2.0. If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to amoxicillin dimer is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the sum of the areas of all the *secondary peaks* is not greater than 9 times the area of the principal peak in the chromatogram obtained with solution (2) (9%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

www.webofpharma.com

Water
Not more than 4.0% w/w, Appendix IX C. Use 0.3 g.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg per mL of amoxicillin (solution A). The endotoxin limit concentration of solution A is 2.5 IU of endotoxin per mL.

ASSAY
Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of mobile phase A to a quantity of the mixed contents of the 10 containers containing the equivalent of 60 mg of amoxicillin and shake for 15 minutes. Mix with the aid of ultrasound for 1 minute, add sufficient mobile phase A to produce 100 mL, mix and filter (Whatman GF/C filter paper is suitable).

(2) 0.070% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

(3) 0.0004% w/v of *cefadroxil BPCRS* and 0.003% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

A mixture of 8 volumes of mobile phase B and 92 volumes of mobile phase A.

Mobile phase A Mix 1 volume of *acetonitrile* and 99 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide*.

Mobile phase B Mix 20 volumes of *acetonitrile* and 80 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to amoxicillin and cefadroxil is at least 2.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{19}N_3O_5S$ in a container of average content weight from the chromatograms obtained and from the declared content of $C_{16}H_{19}N_3O_5S$ in *amoxicillin trihydrate BPCRS*.

LABELLING
The label of the sealed container states the quantity of Amoxicillin Sodium contained in it in terms of the equivalent amount of amoxicillin.

Amoxicillin Oral Suspension

Action and use
Penicillin antibacterial.

DEFINITION
Amoxicillin Oral Suspension is a suspension of Amoxicillin Trihydrate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of amoxicillin, $C_{16}H_{19}N_3O_5S$
When freshly constituted not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral suspension with sufficient *sodium hydrogen carbonate solution* to produce a solution containing the equivalent of 0.25% w/v of amoxicillin.

(2) 0.25% w/v of *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

(3) 0.25% w/v of each of *amoxicillin trihydrate BPCRS* and *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose it to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity
pH, 4.0 to 7.0, Appendix V L.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral suspension containing the equivalent of 60 mg of amoxicillin with

www.webofpharma.com

sufficient mobile phase A to produce 100 mL, mix and filter (Whatman GF/C filter paper is suitable).

(2) 0.070% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

(3) 0.0004% w/v of *cefadroxil BPCRS* and 0.003% w/v of *amoxicillin trihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

8 volumes of mobile phase B and 92 volumes of mobile phase A.

Mobile phase A Mix 1 volume of *acetonitrile* and 99 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide.*

Mobile phase B Mix 20 volumes of *acetonitrile* and 80 volumes of a 25% v/v solution of 0.2M *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide.*

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to amoxicillin and cefadroxil is at least 2.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{19}N_3O_5S$, weight in volume, using the declared content of $C_{16}H_{19}N_3O_5S$ in *amoxicillin trihydrate BPCRS.*

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be kept at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of amoxicillin.

Amphotericin for Infusion

Amphotericin for Infusion from different manufacturers, whilst complying with the requirements of the monograph, is not interchangeable unless otherwise justified and authorised.

This monograph does not apply to formulations where Amphotericin is encapsulated in liposomes.

Action and use

Antifungal.

DEFINITION

Amphotericin for Infusion is a sterile material consisting of Amphotericin as a sodium deoxycholate complex, with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A. Dissolve a quantity of the contents of a sealed container containing the equivalent of 25 mg of amphotericin B in *methanol* and add sufficient *methanol* to produce 50 mL. Dilute 0.5 mL of this solution to 50 mL with *methanol.* The *light absorption* of the resulting solution, Appendix II B, in the range 300 to 450 nm exhibits three maxima, at 362, 381 and 405 nm. The ratio of the *absorbance* at the maximum at 362 nm to that at the maximum at 381 nm is 0.5 to 0.6. The ratio of the *absorbance* at the maximum at 381 nm to that at the maximum at 405 nm is about 0.9.

B. In the test for Related substances, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH of a 0.9% w/v solution, 7.2 to 8.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. Protect the solutions from light and use within 24 hours of preparation, except for solution (4) which should be injected immediately after preparation. Mix 1 volume of a 1% w/v solution of *ammonium acetate,* 1 volume of N-*methylpyrrolidone* and 2 volumes of *methanol* (solution A).

(1) Dissolve a quantity of the contents of a sealed container containing the equivalent of 20 mg of amphotericin B in 15 mL of N-*methylpyrrolidone,* immediately dilute to 50 mL with solution A and filter. Dilute 5 volumes of the filtrate to 25 volumes with solution A.

(2) Dissolve 20 mg of *amphotericin B EPCRS* in 15 mL of N-*methylpyrrolidone* and immediately dilute to 50 mL with solution A. Dilute 5 volumes of the resulting solution to 25 volumes with solution A.

(3) Dilute 1 volume of solution (2) to 100 volumes with solution A.

(4) Dissolve 20 mg of *nystatin EPCRS* in 15 mL of N-*methylpyrrolidone* and immediately dilute to 50 mL with solution A. Dilute 5 volumes of the resulting solution to 25 volumes with solution (2) and further dilute 2 volumes to 100 volumes with solution A.

(5) Dissolve 10 mg of *amphotericin B EPCRS* in 5 mL of N-*methylpyrrolidone* and immediately add 35 mL of a mixture of 1 volume of *methanol* and 4 volumes of *absolute ethanol.* Add 0.1 mL of *dilute hydrochloric acid,* mix and incubate at 25° for 2.5 hours. Add 10 mL of a 1% w/v solution of *ammonium acetate* and mix (generation of impurities B and C).

(6) Dissolve 4 mg of *amphotericin B for peak identification EPCRS* (containing impurities A and B) in 5 mL of N-*methylpyrrolidone* and immediately dilute to 50 mL with solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography* (3 µm) (ACE 3 C18 and YMC-Pack Pro are suitable).

(b) Use gradient elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use detection wavelengths of 303 nm and 383 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 1 volume of *methanol*, 3 volumes of *acetonitrile* and 6 volumes of a 0.42% w/v solution of *citric acid* previously adjusted to pH 4.7 using *concentrated ammonia*.

Mobile phase B 12 volumes of *methanol*, 20 volumes of a 0.42% w/v solution of *citric acid* previously adjusted to pH 3.9 using *concentrated ammonia* and 68 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	100	0	isocratic
3-23	100→70	0→30	linear gradient
23-33	70→0	30→100	linear gradient
33-40	0	100	isocratic

Use the chromatogram obtained with solution (6) to identify the peaks due to impurities A and B. When the chromatograms are recorded under the prescribed conditions the retention time of amphotericin B is about 16 minutes. The retention times relative to amphotericin B are: impurity B, about 0.75; impurity A, about 0.8; nystatin, about 0.85.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5) at 383 nm, the *resolution factor* between the peaks due to impurity B and impurity C is at least 1.5.

LIMITS

At a detection wavelength of 303 nm In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (2%);

the area of any other *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (4) (1%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

At a detection wavelength of 383 nm In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (3) (4%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (2%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

Total impurities The sum of the impurities detected at 303 nm and 383 nm is not greater than 15%.

Loss on drying

When dried over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.7 kPa, lose not more than 8.0% of their weight. Use 0.3 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of amphotericin B per mL (solution A). The endotoxin limit concentration of solution A is 50 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations of the British Pharmacopoeia, Powders for Injections.

Dissolve a quantity of the mixed contents of the 10 containers containing the equivalent of 50 mg of amphotericin B in 10 mL of *water for injections* and dilute to 100 mL with *dimethyl sulfoxide*. Dilute 5 mL of this solution to 100 mL with a phosphate buffer solution prepared by dissolving 35 g of *dipotassium hydrogen orthophosphate* in sufficient *water* to produce 1000 mL and adjusting the pH, if necessary, to 10.5 with *potassium hydroxide*. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of amphotericin B in the infusion taking each 1000 IU found to be equivalent to 1 mg of amphotericin B. For a container of average content weight, the upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated content.

STORAGE

Amphotericin for Infusion should be protected from light and stored at a temperature of 2° to 8°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of amphotericin B.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Amphotericin.

Ampicillin Capsules

Action and use

Penicillin antibacterial.

DEFINITION

Ampicillin Capsules contain Ampicillin or Ampicillin Trihydrate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ampicillin, $C_{16}H_{19}N_3O_4S$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the capsule contents containing the equivalent of 0.125 g of ampicillin with sufficient *sodium hydrogen carbonate solution* to produce 50 mL and filter.

(2) 0.25% w/v of *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

www.webofpharma.com

(3) 0.25% w/v of each of *ampicillin trihydrate BPCRS* and *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose it to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. Suspend a quantity of the capsule contents containing the equivalent of 10 mg of ampicillin in 1 mL of *water* and add 2 mL of a mixture of 2 mL of *cupri-tartaric solution R1* and 6 mL of *water.* A magenta-violet colour is produced immediately.

TESTS

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Shake a quantity of the mixed capsule contents containing the equivalent of 0.3 g of ampicillin with 80 mL of mobile phase A with the aid of ultrasound for 15 minutes, add sufficient mobile phase A to produce 100 mL and filter through a 0.4-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) 0.025% w/v of *anhydrous ampicillin BPCRS* and 0.002% w/v of *cefradine BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use gradient elution and the mobile phase described below. Equilibrate the column with a mobile phase ratio A:B of 85:15 and use this for the system suitability solution (3). Inject solutions (1) and (2) and start the elution isocratically with the chosen mobile phase. Immediately after elution of the ampicillin peak start the linear gradient elution.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 100 volumes of *acetonitrile* to 2000 volumes with *water.*

Mobile phase B Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 800 volumes of *acetonitrile* to 2000 volumes with *water.*

Time (minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 → 30	85 → 0	15 → 100	linear gradient
30 → 45	0	100	isocratic
45 → 60	85	15	re-equilibration

Inject mobile phase A and use the same elution gradient to obtain a blank.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ampicillin and cefradine is at least 3.0. If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Shake a quantity of the mixed contents of 20 capsules containing the equivalent of 60 mg of ampicillin with 80 mL of solution A for 15 minutes, dilute to 100 mL with the same solvent, filter and dilute 5 mL of the solution to 50 mL with solution A.

(2) 0.006% w/v of *anhydrous ampicillin BPCRS* in solution A.

(3) 0.025% w/v of *anhydrous ampicillin BPCRS* and 0.002% w/v of *cefradine BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

15 volumes of solution B and 85 volumes of solution A.

Solution A Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 100 volumes of *acetonitrile* to 2000 volumes with *water.*

Solution B Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 800 volumes of *acetonitrile* to 2000 volumes with *water.*

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ampicillin and cefradine is at least 3.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{19}N_3O_4S$ in the capsules using the declared content of $C_{16}H_{19}N_3O_4S$ in *anhydrous ampicillin BPCRS*.

LABELLING

When the active ingredient is Ampicillin Trihydrate, the quantity is stated in terms of the equivalent amount of ampicillin.

Ampicillin Injection

Action and use

Penicillin antibacterial.

DEFINITION

Ampicillin Injection is a sterile solution of Ampicillin Sodium in Water for Injections. It is prepared by dissolving Ampicillin Sodium for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Ampicillin Injection should be used immediately after preparation.

AMPICILLIN SODIUM FOR INJECTION

DEFINITION

Ampicillin Sodium for Injection is a sterile material consisting of Ampicillin Sodium, with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ampicillin, $C_{16}H_{19}N_3O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of ampicillin sodium *(RS 366)*. If the spectra are not concordant carry out the following procedure. Dissolve a quantity of the contents of the sealed container containing the equivalent of 0.25 g of ampicillin in 5 mL of *water*, add 0.5 mL of 2M *acetic acid*, mix and allow to stand for 10 minutes in ice. Filter through a sintered-glass filter (ISO 4793, porosity grade 3, is suitable), wash the residue with 2 to 3 mL of a mixture of 9 volumes of *acetone* and 1 volume of *water*, dry at 60° for 30 minutes and prepare a new spectrum of the residue. The spectrum of the residue is concordant with the *reference spectrum* of ampicillin trihydrate *(RS 013)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of the sealed container in sufficient *sodium hydrogen carbonate solution* to produce a solution containing the equivalent of 0.25% w/v of ampicillin.

(2) 0.25% w/v of *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

(3) 0.25% w/v of each of *ampicillin trihydrate BPCRS* and *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose it to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

A mixture of 10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Alkalinity

pH of a solution containing the equivalent of 10.0% w/v of ampicillin, 8.0 to 10.0, Appendix V L, measured within 10 minutes of preparing the solution.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the sealed container containing the equivalent of 0.3 g of ampicillin with 80 mL of mobile phase A with the aid of ultrasound for 15 minutes, add sufficient mobile phase A to produce 100 mL and filter through a 0.4-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Add 1 mL of *water* to 0.2 g of *anhydrous ampicillin BPCRS*. Heat the solution at 60° for 1 hour and dilute 0.5 mL to 50 mL with mobile phase A.

(4) 0.025% w/v of *anhydrous ampicillin BPCRS* and 0.002% w/v of *cefradine BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use gradient elution and the mobile phase described below. Equilibrate the column with a mobile phase ratio A:B of 85:15 and use this mobile phase for the system suitability solution (4). Inject solutions (1), (2) and (3) and start the elution isocratically with the chosen mobile phase. Immediately after elution of the ampicillin peak start the linear gradient elution.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A Dilute a mixture of 1 volume of *dilute acetic acid*, 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 100 volumes of *acetonitrile* to 2000 volumes with *water*.

www.webofpharma.com

Mobile phase B Dilute a mixture of 1 volume of *dilute acetic acid*, 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 800 volumes of *acetonitrile* to 2000 volumes with *water*.

Time (minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 → 30	85 → 0	15 → 100	linear gradient
30 → 45	0	100	isocratic
45 → 60	85	15	re-equilibration

Inject mobile phase A and use the same elution gradient to obtain a blank.

SYSTEM SUITABILITY

The chromatogram obtained with solution (3) shows a peak due to ampicillin and a peak due to ampicillin dimer which has a retention time relative to ampicillin of about 2.8.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to ampicillin and cefradine is at least 3.0. If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to ampicillin dimer is not greater than 4.5 times the area of the principal peak in the chromatogram obtained with solution (2) (4.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Water

Not more than 2.0% w/w, Appendix IX C. Use 0.3 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 9.5 mg of ampicillin per mL (solution A). The endotoxin limit concentration of solution A is 1.5 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of the 10 containers in sufficient of solution A to produce a solution containing the equivalent of 0.006% w/v of ampicillin.

(2) 0.006% w/v of *anhydrous ampicillin BPCRS* in solution A.

(3) 0.025% w/v of *anhydrous ampicillin BPCRS* and 0.002% w/v of *cefradine BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

15 volumes of solution B and 85 volumes of solution A.

Solution A Dilute a mixture of 1 volume of *dilute acetic acid*, 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 100 volumes of *acetonitrile* to 2000 volumes with *water*.

Solution B Dilute a mixture of 1 volume of *dilute acetic acid*, 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 800 volumes of *acetonitrile* to 2000 volumes with *water*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ampicillin and cefradine is at least 3.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{19}N_3O_4S$ in a container of average content weight using the declared content of $C_{16}H_{19}N_3O_4S$ in *anhydrous ampicillin BPCRS*.

LABELLING

The label of the sealed container states the quantity of Ampicillin Sodium contained in it in terms of the equivalent amount of ampicillin.

Ampicillin Oral Suspension

Action and use

Penicillin antibacterial.

DEFINITION

Ampicillin Oral Suspension is a suspension of Ampicillin or Ampicillin Trihydrate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ampicillin, $C_{16}H_{19}N_3O_4S$

When freshly constituted not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral suspension containing the equivalent of 0.125 g of ampicillin with sufficient *sodium hydrogen carbonate solution* to produce 50 mL.

(2) 0.25% w/v of *ampicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

(3) 0.25% w/v of each of *ampicillin trihydrate BPCRS* and *amoxicillin trihydrate BPCRS* in *sodium hydrogen carbonate solution*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 F_{254s} (RP-18) plates are suitable).

www.webofpharma.com

(b) Use the mobile phase described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose it to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 4.0 to 7.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral suspension containing the equivalent of 60 mg of ampicillin with sufficient solution A to produce 100 mL and dilute 5 mL of the resulting solution to 50 mL with solution A.

(2) 0.006% w/v of *anhydrous ampicillin BPCRS* in solution A.

(3) 0.025% w/v of *anhydrous ampicillin BPCRS* and 0.002% w/v of *cefradine BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

15 volumes of solution B and 85 volumes of solution A.

Solution A Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 100 volumes of *acetonitrile* to 2000 volumes with *water.*

Solution B Dilute a mixture of 1 volume of *dilute acetic acid,* 100 volumes of 0.2M *potassium dihydrogen orthophosphate* and 800 volumes of *acetonitrile* to 2000 volumes with *water.*

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ampicillin and cefradine is at least 3.0. If necessary, adjust the composition of the mobile phase to achieve the required resolution.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{19}N_3O_4S$, weight in volume, using the declared content of $C_{16}H_{19}N_3O_4S$ in *anhydrous ampicillin BPCRS.*

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be stored at the temperature and used within the period stated on the label.

LABELLING

When the active ingredient is Ampicillin Trihydrate, the quantity is stated in terms of the equivalent amount of ampicillin.

Anastrozole Tablets

Action and use

Aromatase inhibitor; treatment of breast carcinoma.

DEFINITION

Anastrozole Tablets contain Anastrozole.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anastrozole, $C_{17}H_{19}N_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 8 mg of Anastrozole add 10 mL of *diethyl ether,* mix with the aid of ultrasound and filter through a 0.45-µm filter (Nylon 66 is suitable). Add 0.4 g of *potassium bromide* to the residue and evaporate to dryness under a stream of nitrogen. Dry under vacuum at 50° for 1 hour. Triturate the residue with a further 0.4 g of *potassium bromide.* The *infrared absorption spectrum* of the powder, Appendix II A, is concordant with the *reference spectrum* of anastrozole *(RS 493).*

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules,* Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water,* at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with *water* if necessary, to produce a solution expected to contain 0.0001% w/v of Anastrozole.

(2) Dilute a 0.25% w/v solution of *anastrozole BPCRS* in *acetonitrile R1* with sufficient *water* to produce a solution containing 0.0001% w/v of anastrozole.

(3) 0.25% w/v *anastrozole BPCRS* and 0.075% w/v *methyl parahydroxybenzoate* in *acetonitrile R1.* Dilute with *water* to produce a solution containing 0.0001% w/v of anastrozole and 0.00003% w/v of methyl parahydroxybenzoate.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 3.2 mm) packed with octylsilyl and octadecylsilyl multi-alkyl silica gel for chromatography (5 µm) (Hichrom RPB C8/C18 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.75 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

1 volume of *trifluoroacetic acid*, 300 volumes of *acetonitrile R1* and 700 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between methyl parahydroxybenzoate and anastrozole is at least 4.0.

DETERMINATION OF CONTENT

Calculate the total content of anastrozole, $C_{17}H_{19}N_5$, in the medium from the chromatograms obtained and using the declared content of $C_{17}H_{19}N_5$ in *anastrozole BPCRS*.

LIMITS

The amount of anastrozole released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of whole tablets containing 25 mg of Anastrozole with 80 mL of 50% v/v *acetonitrile R1*, mix with the aid of ultrasound, dilute to 100 mL with 50% v/v *acetonitrile R1* and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with 50% v/v *acetonitrile R1*.

(3) Dissolve the contents of a vial of *anastrozole impurity E EPCRS* to 100 mL of 50% v/v *acetonitrile R1*. Dilute 1 volume of the resulting solution to 50 volumes with solution (2).

(4) Dilute 1 volume of solution (2) to 5 volumes with 50% v/v *acetonitrile R1*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer* (3.5 µm) (XBridge Shield RP 18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 0.1 volume of *orthophosphoric acid* and 100 volumes of *water*.

Mobile phase B 0.1 volume of *orthophosphoric acid* and 100 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	95	5	isocratic
2-54	95→35	5→65	linear gradient
54-55	35→95	65→5	linear gradient
55-65	95	5	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to anastrozole (retention time about 30 minutes) are: impurity F, about 0.38; impurity G, about 0.86; impurity A, about 0.93; impurity E, about 1.04; impurity B, about 1.11; impurity H, about 1.48; impurity I, about 1.50; impurity C, about 1.55; impurity D, about 1.65.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to anastrozole and impurity E is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

the sum of the areas of all *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of Content

Tablets containing less than 2 mg and/or less than 2% w/w of Anastrozole must comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.1 volumes of *trifluoroacetic acid*, 100 volumes of *acetonitrile R1* and 100 volumes of *water*.

(1) Shake 1 tablet with a sufficient volume of solution A to produce a solution expected to contain 0.01% w/v of Anastrozole and filter.

(2) 0.01% w/v of *anastrozole BPCRS* in solution A.

(3) 0.01% w/v of *anastrozole BPCRS* and 0.06% w/v of *methyl parahydroxybenzoate* in solution A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but with an injection volume of 10 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to methyl parahydroxybenzoate and anastrozole is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{19}N_5$ in each tablet from the chromatograms obtained using the declared content of $C_{17}H_{19}N_5$ in *anastrozole BPCRS*

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of anastrozole

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of anastrozole

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution B 0.8 volumes of *trifluoroacetic acid*, 200 volumes of *acetonitrile R1* and 800 volumes of *water*.

www.webofpharma.com

(1) Shake 10 tablets with 60 mL of mobile phase. Dilute, if necessary, with mobile phase to produce a solution containing 0.01% w/v Anastrozole and filter.

(2) 0.01% w/v of *anastrozole BPCRS* in solution B.

(3) 0.01% w/v of *anastrozole BPCRS* and 0.006% w/v *methyl parahydroxybenzoate* in solution B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but with an injection volume of 10 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to methyl parahydroxybenzoate and anastrozole is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{19}N_5$ in the tablets using the declared content of $C_{17}H_{19}N_5$ in *anastrozole BPCRS*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Anastrozole.

Aprepitant Capsules

Action and use

Neurokinin-1 (NK_1) receptor antagonist; prevention of nausea and vomiting associated with emetogenic chemotherapy.

DEFINITION

Aprepitant Capsules contain Aprepitant.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of aprepitant, $C_{23}H_{21}F_7N_4O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the capsule contents containing 0.1 g of Aprepitant in 75 mL of *methanol*, mix with the aid of ultrasound and filter (a 0.45-µm nylon-66 filter is suitable). Dilute to 100 mL with *methanol*. Dilute 1 volume of this solution to 10 volumes with *methanol*. The *light absorption*, Appendix II B, in the range 200 to 400 nm, exhibits 3 maxima, at 211, 264 and 270 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 900 mL of a 2.2% w/v solution of *sodium dodecyl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 20 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted, if necessary, with sufficient of a 2.2% w/v solution of *sodium dodecyl sulfate* to produce a solution expected to contain 0.0044% w/v of Aprepitant.

(2) 0.0044% w/v of *aprepitant BPCRS* prepared by dissolving an appropriate amount of *aprepitant BPCRS* in the minimum volume of *methanol* and diluting with a sufficient volume of a 2.2% w/v solution of *sodium dodecyl sulfate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx-C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Equal volumes of a 0.1% v/v solution of *orthophosphoric acid* and *acetonitrile R1*.

DETERMINATION OF CONTENT

Calculate the total content of aprepitant, $C_{23}H_{21}F_7N_4O_3$, in the medium from the chromatograms obtained and using the declared content of $C_{23}H_{21}F_7N_4O_3$ in *aprepitant BPCRS*.

LIMITS

The amount of aprepitant released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a solution containing equal volumes of *acetonitrile R1* and a 0.1% v/v solution of *orthophosphoric acid* (solution A).

(1) Dissolve a quantity of the contents of the capsules containing 0.12 g of Aprepitant in 150 mL of solution A and mix with the aid of ultrasound. Dilute to 200 mL with solution A, mix and filter (a 0.45-µm Nylon 66 syringe filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A. Dilute 1 volume of this solution to 5 volumes with solution A.

(3) 0.06% w/v of *aprepitant impurity standard BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (XTerra RP-18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 5 volumes of *acetonitrile R1* and 95 volumes of a 0.1% v/v solution of *orthophosphoric acid*.

Mobile phase B 5 volumes of a 0.1% v/v solution of *orthophosphoric acid* and 95 volumes of *acetonitrile R1*.

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	60→58	40→42	linear gradient
20-25	58→35	42→65	linear gradient
25-33	35	65	isocratic
33-33.1	35→60	65→40	linear gradient
33.1-40	60	40	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to aprepitant (retention time about 15 minutes) are: impurity A, about 0.85 and aprepitant impurity 1 and 2, about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and aprepitant is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with solution (2) (0.15%);

the area of any peak corresponding to impurity 1 and 2 is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a solution containing 2 volumes of *acetonitrile* and 3 volumes of *water* (solution B).

(1) Shake a quantity of the mixed contents of 20 capsules containing 0.4 g of Aprepitant in solution B. Add sufficient *acetonitrile* to produce a solution containing 0.08% w/v of Aprepitant and filter (0.45-µm PTFE is suitable). Dilute 8 volumes of this solution to 25 volumes with mobile phase.

(2) 0.025% w/v of *aprepitant BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS3 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

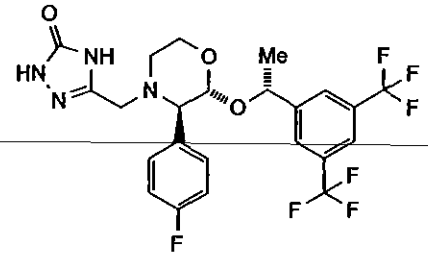
(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

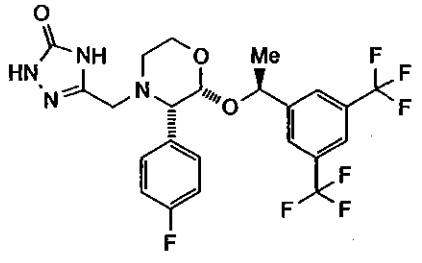
MOBILE PHASE

9 volumes of *acetonitrile R1* and 11 volumes of a 0.34% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 using *orthophosphoric acid*.



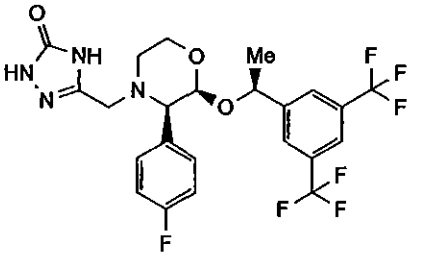
DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{21}F_7N_4O_3$ in the capsules using the declared content of $C_{23}H_{21}F_7N_4O_3$ in *aprepitant BPCRS*.

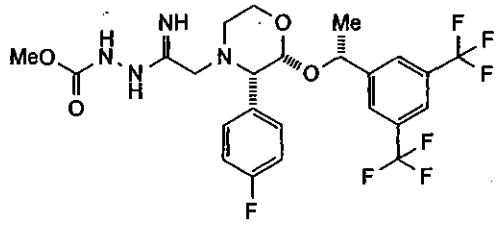


IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aprepitant and:



1. 5-{[(2*R*,3*R*)-2-{(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy}-3-(4-fluorophenyl)morpholin-4-yl]methyl}-2,4-dihydro-3*H*-1,2,4-triazol-3-one (*R*,*R*,*R*-diastereoisomer)



2. 5-{[(2*R*,3*S*)-2-{(1*S*)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy}-3-(4-fluorophenyl)morpholin-4-yl]methyl}-2,4-dihydro-3*H*-1,2,4-triazol-3-one (*R*,*S*,*S*-diastereoisomer)

3. 5-{[(2*S*,3*R*)-2-{(1*S*)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy}-3-(4-fluorophenyl)morpholin-4-yl]methyl}-2,4-dihydro-3*H*-1,2,4-triazol-3-one (*S*,*R*,*S*-enantiomer)

4. methyl 2-{2-[(2*R*,3*S*)-2-{(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy}-3-(4-fluorophenyl)morpholin-4-yl]-1-iminoethyl}hydrazine-1-carboxylate

www.webofpharma.com

Aqueous Cream

DEFINITION

Emulsifying Ointment	300 g
Phenoxyethanol	10 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

The suitability of the Cream for use as a diluent should be confirmed before use.

PRODUCTION

As stated in the General Notice on Antimicrobial Preservatives, a suitable alternative antimicrobial preservative may be substituted provided that the identity and concentration are stated on the label.

Extemporaneous preparation

The following directions apply.

Dissolve the Phenoxyethanol in sufficient Purified Water at about 60° to produce a total weight of about 700 g. Melt the Emulsifying Ointment, add the phenoxyethanol solution when both are at about 60° and mix. Stir gently until cool, add sufficient of the Purified Water to produce 1000 g and mix.

The cream complies with the requirements stated under Topical Semi-solid Preparations.

Arachis Oil Enema

DEFINITION

Arachis Oil Enema is Arachis Oil in a suitable container.

The enema complies with the requirements stated under Rectal Preparations and with the following requirements.

IDENTIFICATION

Carry out the test for *identification of fatty oils by thin-layer chromatography*, Appendix X N. The chromatogram obtained from the oil being examined shows spots corresponding to those in the *typical chromatogram* for arachis oil.

TESTS

Acid value

Not more than 0.6, Appendix X B.

Alkaline impurities

Complies with the test for *alkaline impurities*, Appendix X N.

Peroxide value

Not more than 5.0, Appendix X F.

Relative density

0.912 to 0.918, Appendix V G.

Unsaponifiable matter

Not more than 1.0% w/w, Appendix X H, Method II. Use 5 g.

Foreign fixed oils

Carry out the test for *composition of fatty acids by gas chromatography*, Appendix X N. The fatty-acid fraction of the oil has the following composition.

Saturated fatty acids of chain length less than C_{16} Not more than 0.4%.

Palmitic acid 7.0 to 16.0%.

Stearic acid 1.3 to 6.5%.

Oleic acid 35.0 to 72.0%.

Linoleic acid (equivalent chain length on polyethylene glycol adipate 18.9) 13.0 to 43.0%.

Linolenic acid (equivalent chain length on polyethylene glycol adipate 19.7) Not more than 0.6%.

Arachidic acid 1.0 to 3.0%.

Gadoleic acid (equivalent chain length on polyethylene glycol adipate 20.3) 0.5 to 2.1%.

Behenic acid 1.0 to 5.0%.

Erucic acid (equivalent chain length on polyethylene glycol adipate 22.3) Not more than 0.5%.

Lignoceric acid 0.5 to 3.0%.

The ratio of linoleic acid to behenic acid is not more than 15.

Semi-drying oils

To 1.0 g of the oil being examined add 5 mL of a mixture of 3 volumes of 2M *ethanolic potassium hydroxide* and 1 volume of *ethanol (96%)*, boil under a reflux condenser for 5 minutes, add 1.5 mL of 5M *acetic acid* and 50 mL of *ethanol (70%)* and heat until the solution is clear. Allow to cool or cool very slowly with a thermometer in the liquid. The temperature at which the liquid begins to become cloudy is not lower than 36°.

Sesame oil

Shake 10 mL with 5 mL of a mixture of 0.5 volume of a 0.35% v/v solution of *furfuraldehyde* in *acetic anhydride* and 4.5 volumes of *acetic anhydride* for 1 minute, filter the solution through a filter paper impregnated with *acetic anhydride* and add 0.2 mL of *sulfuric acid*. No bluish green colour develops.

Arginine Hydrochloride Sterile Concentrate

Sterile Arginine Hydrochloride Concentrate

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Amino acid; nutrient.

DEFINITION

Arginine Hydrochloride Sterile Concentrate is a sterile solution containing Arginine Hydrochloride in a suitable solvent.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements. Where appropriate, the concentrate also complies with the requirements stated under Unlicensed Medicines.

Content of arginine hydrochloride, $C_6H_{14}N_4O_2,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Evaporate to dryness 5 mL of the concentrate over *silica gel* at 40° under reduced pressure. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of arginine hydrochloride *(RS 470)*.

B. Dilute a suitable volume of the concentrate with sufficient *water* to produce a solution containing 0.5% w/v of Arginine Hydrochloride. The resulting solution yields reaction A characteristic of *chlorides*.

www.webofpharma.com

TESTS

Acidity

pH, 5.0 to 6.5, Appendix V L.

Ninhydrin-positive substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute the concentrate to contain 1.0% w/v of Arginine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume to 4 volumes.

(3) 0.04% w/v of each of *arginine hydrochloride BPCRS* and *lysine hydrochloride EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat it at 100° to 105° until the ammonia is removed. Spray with *ninhydrin solution* and heat at 100° to 105° for 15 minutes.

MOBILE PHASE

30 volumes of *concentrated ammonia* and 70 volumes of *propan-2-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the concentrate with sufficient *water* to produce a solution containing 0.02% w/v of Arginine Hydrochloride.

(2) 0.02% w/v of *arginine hydrochloride BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *methanol R1* and 60 volumes of 0.05M *sodium dihydrogen orthophosphate* containing 0.075% w/v of *sodium dodecyl sulfate*; adjust the pH to 3.3 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The Assay is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is between 0.8 and 1.5; if necessary, adjust the content of *methanol* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_{14}N_4O_2$,HCl in the concentrate using the declared content of $C_6H_{14}N_4O_2$,HCl in *arginine hydrochloride BPCRS*.

Arginine Hydrochloride Infusion

Arginine Hydrochloride Intravenous Infusion

Action and use

Amino acid; nutrient.

DEFINITION

Arginine Hydrochloride Infusion is a sterile solution containing Arginine Hydrochloride. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of arginine hydrochloride, $C_6H_{14}N_4O_2$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Ninhydrin-positive substances the spot in the chromatogram obtained with solution (2) is similar in position, size and intensity to the spot in the chromatogram obtained with solution (4).

B. Dilute a suitable volume of the infusion with sufficient *water* to produce a solution containing 1.25% w/v of Arginine Hydrochloride. To 2 mL of the resulting solution add 1 mL of *1-naphthol solution* and 2 mL of a mixture of equal volumes of *sodium hypochlorite solution (3% Cl)* and *water*. A red colour develops.

C. Dilute a suitable volume of the infusion with sufficient *water* to produce a solution containing 0.5% w/v of Arginine Hydrochloride. The resulting solution yields reaction A characteristic of *chlorides*.

TESTS

Particulate contamination

When supplied in a container with a nominal volume of more than 100 mL, complies with the test for *sub-visible particles*, Appendix XIII A.

Acidity

pH, 5.0 to 6.5, Appendix V L.

Ninhydrin-positive substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute the infusion to contain 1.0% w/v of Arginine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 50 volumes.

(3) Dilute 1 volume of solution (2) to 4 volumes.

(4) 0.02% w/v of *arginine hydrochloride BPCRS*.

(5) 0.04% w/v each of *arginine hydrochloride BPCRS* and *lysine hydrochloride EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat it at 100° to 105° until the ammonia is removed. Spray with *ninhydrin solution* and heat at 100° to 105° for 15 minutes.

www.webofpharma.com

MOBILE PHASE

30 volumes of *concentrated ammonia* and 70 volumes of *propan-2-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Bacterial endotoxins

The endotoxin limit concentration is 0.5 IU per mL, Appendix XIV C. Dilute infusions containing more than 5.0% w/v of Arginine Hydrochloride with *water BET* to contain 5% w/v.

ASSAY

Dissolve 28 g of *potassium hydroxide* and 2 g of *potassium sodium (+)-tartrate* in 100 mL of *water*, add to the cooled solution 0.1 g of *2,4-dichloro-1-naphthol*, 180 mL of *ethanol (96%)* and 20 mL of a solution prepared by diluting 1 volume of *sodium hypochlorite solution (3% Cl)* to 6 volumes with *water* and allow the mixture to stand for 1 hour (solution A). Dilute a suitable volume of the infusion with sufficient *water* to produce a solution containing 0.004% w/v of Arginine Hydrochloride. To 5 mL add 5 mL of a 0.3% w/v solution of *potassium iodide*, mix and allow to stand for 15 minutes. Add 15 mL of solution A, mix and allow to stand for 15 minutes. Add 5 mL of a solution prepared by diluting 1 volume of *sodium hypochlorite solution (3% Cl)* to 15 volumes with *water* and allow to stand for 15 minutes. Measure the *absorbance* of the resulting solution at the maximum at 520 nm, Appendix II B, using *water* in the reference cell. Repeat the procedure using 5 mL of a 0.004% w/v solution of *arginine hydrochloride BPCRS* in *water* beginning at the words 'add 5 mL of a 0.3% w/v solution of *potassium iodide* ...'. Calculate the content of $C_6H_{14}N_4O_2$, HCl from the absorbances obtained using the declared content of $C_6H_{14}N_4O_2$,HCl in *arginine hydrochloride BPCRS*.

LABELLING

The label states that solutions containing visible solid particles must not be used.

IMPURITIES

The impurities limited by the requirements of the monograph include ornithine.

Arginine Hydrochloride Oral Solution

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Amino acid; nutrient.

DEFINITION

Arginine Hydrochloride Oral Solution is a solution of Arginine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral solution also complies with the requirements stated under Unlicensed Medicines.

Content of arginine hydrochloride, $C_6H_{14}N_4O_2$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a suitable volume of the oral solution with sufficient *water* to produce a solution containing 1.25% w/v of Arginine Hydrochloride. To 2 mL of the resulting solution add 1 mL of *1-naphthol solution* and 2 mL of a mixture of equal volumes of *sodium hypochlorite solution (3% Cl)* and *water*. A red colour develops.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Ninhydrin-positive substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the oral solution with *water* to produce a solution containing 1% w/v of Arginine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 50 volumes with *water* and further dilute 1 volume of the resulting solution to 4 volumes with *water*.

(3) 0.04% w/v of each of *arginine hydrochloride BPCRS* and *lysine hydrochloride EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat at 100° to 105° until the ammonia is removed. Spray with *ninhydrin solution* and heat at 100° to 105° for 15 minutes.

MOBILE PHASE

50 volumes of *concentrated ammonia* and 50 volumes of *propan-2-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution containing 0.4 g of Arginine Hydrochloride to 100 mL with *water*.

(2) 0.4% w/v of *arginine hydrochloride BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

www.webofpharma.com

MOBILE PHASE

100 volumes of *methanol* and 400 volumes of 0.2M *sodium dihydrogen orthophosphate* containing 0.3% w/v of *sodium dodecyl sulfate*; adjust the pH to 3.3 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency* is at least 1800 *theoretical plates* per metre.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_6H_{14}N_4O_2$, HCl, weight in volume, using the declared content of $C_6H_{14}N_4O_2$,HCl in *arginine hydrochloride BPCRS*.

STORAGE

Arginine Hydrochloride Oral Solution should be protected from light.

Ascorbic Acid Injection

Action and use
Vitamin C.

DEFINITION

Ascorbic Acid Injection is a sterile solution of Ascorbic Acid in Water for Injections containing Sodium Bicarbonate.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ascorbic acid, $C_6H_8O_6$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless liquid.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute the injection, if necessary, to contain 0.5% w/v of Ascorbic Acid.

(2) 0.5% w/v of *ascorbic acid BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *water* and 120 volumes of *ethanol (96%)*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. To a volume containing 50 mg of Ascorbic Acid add 0.2 mL of 2M *nitric acid* and 0.2 mL of 0.1M *silver nitrate*. A grey precipitate is produced.

TESTS

Acidity
pH, 5.0 to 6.5, Appendix V L.

Oxalic acid

Dilute a volume containing 0.25 g to 5 mL with *water*, neutralise to *litmus paper* with 2M *sodium hydroxide*, add 1 mL of 2M *acetic acid* and 0.5 mL of *calcium chloride solution* and allow to stand for 1 hour. Any opalescence produced is not more intense than that in a solution prepared at the same time and in the following manner. Dissolve 70 mg of *oxalic acid* in 500 mL of *water* and to 5 mL of the resulting solution add 1 mL of 2M *acetic acid* and 0.5 mL of *calcium chloride solution* (0.3%).

ASSAY

To a volume containing 0.2 g add 5 mL of 2M *sulfuric acid* and titrate with *0.05M iodine VS* using *starch mucilage* as indicator. Each mL of *0.05M iodine VS* is equivalent to 8.806 mg of $C_6H_8O_6$.

STORAGE

Ascorbic Acid Injection should be protected from light and stored at a temperature of 2° to 8°.

When vitamin C injection is prescribed or demanded, Ascorbic Acid Injection shall be dispensed or supplied.

Ascorbic Acid Tablets

Action and use
Vitamin C.

DEFINITION

Ascorbic Acid Tablets contain Ascorbic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ascorbic acid, $C_6H_8O_6$
95.0 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Ascorbic Acid with 10 mL of *water* for 15 minutes and filter.

(2) 0.5% w/v of *ascorbic acid BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *water* and 120 volumes of *ethanol (96%)*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets with *water* and filter. The filtrate is acidic to *litmus solution*, decolourises *2,6-dichlorophenolindophenol solution* and reduces *silver nitrate solution* immediately at room temperature producing a black precipitate.

www.webofpharma.com

ASSAY
Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.15 g of Ascorbic Acid as completely as possible in a mixture of 30 mL of *water* and 20 mL of 1M *sulfuric acid* and titrate with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 8.806 mg of $C_6H_8O_6$.

STORAGE
Ascorbic Acid Tablets should be kept free from contact with metal and protected from light and moisture.

When vitamin C tablets are prescribed or demanded, Ascorbic Acid Tablets shall be dispensed or supplied.

ASSAY
Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.15 g of Ascorbic Acid as completely as possible in a mixture of 30 mL of *water* and 20 mL of 1M *sulfuric acid* and titrate with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 8.806 mg of $C_6H_8O_6$.

STORAGE
Ascorbic Acid Chewable Tablets should be kept free from contact with metal and protected from light and moisture.

When vitamin C chewable tablets are prescribed or demanded, Ascorbic Acid Chewable Tablets shall be dispensed or supplied.

Ascorbic Acid Chewable Tablets

Chewable Ascorbic Acid Tablets

Action and use
Vitamin C.

DEFINITION
Ascorbic Acid Chewable Tablets contain Ascorbic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ascorbic acid, $C_6H_8O_6$
95.0 to 107.5% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Ascorbic Acid with 10 mL of *water* for 15 minutes and filter.

(2) 0.5% w/v of *ascorbic acid BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

A mixture of 20 volumes of *water* and 120 volumes of *ethanol (96%)*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets with *water* and filter. The filtrate is acidic to *litmus solution*, decolourises *2,6-dichlorophenolindophenol solution* and reduces *silver nitrate solution* immediately at room temperature producing a black precipitate.

TESTS
Disintegration
The requirement for Disintegration does not apply to Ascorbic Acid Chewable Tablets.

Aspirin Tablets

Acetylsalicylic Acid Tablets

Action and use
Salicylate; non-selective cyclo-oxygenase inhibitor; antipyretic; analgesic; anti-inflammatory.

DEFINITION
Aspirin Tablets contain Aspirin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aspirin, $C_9H_8O_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.5 g of Aspirin with 20 mL of *absolute ethanol*, filter (Whatman GF/C is suitable), evaporate the filtrate and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, is concordant with the *reference spectrum* of aspirin *(RS 483)*.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 50 revolutions per minute.

(b) Use 500 mL of a pH 4.5 buffer prepared by mixing 29.9 g of *sodium acetate* and 16.6 mL of *glacial acetic acid* with sufficient *water* to produce 10 litres at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 265 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *aspirin BPCRS* using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of aspirin, $C_9H_8O_4$, in the medium using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

www.webofpharma.com

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 0.10 g of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(3) 0.003% w/v of *salicylic acid* (impurity C) in the mobile phase.

(4) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 237 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 1.2 times the retention time of impurity F.

MOBILE PHASE

2 volumes of *orthophosphoric acid*, 400 volumes of *acetonitrile* and 600 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the retention times relative to aspirin (retention time about 5 minutes) are: impurity A, about 0.6; impurity B, about 0.7, impurity C, about 1.4 and impurity F, about 8.0.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4) the *resolution* between the peaks due to aspirin and impurity C is at least 6.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3%);

the area of any other *secondary peak* is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 60 mg of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) 0.06% w/v of *aspirin BPCRS* in the mobile phase.

(3) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3) the *resolution* between the peaks due to aspirin and impurity C is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_8O_4$ in the tablets from the chromatograms obtained using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

LABELLING
The label states that the tablets contain Aspirin, unless this word appears in the name of the tablets. This requirement does not apply in countries where exclusive proprietary rights in the name Aspirin are claimed.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Aspirin.

Aspirin Dispersible Tablets

Dispersible Aspirin Tablets

Action and use
Salicylate; non-selective cyclo-oxygenase inhibitor; antipyretic; analgesic; anti-inflammatory.

DEFINITION
Aspirin Dispersible Tablets contain Aspirin in a suitable dispersible basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aspirin, $C_9H_8O_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.5 g of Aspirin with 20 mL of *absolute ethanol*, filter (Whatman GF/C is suitable), evaporate the filtrate and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, is concordant with the *reference spectrum* of aspirin *(RS 483)*.

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 0.10 g of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase and further dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(3) 0.003% w/v of *salicylic acid* (impurity C) in the mobile phase.

www.webofpharma.com

(4) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 237 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 1.2 times the retention time of impurity F.

MOBILE PHASE

2 volumes of *orthophosphoric acid*, 400 volumes of *acetonitrile* and 600 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the retentions relative to aspirin (retention time about 5 minutes) are: impurity A, about 0.6; impurity B, about 0.7, impurity C, about 1.4 and impurity F, about 8.0.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4) the *resolution* between the peaks due to aspirin and impurity C is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 60 mg of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) 0.06% w/v of *aspirin BPCRS* in the mobile phase.

(3) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3) the *resolution* between the peaks due to aspirin and impurity C is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_8O_4$ in the tablets from the chromatograms obtained using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

LABELLING

The label states that the tablets contain Aspirin, unless this word appears in the name of the tablets (this requirement does not apply in countries where exclusive proprietary rights in the name Aspirin are claimed).

When Aspirin Dispersible Tablets are prescribed or demanded, no strength being stated, tablets containing 300 mg shall be dispensed or supplied.

When Aspirin Soluble tablets are prescribed, Aspirin Dispersible Tablets shall be dispensed.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aspirin.

Aspirin Effervescent Soluble Tablets

Effervescent Soluble Aspirin Tablets

Effervescent Aspirin Tablets

Action and use

Salicylate; non-selective cyclo-oxygenase inhibitor; antipyretic; analgesic; anti-inflammatory.

DEFINITION

Aspirin Effervescent Soluble Tablets contain Aspirin in a suitable soluble, effervescent basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aspirin, $C_9H_8O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve with vigorous effervescence on the addition of warm *water* to produce a clear solution.

B. Dissolve a quantity of the powdered tablets containing 50 mg of Aspirin in 10 mL of warm *water*, boil and add 0.5 mL of *iron(III) chloride solution R1*. A violet-red colour is produced.

TESTS

Disintegration

Comply with the requirement for Effervescent Tablets stated under Tablets.

Salicylic acid

To a quantity of the powdered tablets containing 0.50 g of Aspirin add 50 mL of *dichloromethane*, 2 mL of 2.5M *sulfuric acid* and shake vigorously for 2 minutes. Filter the dichloromethane extract through a dry filter paper containing 1 g of *anhydrous sodium sulfate* and evaporate 5 mL of the filtrate to dryness at room temperature using a rotary evaporator. Dissolve the residue in 2 mL of *ethanol (96%)*, transfer to a *Nessler cylinder* with a further 1 mL of *ethanol (96%)*, dilute to 50 mL with *water* at a temperature not exceeding 10°, add 1 mL of freshly prepared *ammonium iron (III) sulfate solution R1*, mix and allow to stand for 1 minute. Any violet colour produced is not more intense than that obtained by adding 1 mL of freshly prepared *ammonium iron (III) sulfate solution R1* to a mixture of 3 mL of a freshly prepared 0.050% w/v solution of *salicylic acid* in *ethanol*

www.webofpharma.com

(96%) and sufficient *water* to produce 50 mL contained in a second *Nessler cylinder* (3.0%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.3 g of Aspirin in 10 mL of 1M *sulfuric acid* and boil under a reflux condenser for 1 hour. Cool, transfer to a separating funnel, rinsing the flask and condenser with small quantities of *water* and extract the liberated salicylic acid with four 20-mL quantities of *ether*. Wash the combined ether extracts with two 5-mL quantities of *water*, evaporate the ether in a current of air at a temperature not exceeding 30°, dissolve the residue in 20 mL of *0.5M sodium hydroxide VS* and dilute to 200 mL with *water*. Transfer 50 mL to a stoppered flask, add 50 mL of *0.05M bromine VS* and 5 mL of *hydrochloric acid*, protect the solution from light, shake repeatedly during 15 minutes and allow to stand for 15 minutes. Add 20-mL of *dilute potassium iodide solution* shake thoroughly and titrate with 0.1M *sodium thiosulfate VS*, using *starch mucilage*, added towards the end point, as indicator. Each mL of *0.05M bromine VS* is equivalent to 3.003 mg of $C_9H_8O_4$.

LABELLING

The label states that the tablets contain Aspirin, unless this word appears in the name of the tablets (this requirement does not apply in countries where exclusive proprietary rights in the name Aspirin are claimed).

When Aspirin Effervescent Soluble Tablets are prescribed or demanded, no strength being stated, tablets containing 300 mg shall be dispensed or supplied.

When Aspirin Soluble tablets are prescribed, Aspirin Dispersible Tablets shall be dispensed.

Aspirin Gastro-resistant Tablets

Gastro-resistant Aspirin Tablets

Action and use

Salicylate; non-selective cyclo-oxygenase inhibitor; antipyretic; analgesic; anti-inflammatory.

DEFINITION

Aspirin Gastro-resistant Tablets contain Aspirin. They are made gastro-resistant by enteric-coating or by other means.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aspirin, $C_9H_8O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.5 g of Aspirin with 20 mL of *absolute ethanol*, filter (Whatman GF/C is suitable), evaporate the filtrate and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, is concordant with the *reference spectrum* of aspirin *(RS 483)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

First stage

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 1000 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 2 hours, withdraw a sample of the medium, filter and measure the *absorbance* of the filtrate, Appendix II B, at 276 nm using 0.1M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *aspirin BPCRS* in 0.1M *hydrochloric acid*.

DETERMINATION OF CONTENT

Calculate the total content of aspirin, $C_9H_8O_4$, in the medium using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*. The amount of aspirin released is not more than 5% of the stated amount.

Final stage

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Replace the 0.1M *hydrochloric acid* in the vessel with 900 mL of *mixed phosphate buffer pH 6.8*, previously held at 36.5° to 37.5°.

PROCEDURE

(1) After 45 minutes, withdraw a sample of the medium and filter. Immediately measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium, if necessary, at 265 nm using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *aspirin BPCRS* in the dissolution medium.

DETERMINATION OF CONTENT

Calculate the total content of aspirin, $C_9H_8O_4$, in the medium using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 0.10 g of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(3) 0.003% w/v of *salicylic acid* (impurity C) in the mobile phase.

(4) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 237 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 1.2 times the retention time of impurity F.

www.webofpharma.com

MOBILE PHASE

2 volumes of *orthophosphoric acid*, 400 volumes of *acetonitrile* and 600 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the retention times relative to aspirin (retention time about 5 minutes) are: impurity A, about 0.6; impurity B, about 0.7, impurity C, about 1.4 and impurity F, about 8.0.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4) the *resolution* between the peaks due to aspirin and impurity C is at least 6.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3%);

the area of any other *secondary peak* is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *Liquid Chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 60 mg of Aspirin with 40 mL of *acetonitrile*, allow to cool, dilute to 100 mL with *water* and filter through a 0.45-µm PTFE filter.

(2) 0.06% w/v of *aspirin BPCRS* in the mobile phase.

(3) 0.1% w/v of *aspirin impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3) the *resolution* between the peaks due to aspirin and impurity C is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_8O_4$ in the tablets from the chromatograms obtained using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

STORAGE

Aspirin Gastro-resistant Tablets should be protected from moisture.

LABELLING

The label states that the tablets contain Aspirin, unless this word appears in the name of the tablets (this requirement does not apply in countries where exclusive proprietary rights in the name Aspirin are claimed).

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Aspirin.

Aspirin and Caffeine Tablets

Action and use

Salicylate; non-selective cyclo-oxygenase inhibitor; antipyretic; analgesic; anti-inflammatory.

DEFINITION

Aspirin and Caffeine Tablets contain, in each, 350 mg of Aspirin and 30 mg of Caffeine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aspirin, $C_9H_8O_4$

330 to 370 mg.

Content of caffeine, $C_8H_{10}N_4O_2$

27.5 to 32.5 mg.

IDENTIFICATION

A. Boil 1 g of the powdered tablets with 10 mL of 1M *sodium hydroxide*, cool and filter. Acidify the filtrate with 1M *sulfuric acid*; a white precipitate is produced. To a solution of the precipitate add *iron(III) chloride solution R1*; a deep violet colour is produced.

B. Shake 0.5 g of the powdered tablets with 10 mL of *water* for 5 minutes, filter and add 10 mL of 1M *sodium hydroxide*. Extract with three 30 mL quantities of *dichloromethane*, washing each extract with the same 10 mL of *water*. Filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Reserve a quantity of the residue for test C. Dissolve 10 mg of the residue in 1 mL of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness in a porcelain dish. A reddish residue remains, which becomes purple on exposure to ammonia vapour.

C. The *light absorption*, Appendix II B, in the range 240 to 350 nm of a 0.001% w/v solution of the residue reserved in test B exhibits a maximum at 273 nm.

TESTS

Salicylic acid

To a quantity of the powdered tablets containing 0.50 g of Aspirin add 50 mL of *dichloromethane* and 10 mL of *water*, shake well and allow to separate. Filter the dichloromethane layer through a dry filter paper and evaporate 10 mL of the filtrate to dryness at room temperature using a rotary evaporator. To the residue add 4 mL of *ethanol (96%)*, stir well, dilute to 100 mL with *water* at a temperature not exceeding 10°, filter immediately, rapidly transfer 50 mL to a *Nessler cylinder*, add 1 mL of freshly prepared *ammonium iron (III) sulfate solution R1*, mix and allow to stand for 1 minute. Any violet colour produced is not more intense than that obtained by adding 1 mL of freshly prepared *ammonium iron (III) sulfate solution R1* to a mixture of 3 mL of a freshly prepared 0.050% w/v solution of *salicylic acid* in *ethanol (96%)* and sufficient *water* to produce 50 mL contained in a second *Nessler cylinder* (3.0%).

Dissolution

For aspirin

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of a pH 4.5 buffer prepared by mixing 29.9 g of *sodium acetate* and 16.6 mL of *glacial acetic acid*

www.webofpharma.com

with sufficient *water* to produce 10 litres, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 20 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 265 nm, Appendix II B, using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *aspirin BPCRS* in the dissolution medium using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of aspirin, $C_9H_8O_4$, in the medium from the absorbances obtained and using the declared content of $C_9H_8O_4$ in *aspirin BPCRS*.

ASSAY

Weigh and powder 20 tablets.

For aspirin

To a quantity of the powder containing 0.7 g of Aspirin add 20 mL of *water* and 2 g of *sodium citrate* and boil under a reflux condenser for 30 minutes. Cool, wash the condenser with 30 mL of warm *water* and titrate with *0.5M sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of *0.5M sodium hydroxide VS* is equivalent to 45.04 mg of $C_9H_8O_4$.

For caffeine

To a quantity of the powder containing 30 mg of Caffeine add 200 mL of *water* and shake for 30 minutes. Add sufficient *water* to produce 250 mL and filter. To 10 mL of the filtrate add 10 mL of 1M *sodium hydroxide* and extract immediately with five 30 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. Filter the combined chloroform extracts, if necessary, through absorbent cotton previously moistened with *chloroform*. Evaporate the solution to dryness and dissolve the residue as completely as possible in *water*, warming gently if necessary. Cool, add sufficient *water* to produce 100 mL, mix and filter if necessary. Measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_8H_{10}N_4O_2$ taking 504 as the value of A(1%, 1 cm) at the maximum at 273 nm.

LABELLING

The label states that the tablets contain Aspirin, unless this word appears in the name of the tablets. This requirement does not apply in countries where exclusive proprietary rights in the name Aspirin are claimed.

Atenolol Injection

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Atenolol Injection is a sterile solution of Atenolol in Water for Injections containing Citric Acid Monohydrate and Sodium Chloride.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of atenolol, $C_{14}H_{22}N_2O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a volume of the injection containing 5 mg of Atenolol add sufficient 1M *sodium hydroxide* to make it alkaline (about 0.5 mL) and extract with three 10-mL quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*. Filter the combined extracts through *anhydrous sodium sulfate* and evaporate to dryness in a current of nitrogen. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of atenolol *(RS 015)*.

TESTS

Acidity

pH, 5.5 to 6.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the injection being examined.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve 10 mg of *atenolol impurity standard BPCRS* in 0.1 mL of *dimethyl sulfoxide*, with the aid of gentle heat, and dilute to 20 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Luna-C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of impurity G.

MOBILE PHASE

20 volumes of *tetrahydrofuran*, 180 volumes of *methanol* and 800 volumes of 0.025M *potassium dihydrogen orthophosphate*. Dissolve 0.8 g of *sodium octanesulfonate* and 0.4 g of *tetrabutylammonium hydrogen sulfate* to 1 litre of this solution and adjust the pH to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles that of the reference chromatogram provided with *atenolol impurity standard BPCRS* in that the peak due to impurity E precedes, and is separated from, that due to impurity F, which is normally a doublet. If necessary adjust the concentration of sodium octanesulfonate in the mobile phase; increasing the concentration increases the retention time of impurity F.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity G is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to either impurity E or impurity F is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Dilute a volume of the injection containing 10 mg of Atenolol to 100 mL with *methanol* and measure the

www.webofpharma.com

absorbance at the maximum at about 275 nm, Appendix II B. Calculate the content of $C_{14}H_{22}N_2O_3$ taking 53.7 as the value of A(1%, 1 cm) at the maximum at 275 nm.

STORAGE

Atenolol Injection should be protected from light.

Atenolol Oral Solution

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Atenolol Oral Solution is a solution of Atenolol in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of atenolol, $C_{14}H_{22}N_2O_3$

94.0 to 106.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Make a volume of the oral solution containing 50 mg of Atenolol alkaline with 1M *sodium hydroxide* (about 0.5 mL), extract with three 10-mL quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, filter the combined extracts through *anhydrous sodium sulfate*, evaporate to dryness under reduced pressure with gentle heat and dissolve the residue in 0.5 mL of *methanol*.

(2) 1.0% w/v of *atenolol BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 18M *ammonia* and 99 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and intensity to that in the chromatogram obtained with solution (2). Disregard any spots due to excipients at Rf values of 0.69 and 0.80.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.5 to 6.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the oral solution with the mobile phase to produce a solution containing 0.2% w/v of Atenolol.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve 10 mg of *atenolol impurity standard BPCRS* in 0.1 mL of *dimethyl sulfoxide*, with the aid of gentle heat, and dilute to 20 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of impurity G.

MOBILE PHASE

20 volumes of *tetrahydrofuran*, 180 volumes of *methanol* and 800 volumes of 0.025M *potassium dihydrogen orthophosphate*. Dissolve 0.8 g of *sodium octanesulfonate* and 0.4 g of *tetrabutylammonium hydrogen sulfate* to 1 litre of this solution and adjust the pH to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles that of the reference chromatogram provided with *atenolol impurity standard BPCRS* in that the peak due to impurity E precedes, and is separated from, that due to impurity F, which is normally a doublet. If necessary adjust the concentration of sodium octanesulfonate in the mobile phase; increasing the concentration increases the retention time of impurity F.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity G is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to either impurity E or impurity F is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the oral solution with the mobile phase to produce a solution containing 0.025% w/v of Atenolol.

(2) 0.025% w/v of *atenolol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for at least 30 minutes.

MOBILE PHASE

1 volume of *sulfuric acid (10%)*, 25 volumes of *acetonitrile* and 74 volumes of *water* containing 0.93 g per litre of *sodium octyl sulfate* adjusted to pH 3 with 2M *sodium hydroxide*.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{22}N_2O_3$ in the oral solution using the declared content of $C_{14}H_{22}N_2O_3$ in *atenolol BPCRS*.

Atenolol Tablets

Action and use
Beta-adrenoceptor antagonist.

DEFINITION
Atenolol Tablets contain Atenolol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of atenolol, $C_{14}H_{22}N_2O_3$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
A. Heat a quantity of the powdered tablets containing 0.1 g of Atenolol with 15 mL of *methanol* to 50°, shake for 5 minutes, filter (Whatman No. 42 paper is suitable) and evaporate the filtrate to dryness on a water bath. Warm the residue with 10 mL of 0.1M *hydrochloric acid*, shake and filter. Add to the filtrate sufficient 1M *sodium hydroxide* to make it alkaline, extract with 10 mL of *chloroform*, dry by shaking with *anhydrous sodium sulfate*, filter, evaporate the filtrate to dryness on a water bath and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of atenolol *(RS 015)*.

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 25 mg of Atenolol with 25 mL of the mobile phase, mix with the aid of ultrasound for 20 minutes, filter (Whatman GF/C filter paper is suitable) and use the filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve 10 mg of *atenolol impurity standard BPCRS* in 0.1 mL of *dimethyl sulfoxide*, with the aid of gentle heat, and dilute to 20 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Luna-C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of impurity G.

MOBILE PHASE

20 volumes of *tetrahydrofuran*, 180 volumes of *methanol* and 800 volumes of 0.025M *potassium dihydrogen orthophosphate*. Dissolve 0.8 g of *sodium octanesulfonate* and 0.4 g of *tetrabutylammonium hydrogen sulfate* to 1 litre of this solution and adjust the pH to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles that of the reference chromatogram provided with *atenolol impurity standard BPCRS* in that the peak due to impurity E precedes, and is separated from, that due to impurity F, which is normally a doublet. If necessary adjust the concentration of sodium octanesulfonate in the mobile phase; increasing the concentration increases the retention time of impurity F.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity G is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to either impurity E or impurity F is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.25%).

ASSAY
Powder 20 tablets. Transfer the powder to a 500 mL flask using 300 mL of *methanol*, heat the resulting suspension to 60° and shake for 15 minutes. Cool, dilute to 500 mL with *methanol*, filter through a fine glass micro-fibre filter paper (Whatman GF/C is suitable) and dilute a suitable volume of the filtrate with sufficient *methanol* to produce a solution containing 0.01% w/v of Atenolol. Measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_{14}H_{22}N_2O_3$ taking 53.7 as the value of A(1%, 1 cm) at the maximum at 275 nm.

Atropine Eye Drops

Action and use
Anticholinergic.

DEFINITION
Atropine Eye Drops are a sterile solution of Atropine Sulfate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of atropine sulfate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Comply with test A for Identification described under Atropine Injection, using for the preparation of solution (1) a volume of the eye drops containing 5 mg of Atropine Sulfate.

B. In the Assay, the chromatogram obtained with solution (1) exhibits a peak with the same retention time as the peak due to atropine sulfate in the chromatogram obtained with solution (2).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For eye drops containing less than 0.1% w/v of Atropine Sulfate.

(1) Use the eye drops being examined.

(2) 0.05% w/v of *atropine sulfate BPCRS* and 0.05% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

For eye drops containing 0.1% w/v of Atropine Sulfate or more.

(1) Dilute the eye drops to contain 0.1% w/v of Atropine Sulfate with *water*.

www.webofpharma.com

(2) 0.1% w/v of *atropine sulfate BPCRS* and 0.1% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) For eye drops containing less than 0.1% w/v of Atropine Sulfate inject 100 µL of each solution. For eye drops containing 0.1% w/v of Atropine Sulfate or more inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to atropine sulfate and homatropine hydrobromide is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the eye drops using the declared content of $(C_{17}H_{23}NO_3)_2$, H_2SO_4,H_2O in *atropine sulfate BPCRS.*

Atropine Eye Ointment

Action and use
Anticholinergic.

DEFINITION

Atropine Eye Ointment is a sterile preparation containing Atropine Sulfate in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of atropine sulfate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$
92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Complies with test A for Identification described under Atropine Injection but preparing solution (1) in the following manner. Dissolve a quantity of the ointment containing 10 mg of Atropine Sulfate as completely as possible in 10 mL of *petroleum spirit (boiling range, 40° to 60°)* and extract with two 10 mL quantities of 0.05M *sulfuric acid,* washing each acid solution with the same 5 mL of *petroleum spirit (boiling range, 40° to 60°).* Mix the acid solutions, make alkaline with 5M *ammonia* and extract with two 15 mL quantities of *chloroform.* Evaporate the chloroform and dissolve the residue in 2 mL of *ethanol (96%).*

B. In the Assay, the chromatogram obtained with solution (1) exhibits a peak with the same retention time as the peak due to atropine sulfate in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dissolve a quantity of the eye ointment containing 10 mg of Atropine Sulfate in 10 mL of *ether* and extract with two 10 mL quantities of 0.01M *hydrochloric acid.* Use the combined extracts.

(2) 0.05% w/v of *atropine sulfate BPCRS* and 0.05% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to atropine sulfate and homatropine hydrobromide is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the eye ointment using the declared content of $(C_{17}H_{23}NO_3)_2$, H_2SO_4,H_2O in *atropine sulfate BPCRS.*

Atropine Injection

Action and use
Anticholinergic.

DEFINITION

Atropine Injection is a sterile solution of Atropine Sulfate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of atropine sulfate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Evaporate a volume of the injection containing 5 mg of Atropine Sulfate to dryness on a water bath, triturate the residue with 1 mL of *ethanol (96%),* allow to stand and use the supernatant liquid.

(2) 0.5% w/v of *atropine sulfate BPCRS* in *ethanol (96%).*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel.*

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution.*

www.webofpharma.com

MOBILE PHASE

10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *chloroform*.

CONFIRMATION

The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) exhibits a peak with the same retention time as the peak due to atropine sulfate in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.8 to 4.5, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For injections containing less than 0.1% w/v of Atropine Sulfate

(1) Use the injection being examined.

(2) Use *atropine sulfate BPCRS* and *homatropine hydrobromide BPCRS* in the mobile phase, both at the same concentration as the solution being examined.

For injections containing 0.1% w/v or more of Atropine Sulfate

(1) Dilute the injection, if necessary, to contain 0.1% w/v of Atropine Sulfate with *water*.

(2) 0.1% w/v of *atropine sulfate BPCRS* and 0.1% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) For injections containing less than 0.1% w/v of Atropine Sulfate inject 100 µL of each solution. For injections containing 0.1% w/v or more of Atropine Sulfate inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to atropine sulfate and homatropine hydrobromide is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the injection using the declared content of $(C_{17}H_{23}NO_3)_2$, H_2SO_4,H_2O in *atropine sulfate BPCRS*.

Atropine Oral Solution

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Anticholinergic.

DEFINITION

Atropine Oral Solution is a solution of Atropine Sulfate in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral solution also complies with the requirements stated under Unlicensed Medicines.

Content of atropine sulfate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

For oral solutions containing less than 0.1% w/v of Atropine Sulfate

(1) Use the solution being examined.

(2) A solution of *atropine sulfate BPCRS* in *ethanol (96%)* at the same concentration as the solution being examined.

For oral solutions containing 0.1% w/v or more of Atropine Sulfate

(1) Evaporate a quantity of the oral solution containing 5 mg of Atropine Sulfate to dryness on a water bath, triturate the residue with 1 mL of *ethanol (96%)*, allow to stand and use the supernatant liquid.

(2) 0.5% w/v of *atropine sulfate BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For oral solutions containing less than 0.1% w/v of Atropine Sulfate

(1) Use the solution being examined.

(2) A solution containing *atropine sulfate BPCRS* and *homatropine hydrobromide BPCRS* in the mobile phase, both at the same concentration as the solution being examined.

www.webofpharma.com

For oral solutions containing 0.1% w/v or more of Atropine Sulfate

(1) Dilute the oral solution with *water*, if necessary, to contain 0.1% w/v of Atropine Sulfate.

(2) 0.1% w/v of *atropine sulfate BPCRS* and 0.1% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) For oral solutions containing less than 0.1% w/v of Atropine Sulfate, inject 100 µL of each solution. For injections containing 0.1% w/v or more of Atropine Sulfate, inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in *methanol (60%)*, adjusted to pH 5.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to atropine sulfate and homatropine hydrobromide is at least 2.5.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the oral solution using the declared content of $(C_{17}H_{23}NO_3)_2$, H_2SO_4,H_2O in *atropine sulfate BPCRS*.

Atropine Tablets

Action and use
Anticholinergic.

DEFINITION
Atropine Tablets contain Atropine Sulfate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of atropine sulfate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Shaking a quantity of the powdered tablets containing 10 mg of Atropine Sulfate with 2 mL of *ethanol (96%)*, centrifuge and use the supernatant liquid.

(2) 0.5% w/v of *atropine sulfate BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *chloroform*.

CONFIRMATION

The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) exhibits a peak with the same retention time as the peak due to atropine sulfate in the chromatogram obtained with solution (2).

TESTS

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Atropine Sulfate comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake 1 tablet with 2 ml of the mobile phase with the aid of ultrasound until fully disintegrated and filter.

(2) 0.03% w/v of *atropine sulfate BPCRS* and 0.03% w/v of *homatropine hydrobromide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to atropine sulfate and homatropine hydrobromide is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in each tablet using the declared content of $(C_{17}H_{23}NO_3)_2,H_2SO_4$, H_2O in *atropine sulfate BPCRS*.

ASSAY
Use the average of the individual results determined in the test for Uniformity of content.

Azathioprine Oral Suspension

Different formulations of Azathioprine Oral Suspension may vary in bioavailability. Patients should be monitored in accordance with appropriate clinical guidelines.

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Immunosuppressant.

DEFINITION
Azathioprine Oral Suspension is a suspension of Azathioprine in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where

www.webofpharma.com

appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

Content of azathioprine, $C_9H_7N_7O_2S$
95.0 to 105.0% of the stated amount.

Shake the oral suspension vigorously before carrying out the following tests.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions prepared immediately before use.

(1) Dilute a quantity of the oral suspension containing 40 mg of Azathioprine to 5 mL with *water* and then extract with three 20-mL quantities of *dichloromethane*. Combine the dichloromethane extracts, wash with 20 mL of *water*, discard the aqueous layer and evaporate the dichloromethane under a stream of nitrogen until about 5 mL remains.

(2) Disperse 40 mg of *azathioprine BPCRS* in 5 mL of *water* and then treat in the same manner as for solution (1) beginning at the words 'and then extract ...'.

(3) 0.005% w/v of each of *azathioprine BPCRS* and *5-chloro-1-methyl-4-nitroimidazole BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *cellulose F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 50° and examine under *ultraviolet light (366 nm)*.

MOBILE PHASE

butan-1-ol saturated with 6M *ammonia*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L.

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions, using 900 mL of *water* as the dissolution medium and rotating the paddle at 50 revolutions per minute. Use a volume of the oral suspension containing one dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the oral suspension containing 10 mg of Azathioprine with 12.5 mL of *dimethyl sulfoxide*, shake for 30 minutes and add sufficient *0.1M hydrochloric acid* to produce 25 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *dimethyl sulfoxide* and *0.1M hydrochloric acid*.

(3) 0.004% w/v of each of *azathioprine BPCRS*, *5-chloro-1-methyl-4-nitroimidazole BPCRS* and *6-mercaptopurine* in a mixture of equal volumes of *dimethyl sulfoxide* and *0.1M hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 25°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 300 volumes of *methanol* and 700 volumes of a 0.01M phosphate buffer prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water*.

Mobile phase B 600 volumes of *methanol* and 400 volumes of a 0.01M phosphate buffer prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	100	0	isocratic
20-30	100→0	0→100	linear gradient
30-40	0	100	isocratic
40-41	0→100	100→0	linear gradient
41-50	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the retention time of azathioprine is about 6.5 minutes;

there are peaks with retentions relative to azathioprine of about 0.53 (6-mercaptopurine) and about 1.14 (5-chloro-1-methyl-4-nitroimidazole).

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 5-chloro-1-methyl-4-nitroimidazole is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to 6-mercaptopurine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral suspension containing 0.1 g of Azathioprine to 50 mL with *dimethyl sulfoxide*, shake for 30 minutes and add sufficient *0.1M hydrochloric acid* to produce 250 mL.

www.webofpharma.com

(2) Dilute 5 volumes of a 0.08% w/v solution of *azathioprine BPCRS* in *dimethyl sulfoxide* to 10 volumes with *0.1M hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

(g) Wash the column with *water* between injections.

MOBILE PHASE

300 volumes of *methanol* and 700 volumes of a 0.01M phosphate buffer prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water.*

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_9H_7N_7O_2S$, weight in volume, using the declared content of $C_9H_7N_7O_2S$ in *azathioprine BPCRS.*

STORAGE

Azathioprine Oral Suspension should be protected from light.

Azathioprine Tablets

Action and use

Immunosuppressant.

DEFINITION

Azathioprine Tablets contain Azathioprine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of azathioprine, $C_9H_7N_7O_2S$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Azathioprine with 50 mL of 6M *ammonia,* filter through a glass micro fibre paper (Whatman GF/C is suitable) and use the filtrate.

(2) 0.4% w/v of *azathioprine BPCRS* in 6M *ammonia.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *cellulose* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 20 cm.

(e) After removal of the plate, dry it at 50° and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

butan-1-ol saturated with 6M *ammonia.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Heat a quantity of the powdered tablets containing 20 mg of Azathioprine with 100 mL of *water* and filter. To 5 mL of the filtrate add 1 mL of *hydrochloric acid* and 10 mg of *zinc powder* and allow to stand for 5 minutes; a yellow colour is produced. Filter, cool in ice, add 0.1 mL of a 10% w/v solution of *sodium nitrite* and 0.1 g of *sulfamic acid* and shake until the bubbles disappear. Add 1 mL of *2-naphthol solution;* a pale pink precipitate is produced.

TESTS

5-Chloro-1-methyl-4-nitroimidazole and 6-mercaptopurine

Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.20 g of Azathioprine with 10 mL of 6M *ammonia* and filter through a glass micro fibre filter paper (Whatman GF/C is suitable).

(2) 2.0% w/v of *azathioprine BPCRS* and 0.020% w/v of *6-mercaptopurine* in 6M *ammonia.*

(3) 0.020% w/v of *6-mercaptopurine* in 6M *ammonia.*

(4) 0.020% w/v of *5-chloro-1-methyl-4-nitroimidazole BPCRS* in 6M *ammonia.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *cellulose* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 20 cm.

(e) After removal of the plate, dry it at 50° and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

butan-1-ol saturated with 6M *ammonia.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

LIMITS

Any spot in the chromatogram obtained with solution (1):

corresponding to 6-mercaptopurine in the chromatogram obtained with solution (2) is not more intense than the spot in the chromatogram obtained with solution (3);

any spot corresponding to 5-chloro-1-methyl-4-nitroimidazole in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.15 g of Azathioprine with 20 mL of *dimethyl sulfoxide* for 15 minutes and dilute to 500 mL with 0.1M *hydrochloric acid.* Avoid heating or the use of ultrasound. Filter, dilute 25 mL of the filtrate to 1000 mL with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of $C_9H_7N_7O_2S$ taking 628 as the value of A(1%, 1 cm) at the maximum at 280 nm.

STORAGE

Azathioprine Tablets should be protected from light.

www.webofpharma.com

Azithromycin Capsules

Action and use
Macrolide antibacterial.

DEFINITION
Azithromycin Capsules contain Azithromycin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of azithromycin, $C_{38}H_{72}N_2O_{12}$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the capsule contents containing 0.5 g of Azithromycin with 50 mL of *dichloromethane*. Filter (a 0.45-µm nylon filter is suitable) and evaporate the filtrate to dryness under a stream of nitrogen. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of azithromycin (*RS 487*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the requirements in the dissolution test for tablets and capsules, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *sodium dihydrogen orthophosphate* previously adjusted to pH 6.0 with *sodium hydroxide* or *sodium hydroxide*, at a temperature of 37°, as the dissolution medium.

PROCEDURE

Carry out the method for liquid chromatography, Appendix III D, using the following solutions.

Solvent A 40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *dilute phosphoric acid*, and 60 volumes of *acetonitrile R1*.

(1) After 45 minutes withdraw a sample of the medium and filter. Dilute a quantity of the filtrate with the dissolution medium to produce a solution expected to contain 0.027% w/v of Azithromycin.

(2) 0.027% w/v of *azithromycin EPCRS* in the dissolution medium.

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl vinyl polymer for chromatography* (5 µm) (Asahipak ODP-50 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 11.0 with a 56% w/v solution of *potassium hydroxide*, and 60 volumes of *acetonitrile R1*.

When the chromatograms are recorded under the prescribed conditions the retention time of azithromycin is about 10 minutes.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to azithromycin is between 0.8 and 2.0;

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Calculate the total content of azithromycin, $C_{38}H_{72}N_2O_{12}$, in the medium using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

LIMITS

The amount of azithromycin, $C_{38}H_{72}N_2O_{12}$, released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions

Solvent B 35 volumes of a 0.173% w/v solution of *ammonium dihydrogen orthophosphate* adjusted to pH 10.0 with *ammonia*, 35 volumes of *methanol R1* and 30 volumes of *acetonitrile R1*.

(1) Shake a quantity of the capsule contents containing 0.2 g of Azithromycin with 15 mL of solvent B, dilute to 25 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent B.

(3) Dissolve the contents of a vial of *azithromycin for system suitability EPCRS* in 1.0 mL of solvent B.

(4) 0.8% w/v of *azithromycin for peak identification EPCRS* in solvent B.

(5) Dilute 1 volume of solution (2) to 10 volumes with solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl amorphous organosilica polymer for mass spectrometry* (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 0.180% w/v solution of *anhydrous disodium hydrogen orthophosphate* adjusted to pH 8.9 with dilute *orthophosphoric acid* or with *dilute sodium hydroxide solution*.

Mobile phase B 25 volumes of *methanol R1* and 75 volumes of *acetonitrile R1*.

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-25	50→45	50→55	linear gradient
25-30	45→40	55→60	linear gradient
30-80	40→25	60→75	linear gradient
80-81	25→50	75→50	linear gradient
81-93	50	50	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to azithromycin (Retention time about 45 minutes) are: impurity L, about 0.29; impurity M, about 0.37; impurity E, about 0.43; impurity F, about 0.51; impurity D, about 0.54; impurity J, about 0.54; impurity I, about 0.61; impurity C, about 0.73; impurity N, about 0.76; impurity H, about 0.79; impurity A, about 0.83; impurity P, about 0.92; impurity O, about 1.23; impurity G, about 1.26; impurity B, about 1.31.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where Hp is the height above the baseline of the peak due to impurity J and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to Impurity F.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurities F and H using solution (3) and any peaks corresponding to impurities G, L, M, and N using solution (4). Multiply the area of these peaks by corresponding correction factors: impurity F, 0.3, impurity H, 0.1; impurity G, 0.2; impurity L, 2.3, impurity M, 0.6; impurity N, 0.7;

the area of any peak due to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the areas of any peaks due to azithromycin impurities A, C, E, F, H, I, L, M, N, O, P is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any peaks due to impurities D and J is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (5) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peaks eluting before impurity L and after impurity B and any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent C 40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile R1*.

(1) Shake a quantity of the mixed contents of 20 capsules containing 0.5 g of Azithromycin with 40 mL of solvent C, dilute to 100 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable). Dilute 1 volume of the filtrate to solution to 10 volumes with solvent C.

(2) 0.05% w/v of *azithromycin EPCRS* in solvent C.

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent C.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but with an injection volume of 10 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of azithromycin, $C_{38}H_{72}N_2O_{12}$, in the capsules using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Azithromycin.

Azithromycin Eye Drops

Action and use
Macrolide antibacterial.

DEFINITION

Azithromycin Eye Drops are a sterile solution of Azithromycin in a suitable oily vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of azithromycin, $C_{38}H_{72}N_2O_{12}$
90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Add 10 mL of *absolute ethanol* to a quantity of the eye drops containing 0.1 g of Azithromycin and mix. Allow to stand, retain the upper ethanolic layer and evaporate it to dryness under a stream of nitrogen. Wash the residue with 10 mL of *hexane* followed by a further 50 mL of *hexane* and allow to dry in air. The *infrared absorption spectrum* of the dried residue, *Appendix II A*, is concordant with the reference spectrum of azithromycin (*RS 487*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 20 volumes of *dichloromethane* and 80 volumes of *methanol*.

(1) Dilute a quantity of the eye drops, if necessary, to produce a solution containing 0.8% w/v of Azithromycin.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dissolve the contents of a vial of *azithromycin for system suitability EPCRS* in 1.0 mL.

(4) 0.8% w/v of *azithromycin for peak identification EPCRS*.

(5) Dilute 1 volume of solution (2) to 10 volumes.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl amorphous organosilica polymer for mass spectrometry* (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 0.18% w/v solution of *anhydrous disodium hydrogen orthophosphate* adjusted to pH 8.9 with dilute *orthophosphoric acid* or with *dilute sodium hydroxide solution.*

Mobile phase B 25 volumes of *methanol R1* and 75 volumes of *acetonitrile R1.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0 - 25	50 → 45	50 → 55	linear gradient
25 - 30	45 → 40	55 → 60	linear gradient
30 - 80	40 → 25	60 → 75	linear gradient
80 - 81	25 → 50	75 → 50	linear gradient
81 - 93	50	50	re-equilabration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to azithromycin (retention time about 45 minutes) are: impurity L, about 0.29; impurity M, about 0.37; impurity E, about 0.43; impurity F, about 0.51; impurity D, about 0.54; impurity J, about 0.54; impurity I, about 0.61; impurity C, about 0.73; impurity N, about 0.76; impurity H, about 0.79; impurity A, about 0.83; impurity P, about 0.92; impurity O, about 1.23; impurity G, about 1.26; impurity B, about 1.31.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where *Hp* is the height above the baseline of the peak due to impurity J and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity F.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurities F and H using solution (3) and any peaks corresponding to impurities G, L, M, and N using solution (4). Multiply the area of these peaks by the corresponding correction factors: impurity F, 0.3; impurity H, 0.1; impurity G, 0.2; impurity L, 2.3; impurity M, 0.6; impurity N, 0.7;

the area of any peak corresponding to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peaks corresponding to impurities A, C, E, F, H, I, L, M, N, O, P is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any peaks due to impurities D and J is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (5) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak eluting before impurity L and after impurity B and with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in a mixture of 20 volumes of *dichloromethane* and 80 volumes of *methanol.*

(1) Dilute a weighed quantity of the eye drops to produce a solution containing 0.05% w/v of Azithromycin.

(2) 0.05% w/v of *azithromycin EPCRS.*

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl vinyl polymer for chromatography* (5 µm) (Asahipak ODP-50 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 11.0 with a 56% w/v solution of *potassium hydroxide,* and 60 volumes of *acetonitrile R1.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the eye drops, *Appendix V G,* and calculate the total content of azithromycin, $C_{38}H_{72}N_2O_{12}$ in the eye drops using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Azithromycin.

Azithromycin for Infusion

Action and use

Macrolide antibacterial.

DEFINITION

Azithromycin for Infusion is a sterile material prepared from Azithromycin with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of azithromycin, $C_{38}H_{72}N_2O_{12}$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Dissolve a quantity of the contents of the sealed container containing 0.5 g of Azithromycin in 50 mL of *dichloromethane*. Filter (a 0.45-µm nylon filter is suitable) and evaporate the filtrate to dryness under a stream of nitrogen. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of azithromycin (*RS 487*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolve the contents of one container in a suitable solvent as directed in the manufacturer's instructions. Further dilute with the same solvent to prepare a final solution containing 10% w/v of azithromycin and allow to stand for 30 minutes (solution A).

Acidity

The pH of solution A is 6.4 to 6.8, Appendix V L.

Clarity of solution

Solution A is not more opalescent than *reference suspension I*, Appendix IV A.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent A 35 volumes of a 0.173% w/v solution of *ammonium dihydrogen orthophosphate* adjusted to pH 10.0 with *ammonia*, 35 volumes of *methanol R1* and 30 volumes of *acetonitrile R1*.

(1) Dissolve a quantity of the contents of the sealed container containing 0.2 g of Azithromycin in 15 mL of solvent A, dilute to 25 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A.

(3) Dissolve the contents of a vial of *azithromycin for system suitability EPCRS* in 1.0 mL of solvent A.

(4) 0.8% w/v of *azithromycin for peak identification EPCRS* in solvent A.

(5) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl amorphous organosilica polymer for mass spectrometry* (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 0.180% w/v solution of *anhydrous disodium hydrogen orthophosphate* adjusted to pH 8.9 with dilute *orthophosphoric acid* or with *dilute sodium hydroxide solution*.

Mobile phase B *25 volumes of methanol R1* and 75 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-25	50→45	50 →55	linear gradient
25-30	45→40	55→60	linear gradient
30-80	40→25	60→75	linear gradient
80-81	25→50	75→50	linear gradient
81-93	50	50	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to azithromycin (Retention time about 45 minutes) are: impurity L, about 0.29; impurity M, about 0.37; impurity E, about 0.43; impurity F, about 0.51; impurity D, about 0.54; impurity J, about 0.54; impurity I, about 0.61; impurity C, about 0.73; impurity N, about 0.76; impurity H, about 0.79; impurity A, about 0.83; impurity P, about 0.92; impurity O, about 1.23; impurity G, about 1.26; impurity B, about 1.31.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where Hp is the height above the baseline of the peak due to impurity J and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to Impurity F.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurities F and H using solution (3) and any peaks corresponding to impurities G, L, M, and N using solution (4). Multiply the area of these peaks by corresponding correction factors: impurity F, 0.3, impurity H, 0.1; impurity G, 0.2; impurity L, 2.3, impurity M, 0.6; impurity N, 0.7;

the area of any peak due to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the areas of any peaks due to azithromycin impurities A, C, E, F, H, I, L, M, N, O, P is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any peaks due to impurities D and J is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (5) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peaks eluting before impurity L and after impurity B and any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

Water

Not more than 3.0% w/w, Appendix IX C. Method I. Use 0.5 g.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

Solvent B 40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile R1*.

(1) Dissolve a quantity of the mixed contents of the 10 containers containing 0.5 g of Azithromycin in 50 mL of solvent B, dilute to 100 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable). Dilute 1 volume of the filtrate to solution to 10 volumes with solvent B.

(2) 0.05% w/v of *azithromycin EPCRS* in solvent B.

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl vinyl polymer for chromatography* (5 µm) (Asahipak ODP-50 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 11.0 with a 56% w/v solution of *potassium hydroxide*, and 60 volumes of acetonitrile *R1*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of azithromycin, $C_{38}H_{72}N_2O_{12}$, in a container of average content weight using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Azithromycin.

Azithromycin Oral Suspension

Action and use

Macrolide antibacterial.

DEFINITION

Azithromycin Oral Suspension is a suspension of Azithromycin in a suitable vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of azithromycin, $C_{38}H_{72}N_2O_{12}$

When freshly constituted not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing 0.5 g of Azithromycin with 50 mL of *dichloromethane*, allow to separate and retain the lower layer. Filter (a 0.45-µm nylon filter is suitable) and evaporate the filtrate to dryness under a stream of nitrogen. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of azithromycin (*RS 487*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH, 9.0 to 11.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions

Solvent A 35 volumes of a 0.173% w/v solution of *ammonium dihydrogen orthophosphate* adjusted to pH 10.0 with *ammonia*, 35 volumes of *methanol R1* and 30 volumes of *acetonitrile R1*.

(1) Shake a quantity of the oral suspension containing 0.2 g of Azithromycin with 15 mL of solvent A, dilute to 25 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A.

(3) 0.005% w/v of *azithromycin for system suitability EPCRS* in solvent A.

(4) 0.8% w/v of *azithromycin for peak identification EPCRS* in solvent A.

(5) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl amorphous organosilica polymer for mass spectrometry* (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 0.180% w/v solution of *anhydrous disodium hydrogen orthophosphate* adjusted to pH 8.9 with dilute *orthophosphoric acid* or with *dilute sodium hydroxide solution*.

Mobile phase B *25 volumes of methanol R1* and 75 volumes of *acetonitrile R1*.

0-25	50→45	50→55	linear gradient
25-30	45→40	55→60	linear gradient
30-80	40→25	60→75	linear gradient
80-81	25→50	75→50	linear gradient
81-93	50	50	isocratic

www.webofpharma.com

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to azithromycin (Retention time about 45 minutes) are: impurity L, about 0.29; impurity M, about 0.37; impurity E, about 0.43; impurity F, about 0.51; impurity D, about 0.54; impurity J, about 0.54; impurity I, about 0.61; impurity C, about 0.73; impurity N, about 0.76; impurity H, about 0.79; impurity A, about 0.83; impurity P, about 0.92; impurity O, about 1.23; impurity G, about 1.26; impurity B, about 1.31.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where Hp is the height above the baseline of the peak due to impurity J and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity F.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurities F and H using solution (3) and any peaks corresponding to impurities G, L, M, and N using solution (4). Multiply the area of these peaks by corresponding correction factors: impurity F, 0.3, impurity H, 0.1; impurity G, 0.2; impurity L, 2.3, impurity M, 0.6; impurity N, 0.7;

the area of any peak due to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the areas of any peaks due to azithromycin impurities A, C, E, F, H, I, L, M, N, O, P is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any peaks due to impurities D and J is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (5) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peaks eluting before impurity L and after impurity B and with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

Water

Not more than 2.0% w/w, Appendix IX C. Method I. Use 0.5g of the dry ingredients.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent B 1590 volumes of a 0.138% w/v solution of *potassium dihydrogen orthophosphate*, 600 volumes of *isopropanol*, 480 volumes of *methanol* and 330 volumes of *acetonitrile*, adjusted to pH 8.4 with 10M *potassium hydroxide*.

(1) Shake a weighed quantity of the oral suspension containing 0.2 g of Azithromycin with 300 mL of solvent B, dilute to 500 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable).

(2) 0.04% w/v of *azithromycin EPCRS* in solvent B.

(3) 0.04% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl vinyl polymer for chromatography* (5 µm) (Asahipak ODP-50 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 11.0 with a 56% w/v solution of *potassium hydroxide*, and 60 volumes of *acetonitrile R1*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Determine the weight per mL of the oral suspension, Appendix V G, and calculate the content of azithromycin, $C_{38}H_{72}N_2O_{12}$ in the oral suspension using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be kept at the temperature and used within the period stated on the label.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Azithromycin.

Azithromycin Tablets

Action and use

Macrolide antibacterial.

DEFINITION

Azithromycin Tablets contain Azithromycin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of azithromycin, $C_{38}H_{72}N_2O_{12}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.5 g of Azithromycin with 50 mL of *dichloromethane*. Filter (a 0.45-µm nylon filter is suitable) and evaporate the filtrate to dryness under a stream of nitrogen. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of azithromycin (*RS 487*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Dissolution

Comply with the requirements in the dissolution test for tablets and capsules, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *sodium dihydrogen orthophosphate* previously adjusted to pH 6.0 with *sodium hydroxide*, at a temperature of 37°, as the dissolution medium.

PROCEDURE

Carry out the method for liquid chromatography, Appendix III D, using the following solutions.

Solvent A 40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile R1*.

(1) After 45 minutes withdraw a sample of the medium and filter. Dilute a quantity of the filtrate with the dissolution medium to produce a solution expected to contain 0.027% w/v of Azithromycin.

(2) 0.027% w/v of *azithromycin EPCRS* in the dissolution medium.

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl vinyl polymer for chromatography* (5 µm) (Asahipak ODP-50 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 11.0 with a 56% w/v solution of *potassium hydroxide*, and 60 volumes of *acetonitrile R1*.

When the chromatograms are recorded under the prescribed conditions the retention time of azithromycin is about 10 minutes.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2) the *symmetry factor* of the peak due to azithromycin is between 0.8 and 2.0;

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Calculate the total content of azithromycin, $C_{38}H_{72}N_2O_{12}$, in the medium using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

LIMITS

The amount of azithromycin, $C_{38}H_{72}N_2O_{12}$, released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent B 35 volumes of a 0.173% w/v solution of *ammonium dihydrogen orthophosphate* adjusted to pH 10.0 with *ammonia*, 35 volumes of *methanol R1* and 30 volumes of *acetonitrile R1*.

(1) Shake a quantity of powdered tablets containing 0.2 g of Azithromycin with 15 mL of solvent B, dilute to 25 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent B.

(3) Dissolve the contents of a vial of *azithromycin for system suitability EPCRS* in 1.0 mL of solvent B.

(4) 0.8% w/v of *azithromycin for peak identification EPCRS* in solvent B.

(5) Dilute 1 volume of solution (2) to 10 volumes with solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl amorphous organosilica polymer for mass spectrometry* (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A 0.180% w/v solution of *anhydrous disodium hydrogen orthophosphate* adjusted to pH 8.9 with dilute *orthophosphoric acid* or with *dilute sodium hydroxide solution*.

Mobile phase B 25 volumes of *methanol R1* and 75 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-25	50→45	50→55	linear gradient
25-30	45→40	55→60	linear gradient
30-80	40→25	60→75	linear gradient
80-81	25→50	75→50	linear gradient
81-93	50	50	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to azithromycin (Retention time about 45 minutes) are: impurity L, about 0.29; impurity M, about 0.37; impurity E, about 0.43; impurity F, about 0.51; impurity D, about 0.54; impurity J, about 0.54; impurity I, about 0.61; impurity C, about 0.73; impurity N, about 0.76; impurity H, about 0.79; impurity A, about 0.83; impurity P, about 0.92; impurity O, about 1.23; impurity G, about 1.26; impurity B, about 1.31.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where Hp is the height above the baseline of the peak due to impurity J and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to Impurity F.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

identify any peaks corresponding to impurities F and H using solution (3) and any peaks corresponding to impurities G, L, M, and N using solution (4). Multiply the area of these peaks by corresponding correction factors: impurity F, 0.3, impurity H, 0.1; impurity G, 0.2; impurity L, 2.3, impurity M, 0.6; impurity N, 0.7;

the area of any peak due to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the areas of any peaks due to azithromycin impurities A, C, E, F, H, I, L, M, N, O, P is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any peaks due to impurities D and J is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (5) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak eluting before impurity L and after impurity B and with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solvent C 40 volumes of a 0.67% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile R1*.

(1) Shake a quantity of the powdered tablets containing 0.5 g of Azithromycin with 40 mL of solvent C, dilute to 100 mL with the same solvent and filter (a 0.45-µm nylon filter is suitable). Dilute 1 volume of the filtrate to 10 volumes with solvent C.

(2) 0.05% w/v of *azithromycin EPCRS* in solvent C.

(3) 0.05% w/v each of *azithromycin EPCRS* and *azithromycin impurity A EPCRS* in solvent C.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but with an injection volume of 10 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and azithromycin is at least 1.5.

DETERMINATION OF CONTENT

Calculate the total content of azithromycin, $C_{38}H_{72}N_2O_{12}$ in the tablets using the declared content of $C_{38}H_{72}N_2O_{12}$ in *azithromycin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Azithromycin.

Baclofen Oral Solution

Action and use
Skeletal muscle relaxant.

DEFINITION

Baclofen Oral Solution is a solution of Baclofen in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of baclofen, $C_{10}H_{12}ClNO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of 35 volumes of *acetonitrile* and 65 volumes of *water*.

(1) Dilute a volume of the oral solution containing 5 mg of Baclofen to 100 mL.

(2) 0.005% w/v of *baclofen BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry in air.

(f) Place an evaporating dish containing 4 mL of *water*, 1 mL of 7M *hydrochloric acid* and 0.5 g of *potassium permanganate* in a chromatography tank, close the tank and allow to stand for 2 minutes. Place the plate in the tank, close the tank and leave the plate in contact with the vapour for 1 minute.

(g) After removal of the plate, place it in a current of cold air until an area of coating below the line of application shows only a faint blue colour on the addition of 0.05 mL of *potassium iodide and starch solution*. Spray the plate with *potassium iodide and starch solution* and examine in daylight.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *water* and 80 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Impurity A
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution containing 5 mg of Baclofen to 50 mL.

(2) 0.0002% w/v of *baclofen impurity A EPCRS*.

(3) 0.01% w/v of *baclofen BPCRS*, 0.0003% w/v of *propyl 4-hydroxybenzoate*, 0.0003% w/v of *methyl 4-hydroxybenzoate* and 0.0002% w/v of *baclofen impurity A EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

www.webofpharma.com

MOBILE PHASE

5 g of *sodium dodecyl sulfate* in a mixture of 5 mL of *orthophosphoric acid* and 650 mL of *water* and diluted to 1000 mL with *acetonitrile R1*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to methyl-4-hydroxybenzoate and impurity A (lactam) and between the peaks due to impurity A and propyl-4-hydroxybenzoate is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution containing 5 mg of Baclofen to 50 mL.

(2) 0.01% w/v of *baclofen BPCRS*.

(3) 0.01% w/v of *baclofen BPCRS*, 0.0003% w/v of *propyl 4-hydroxybenzoate* and 0.0002% w/v of *baclofen impurity A EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl-silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 218 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 g of *sodium dodecyl sulfate* in a mixture of 5 mL of *orthophosphoric acid* and 650 mL of *water* and diluting to 1000 mL with *acetonitrile R1*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and propyl-4-hydroxybenzoate is at least 5.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{10}H_{12}ClNO_2$, weight in volume, using the declared content of $C_{10}H_{12}ClNO_2$ in *baclofen BPCRS*.

STORAGE

Baclofen Oral Solution should be stored below 25° and protected from light. It should not be refrigerated.

Baclofen Tablets

Action and use

Skeletal muscle relaxant.

DEFINITION

Baclofen Tablets contain Baclofen.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of baclofen, $C_{10}H_{12}ClNO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Baclofen with 20 mL of a mixture of 4 volumes of *absolute ethanol* and 1 volume of *glacial acetic acid* for 30 minutes and filter.

(2) 0.1% w/v of *baclofen BPCRS* in a mixture of 4 volumes of *absolute ethanol* and 1 volume of *glacial acetic acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution* and heat at 100° for 10 minutes.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *water* and 80 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 50 revolutions per minute.

(b) Use 900 mL of *0.1M hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 20 mL sample of the medium and filter through a membrane filter with a nominal pore size not greater than 0.45 µm, discarding the first 10 mL of filtrate.

(2) 0.001% w/v of *baclofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the total content of baclofen, $C_{10}H_{12}ClNO_2$, in the medium from the declared content of $C_{10}H_{12}ClNO_2$ in *baclofen BPCRS*.

Impurity A

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Baclofen with 50 mL for 30 minutes, shaking occasionally to disperse the sample, and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.004% w/v of *baclofen impurity A EPCRS*.

(3) 0.2% w/v of *baclofen BPCRS* and 0.004% w/v of *baclofen impurity A EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 266 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *glacial acetic acid*, 440 volumes of *methanol* and 560 volumes of *water*, the mixture containing 0.182% w/v of *sodium hexanesulfonate*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to baclofen and impurity A is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to baclofen impurity A is not greater than the area of the peak in the chromatogram obtained with solution (2) (2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add a quantity of whole tablets containing 0.1 g of Baclofen to 25 mL of a mixture of 1 volume of *glacial acetic acid* and 100 volumes of *water* and disperse with the aid of ultrasound. Dilute to 50 mL with *methanol*, filter and use the filtrate.

(2) 0.2% w/v of *baclofen BPCRS* in a mixture of 1 volume of *glacial acetic acid*, 100 volumes of *methanol* and 100 volumes of *water*.

(3) 0.2% w/v of *baclofen BPCRS* and 0.004% w/v of *baclofen impurity A EPCRS* in a mixture of 1 volume of *glacial acetic acid*, 100 volumes of *methanol* and 100 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium hexanesulfonate* in a mixture of 1 volume of *glacial acetic acid*, 100 volumes of *methanol* and 100 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to baclofen and impurity A is at least 7.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{12}ClNO_2$ in the tablets using the declared content of $C_{10}H_{12}ClNO_2$ in *baclofen BPCRS*.

Barium Sulfate Oral Suspension

Barium Sulphate Oral Suspension

DEFINITION

Barium Sulfate Oral Suspension is a suspension of Barium Sulfate for Suspension in a suitable aqueous vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of barium sulfate, $BaSO_4$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A smooth, white or creamy white suspension.

IDENTIFICATION

Evaporate 1 mL to dryness and ignite to constant weight. The residue complies with the following tests.

A. To 0.2 g add 5 mL of a 50% w/v solution of *sodium carbonate* and boil for 5 minutes, add 10 mL of *water* and filter. Reserve the residue for test B. Acidify the filtrate with 2M *hydrochloric acid*. The resulting solution yields the reactions characteristic of *sulfates*, Appendix VI.

B. Wash the residue reserved in test A with *water*, add 5 mL of 2M *hydrochloric acid*, mix well and filter. Add 0.3 mL of 1M *sulfuric acid* to the filtrate. A white precipitate is produced which is insoluble in 2M *hydrochloric acid*.

Acidity or alkalinity

pH, 3.5 to 8.5, Appendix V L.

ASSAY

Evaporate to dryness a quantity containing 0.6 g of Barium Sulfate in a platinum dish on a water bath and carry out the Assay described under Barium Sulfate for Suspension, beginning at the words 'add 5 g of *sodium carbonate*...'. Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the percentage of $BaSO_4$, weight in volume.

www.webofpharma.com

Beclometasone Cream

Action and use
Glucocorticoid.

DEFINITION

Beclometasone Cream contains Beclometasone Dipropionate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the preparation being examined containing 0.5 mg of Beclometasone Dipropionate in 20 mL of *methanol (80%)* by heating on a water bath until the methanol begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 mL of the supernatant liquid with 3 mL of *water* and 5 mL of *chloroform*, shake vigorously, allow the layers to separate, evaporate the chloroform layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 mL of *chloroform*.

(2) 0.025% w/v of *beclometasone dipropionate BPCRS* in *chloroform*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and, while hot, spray with *alkaline tetrazolium blue solution*.

MOBILE PHASE

100 volumes of *chloroform*, 10 volumes of *acetone* and 5 volumes of *absolute ethanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to beclometasone dipropionate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing 0.025% w/w of Beclometasone Dipropionate.

(1) Mix 10 mL of *methanol (80%)* containing 0.01% w/v of *beclometasone dipropionate BPCRS* and 0.0005% w/v of *beclometasone 17-propionate BPCRS* with 2 mL of a 0.05% w/v solution of *testosterone propionate* (internal standard) in *methanol (80%)* and dilute to 50 mL with the same solvent.

(2) Disperse a quantity of the preparation being examined containing 1 mg of Beclometasone Dipropionate in 20 mL of hot *methanol (90%)*, add 25 mL of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower layer through a small plug of absorbent cotton previously washed with *methanol (80%)*. Repeat the extraction of the trimethylpentane solution with two further 10 mL quantities of *methanol (80%)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80%)* to produce 50 mL. If the resulting solution is more than slightly cloudy, filter.

(3) Prepare in the same manner as solution (2) but add 2 mL of a 0.05% w/v solution of the internal standard in *methanol (80%)* before diluting to 50 mL.

For creams containing 0.5% w/w of Beclometasone Dipropionate.

(1) Mix 25 mL of *methanol (80%)* containing 0.04% w/v of *beclometasone dipropionate BPCRS* and 0.002% w/v of *beclometasone 17-propionate BPCRS* with 20 mL of a 0.05% w/v solution of *testosterone propionate* (internal standard) in *methanol (80%)* and dilute to 200 mL with the same solvent.

(2) Add 100 mL of *methanol (80%)* to a quantity of the preparation being examined containing 10 mg of Beclometasone Dipropionate and heat on a water bath, with swirling, until the preparation has dispersed. Cool, dilute to 200 mL with *methanol (80%)* and filter.

(3) Prepare in the same manner as solution (2) but add 20 mL of a 0.05% w/v solution of the internal standard in *methanol (80%)* before diluting to 200 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of *methanol* and *water* such that the *resolution factor* between the peaks due to beclometasone 17-propionate (retention time about 1.5 minutes) and beclometasone dipropionate (retention time about 2 minutes) is greater than 2.0 (a mixture of 70 volumes of *methanol* and 30 volumes of *water* is usually suitable).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (1), the *resolution factor* between the peaks due to beclometasone 17-propionate (retention time about 1.5 minutes) and beclometasone dipropionate (retention time about 2 minutes) is greater than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{37}ClO_7$ in the preparation being examined using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS*.

STORAGE

Beclometasone Cream should be protected from light.

www.webofpharma.com

Beclometasone Inhalation Powder

Beclometasone Powder for Inhalation, Metered-dose Powder Inhaler

Action and use
Glucocorticoid.

DEFINITION

Beclometasone Inhalation Powder consists of Beclometasone Dipropionate or Beclometasone Dipropionate Monohydrate in *microfine powder* or aerodynamically equivalent, either alone or combined with a suitable carrier. It is administered by a dry-powder inhaler.

The inhalation powder complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7. Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$
80.0 to 120.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. *For products containing lactose;* disperse 0.25 g of the inhalation powder in 5 mL of *water.* Add 5 mL of 6M *ammonia* and heat in a water-bath at 80° for 10 minutes. An orange-red colour is produced.

TESTS

Uniformity of delivered dose
Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient of a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile* to produce a solution containing the equivalent of 0.00005% w/v of beclometasone dipropionate.

(2) Dilute 10 mL of a solution containing 0.0005% w/v of *beclometasone dipropionate BPCRS* in *methanol* to 100 mL with a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated end-capped octylsilyl silica gel for chromatography* (5 µm) (Lichrospher 60 RP-select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

25 volumes of *water* and 75 volumes of *methanol.*

DETERMINATION OF CONTENT

Calculate the amount of beclometasone dipropionate, $C_{28}H_{37}ClO_7$, per delivered dose using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS.* Repeat the procedure as described for reservoir systems under Inhalation Powders, Uniformity of delivered dose.

Related substances
Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dissolve a quantity of the inhalation powder containing the equivalent of 1.2 mg of beclometasone dipropionate in the mobile phase and dilute to 5 mL with the mobile phase.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.0040% w/v each of *beclometasone 17-propionate BPCRS* and *beclometasone 21-propionate BPCRS* in the mobile phase.

(4) Dilute 1 volume of solution (2) to 20 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 or Lichrospher RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 100 µL of each solution.

(g) For solutions (1) and (2) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

Dilute 60 volumes of *acetonitrile* to 100 volumes with *water.*

When the chromatograms are recorded under the prescribed conditions, the retention time for beclometasone 17-propionate is about 6 minutes, for beclometasone 21-propionate, about 7 minutes and for beclometasone dipropionate, about 13 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to beclometasone 17-propionate and beclometasone 21-propionate is at least 1.4. If necessary adjust the concentration of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

www.webofpharma.com

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Use the average of the individual results determined in the test for Uniformity of delivered dose.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of beclometasone dipropionate.

Beclometasone Inhalation Powder, pre-metered

Beclometasone Powder for Inhalation, pre-dispensed

Action and use

Glucocorticoid.

DEFINITION

Beclometasone Inhalation Powder, pre-metered consists of Beclometasone Dipropionate or Beclometasone Dipropionate Monohydrate in *microfine powder* either alone or combined with a suitable carrier. The pre-metered unit is loaded into a dry-powder inhaler to generate an aerosol.

The inhalation powder, pre-metered complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7. Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$

When supplied as disks, 90.0 to 110.0% of the stated amount per pre-metered unit. When supplied as capsules, 80.0 to 120.0% of the stated amount per pre-metered unit.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Disperse a quantity of powder, containing the equivalent of 200 µg of beclometasone dipropionate in 5 mL of 1M *sodium hydroxide* in a 25 mL conical flask. Add three drops of *copper sulfate solution* and shake. A precipitate may form which dissolves to give a clear blue solution. Heat the solution to boiling; a red precipitate is produced.

C. *For products containing lactose* disperse 0.25 g of the powder for inhalation in 5 mL of *water*. Add 5 mL of 6M *ammonia* and heat in a water-bath at 80° for 10 minutes. An orange-red colour is produced.

TESTS

Uniformity of delivered dose

Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient of a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile* to produce a solution containing the equivalent of 0.00005% w/v of beclometasone dipropionate.

(2) Dilute 10 mL of a solution containing 0.0005% w/v of *beclometasone dipropionate BPCRS* in *methanol* to 100 mL with a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated end-capped octylsilyl silica gel for chromatography* (5 µm) (Lichrospher 60 RP-select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

25 volumes of *water* and 75 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$, per delivered dose using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS*. Repeat the procedure as described for pre-metered systems under Inhalation Powders, Uniformity of delivered dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of 20 units containing the equivalent of 1.2 mg of beclometasone dipropionate in the mobile phase and dilute to 5 mL with the mobile phase.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.0040% w/v each of *beclometasone 17-propionate BPCRS* and *beclometasone 21-propionate BPCRS* in the mobile phase.

(4) Dilute 1 volume of solution (2) to 20 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 or Lichrospher RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 100 µL of each solution.

(g) For solutions (1) and (2) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

Dilute 60 volumes of *acetonitrile* to 100 volumes with *water*.

When the chromatograms are recorded under the prescribed conditions, the retention time for beclometasone

www.webofpharma.com

17-propionate is about 6 minutes, for beclometasone 21-propionate, about 7 minutes and for beclometasone dipropionate, about 13 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to beclometasone 17-propionate and beclometasone 21-propionate is at least 1.4. If necessary adjust the concentration of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

not more than one such *secondary peak* has an area greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Weigh and powder the contents of 20 pre-dispensed units. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of the pre-dispensed unit in sufficient of the mobile phase to produce a solution containing the equivalent of 0.001% w/v of beclometasone dipropionate.

(2) 0.001% w/v of *beclometasone dipropionate BPCRS* in the mobile phase.

(3) 0.001% w/v each of *beclometasone 17-propionate BPCRS* and *beclometasone 21-propionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to beclometasone 17-propionate and beclometasone 21-propionate is at least 1.4. If necessary adjust the concentration of *acetonitrile* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{37}ClO_7$ using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of beclometasone dipropionate.

Beclometasone Pressurised Inhalation

Beclometasone Pressurised Inhalations from different manufacturers, whilst complying with the requirements of the monograph, are not necessarily interchangeable.

Action and use

Glucocorticoid.

DEFINITION

Beclometasone Pressurised Inhalation is a solution or suspension of Beclometasone Dipropionate in a suitable liquid in a pressurised container fitted with a metering dose valve.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7 Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$

85.0 to 115.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of beclometasone dipropionate (2) (*RS 379*). Examine the substance as a dispersion in *potassium bromide* prepared in the following manner. Discharge the container a sufficient number of times, under conditions of very low relative humidity (less than 5%), into a mortar to obtain 2 mg of Beclometasone Dipropionate. Heat at 110° for 2 hours at a pressure of 2 kPa, cool, grind the residue thoroughly with 0.1 g of *potassium bromide*, add a further 0.2 g of *potassium bromide* and mix thoroughly.

TESTS

Uniformity of delivered dose

Complies with the requirements stated under Pressurised Metered-dose Preparations for Inhalation using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.272% w/v of *potassium dihydrogen orthophosphate*.

(1) Collect single doses of the preparation being examined using the procedure described under *Pressurised Metered-dose Preparations for Inhalation*, Uniformity of delivered dose and dissolve the collected dose in sufficient *methanol (70%)* to produce a solution containing 0.00025% w/v of Beclometasone Dipropionate.

(2) 0.00025% w/v of *Beclometasone Dipropionate BPCRS* in *methanol (70%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (50 mm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters Sunfire C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

52 volumes of *tetrahydrofuran*, 240 volumes of *acetonitrile*, 260 volumes of *methanol* and 450 volumes of Solution A. Adjust the final pH to 3.25 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to beclometasone is about 8 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the column efficiency of the peak due to beclometasone dipropionate is at least 2000 theoretical plates.

DETERMINATION OF CONTENT

Calculate the content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$, per delivered dose from the chromatograms obtained and using the declared content of $C_{28}H_{37}ClO_7$, in *beclometasone dipropionate BPCRS*. Repeat the procedure as described under Pressurised Metered-dose Preparations for Inhalation.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.

(1) Discharge the container into a small, dry flask a sufficient number of times to obtain 0.5 mg of Beclometasone Dipropionate and dissolve the residue in 2 mL of *acetone*. Evaporate the solution to a volume such that the whole solution can be applied to the plate.

(2) 0.1% w/v of *beclometasone dipropionate BPCRS*.

(3) Dilute 1 volume of solution (2) to 2 volumes.

(4) Dilute 1 volume of solution (2) to 4 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase described below.

(c) Apply separately to the plate the whole of solution (1) and 10 µL of each of solutions (2), (3) and (4).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *alkaline tetrazolium blue solution* and heat at 50° for 5 minutes. Cool and spray again with *alkaline tetrazolium blue solution*.

MOBILE PHASE

3 volumes of *methanol* and 97 volumes of *1,2-dichloroethane*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.5%).

Disregard any spot with an Rf value of more than 0.85.

ASSAY

Use the average of the individual results obtained in the test for Uniformity of delivered dose.

LABELLING

The label states the content of active ingredient in terms of the equivalent delivered dose.

Beclometasone Aqueous Nasal Spray

Beclometasone Nasal Spray

Action and use

Glucocorticoid.

DEFINITION

Beclometasone Aqueous Nasal Spray is an aqueous suspension of either Beclometasone Dipropionate or Beclometasone Dipropionate Monohydrate in a suitable container fitted with an appropriate nasal delivery system.

The liquid nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Evaporate a quantity of the nasal spray containing the equivalent of 0.5 mg of beclometasone dipropionate to dryness and dissolve the residue in 0.5 mL of *acetone*.

(2) 0.1% w/v of *beclometasone dipropionate BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to the peak due to beclometasone dipropionate in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.

(1) Evaporate a quantity of the nasal spray containing the equivalent of 0.5 mg of beclometasone dipropionate to dryness and dissolve the residue in 2 mL of *acetone*. Evaporate the solution to a volume such that the whole solution can be applied to the plate.

(2) 0.1% w/v of *beclometasone dipropionate BPCRS*.

(3) Dilute 1 volume of solution (2) to 2 volumes.

(4) Dilute 1 volume of solution (2) to 4 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase described below.

(c) Apply separately to the plate the whole of solution (1) and 10 µL of each of solutions (2), (3) and (4).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *alkaline tetrazolium blue solution* and heat at 50° for

www.webofpharma.com

5 minutes. Cool and spray again with *alkaline tetrazolium blue solution.*

MOBILE PHASE

3 volumes of *methanol* and 97 volumes of *1,2-dichloroethane.*

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.5%).

Disregard any spot with an Rf value of more than 0.85.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Discharge the container a sufficient number of times to obtain the equivalent of 0.5 mg of beclometasone dipropionate, add 30 mL of mobile phase, mix with the aid of ultrasound, dilute to 50 mL with mobile phase and filter. Dilute 3 volumes of this solution to 20 volumes with the mobile phase.

(2) 0.00015% w/v of *beclometasone dipropionate BPCRS* in the mobile phase.

(3) 0.00015% w/v each of *testosterone propionate BPCRS* and *beclometasone dipropionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *water* and 70 volumes of *methanol.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the average content of $C_{28}H_{37}ClO_7$ delivered by a single actuation of the valve using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS.*

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of beclometasone dipropionate.

Beclometasone Ointment

Action and use

Glucocorticoid.

DEFINITION

Beclometasone Ointment contains Beclometasone Dipropionate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of beclometasone dipropionate, $C_{28}H_{37}ClO_7$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Dissolve a quantity of the ointment containing 0.5 mg of Beclometasone Dipropionate in 2 mL of *chloroform* by heating on a water bath, add 10 mL of *methanol* and heat on the water bath until the mixture begins to boil. Shake vigorously, cool in ice for 30 minutes and filter. Evaporate the filtrate to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 mL of *chloroform.*

(2) 0.05% w/v of *beclometasone dipropionate BPCRS* in *chloroform.*

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) Use the mobile phase as described below.

(c) Apply10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and, while hot, spray with *alkaline tetrazolium blue solution.*

MOBILE PHASE

5 volumes of *absolute ethanol,* 10 volumes of *acetone* and 100 volumes of *chloroform.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to beclometasone dipropionate in the chromatogram obtained with solution (1).

ASSAY

(1) Disperse a quantity of the ointment containing 1 mg of Beclometasone Dipropionate in 25 mL of hot *2,2,4-trimethylpentane,* cool and extract the mixture with successive quantities of 20, 10 and 10 mL of *methanol (80%),* filtering each extract in turn through a small plug of absorbent cotton previously washed with *methanol (80%).* Combine the filtrates and dilute to 50 mL with *methanol (80%).*

(2) Mix 10 mL of *methanol (80%)* containing 0.01% w/v of *beclometasone dipropionate BPCRS* and 0.0005% w/v of *beclometasone 17-propionate BPCRS* with 2 mL of a 0.05% w/v solution of *testosterone propionate* (internal standard) in *methanol (80%)* and dilute to 50 mL with the same solvent.

(3) Prepare solution (3) in the same manner as solution (1) but add 2 mL of a 0.05% w/v solution of the internal standard in *methanol (80%)* before diluting to 50 mL.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of *methanol* and *water* such that the *resolution factor* between the peaks due to beclometasone 17-propionate (retention time about 1.5 minutes) and beclometasone dipropionate (retention time about 2 minutes) is greater than 2.0 (a mixture of 30 volumes of *water* and 70 volumes of *methanol* is usually suitable).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to beclometasone 17-propionate (retention time about 1.5 minutes) and beclometasone dipropionate (retention time about 2 minutes) is greater than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{37}ClO_7$ in the preparation being examined using the declared content of $C_{28}H_{37}ClO_7$ in *beclometasone dipropionate BPCRS*.

STORAGE

Beclometasone Ointment should be protected from light.

Bendroflumethiazide Oral Suspension

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Thiazide diuretic.

DEFINITION

Bendroflumethiazide Oral Suspension is a suspension of Bendroflumethiazide in a suitable flavoured aqueous vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

Content of bendroflumethiazide, $C_{15}H_{14}F_3N_3O_4S_2$

92.5 to 105.0% of the stated amount.

Shake the oral suspension vigorously before carrying out the following tests.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mix a quantity of the oral suspension with sufficient *acetone* to produce a solution containing 0.025% w/v of Bendroflumethiazide; shake for 10 minutes and filter.

(2) 0.1% w/v of *bendroflumethiazide BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of solution (1) and 5 µL of solution (2).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in air, examine under *ultraviolet light (254 nm)* and then reveal the spots by *Method I*.

MOBILE PHASE

Ethyl acetate.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.6 to 3.0, Appendix V L.

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions. Use a volume of the oral suspension containing one dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. Store and inject the solutions at 4°, using a cooled autosampler.

(1) Add 30 mL of *methanol* to a quantity of the oral suspension containing 2.5 mg of Bendroflumethiazide and shake vigorously. Add about 10 mL of a 5% w/v solution of *sodium chloride*, allow to cool and add sufficient of the 5% w/v *sodium chloride* to produce 50 mL. Filter the resulting solution through a 0.45-µm nylon filter, discarding the first 5 mL of filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Dilute 1 volume of solution (2) to 10 volumes with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed *with octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters SunFire C18 is suitable) fitted with a stainless steel guard column (4 mm × 3 mm) packed with the same material.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 20°.

(e) Use a detection wavelength of 273 nm.

(f) Inject 10 µL of each solution.

When the chromatograms are recorded under the prescribed conditions the retention time of bendroflumethiazide is about 16.5 minutes and the relative retention of impurity A [4-amino-6-(trifluoromethyl)benzene-1,3-disulfonamide] is about 0.33.

MOBILE PHASE

Mobile phase A

4 volumes of *acetonitrile* and 16 volumes of *water*, adjust the pH of the mixture to 2.0 using *orthophosphoric acid*.

www.webofpharma.com

Mobile phase B

4 volumes of *water* and 6 volumes of *acetonitrile*; adjust the pH of the mixture to 2.0 using *orthophosphoric acid*.

Equilibrate the column with mobile phase A for at least 1 hour before starting the elution programme.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	100	0	isocratic
10-14	100→0	0→100	linear gradient
14-18	0	100	isocratic
18-22	0→100	100→0	linear gradient
22-28	100	0	re-equilibration

SYSTEM SUITABILITY

The following test applies only if a peak due to impurity A and a peak with a retention relative to that of bendroflumethiazide of about 0.24 are present.

The test is not valid unless, in the chromatogram obtained with solution (1), the *resolution* between the peak due to impurity A and the peak with a retention relative to bendroflumethiazide of about 0.24 is at least 1.5.
If co-elution of these peaks occurs, re-equilibrate the column for at least 1 hour and repeat using freshly prepared mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks*, excluding the peak due to impurity A, is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. Store and inject the solutions at 4°, using a cooled autosampler.

(1) Add 30 mL of *methanol* to a weighed quantity of the oral suspension containing 2.5 mg of Bendroflumethiazide and shake vigorously. Add about 10 mL of a 5% w/v solution of *sodium chloride*, allow to cool and add sufficient of the 5% w/v *sodium chloride* to produce 50 mL. Filter the resulting solution through a 0.45-µm nylon filter, discarding the first 5 mL of filtrate.

(2) Dilute 1 volume of a 0.025% w/v solution of *bendroflumethiazide BPCRS* in *methanol* to 5 volumes with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak corresponding to bendroflumethiazide is between 0.9 and 2.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{14}F_3N_3O_4S_2$, weight in volume, using the declared content of $C_{15}H_{14}F_3N_3O_4S_2$ in *bendroflumethiazide BPCRS*.

STORAGE

Bendroflumethiazide Oral Suspension should be stored at a temperature of 2° to 8°.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Bendroflumethiazide.

Bendroflumethiazide Tablets

Action and use
Thiazide diuretic.

DEFINITION

Bendroflumethiazide Tablets contain Bendroflumethiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bendroflumethiazide, $C_{15}H_{14}F_3N_3O_4S_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

In the Assay, record the UV spectrum of the principal peak in the chromatograms obtained with solutions (1) and (2) with a diode array detector in the range of 210 to 400 nm.

The UV spectrum of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2);

the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 50 revolutions per minute.

(b) Use 900 mL of 0.005M *sodium hydroxide*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions preparedimmediately before use.

(1) After 45 minutes withdraw a sample of the medium, filter (a polyethylene filter is suitable) and dilute the filtrate with sufficient of the dissolution medium, if necessary, to produce a solution expected to contain 0.00028% w/v of Bendroflumethiazide.

(2) 0.028% w/v of *bendroflumethiazide BPCRS* in *methanol*. Dilute 1 volume to 100 volumes with the dissolution medium.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3.5 µm) (SunFire C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of *water*, adjusted to pH 2.0 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of bendroflumethiazide is about 8 minutes.

DETERMINATION OF CONTENT

Calculate the total content of bendroflumethiazide, $C_{15}H_{14}F_3N_3O_4S_2$, in the medium from the chromatograms obtained and using the declared content of $C_{15}H_{14}F_3N_3O_4S_2$ in *bendroflumethiazide BPCRS*.

LIMITS

The amount of bendroflumethiazide released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A. Protect the solutions from light.

(1) Shake a quantity of powdered tablets containing 12.5 mg of Bendroflumethiazide with 15 mL of *methanol*, dilute to 25 mL with mobile phase A and filter through a 0.45-µm nylon filter.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) 0.5% w/v of *bendroflumethiazide BPCRS* and 0.005% w/v of *bendroflumethiazide impurity A EPCRS* in *methanol*. Dilute 1 volume to 10 volumes with mobile phase A.

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters SunFire C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 20 volumes of *acetonitrile* and 80 volumes of *water*, adjusted to pH 2.0 with *orthophosphoric acid*.

Mobile phase B 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 2.0 with *orthophosphoric acid*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	100	0	isocratic
10-14	100→0	0→100	linear gradient
14-18	0	100	isocratic
18-22	0→100	100→0	linear gradient
22-28	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference bendroflumethiazide (retention time about 16 minutes) is: impurity A, about 0.4.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and bendroflumethiazide is at least 40.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of any other *secondary peak* is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Protect the solutions from light.

(1) Shake a quantity of powdered tablets containing 12.5 mg of Bendroflumethiazide with 30 mL of *methanol* and dilute to 50 mL with the mobile phase. Dilute 1 volume to 50 volumes with the mobile phase and filter through a 0.45-µm nylon filter.

(2) 0.005% w/v of *bendroflumethiazide BPCRS* in *methanol*. Dilute 1 volume to 10 volumes with the mobile phase.

(3) 0.005% w/v of *bendroflumethiazide BPCRS* and 0.0005% w/v of *bendroflumethiazide impurity A EPCRS* in *methanol*. Dilute 1 volume to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and bendroflumethiazide is at least 15.

DETERMINATION OF CONTENT

Calculate the content of bendroflumethiazide, $C_{15}H_{14}F_3N_3O_4S_2$, in the tablets from the chromatograms obtained and using the declared content of $C_{15}H_{14}F_3N_3O_4S_2$ in *bendroflumethaizide BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Bendroflumethiazide.

www.webofpharma.com

Benzatropine Tablets

Action and use
Anticholinergic.

DEFINITION
Benzatropine Tablets contain Benzatropine Mesilate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

PRODUCTION
Risk assessment should be used to evaluate the potential for genotoxic methanesulfonate esters to be formed in the presence of low molecular weight alcohols. If a risk of methanesulfonate ester formation is identified through risk assessment, these impurities should not exceed the threshold of toxicological concern.

Content of benzatropine mesilate, $C_{21}H_{25}NO,CH_4O_3S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Shake a suitable quantity of the powdered tablets with 2M *hydrochloric acid* and filter. Dilute the filtrate with sufficient 2M *hydrochloric acid* to produce a solution containing 0.1% w/v of Benzatropine Mesilate. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 253 nm and 258 nm.

B. Extract a quantity of the powdered tablets containing 10 mg of Benzatropine Mesilate with 10 mL of *ethanol (96%)* and filter. Evaporate the filtrate to about 2 mL, pour into 5 mL of hot *picric acid solution R1* and allow to cool. The *melting point* of the precipitate, after drying at 105°, is about 185°, Appendix V A.

TESTS

Tropine
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Benzatropine Mesilate with 4 mL of *acetone* for 5 minutes, centrifuge, evaporate 2 mL of the supernatant liquid to dryness and dissolve the residue in 0.5 mL of *acetone*.

(2) 0.010% w/v of *tropine* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *sodium iodobismuthate solution* and then with a 0.4% w/v solution of *sulfuric acid*.

MOBILE PHASE

15 volumes of 13.5M *ammonia* and 75 volumes of *ethanol (96%)*.

LIMITS

Any spot corresponding to tropine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Benzatropine Mesilate comply with the requirement stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake one tablet with 8 mL of the mobile phase for 5 minutes, add sufficient of the mobile phase to produce 10 mL, centrifuge for 5 minutes and use the supernatant liquid.

(2) 0.02% w/v of *benzatropine mesilate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP8 or Spherisorb C8 is suitable).

(b) Use isocratic elution (or gradient elution) and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 259 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

35 volumes of *octylamine phosphate buffer pH 3.0* and 65 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{25}NO,CH_4O_3S$ in each tablet using the declared content of $C_{21}H_{25}NO,CH_4O_3S$ in *benzatropine mesilate BPCRS*.

ASSAY
Weigh and powder 30 tablets. To a quantity of the powder containing 50 mg of Benzatropine Mesilate add 50 mL of *water* and shake for 15 minutes. Add 10 mL of a 50% w/v solution of *sodium hydroxide* and an excess of *sodium chloride* and extract with successive quantities of 50, 25, 25 and 25 mL of *ether*. Extract the combined ether layers with successive quantities of 25, 25, 25 and 15 mL of 2M *hydrochloric acid*, dilute the combined extracts to 100 mL with 2M *hydrochloric acid*, mix and filter if necessary. Measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{21}H_{25}NO$, CH_4O_3S from the *absorbance* obtained by repeating the operation using 50 mg of *benzatropine mesilate BPCRS* in place of the powdered tablets and from the declared content of $C_{21}H_{25}NO,CH_4O_3S$ in *benzatropine mesilate BPCRS*.

Compound Benzoic Acid Ointment

Whitfield's Ointment

DEFINITION
Compound Benzoic Acid Ointment contains 6.0% w/w of Benzoic Acid and 3.0% w/w of Salicylic Acid in a suitable emulsifying basis.

Extemporaneous preparation
The following formula and directions apply.

Benzoic Acid in *fine powder*	60 g
Salicylic Acid in *fine powder*	30 g
Emulsifying Ointment	910 g

Triturate the Benzoic Acid and the Salicylic Acid with a portion of the Emulsifying Ointment until smooth and gradually incorporate the remainder of the Emulsifying Ointment.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

www.webofpharma.com

Content of benzoic acid, $C_7H_6O_2$
5.7 to 6.3% w/w.

Content of salicylic acid, $C_7H_6O_3$
2.7 to 3.3% w/w.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 80 volumes of *toluene* and 20 volumes of *glacial acetic acid* as the mobile phase. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) warm 1 g of the ointment with 10 mL of *chloroform*, cool and filter. Solution (2) contains 0.6% w/v of *benzoic acid* and 0.3% w/v of *salicylic acid* in *chloroform*. After removal of the plate, allow the solvent to evaporate in a current of air and examine under *ultraviolet light (254 nm)*. The chromatogram obtained with solution (1) shows spots corresponding in colour and position to those in the chromatogram obtained with solution (2). Examine under *ultraviolet light (365 nm)*.
The chromatogram obtained with solution (1) shows a blue fluorescent spot corresponding in colour and position to that in the chromatogram obtained with solution (2). Spray the plate with *iron(III) chloride solution R1*. The chromatogram obtained with solution (1) shows a purple spot corresponding in position to the blue fluorescent spot observed under ultraviolet light (365 nm) and corresponding in colour and position to the spot in the chromatogram obtained with solution (2).

ASSAY
For benzoic acid
To 2 g add 150 mL of *water*, warm until melted and titrate with *0.1M sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Reserve the solution for the Assay for salicylic acid. After the subtraction of 1 mL for each 13.81 mg of $C_7H_6O_3$ found in the Assay for salicylic acid, each mL of *0.1M sodium hydroxide VS* is equivalent to 12.21 mg of $C_7H_6O_2$.

For salicylic acid
Cool the titrated solution obtained in the Assay for benzoic acid, dilute to 250 mL with *water* and filter. To 5 mL of the filtrate add sufficient *iron(III) nitrate solution* to produce 50 mL. Filter, if necessary, to remove haze and measure the *absorbance* of the resulting solution at the maximum at 530 nm, Appendix II B, using *iron(III) nitrate solution* in the reference cell. Calculate the content of $C_7H_6O_3$ from the absorbance obtained by repeating the operation using 5 mL of a 0.024% w/v solution of *salicylic acid* and beginning at the words 'add sufficient *iron(III) nitrate solution* ...'.

Benzoic Acid Solution

DEFINITION

Benzoic Acid	50 g
Propylene Glycol	750 mL
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.
Dissolve the Benzoic Acid in the Propylene Glycol and add sufficient Purified Water, in small quantities and with constant stirring, to produce 1000 mL.

Content of benzoic acid, $C_7H_6O_2$
4.75 to 5.25% w/v.

IDENTIFICATION
A. To 5 mL add 30 mL of 1M *sulfuric acid* and extract the precipitated acid with three 25-mL quantities of *petroleum spirit (boiling range, 40° to 60°)*. Wash the combined extracts with three 25-mL quantities of *water*, filter through absorbent cotton and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of benzoic acid *(RS 025)*.

B. *Melting point* of the residue obtained in test A, about 121°, Appendix V A.

TESTS
Weight per mL
1.045 to 1.055 g, Appendix V G.

ASSAY
To 10 mL add 20 mL of *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* and titrate with *0.1M sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of *0.1M sodium hydroxide VS* is equivalent to 12.21 mg of $C_7H_6O_2$.

Benzoyl Peroxide and Clindamycin Gel

Action and use
Used topically in the treatment of acne.

DEFINITION
Benzoyl Peroxide and Clindamycin Gel contains Hydrous Benzoyl Peroxide and Clindamycin Phosphate in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$
90.0 to 110.0% of the stated amount.

Content of clindamycin, $C_{18}H_{33}ClN_2O_5S$
92.0 to 107.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the preparation being examined containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 50 mL of *dichloromethane*. Add sufficient *dichloromethane* to produce 100 mL and filter.

(2) 0.05% w/v of *benzoyl peroxide* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 2 volumes of *dichloromethane* and 50 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the preparation being examined containing the equivalent of 20 mg of clindamycin with 5 mL of *methanol*. Add sufficient *methanol* to produce 10 mL and filter.

(2) 0.2% w/v of *clindamycin phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 100° to 105° for 30 minutes, allow it to cool and spray with a 0.1% w/v solution of *potassium permanganate* and examine.

MOBILE PHASE

20 volumes of *water*, 20 volumes of *glacial acetic acid* and 60 volumes of *1-butanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the preparation being examined containing the equivalent of 20 mg of clindamycin with 5 mL of *methanol*. Add sufficient *methanol* to produce 10 mL and filter.

(2) 0.2% w/v of *clindamycin phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 100° to 105° for 30 minutes, allow it to cool and spray with a 0.1% w/v solution of *potassium permanganate* and examine.

MOBILE PHASE

20 volumes of *water*, 20 volumes of *glacial acetic acid* and 60 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. In the test for Related substances for benzoyl peroxide, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (5).

D. In the Assay for clindamycin, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

Related substances

for benzoyl peroxide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the gel containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 50 mL of *acetone*, dilute to 100 mL with *acetone* and centrifuge. Dilute 1 mL of the supernatant liquid to 10 mL with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *acetonitrile*.

(3) 0.003% w/v of *benzoic acid*, 0.0003% w/v of *ethyl benzoate* and 0.0003% w/v of *benzaldehyde* in *acetonitrile*.

(4) Dilute 1 volume of solution (2) to 10 volumes with *acetonitrile*.

(5) 0.005% w/v *benzoyl peroxide* in a mixture of 1 volume of *acetone* and 9 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *polar end-capped ether-linked phenyl for chromatography* (4 µm) (Phenomenex Synergi Polar RP is suitable) fitted with a suitable stainless steel guard column packed with *octadecylsilyl silica gel for chromatography*.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.00042% v/v *orthophosphoric acid*.

Mobile phase B *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	65	35	isocratic
5-15	65→15	35→85	linear gradient
15-18	15	85	isocratic
18-20	15→65	85→35	linear gradient
20-31	65	35	re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retentions with reference to benzoyl peroxide (retention time about 14 minutes) are: benzoic acid, about 0.3; benzaldehyde, about 0.5 and ethyl benzoate, about 0.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to benzoic acid and benzaldehyde is at least 2.0.

LIMITS

Identify the peaks due to benzoic acid, benzaldehyde and ethyl benzoate using the chromatogram obtained with solution (3) and multiply the areas of these peaks by the corresponding correction factors: benzoic acid, 1.5; benzaldehyde, 1.7; and ethyl benzoate, 1.7.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to benzoic acid is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all *secondary peaks* excluding benzoic acid is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

www.webofpharma.com

for clindamycin

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a solution containing *0.002% w/v* of *2-phenoxyethanol (internal standard)* in *0.1% v/v trifluoroacetic acid.*

(1) Shake a quantity of the gel containing the equivalent of 0.1 g of clindamycin with 30 mL, and then dilute to 50 mL.

(2) Dissolve 0.15 g of *clindamycin phosphate BPCRS* and 0.25 g of *benzoyl peroxide* in 10 mL of *water*, heat at 85° for 16 hours, and filter. Dilute 1 mL of the filtrate to 25 mL with *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of clindamycin.

MOBILE PHASE

0.1 volume of *trifluoroacetic acid*, 17 volumes of *acetonitrile R1* and 83 volumes of *water.*

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to clindamycin (retention time about 30 minutes) are: impurity A, about 0.14; impurity 1, about 0.28; impurity 2, about 0.36; impurity 3, about 0.38; impurity B, about 0.40; impurity 4, about 0.43; benzoic acid, about 0.70; impurity E, about 1.48.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) closely resembles the degradation chromatogram supplied with *clindamycin phosphate BPCRS.*

LIMITS

In the chromatogram obtained with solution (1):

Identify the peaks corresponding to impurities A, 1, 2, 3 and 4 using the chromatogram obtained with solution (2). Multiply the heights of these peaks by the corresponding correction factors: impurity A, 0.15; impurity 1, 0.26; impurity 2, 0.39; impurity 3, 0.26; impurity 4, 0.39.

Calculate the ratio of the height of the peak corresponding to clindamycin, to the height of the peak corresponding to the internal standard (*R*).

the ratio of the height of any peak corresponding to impurity 1 to the height of the internal standard is not greater than *0.06R* (6.0%);

the ratio of the height of any peak corresponding to impurity 2 to the height of the internal standard is not greater than *0.02R* (2.0%);

the ratio of the height of any peak corresponding to impurity 3 to the height of the internal standard is not greater than *0.09R* (9.0%);

the ratio of the height of any other *secondary peak* to the height of the internal standard is not greater than 0.01R (1.0%);

the sum of the ratios of the heights of all *secondary peaks* to the height of the internal standard is not greater than *0.15R* (15.0%);

Disregard any secondary peak where the ratio of the height of the peak is less than *0.01R* (1.0%).

ASSAY

For benzoyl peroxide

Mix, with the aid of ultrasound, a weighed quantity of the gel containing the equivalent of 10 mg of anhydrous benzoyl peroxide with 5 mL of *dimethylformamide* and 25 mL of *acetone.* Add 5 mL of a 50% w/v solution of *potassium iodide.* Titrate with 0.1M *sodium thiosulfate VS* using *starch solution*, added towards the end of the titration, as indicator. Carry out a blank titration using 5 mL of *dimethylformamide* and 25 mL of *acetone.* The difference between the titrations represents the amount of sodium thiosulfate required. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 1.211 mg of $C_{14}H_{10}O_4$.

For clindamycin

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a solution containing 0.002% w/v of *2-phenoxyethanol (internal standard)* in 0.1% v/v *trifluoroacetic acid.*

(1) Shake a quantity of the gel containing the equivalent of 10 mg of clindamycin with 30 mL, and then dilute to 50 mL.

(2) 0.02% w/v of clindamycin phosphate BPCRS

(3) Dissolve 0.15 g of *clindamycin phosphate BPCRS* and 0.25 g of *benzoyl peroxide* in 10 mL of *water*, heat at 85° for 16 hours, and filter. Dilute 1 volume of the filtrate to 25 volumes with *water.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the degradation chromatogram supplied with *clindamycin phosphate BPCRS.*

DETERMINATION OF CONTENT

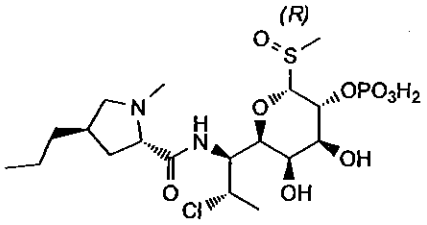
Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the gel from the chromatograms obtained and from the declared content of $C_{18}H_{34}ClN_2O_8PS$ in *clindamycin phosphate BPCRS.* Each mg of $C_{18}H_{34}ClN_2O_8PS$ is equivalent to 0.8416 mg of $C_{18}H_{33}ClN_2O_5S$.

STORAGE

Benzoyl Peroxide and Clindamycin Gel should be stored at a temperature of 2° to 8°. It should not be allowed to freeze.

LABELLING

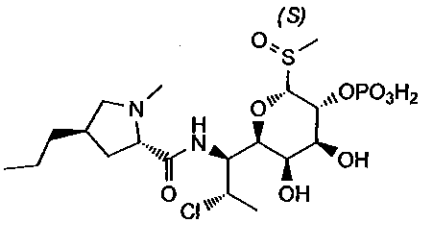
The content of Hydrous Benzoyl Peroxide is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.



The content of Clindamycin Phosphate is stated in terms of the equivalent amount of clindamycin.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and E listed under Clindamycin Phosphate and the following:



1. [(2*R*,3*R*,4*S*,5*R*,6*R*)-6-[(1*S*,2*S*)-2-chloro-1-{[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]formamido}propyl]-4,5-dihydroxy-2-[(*R*)-methanesulfinyl]oxan-3-yl dihydrogen phosphate.

www.webofpharma.com

2. (2*S*,4*R*)-*N*-{(1*S*,2*S*)-2-chloro-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-methanesulfinyloxan-2-yl]propyl-1-methyl-4-propylpyrroliin-2-carboxamide.

3. [(2*R*,3*R*,4*S*,5*R*,6*R*)-6-[(1*S*,2*S*)-2-chloro-1-{[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl] formamido]propyl]-4,5-dihydroxy-2-[(*S*)-methanesulfinyl]oxan-3-yl dihydrogen phosphate.

4. (2*S*,4*R*)-*N*-{(1*S*,2*S*)-2-chloro-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-[(ξ)-methanesulfinyl]oxan-2-yl}propyl-1-methyl-4-propylpyrroliin-2-carboxamide.

Benzoyl Peroxide Cream

Action and use
Used topically in the treatment of acne.

DEFINITION
Benzoyl Peroxide Cream contains Hydrous Benzoyl Peroxide in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

(1) Shake a quantity of the preparation being examined containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 10 mL of *dichloromethane* and filter.

(2) 0.5% w/v of *benzoyl peroxide* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 2 volumes of *dichloromethane* and 50 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Related substances, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to benzoyl peroxide in the chromatogram obtained with solution (4).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a mixture of 0.1 volumes of *acetic acid* and 999.9 volumes of *acetonitrile* (solvent A).

(1) Add 1 mL of solvent A to a quantity of the cream containing the equivalent of 25 mg of anhydrous benzoyl peroxide. Mix using a vortex mixer until a uniform suspension is obtained. Add three 1-mL quantities of *acetonitrile* and mix using a vortex mixer between each addition. Add a further 15 mL of *acetonitrile* and mix with the aid of ultrasound for 3 minutes. Add sufficient *acetonitrile* to produce 100 mL. Dilute 1 volume to 10 volumes with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *acetonitrile*.

(3) 0.003% w/v of *benzoic acid*, 0.0003% w/v of *ethyl benzoate* and 0.0003% w/v of *benzaldehyde* in *acetonitrile*.

(4) 0.0025% w/v of *benzoyl peroxide* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped phenyl ethyl silica gel for chromatography* (4 µm) (Phenomenex Synergi Polar RP is suitable) fitted with a suitable stainless steel guard column packed with *octadecylsilyl silica gel for chromatography*.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.00042% v/v *Orthophosphoric acid*.

Mobile phase B *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	65	35	isocratic
5-15	65→15	35→85	linear gradient
15-18	15	85	isocratic
18-20	15→65	85→35	linear gradient
20-31	65	35	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to benzoyl peroxide (retention time, about 14.5 minutes) are: benzoic acid, about 0.3; benzaldehyde, about 0.5 and ethyl benzoate, about 0.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to benzoic acid and benzaldehyde is at least 2.0.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

Identify the peaks due to benzoic acid, benzaldehyde and ethyl benzoate using the chromatogram obtained with solution (3) and multiply the areas of these peaks by the corresponding correction factors: benzoic acid, 1.50; benzaldehyde, 1.74; and ethyl benzoate, 1.72.

the area of any peak corresponding to benzoic acid is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (10%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Mix a quantity of the preparation being examined containing the equivalent of 0.25 g of anhydrous benzoyl peroxide with 50 mL of *acetone* and add sufficient *acetone* to produce 100 mL. To 10 mL add 25 mL of a 20% w/v solution of *potassium iodide*, mix, stopper the flask and allow to stand for 15 minutes protected from light. Add 25 mL of *acetone* and titrate with 0.01M *sodium thiosulfate VS* using *starch mucilage*, added towards the end of the titration, as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of sodium thiosulfate required. Each mL of 0.01M *sodium thiosulfate VS* is equivalent to 1.211 mg of $C_{14}H_{10}O_4$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Benzoyl Peroxide Gel

Action and use

Used topically in the treatment of acne.

DEFINITION

Benzoyl Peroxide Gel is a solution of Hydrous Benzoyl Peroxide in a suitable water-soluble basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

(1) Shake a quantity of the preparation being examined containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 10 mL of *dichloromethane* and filter.

(2) 0.5% w/v of *benzoyl peroxide* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 2 volumes of *dichloromethane* and 50 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Related substances, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to benzoyl peroxide in the chromatogram obtained with solution (4).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a mixture of 0.1 volumes of *acetic acid* and 999.9 volumes of *acetonitrile* (solvent A).

(1) Add 1 mL of solvent A to a quantity of the gel containing the equivalent of 25 mg of anhydrous benzoyl peroxide. Mix using a vortex mixer until a uniform suspension is obtained. Add three 1-mL quantities of *acetonitrile* and mix using a vortex mixer between each addition. Add a further 15 mL of *acetonitrile* and mix with the aid of ultrasound for 3 minutes. Add sufficient *acetonitrile* to produce 100 mL. Dilute 1 volume to 10 volumes with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *acetonitrile*.

(3) 0.003% w/v of *benzoic acid*, 0.0003% w/v of *ethyl benzoate* and 0.0003% w/v of *benzaldehyde* in *acetonitrile*.

(4) 0.0025% w/v of *benzoyl peroxide* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped phenyl ethyl silica gel for chromatography* (4 µm) (Phenomenex Synergi Polar RP is suitable) fitted with a suitable stainless steel guard column packed with *octadecylsilyl silica gel for chromatography*.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.00042% v/v of *orthophosphoric acid*.

Mobile phase B *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	65	35	isocratic
5-15	65→15	35→85	linear gradient
15-18	15	85	isocratic
18-20	15→65	85→35	linear gradient
20-31	65	35	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to benzoyl peroxide (retention time about 14.5 minutes) are: benzoic acid, about 0.3; benzaldehyde, about 0.5 and ethyl benzoate, about 0.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to benzoic acid and benzaldehyde is at least 2.0.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

Identify the peaks due to benzoic acid, benzaldehyde and ethyl benzoate using the chromatogram obtained with solution (3) and multiply the areas of these peaks by the corresponding correction factors: benzoic acid, 1.50; benzaldehyde, 1.74; and ethyl benzoate, 1.72.

the area of any peak corresponding to benzoic acid is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (10%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Mix a quantity of the preparation being examined containing the equivalent of 0.25 g of anhydrous benzoyl peroxide with 50 mL of *acetone* and add sufficient *acetone* to produce 100 mL. To 10 mL add 25 mL of a 20% w/v solution of *potassium iodide*, mix, stopper the flask and allow to stand for 15 minutes protected from light. Add 25 mL of *acetone* and titrate with 0.01M *sodium thiosulfate VS* using *starch mucilage*, added towards the end of the titration, as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of sodium thiosulfate required. Each ml of 0.01M *sodium thiosulfate VS* is equivalent to 1.211 mg of $C_{14}H_{10}O_4$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Benzoyl Peroxide Lotion

Benzoyl Peroxide Cutaneous Suspension

Action and use

Used topically in the treatment of acne.

DEFINITION

Benzoyl Peroxide Lotion is a *cutaneous suspension*. It contains Hydrous Benzoyl Peroxide in a suitable non-greasy vehicle.

The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

(1) Shake a quantity of the preparation being examined containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 10 mL of *dichloromethane* and filter.

(2) 0.5% w/v of *benzoyl peroxide* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 2 volumes of *dichloromethane* and 50 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Related substances, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to benzoyl peroxide in the chromatogram obtained with solution (4).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a mixture of 0.1 volumes of *acetic acid* and 999.9 volumes of *acetonitrile* (solvent A).

(1) Add 1 mL of solvent A to a quantity of the lotion containing the equivalent of 25 mg of anhydrous benzoyl peroxide. Mix using a vortex mixer until a uniform suspension is obtained. Add three 1-mL quantities of *acetonitrile* and mix using a vortex mixer between each addition. Add a further 15 mL of *acetonitrile* and mix with the aid of ultrasound for 3 minutes. Add sufficient *acetonitrile* to produce 100 mL. Dilute 1 volume to 10 volumes with *acetonitrile*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *acetonitrile*.

(3) 0.003% w/v of *benzoic acid*, 0.0003% w/v of *ethyl benzoate* and 0.0003% w/v of *benzaldehyde* in *acetonitrile*.

(4) 0.0025% w/v of *benzoyl peroxide* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped phenylethyl silica gel for chromatography* (4 µm) (Phenomenex Synergi Polar RP is suitable) fitted with a suitable stainless steel guard column packed with *octadecylsilyl silica gel for chromatography*.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 0.00042% v/v *Orthophosphoric acid*.

Mobile phase B *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	65	35	isocratic

Repeat the operation without the substance being examined. The difference between the titrations represents the amount of sodium thiosulfate required. Each mL of 0.01M *sodium thiosulfate VS* is equivalent to 1.211 mg of $C_{14}H_{10}O_4$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Benzydamine Cream

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Benzydamine Cream contains Benzydamine Hydrochloride in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of benzydamine hydrochloride, $C_{19}H_{23}N_3O$, HCl

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Heat a quantity of the cream containing 25 mg of Benzydamine Hydrochloride with 50 mL of *absolute ethanol* until the cream is completely dissolved and place in an ice-bath until a white precipitate forms. Allow to warm to 20°, dilute to 100 mL with *absolute ethanol* and filter. Dilute 10 mL of the filtrate to 100 mL with *absolute ethanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 308 nm.

B. In the test for 1-Benzyl-1*H*-indazol-3-ol, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

1-Benzyl-1*H*-indazol-3-ol

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Extract a quantity of the cream containing 60 mg of Benzydamine Hydrochloride with 25 mL of hot *methanol*, cool the solution in ice and filter; repeat the extraction twice, filtering each extract and evaporate the combined extracts to dryness using a rotary evaporator; dissolve the residue in 5 mL of *methanol*.

(2) 1.2% w/v of *benzydamine hydrochloride BPCRS*.

(3) 0.0024% w/v of *1-benzyl-1H-indazol-3-ol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm* and *365 nm)*.

MOBILE PHASE

30 volumes of *triethylamine* and 80 volumes of *toluene*.

LIMITS

By each method of visualisation, any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

To a quantity of the cream containing 25 mg of Benzydamine Hydrochloride add 50 mL of *ethanol (96%)*, heat until the cream is completely dissolved and cool in an ice-bath until a white precipitate forms. Allow to warm to 20°, dilute to 100 mL with *ethanol (96%)* and filter. Dilute 10 mL of the filtrate to 100 mL with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at about 308 nm, Appendix II B, using *ethanol (96%)* in the reference cell. Calculate the content of $C_{19}H_{23}N_3O$,HCl from the *absorbance* obtained with a solution containing 0.0025% w/v of *benzydamine hydrochloride BPCRS* in *ethanol (96%)* and using the declared content of $C_{19}H_{23}N_3O$,HCl in *benzydamine hydrochloride BPCRS*.

Benzydamine Mouthwash

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Benzydamine Mouthwash is a solution of Benzydamine Hydrochloride in a suitable flavoured and coloured vehicle.

The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of benzydamine hydrochloride, $C_{19}H_{23}N_3O$, HCl

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the mouthwash, if necessary, with *absolute ethanol* to contain 0.15% w/v of Benzydamine Hydrochloride.

www.webofpharma.com

(2) 0.15% w/v of *benzydamine hydrochloride BPCRS* in *absolute ethanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} precoated plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

30 volumes of *triethylamine* and 80 volumes of *toluene.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

5.0 to 7.0, Appendix V L.

1-Benzyl-1*H*-indazol-3-ol

Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Extract a quantity of the mouthwash containing 15 mg of Benzydamine Hydrochloride with seven 90-mL quantities of *chloroform.* Filter each extract through phase separating paper, evaporate the combined extracts to dryness and dissolve the residue in 10 mL of *methanol.*

(2) 0.0015% w/v of *1-benzyl-1H-indazol-3-ol BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate.*

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm).*

MOBILE PHASE

10 volumes of *glacial acetic acid,* 20 volumes of *chloroform* and 70 volumes of *cyclohexane.*

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *gas chromatography,* Appendix III B, using the following solutions. Prepare a 0.075% w/v solution of *1-benzyl-3-(3-diethylamino-propoxy)-1H-indazole BPCRS* (internal standard) in *water* (solution A).

(1) Add 10 mL of solution A, 5 mL of *water,* 5 mL of 1M *sodium hydroxide* and 20 mL of *chloroform* to a quantity of the mouthwash containing 7.5 mg of Benzydamine Hydrochloride, diluted, if necessary to 5 mL with *water,* shake for 5 minutes, centrifuge and use the chloroform layer.

(2) Prepare solution (2) in the same manner as solution (1) except using 5 mL of a solution containing 0.15% w/v of *benzydamine hydrochloride BPCRS* in *water* in place of a quantity of the mouthwash containing 7.5 mg of Benzydamine Hydrochloride, diluted, if necessary, to 5 mL with *water.*

CHROMATOGRAPHIC CONDITIONS

a) Use a glass column (2 m × 2 mm) packed with *acid-washed, diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable).

(b) Use *nitrogen for chromatography* as the carrier gas at 30 mL per minute.

(c) Use isothermal conditions maintained at 260°.

(d) Use an inlet temperature of 300°.

(e) Use a flame ionisation detector at 300°.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{23}N_3O$,HCl from the chromatograms obtained using the declared content of $C_{19}H_{23}N_3O$,HCl in *benzydamine hydrochloride BPCRS.*

LABELLING

The label states, where appropriate, that the preparation is also suitable for use as a gargle.

Benzydamine Oromucosal Spray

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Benzydamine Oromucosal Spray is a solution of Benzydamine Hydrochloride in a suitable flavoured vehicle in a suitable metered-dose container.

The oromucosal spray complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of benzydamine hydrochloride, $C_{19}H_{23}N_3O$, HCl

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Dilute the oromucosal spray, if necessary, with *absolute ethanol* to contain 0.15% w/v of Benzydamine Hydrochloride.

(2) 0.15% w/v of *benzydamine hydrochloride BPCRS* in *absolute ethanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} precoated plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

30 volumes of *triethylamine* and 80 volumes of *toluene.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

www.webofpharma.com

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity
5.0 to 7.0, Appendix V L.

Uniformity of weight
Weigh one unit. Fire one shot and reweigh the unit. Repeat four times, then repeat the entire process with 3 more units (20 shots). Determine the average weight delivered per shot. Not more than two of the individual weights deviate from the average weight by more than 10% and none deviates by more than 20%.

1-Benzyl-1*H*-indazol-3-ol
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the oromucosal spray containing 15 mg of Benzydamine Hydrochloride with seven 90-mL quantities of *chloroform*. Filter each extract through phase separating paper, evaporate the combined extracts to dryness and dissolve the residue in 10 mL of *methanol*.

(2) 0.0015% w/v of *1-benzyl-1H-indazol-3-ol BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *glacial acetic acid*, 20 volumes of *chloroform* and 70 volumes of *cyclohexane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY
Carry out the method for *gas chromatography*, Appendix III B using the following solutions. Prepare a 0.075% w/v solution of *1-benzyl-3-(3-diethylamino-propoxy)-1H-indazole BPCRS* (internal standard) in *water* (solution A).

(1) Add 10 mL of solution A, 5 mL of *water*, 5 mL of 1M *sodium hydroxide* and 20 mL of *chloroform* to a quantity of the oromucosal spray containing 7.5 mg of Benzydamine Hydrochloride, diluted, if necessary to 5 mL with *water*, shake for 5 minutes, centrifuge and use the chloroform layer.

(2) Prepare solution (2) in the same manner as solution (1) but using 5 mL of solution containing 0.15% w/v of *benzydamine hydrochloride BPCRS* in *water* in place of a quantity of the oromucosal spray containing 7.5 mg of Benzydamine Hydrochloride, diluted, if necessary, to 5 mL with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (2 m × 2 mm) packed with *acid-washed, diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable).

(b) Use *nitrogen for chromatography* as the carrier gas at 30 mL per minute.

(c) Use isothermal conditions maintained at 260°.

(d) Use an inlet temperature of 300°.

(e) Use a flame ionisation detector at 300°.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{23}N_3O$,HCl from the chromatograms obtained using the declared content of $C_{19}H_{23}N_3O$,HCl in *benzydamine hydrochloride BPCRS*.

Benzyl Benzoate Application

Benzyl Benzoate Cutaneous Emulsion

DEFINITION
Benzyl Benzoate Application is a *cutaneous emulsion*. It contains 25% w/v of Benzyl Benzoate in a suitable oil-in-water emulsified basis.

Extemporaneous preparation
The following formula and directions apply.

Benzyl Benzoate	250 g
Emulsifying Wax	20 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Melt the Emulsifying Wax, add the Benzyl Benzoate and mix. Pour the mixture into sufficient warm Purified Water to produce 1000 mL and stir thoroughly until cold.

The application complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of benzyl benzoate, $C_{14}H_{12}O_2$
23.1 to 26.9% w/v.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve 1 g of the application in sufficient of the mobile phase to produce 100 mL and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

(2) 0.0050% w/v of *benzyl benzoate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *water* and 70 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the application, Appendix V G, and calculate the content of $C_{14}H_{12}O_2$, weight in volume, using the declared content of $C_{14}H_{12}O_2$ in *benzyl benzoate BPCRS*.

www.webofpharma.com

Benzylpenicillin Eye Drops

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Penicillin antibacterial.

DEFINITION

Benzylpenicillin Eye Drops are a sterile solution of Benzylpenicillin Sodium in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of penicillins, calculated as $C_{16}H_{18}N_2O_4S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute the eye drops, if necessary, to produce a solution containing the equivalent of 0.15% w/v of benzylpenicillin.

(2) 0.15% w/v of *benzylpenicillin sodium EPCRS*.

(3) 0.15% w/v of *benzylpenicillin sodium EPCRS* and 0.15% w/v of *phenoxymethylpenicillin potassium BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose to iodine vapour until spots appear and examine in daylight.

MOBILE PHASE

30 volumes of *acetone* and 70 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity
pH, 5.5 to 7.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*, prepared immediately before use.

For eye drops containing the equivalent of 0.15% w/v of benzylpenicillin

(1) Use the preparation being examined.

For solutions (2) to (4), use the solutions described below.

For eye drops containing more than the equivalent of 0.15% w/v of benzylpenicillin

(1) Dilute a quantity of the eye drops, if necessary, to produce a solution containing the equivalent of 0.3% w/v of benzylpenicillin.

(2) 0.5% w/v of *benzylpenicillin for system suitability EPCRS* in a mixture of 35 volumes of *methanol R1* and 65 volumes of *water*.

(3) Dilute 1 volume of solution (1) to 100 volumes.

(4) Dilute 1 volume of solution (3) to 20 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Kromasil C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 30 volumes of *methanol R1* and 60 volumes of *water*.

Mobile phase B 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 35 volumes of *water* and 55 volumes of *methanol R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-7	70	30	isocratic
7-17	70→0	30→100	linear gradient
17-22	0	100	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to benzylpenicillin (retention time, about 7 minutes) are: impurity A, about 0.22; impurity D, about 0.33; impurity C; about 0.35; impurity E, about 0.48 and 0.55; impurity B, about 0.62; impurity F, about 0.81 and 0.83; impurity G, about 1.47; impurity H, about 1.90.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to the epimers of impurity F is at least 1.2 and the *resolution* between the peaks due to impurities C and D is at least 1.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities A, D, E and F using the chromatogram obtained with solution (2) and multiply the areas of these peaks by the corresponding correction factors: impurity A, 1.3; impurity D, 0.6; impurity E, 2.0; impurity F, 1.7.

In the chromatogram obtained with solution (1):

the sum of the areas of any peaks corresponding to impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (2.0% for the sum of the isomers);

www.webofpharma.com

the sum of the areas of any peaks corresponding to impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1.0% for the sum of the epimers);

the area of any peak corresponding to impurity B is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*, prepared immediately before use.

(1) Dilute the eye drops to produce a solution containing the equivalent of 0.1% w/v of benzylpenicillin.

(2) 0.1% w/v of *benzylpenicillin sodium EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used, but using the following mobile phase.

MOBILE PHASE

30 volumes of mobile phase B and 70 volumes of mobile phase A as described under Related substances.

DETERMINATION OF CONTENT

Calculate the content of penicillins, as $C_{16}H_{18}N_2O_4S$, in the eye drops using the declared content of $C_{16}H_{17}N_2NaO_4S$ in *benzylpenicillin sodium EPCRS*. Each mg of $C_{16}H_{17}N_2NaO_4S$ is equivalent to 0.9383 mg of $C_{16}H_{18}N_2O_4S$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of benzylpenicillin.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Benzylpenicillin Sodium.

Benzylpenicillin Infusion

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Penicillin antibacterial.

DEFINITION

Benzylpenicillin Infusion is a sterile solution containing Benzylpenicillin Sodium and a suitable buffer. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements. Where appropriate, the infusion also complies with the requirements stated under Unlicensed Medicines.

Content of benzylpenicillin, $C_{16}H_{18}N_2O_4S$

90.0 to 105.0% of the stated amount.

CHARACTERS

A clear, colourless solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute a volume of the infusion to produce a solution containing the equivalent of 0.6% w/v of benzylpenicillin.

(2) 0.64% w/v of *benzylpenicillin sodium EPCRS*.

(3) 0.5% w/v of each of *benzylpenicillin sodium EPCRS* and *phenoxymethylpenicillin EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel silanised plate* (Merck silanised silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose to iodine vapour until the spots appear and examine in daylight.

MOBILE PHASE

30 volumes of *acetone* and 70 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*, prepared immediately before use.

(1) Dilute a volume of the infusion to produce a solution containing the equivalent of 0.6% w/v of benzylpenicillin.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dissolve 5 mg of *benzylpenicillin for system suitability EPCRS* in 0.35 mL of *methanol R1* and add 0.65 mL of *water*.

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (YMC-Pack Pro is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

MOBILE PHASE

Mobile phase A 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 30 volumes of *methanol R1* and 60 volumes of *water*.

Mobile phase B 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 35 volumes of *water* and 55 volumes of *methanol R1*.

Time (min)	Mobile Phase A (% V/V)	Mobile Phase B (% V/V)	Comment
0 - 7	70	30	isocratic
7 - 17	70 → 0	30 → 100	linear gradient
17 - 22	0	100	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to benzylpenicillin (retention time, about 7 minutes) are: impurity A, about 0.22; impurity D, about 0.33; impurity C, about 0.35; impurity E, about 0.48 and 0.55; impurity B, about 0.62; impurity F, about 0.81 and 0.83; impurity G, about 1.47; impurity H, about 1.90.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to the epimers of impurity F is at least 1.2;

the *resolution* between the peaks due to impurities D and C is at least 1.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities A, D, E and F using the chromatogram obtained with solution (3) and multiply the areas of these peaks by the following correction factors: impurity A, 1.3; impurity D, 0.6; impurity E, 2.0; impurity F, 1.7.

In the chromatogram obtained with solution (1);

the sum of the areas of any peaks corresponding to the isomers of impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the sum of the areas of any peaks corresponding to the epimers of impurity F is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the area of any peak corresponding to impurity B is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3.0%).

Disregard any peak with an area less than 0.75 times the area of the principal peak in the chromatogram obtained with solution (4) (0.15%).

Bacterial endotoxins

Dilute the infusion with *water BET* to contain the equivalent of 10 mg of benzylpenicillin per mL (solution A).

The endotoxin limit concentration of solution A is 1.6 IU per mL, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water* prepared immediately before use.

(1) Dilute a volume of the infusion to produce a solution containing the equivalent of 0.12% w/v of benzylpenicillin.

(2) 0.13% w/v of *benzylpenicillin sodium EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but using isocratic elution, a flow rate of 1.2 mL per minute and an injection volume of 10 µL.

MOBILE PHASE

30 volumes of mobile phase B and 70 volumes of mobile phase A as described under Related substances.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{18}N_2O_4S$ in the infusion using the declared content of $C_{16}H_{17}N_2NaO_4S$ in *benzylpenicillin sodium EPCRS*. Each mg of $C_{16}H_{17}N_2NaO_4S$ is equivalent to 0.9383 mg of $C_{16}H_{18}N_2O_4S$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of benzylpenicillin.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Benzylpenicillin Sodium.

Benzylpenicillin for Injection

Action and use

Penicillin antibacterial.

DEFINITION

Benzylpenicillin for Injection is a sterile material consisting of Benzylpenicillin Potassium or Benzylpenicillin Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of penicillins, calculated as $C_{16}H_{18}N_2O_4S$

95.0 to 105.0% of the content of benzylpenicillin stated on the label.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the spectrum of *benzylpenicillin potassium EPCRS* or *benzylpenicillin sodium EPCRS* as appropriate.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 10.0% w/v of benzylpenicillin, 5.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*, prepared immediately before use.

www.webofpharma.com

(1) Dissolve a quantity of the contents of a sealed container to produce a solution containing the equivalent of 0.4% w/v of benzylpenicillin.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dissolve 5 mg of *benzylpenicillin for system suitability EPCRS* in 0.35 mL of *methanol R1* and add 0.65 mL of *water*.

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (YMC-Pack Pro is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 30 volumes of *methanol R1* and 60 volumes of *water*.

Mobile phase B 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.4 with a 50% w/v solution of *orthophosphoric acid*, 35 volumes of *water* and 55 volumes of *methanol R1*.

Time (min)	Mobile Phase A (% V/V)	Mobile Phase B (% V/V)	Comment
0 - 7	70	30	isocratic
7 - 17	70 → 0	30 → 100	linear gradient
17 - 22	0	100	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to benzylpenicillin (retention time about 7 minutes) are: impurity A, about 0.2; impurity D, about 0.3; impurity C, about 0.4; impurity E, about 0.48 and 0.55; impurity B, about 0.6; impurity F, about 0.81 and 0.83; impurity G, about 1.5 and impurity H, about 1.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to the epimers of impurity F is at least 1.2; and the resolution between the peaks due to impurities D and C is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurities A to H using the chromatogram supplied with *benzylpenicillin for system suitability EPCRS* and the chromatogram obtained with solution (3). Multiply the area of any peaks corresponding to impurity A, impurity D, impurity E and impurity F by the following correction factors respectively: 1.3, 0.6, 2.0 and 1.7.

the sum of the areas of any peaks corresponding to the isomers of impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the sum of the areas of any peaks corresponding to the epimers of impurity F is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the area of any peak corresponding to impurity B is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3.0%).

Disregard any peak with an area less than 0.75 times the area of the principal peak in the chromatogram obtained with solution (4) (0.15%).

Loss on drying

When dried to constant weight at 105°, lose not more than 1.0% of their weight. Use 1 g.

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of benzylpenicillin per mL (solution A). The endotoxin limit of solution A is 1.6 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water* prepared immediately before use.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.1% w/v of benzylpenicillin.

(2) 0.11% w/v of *benzylpenicillin sodium EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (YMC-Pack Pro is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mix 10 volumes of a 6.8% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.5 with a 50% w/v solution of *dilute orthophosphoric acid*, 36 volumes of *methanol* and 54 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of penicillins, as $C_{16}H_{18}N_2O_4S$, in a container of average content weight using the declared content of $C_{16}H_{17}N_2NaO_4S$ in *benzylpenicillin sodium EPCRS*. Each mg of $C_{16}H_{17}N_2NaO_4S$ is equivalent to 0.9383 mg of $C_{16}H_{18}N_2O_4S$.

STORAGE

The sealed container should be stored at a temperature not exceeding 30°.

www.webofpharma.com

LABELLING
The label of the sealed container states (1) whether the contents are Benzylpenicillin Potassium or Benzylpenicillin Sodium; (2) the quantity of Benzylpenicillin Potassium or Benzylpenicillin Sodium contained in it in terms of the equivalent amount of benzylpenicillin.

IMPURITIES
The impurities limites by the requirements of this monograph include those listed under Benzylpenicillin Potassium and Benzylpenicillin Sodium.

Betahistine Dihydrochloride Tablets

Action and use
Histamine H_1 receptor antagonist; antihistamine.

DEFINITION
Betahistine Dihydrochloride Tablets contain Betahistine Dihydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of betahistine dihydrochloride, $C_8H_{12}N_2,2HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract a quantity of the powdered tablets containing 5 mg of Betahistine Dihydrochloride with 100 mL of *water* and filter. The *light absorption*, Appendix II B, in the range 230 to 350 nm exhibits a maximum at about 260 nm, a less well-defined maximum at about 267 nm and a shoulder at about 256 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 50 mL of the mobile phase to a quantity of the powdered tablets containing 32 mg of Betahistine Dihydrochloride, shake for 10 minutes, add sufficient mobile phase to produce 100 mL, mix, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 500 volumes with the mobile phase.

(3) 0.00064% w/v of N-*methyl-2-(pyridin-2-yl)*-N-*[2-(pyridine-2-yl)ethyl]ethanamine trihydrochloride BPCRS* in the mobile phase.

(4) 0.000032% w/v of *2-vinylpyridine* in *acetonitrile*.

(5) 0.00064% w/v each of N-*methyl-2-(pyridin-2-yl)*-N-*[2-(pyridine-2-yl)ethyl]ethanamine trihydrochloride BPCRS* and *betahistine dihydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax XDB Eclipse is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for four times the retention time of betahistine (retention time of betahistine, about 5 minutes).

MOBILE PHASE

Dissolve 0.4 g of *hexylamine* in 600 mL of a solution containing 0.46% w/v of *sodium dihydrogen orthophosphate monohydrate* and 0.27% w/v of *sodium dodecyl sulfate*, add 400 mL of *acetonitrile*, mix and adjust the pH to 3.5 using *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to *N*-methyl-bis[β-(2-pyridyl)ethyl]amine is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2%);

the area of any peak corresponding to 2-vinylpyridine is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of the peaks corresponding to *N*-methyl-bis[β-(2-pyridyl)ethyl]amine, 2-vinylpyridine and any other *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.05% of that of the principal peak in the chromatogram obtained with solution (1) (0.05%).

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 50 mL of the mobile phase to a quantity of the powdered tablets containing 32 mg of Betahistine Dihydrochloride, shake for 10 minutes, add sufficient mobile phase to produce 100 mL, mix, centrifuge and use the supernatant liquid.

(2) 0.032% w/v of *betahistine dihydrochloride BPCRS* in the mobile phase.

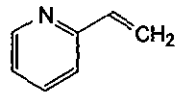
(3) 0.00064% w/v each of N-*methyl-2-(pyridin-2-yl)*-N-*[2-(pyridine-2-yl)ethyl]ethanamine trihydrochloride BPCRS* and *betahistine dihydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

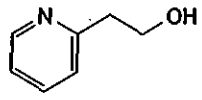
SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.



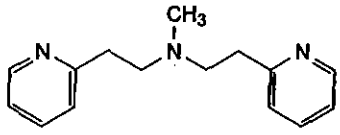
DETERMINATION OF CONTENT

Calculate the content of $C_8H_{12}N_2,2HCl$ in the tablets using the declared content of $C_8H_{12}N_2,2HCl$ in *betahistine dihydrochloride BPCRS*.



www.webofpharma.com

STORAGE
Betahistine Dihydrochloride Tablets should be protected from light and moisture.



IMPURITIES

1. 2-ethenylpyridine (2-vinylpyridine),

2. 2-(pyridin-2-yl)ethanol,

3. *N*-methyl-2-(pyridin-2-yl)-*N*-[2-(pyridin-2-yl)ethyl] ethanamine.

Betamethasone Eye Drops

Action and use
Glucocorticoid.

DEFINITION
Betamethasone Eye Drops are a sterile solution of Betamethasone Sodium Phosphate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of betamethasone sodium phosphate, $C_{22}H_{28}FNa_2O_8P$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the eye drops, diluted if necessary with *water*, to contain 0.1% w/v of Betamethasone Sodium Phosphate.

(2) 0.1% w/v of *betamethasone sodium phosphate BPCRS*.

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (2) and a 0.1% w/v solution of *prednisolone sodium phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, heat at 110° for 10 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol*, prepared immediately before use.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two principal spots with almost identical Rf values.

CONFIRMATION

The chromatograms obtained with solutions (1), (2) and (3) show single principal spots with similar Rf values.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone sodium phosphate in the chromatogram obtained with solution (1).

C. To a volume containing 0.2 mg of Betamethasone Sodium Phosphate, add slowly 1 mL of *sulfuric acid* and allow to stand for 2 minutes. A brownish yellow colour but no red colour or yellowish green fluorescence is produced.

TESTS

Acidity or alkalinity
pH, 7.0 to 8.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, protected from light and using the following solutions in the mobile phase.

(1) Dilute the eye drops if necessary to give a solution containing 0.10% w/v of Betamethasone Sodium Phosphate.

(2) Dilute 1 volume of solution (1) to 50 volumes with *water*.

(3) 0.0060% w/v each of *betamethasone sodium phosphate BPCRS* and *betamethasone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 241 nm.

(f) Inject 20 µL of each solution.

(g) For solutions (1) and (2) record the chromatogram for three times the retention time of the principal peak.

MOBILE PHASE

40 volumes of *methanol* and 60 volumes of *citro-phosphate buffer pH 5.0*.

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to betamethasone sodium phosphate and betamethasone is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to betamethasone is not greater than 1.3 times the area of the principal peak in the chromatogram obtained with solution (2) (2.6%);

the area of any other *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%).

Disregard any peak the area of which is less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Mix a quantity of the eye drops containing 5 mg of Betamethasone Sodium Phosphate with 10 mL of *methanol* and dilute to 25 mL with *water*.

(2) A mixture of 5 mL of a 0.1% w/v solution of *betamethasone sodium phosphate BPCRS* in *water* (solution A) and 10 mL of a 0.06% w/v solution of *hydrocortisone* (internal standard) in *methanol* and sufficient *water* to produce 25 mL.

(3) Prepare in the same manner as solution (1) but using 10 mL of the internal standard solution in place of the methanol.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 241 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{28}FNa_2O_8P$ in solution A by measuring the *absorbance*, Appendix II B, of an aliquot diluted with *water* to contain 0.002% w/v of Betamethasone Sodium Phosphate at the maximum at 241 nm and taking 297 as the value of A(1%, 1 cm) at the maximum at 241 nm. Calculate the content of $C_{22}H_{28}FNa_2O_8P$ in the eye drops using peak areas.

STORAGE

Betamethasone Eye Drops should be protected from light.

Betamethasone Injection

Action and use

Glucocorticoid.

DEFINITION

Betamethasone Injection is a sterile solution of Betamethasone Sodium Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a volume of the injection containing the equivalent of 4 mg of betamethasone add 1 mL of *water* and sufficient *absolute ethanol* to produce 40 mL. Place 2 mL of the solution in a stoppered tube, add 10 mL of *phenylhydrazine-sulfuric acid solution*, mix, warm in a water bath at 60° for 20 minutes and cool immediately. The *absorbance* of the resulting solution at the maximum at 450 nm is not more than 0.1, Appendix II B.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the injection, if necessary, with sufficient *water* to produce a solution containing the equivalent of 2 mg of betamethasone per mL.

(2) 0.25% w/v solution of *betamethasone sodium phosphate BPCRS* in *water*.

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (1) and a 0.25% w/v solution of *prednisolone sodium phosphate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below and prepare immediately before use.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, heat at 110° for 10 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol*.

CONFIRMATION

The chromatograms obtained with solutions (1), (2) and (3) show single spots with similar Rf values;

the chromatogram obtained with solution (4) shows two principal spots with almost identical Rf values.

Secondary spots due to excipients may also be observed in the chromatograms obtained with solutions (1), (3) and (4).

C. Evaporate a volume containing the equivalent of 2 mg of betamethasone to dryness on a water bath, dissolve the residue in 2 mL of *sulfuric acid* and allow to stand for 2 minutes. No red colour is produced.

TESTS

Alkalinity

pH, 8.0 to 9.0, Appendix V L.

Colour

The injection, diluted if necessary with *water* to contain the equivalent of 2 mg of betamethasone per mL, is not more intensely coloured than *reference solution BY_4*, Appendix IV B, Method I.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions.

(1) Dilute the injection with mobile phase, if necessary, to give a solution containing the equivalent of 0.10% w/v of betamethasone.

(2) Dilute 1 volume of solution (1) to 50 volumes with mobile phase.

(3) 0.0060% w/v each of *betamethasone sodium phosphate BPCRS* and *betamethasone* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 241 nm.

(f) Inject 20 µL of each solution. For solutions (1) and (2) record the chromatogram for three times the retention time of the principal peak.

www.webofpharma.com

MOBILE PHASE

40 volumes of methanol and 60 volumes of citro-phosphate buffer pH 5.0.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to betamethasone sodium phosphate and betamethasone is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to betamethasone is not greater than 1.3 times the area of the principal peak in the chromatogram obtained with solution (2)(2.6%);

the area of any other *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2)(3%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2)(5%).

Disregard any peak the area of which is less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2)(0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Dilute a volume of the injection containing the equivalent of 8 mg of betamethasone to 50 mL with *methanol (50%)*.

(2) Dilute 5 mL of a 0.045% w/v solution of *betamethasone sodium phosphate BPCRS* in *water* (solution A) to 10 mL with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 241 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of methanol and 55 volumes of citro-phosphate buffer pH 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the injection, determining the exact strength of $C_{22}H_{29}FO_5$ in solution (2) as follows. Dilute 3 mL of solution A to 50 mL with *water* and measure the *absorbance*, Appendix II B, of the resulting solution at the maximum at 241 nm, taking 391 as the value of A(1%, 1 cm) for betamethasone.

STORAGE

Betamethasone Injection should be stored at a temperature not exceeding 30° and protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone in a suitable dose-volume.

Betamethasone Tablets

Action and use

Glucocorticoid.

DEFINITION

Betamethasone Tablets contain Betamethasone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 25 mg of Betamethasone with 150 mL of *dichloromethane* for 30 minutes, filter, wash the filtrate with 20 mL of *water*, dry over *anhydrous sodium sulfate*, evaporate the solution to dryness and dry the residue at 105° for 2 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of betamethasone *(RS 029)*.

B. The residue obtained in test A complies with the test for the *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase A*. At a fourth point apply to the plate 2 µL of a mixture of equal volumes of solution (1) and a 0.25% w/v solution of *dexamethasone BPCRS* in a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*. The chromatogram obtained with this solution shows two principal spots with almost identical Rf values.

C. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to betamethasone in the chromatogram obtained with solution (2).

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Betamethasone comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely crush one tablet, add 20 mL of a 0.002% w/v solution of *hydrocortisone* in *methanol (50%)*, shake for 10 minutes and filter through a glass-fibre filter paper (Whatman GF/C is suitable).

(2) 0.0025% w/v of *betamethasone BPCRS* and 0.002% w/v of *hydrocortisone* (internal standard) in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.4 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

47 volumes of *methanol* and 53 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in each tablet using the ratios of the peak areas and the declared content of $C_{22}H_{29}FO_5$ in *betamethasone BPCRS*.

www.webofpharma.com

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Betamethasone

Use the average of the individual results determined in the test for Uniformity of content.

For Tablets containing 2 mg or more and 2% w/w or more of Betamethasone

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powder containing 2.5 mg of Betamethasone add 20 mL of *methanol (50%)*, shake for 10 minutes and filter through a glass-fibre filter paper (Whatman GF/C is suitable).

(2) 0.0125% w/v of *betamethasone BPCRS* and 0.010% w/v of *hydrocortisone* (internal standard) in *methanol (50%)*.

(3) Prepare the solution in the same manner as solution (1) but use 20 mL of a 0.01% w/v solution of *hydrocortisone* in *methanol (50%)* in place of the 20 mL of *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets using the ratios of the peak areas and the declared content of $C_{22}H_{29}FO_5$ in *betamethasone BPCRS*.

STORAGE

Betamethasone Tablets should be protected from light.

Betamethasone and Clioquinol Cream

Action and use
Glucocorticoid.

DEFINITION

Betamethasone and Clioquinol Cream contains Betamethasone Valerate and Clioquinol, the latter in *very fine powder*, in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$
90.0 to 110.0% of the stated amount.

Content of clioquinol, C_9H_5ClINO
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the preparation being examined containing the equivalent of 0.5 mg of betamethasone in 20 mL of *methanol (80%)* by heating on a water bath until the methanol begins to boil. Shake vigorously, cool in ice and centrifuge. Transfer 10 mL of the supernatant liquid to a separating funnel, add 3 mL of *water* and 5 mL of *chloroform*, shake vigorously, allow the layers to separate and evaporate the chloroform layer to dryness in a current of *nitrogen* with gentle heating. Dissolve the residue in 1 mL of *chloroform*.

(2) 0.03% w/v of *betamethasone valerate BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay for betamethasone the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (3).

C. In the Assay for clioquinol the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to clioquinol in the chromatogram obtained with solution (2).

ASSAY

For betamethasone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the cream containing the equivalent of 2 mg of betamethasone with 100 mL of hot *hexane* for 2 minutes, cool, extract the mixture with 20 mL of *ethanol (96%)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (75%)*. Repeat the extraction of the hexane mixture with two 10-mL quantities of *ethanol (75%)*, filtering each extract in turn through the absorbent cotton and dilute the combined filtrates to 50 mL with *ethanol (75%)*.

(2) Prepared in the same manner as solution (1) but add 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (80%)* before diluting to 50 mL.

(3) Mix 2 volumes of a solution containing 0.024% w/v of *betamethasone valerate BPCRS* and 0.0012% w/v of *betamethasone 21-valerate BPCRS* in *ethanol (80%)* with 1 volume of a 0.072% w/v solution of the internal standard in *ethanol (80%)* and dilute to 10 volumes with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

42 volumes of *absolute ethanol* and 58 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to betamethasone valerate (retention time about 5 minutes) and betamethasone 21-valerate (retention time about

www.webofpharma.com

7 minutes) is more than 1.0, if necessary adjust the mixture of *absolute ethanol* and *water* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the cream using the declared content of $C_{22}H_{29}FO_5$ in *betamethasone valerate BPCRS*.

For clioquinol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of a hot 80% v/v solution of *2-methoxyethanol* to a quantity of the cream containing 30 mg of Clioquinol and heat on a water bath for 5 minutes, swirling vigorously. Cool to room temperature, dilute to 100 mL with the same solvent, mix and filter. To 5 mL of the filtrate add 1 mL of a solution containing 1% w/v of *nickel(II) chloride hexahydrate* and dilute to 50 mL with the mobile phase.

(2) Mix 5 mL of a solution containing 0.024% w/v of *clioquinol BPCRS* in an 80% v/v solution of *2-methoxyethanol* and 1 mL of a solution containing 1% w/v of *nickel(II) chloride hexahydrate* in *water* and dilute to 50 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *phenyl silica gel for chromatography* (5 µm) (Spherisorb Phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.024% w/v of *nickel(II) chloride hexahydrate* in a mixture of 2 volumes of *methanol*, 3 volumes of *acetonitrile* and 5 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of C_9H_5ClINO in the cream using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Betamethasone and Clioquinol Cream should be protected from light.

LABELLING

The quantity of active ingredient with respect to Betamethasone Valerate is stated in terms of the equivalent amount of betamethasone.

Betamethasone and Clioquinol Ointment

Action and use

Glucocorticoid.

DEFINITION

Betamethasone and Clioquinol Ointment contains Betamethasone Valerate and Clioquinol, the latter in *very fine powder*, in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$

90.0 to 110.0% of the stated amount.

Content of clioquinol, C_9H_5ClINO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing the equivalent of 1 mg of betamethasone with 10 mL of *methanol* by heating on a water bath until the methanol begins to boil. Shake vigorously, cool in ice and filter. Evaporate the filtrate to dryness in a current of nitrogen and dissolve the residue in 0.5 mL of *chloroform*.

(2) 0.24% w/v of *betamethasone valerate BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay for betamethasone the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (3).

C. In the Assay for clioquinol the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to clioquinol in the chromatogram obtained with solution (2).

ASSAY

For betamethasone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing the equivalent of 2 mg of betamethasone in 100 mL of hot *hexane*, cool, extract with 20 mL of *ethanol (65%)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (65%)*; repeat the extraction of the hexane mixture with two 10-mL quantities of *ethanol (65%)*, filtering each extract in turn through the absorbent cotton. To the combined extracts, add 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (65%)* and dilute the combined filtrates to 50 mL with *ethanol (65%)*.

(2) Prepare in the same manner as solution (1) but do not add the internal standard before diluting to 50 mL.

(3) Mix 10 mL of a solution containing 0.024% w/v of *betamethasone valerate BPCRS* and 0.0012% w/v of *betamethasone 21-valerate BPCRS* in *ethanol (65%)* with 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (65%)* and dilute to 50 mL with *ethanol (65%)*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°C.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of *absolute ethanol* and *water* adjusted so that the *resolution factor* between the peaks due to betamethasone valerate (retention time about 5 minutes) and betamethasone 21-valerate (retention time about 7 minutes) is greater than 1.0 (a mixture of 42 volumes of *absolute ethanol* and 58 volumes of *water* is usually suitable).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to betamethasone valerate and betamethasone 21-valerate is greater than 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the ointment using the declared content of $C_{22}H_{29}FO_5$ in *betamethasone valerate BPCRS* and using peak areas.

For clioquinol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 80 mL of a hot 80% v/v solution of *2-methoxyethanol* to a quantity of the cream containing 30 mg of Clioquinol and heat on a water bath for 5 minutes, swirling vigorously. Cool to room temperature, dilute to 100 mL with the same solvent, mix and filter. To 5 mL of the filtrate add 1 mL of a solution containing 1% w/v of *nickel(II) chloride hexahydrate* and dilute to 50 mL with the mobile phase.

(2) Mix 5 mL of a solution containing 0.024% w/v of *clioquinol BPCRS* in an 80% v/v solution of *2-methoxyethanol* and 1 mL of a solution containing 1% w/v of *nickel(II) chloride hexahydrate* in *water* and dilute to 50 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with particles of silica, the surface of which has been modified with chemically bonded phenyl groups (5 µm) (Spherisorb Phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution containing 0.024% w/v of *nickel(II) chloride hexahydrate* in a mixture of 2 volumes of *methanol*, 3 volumes of *acetonitrile* and 5 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of C_9H_5ClINO in the cream using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Betamethasone and Clioquinol Ointment should be protected from light.

LABELLING

The quantity of active ingredient with respect to Betamethasone Valerate is stated in terms of the equivalent amount of betamethasone.

Betamethasone Sodium Phosphate Tablets

Action and use

Glucocorticoid.

DEFINITION

Betamethasone Sodium Phosphate Tablets contain Betamethasone Sodium Phosphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing the equivalent of 2 mg of betamethasone in 25 mL of *water*, add 2.5 g of *sodium chloride* and 1 mL of *hydrochloric acid*, extract with 25 mL of *chloroform* and discard the chloroform layer. Extract with 25 mL of *tributyl orthophosphate* and discard the aqueous layer.

(2) Prepare in the same manner as solution (1) but using 2.5 mg of *betamethasone sodium phosphate BPCRS* in place of the powdered tablets.

(3) Mix equal volumes of solutions (1) and (2).

(4) Mix equal volumes of solution (1) and a solution prepared in the same manner as solution (1) but using 2.5 mg of *prednisolone sodium phosphate BPCRS* in place of the powdered tablets.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below prepared immediately before use.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, heat at 110° for 10 minutes, spray the hot plate with *ethanolic sulfuric acid (20%)* and again heat at 110° for 10 minutes.

MOBILE PHASE

20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol* prepared immediately before use.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two principal spots with almost identical Rf values.

CONFIRMATION

The chromatograms obtained with solutions (1), (2) and (3) show single spots with identical Rf values.

B. Mix a quantity of the powdered tablets containing the equivalent of 0.4 mg of betamethasone with 1 mL of *sulfuric*

www.webofpharma.com

acid and allow to stand for 5 minutes. A pale yellow colour is produced (distinction from prednisolone sodium phosphate tablets).

TESTS

Disintegration
Maximum time, 5 minutes, Appendix XII A1.

Uniformity of content
Tablets containing less than the equivalent of 2 mg and/or less than 2% w/w of betamethasone comply with the requirements stated under Tablets using the following method of analysis. Carry out the procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve one tablet as completely as possible in 5 mL of *water*, add 5 mL of *methanol* and filter.Add sufficient *methanol (50%)* to produce a solution expected to contain 0.00325% w/v of betamethasone sodium phosphate.

(2) 0.0065% w/v of *betamethasone sodium phosphate BPCRS* in *water*. Dilute 1 volume of this solution to 2 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 241 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in each tablet, determining the exact strength of the solution of *betamethasone sodium phosphate BPCRS* as described in the Assay.

ASSAY
Weigh and powder 20 tablets. Carry out the procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 2.5 mg of betamethasone for 20 minutes with 25 mL of *water*, dilute to 50 mL with *methanol*, mix and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) Dilute 5 mL of a 0.014% w/v solution of *betamethasone sodium phosphate BPCRS* in *water* (solution A) to 10 mL with *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets, determining the exact strength of $C_{22}H_{29}FO_5$ in solution (2) as follows. Dilute 5 mL of solution A to 25 mL with *water* and measure the *absorbance*, Appendix II B, of the resulting solution at the maximum at 241 nm, taking 391 as the value of A(1%, 1 cm) for betamethasone.

STORAGE
Betamethasone Sodium Phosphate Tablets should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

Betamethasone Valerate Scalp Application

Action and use
Glucocorticoid.

DEFINITION
Betamethasone Valerate Scalp Application is a *cutaneous solution*. It contains Betamethasone Valerate in a suitable liquid basis.

The application complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$
90.0 to 115.0% of the stated amount.

IDENTIFICATION
A. Complies with test A for Identification described under Betamethasone Valerate Lotion, preparing solution (1) by diluting a suitable volume of the application with *absolute ethanol* to give a solution containing the equivalent of 0.04% w/v of betamethasone.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (1).

ASSAY
Carry out the Assay described under Betamethasone Valerate Lotion, preparing solutions (2) and (3) in the following manner. For solution (2) dilute a quantity of the application containing the equivalent of 3 mg of betamethasone to 25 mL with *ethanol (65%)*. For solution (3) add 5 mL of a 0.11% w/v solution of the internal standard to a quantity of the application containing the equivalent of 3 mg of betamethasone and dilute to 25 mL with *ethanol (65%)*.

STORAGE
Betamethasone Valerate Scalp Application should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

The label indicates the pharmaceutical form as 'cutaneous solution'.

www.webofpharma.com

Betamethasone Valerate Cream

Action and use
Glucocorticoid.

DEFINITION
Betamethasone Valerate Cream contains Betamethasone Valerate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 0.5 mg of betamethasone in 20 mL of *methanol (80%)* by heating on a water bath until the methanol begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 mL of the supernatant liquid with 3 mL of *water* and 5 mL of *chloroform*, shake vigorously, allow the layers to separate and evaporate the chloroform layer to dryness in a current of nitrogen with gentle heating. Dissolve the residue in 1 mL of *chloroform*.

(2) 0.03% w/v of *betamethasone valerate BPCRS* in *chloroform*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air until the solvent has evaporated, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). The spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (3).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the cream containing the equivalent of 2 mg of betamethasone with 100 mL of hot *hexane* for 2 minutes, cool, extract the mixture with 20 mL of *ethanol (96%)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (75%)*. Repeat the extraction of the hexane mixture with two 10-mL quantities of *ethanol (75%)*, filtering each extract in turn through the absorbent cotton. Combine the filtrates, add 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) and dilute to 50 mL with *ethanol (75%)*.

(2) Shake a quantity of the cream containing the equivalent of 2 mg of betamethasone with 100 mL of hot *hexane* for 2 minutes, cool, extract the mixture with 20 mL of *ethanol (96%)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (75%)*. Repeat the extraction of the hexane mixture with two 10-mL quantities of *ethanol (75%)*, filtering each extract in turn through the absorbent cotton and dilute the combined filtrates to 50 mL with *ethanol (75%)*.

(3) Mix 10 mL of a solution containing 0.024% w/v of *betamethasone valerate BPCRS* and 0.0012% w/v of *betamethasone 21-valerate BPCRS* in *ethanol (80%)* with 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (80%)* and dilute to 50 mL with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

42 volumes of *absolute ethanol* and 58 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to betamethasone valerate (retention time about 5 minutes) and betamethasone 21-valerate (retention time about 7 minutes) is greater than 1.0. If necessary, adjust the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the cream using the declared content of $C_{22}H_{29}FO_5$, in *betamethasone valerate BPCRS*.

STORAGE
Betamethasone Valerate Cream should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

Betamethasone Valerate Lotion
Betamethasone Valerate Cutaneous Solution

Action and use
Glucocorticoid.

DEFINITION
Betamethasone Valerate Lotion is a *cutaneous solution*. It contains Betamethasone Valerate in a suitable vehicle.

The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Disperse a quantity of the preparation being examined containing the equivalent of 1 mg of betamethasone with 5 mL of *methanol (80%)* by heating on a water bath until the methanol begins to boil. Shake vigorously, cool in ice and filter. Transfer the filtrate to a separating funnel and add 0.5 mL of *water* and 1 mL of *chloroform*. Shake vigorously, allow the layers to separate and use the chloroform layer.

(2) 0.05% w/v of *betamethasone valerate BPCRS* in *chloroform*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air until the solvent has evaporated, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). The spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (3).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the lotion containing the equivalent of 3 mg of betamethasone in a mixture of 10 mL of *ethanol (65%)* and 50 mL of *hexane*, shake for 2 minutes and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (65%)*. Repeat the extraction of the hexane mixture with two 5-mL quantities of *ethanol (65%)*, filtering the ethanol extracts through the absorbent cotton, add 5 mL of a 0.11% w/v solution of *beclometasone dipropionate BPCRS* (internal standard)to the combined filtrates and mix.

(2) Disperse a quantity of the lotion containing the equivalent of 3 mg of betamethasone in a mixture of 10 mL of *ethanol (65%)* and 50 mL of *hexane*, shake for 2 minutes and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (65%)*. Repeat the extraction of the hexane mixture with two 5-mL quantities of *ethanol (65%)*, filtering the ethanol extracts through the absorbent cotton, add 5 mL of *ethanol (65%)* to the combined filtrates and mix.

(3) Mix 20 mL of a solution containing 0.018% w/v of *betamethasone valerate BPCRS* and 0.0010% w/v of *betamethasone 21-valerate BPCRS* in *ethanol (65%)* with 5 mL of a 0.11% w/v solution of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (65%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

42 volumes of *absolute ethanol* and 58 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to betamethasone valerate (retention time about 5 minutes) and betamethasone 21-valerate (retention time about 7 minutes) is greater than 1.0. If necessary, adjust the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the lotion using the declared content of $C_{22}H_{29}FO_5$, in *betamethasone valerate BPCRS*.

STORAGE

Betamethasone Valerate Lotion should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

Betamethasone Valerate Ointment

Action and use
Glucocorticoid.

DEFINITION

Betamethasone Valerate Ointment contains Betamethasone Valerate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of betamethasone, $C_{22}H_{29}FO_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Complies with test A for Identification described under Betamethasone Valerate Lotion preparing solution (1) in the following manner. Disperse a quantity of the ointment containing the equivalent of 1 mg of betamethasone in 10 mL of *methanol* by heating on a water bath until the methanol begins to boil, shake vigorously, cool in ice for 30 minutes and filter. Evaporate the filtrate to dryness in a current of nitrogen with gentle heating and dissolve the residue in 0.5 mL of *chloroform*. Solution (2) contains 0.24% w/v of *betamethasone valerate BPCRS* in *chloroform*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to betamethasone valerate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix 10 mL of a solution containing 0.024% w/v of *betamethasone valerate BPCRS* and 0.0012% w/v of *betamethasone 21-valerate BPCRS* in *ethanol (65%)* with 5 mL of a 0.072% w/v solution of *beclometasone dipropionate BPCRS*

www.webofpharma.com

(internal standard) in *ethanol (65%)* and dilute to 50 mL with *ethanol (65%)*. For solution (2) disperse a quantity of the ointment containing the equivalent of 2 mg of betamethasone in 100 mL of hot *hexane*, cool, extract with 20 mL of *ethanol (65%)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (65%)*; repeat the extraction of the hexane mixture with two 10-mL quantities of *ethanol (65%)*, filtering each extract in turn through the absorbent cotton and dilute the combined filtrates to 50 mL with *ethanol (65%)*. Prepare solution (3) in the same manner as solution (2) but add 5 mL of the 0.072% w/v solution of the internal standard in *ethanol (65%)* before diluting to 50 mL.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of *absolute ethanol* and *water* adjusted so that the *resolution factor* between the peaks due to betamethasone valerate (retention time about 5 minutes) and betamethasone 21 valerate (retention time about 7 minutes) is more than 1.0 (a mixture of 42 volumes of *absolute ethanol* and 58 volumes of *water* is usually suitable) and (c) a detection wavelength of 238 nm.

Calculate the content of $C_{22}H_{29}FO_5$ in the ointment using the declared content of $C_{22}H_{29}FO_5$ in *betamethasone valerate BPCRS*.

STORAGE

Betamethasone Valerate Ointment should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

Betamethasone Valerate and Coal Tar Paste

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Used in the treatment of psoriasis.

DEFINITION

Betamethasone Valerate and Coal Tar Paste contains Betamethasone Valerate and Coal Tar in a suitable basis containing Zinc Oxide.

The paste complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements. Where appropriate, the paste also complies with the requirements stated under Unlicensed Medicines.

Content of betamethasone valerate, $C_{27}H_{37}FO_6$
90.0 to 110.0% of the stated amount.

Content of zinc oxide, ZnO
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the paste containing 20 µg of Betamethasone Valerate in 10 mL of *chloroform* and filter (Whatman No. 1 paper is suitable). Evaporate the *chloroform* to dryness and extract the residue with 1 mL of a mixture of 30 volumes of *methanol* and 70 volumes of *water*.

(2) 20 µg of *betamethasone valerate BPCRS* in a mixture of 30 volumes of *methanol* and 70 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*. Heat the plate at 105° for 5 minutes and spray while warm with a mixture containing 1 volume of a 0.2% w/v solution of *alkaline tetrazolium blue* in *methanol* and 9 volumes of 10% w/v *methanolic sodium hydroxide*.

MOBILE PHASE

Mix 1 volume of *ethyl acetate*, 1 volume of *water* and 2 volumes of *1,2 –dichloroethane*. Use the lower layer.

CONFIRMATION

By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) corresponds in position and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay for betamethasone valerate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Heat 0.5 g of the paste gently in a porcelain dish over a small flame until the basis is completely volatilised or charred. Increase the heat until all the carbon is removed. The residue obtained is yellow when hot and white when cool.

ASSAY

For betamethasone valerate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) 0.1% w/v of *beclometasone dipropionate BPCRS* (internal standard) in *methanol*.

(2) To a quantity of the paste containing 0.25 mg of Betamethasone Valerate add 1 mL of solution (1) and 10 mL of *chloroform*. Mix using a vortex mixer and filter (Whatman No. 1 filter paper is suitable), rinsing with a further 10 mL of *chloroform*. Evaporate the filtrate in a water bath at 40° to 50° in a current of air. Dissolve the residue in 25 mL of *hexane* and transfer to a separating funnel containing 20 mL of *ethanolic hydrochloric acid*, washing the flask with *hexane*. Repeat the extraction with two 10-mL quantities of *ethanolic hydrochloric acid*, filtering the extracts through absorbent cotton, and add sufficient *ethanolic hydrochloric acid* to produce 50 mL.

(3) 0.05% w/v of *betamethasone valerate BPCRS* in *methanol*.

(4) Dilute 1 volume of solution (1) and 1 volume of solution (3) to 50 volumes with *ethanolic hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of solutions (2), (3) and (4).

MOBILE PHASE

4 volumes of *water* and 6 volumes of *acetonitrile*.

When the chromatograms are recorded under the prescribed conditions, the retention time for betamethasone valerate is about 8 minutes and the retention time for beclometasone dipropionate is about 14 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the two principal peaks is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{37}FO_6$ in the paste using the declared content of $C_{27}H_{37}FO_6$ in *betamethasone valerate BPCRS*.

For zinc oxide

Heat 0.5 g of the paste gently in a porcelain dish over a small flame until the basis is completely volatilised or charred. Increase the heat until all the carbon is removed. Dissolve the residue in 10 mL of 2M *acetic acid* and add sufficient *water* to produce 50 mL. To the resulting solution add 50 mg of *xylenol orange triturate* and sufficient *hexamine* to produce a violet-pink colour. Add a further 2 g of *hexamine* and titrate with 0.1M *disodium edetate VS* until the solution becomes yellow. Each mL of 0.1M *disodium edetate VS* is equivalent to 8.138 mg of ZnO.

STORAGE

Betamethasone Valerate and Coal Tar Paste should be stored at a temperature of 2° to 8°.

Betaxolol Eye Drops, Solution

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Betaxolol Eye Drops, Solution are a sterile solution of Betaxolol Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of betaxolol, $C_{18}H_{29}NO_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the eye drops with *water* to produce a solution containing the equivalent of 0.1% w/v of betaxolol. Shake 1 mL of the solution with 4 mL of *water*, 0.1 mL of 13.5M *ammonia* and 2 mL of *chloroform*, centrifuge and use the chloroform layer.

(2) Prepare solution (2) in the same manner as solution (1) but using a 0.1% w/v solution of *betaxolol hydrochloride BPCRS* in place of the eye drops.

(3) A mixture of equal volumes of solution (1) and solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a solution prepared by dissolving 5 g of *iodine* and 10 g of *potassium iodide* in sufficient *water* to produce 100 mL and mixing 20 mL of the resulting solution with 30 mL of *water* and 50 mL of 2M *acetic acid*. Examine the plate immediately; spots due to betaxolol appear brown.

MOBILE PHASE

30 volumes of a solution prepared by diluting 1 volume of 13.5M *ammonia* to 50 volumes with *propan-2-ol* immediately before use and 70 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows a single, compact spot.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.8, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a suitable volume of the eye drops to produce a solution containing the equivalent of 0.02% w/v of betaxolol.

(2) Dilute 1 volume of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS-2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 3 g of *sodium dodecyl sulfate* in 450 mL of the following solution. 45 volumes of a buffer solution prepared as described below and 55 volumes of *acetonitrile*. To prepare the buffer solution add 5 mL of *orthophosphoric acid* to 990 mL of *water*, adjust the pH to 3.0 with 2M *ammonia* and add sufficient *water* to produce 1000 mL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to betaxolol is at least 8000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is not more than 2.5.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of not more than one *secondary peak* is greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the eye drops to produce a solution containing the equivalent of 0.01% w/v of betaxolol.

(2) 0.012% w/v of *betaxolol hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS-2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of *water* containing 0.71% w/v of *anhydrous disodium hydrogen orthophosphate* and 0.91% w/v of *dimethylamine hydrochloride*, adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{29}NO_3$ in the eye drops using the declared content of $C_{18}H_{29}NO_3$ in *betaxolol hydrochloride BPCRS*.

STORAGE

Betaxolol Eye Drops, Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of betaxolol.

Betaxolol Eye Drops, Suspension

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Betaxolol Eye Drops, Suspension are a sterile suspension of Betaxolol Hydrochloride in Purified Water containing suitable binding and suspending agents.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of betaxolol, $C_{18}H_{29}NO_3$

90.0 to 110.0% of the stated amount.

The eye drops should be shaken vigorously before carrying out the following tests.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the eye drops with *water* to produce a solution containing the equivalent of 0.1% w/v of betaxolol. Shake 1 mL of the solution with 4 mL of *water*, 0.1 mL of 13.5M *ammonia* and 2 mL of *chloroform*, centrifuge and use the chloroform layer.

(2) Prepare solution (2) in the same manner as solution (1) but using a 0.1% w/v solution of *betaxolol hydrochloride BPCRS* in place of the eye drops.

(3) Equal volumes of solution (1) and solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a solution prepared by dissolving 5 g of *iodine* and 10 g of *potassium iodide* in sufficient *water* to produce 100 mL and mixing 20 mL of the resulting solution with 30 mL of *water* and 50 mL of 2M *acetic acid*. Examine the plate immediately; spots due to betaxolol appear brown.

MOBILE PHASE

30 volumes of a solution prepared by diluting 1 volume of 13.5M *ammonia* to 50 volumes with *propan-2-ol* immediately before use and 70 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows a single, compact spot.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Particle size

Examine using an automated light obscuration instrument such as that described in Appendix XIII A. Not less than 99.5% of the particles are less than 25 µm, not less than 99.95% are less than 50 µm and none exceeds 75 µm.

Acidity or alkalinity

pH, 6.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a suitable volume of the eye drops with sufficient of the mobile phase to produce a solution containing the equivalent of 0.02% w/v of betaxolol, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS-2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

www.webofpharma.com

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 3 g of *sodium dodecyl sulfate* in 450 mL of the following solution. 45 volumes of a buffer solution prepared as described below and 55 volumes of *acetonitrile*. To prepare the buffer solution add 5 mL of *orthophosphoric acid* to 990 mL of *water*, adjust the pH to 3.0 with 2M *ammonia* and add sufficient *water* to produce 1000 mL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to betaxolol is at least 8000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is not more than 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of not more than one *secondary peak* is greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%).

Bound betaxolol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the eye drops with sufficient of the mobile phase to produce a solution containing the equivalent of 0.01 % w/v betaxolol. Mix with the aid of ultrasound for 15 minutes and allow to cool. Centrifuge at a speed of 2000 revolutions per minute for 10 minutes and use the supernatant liquid.

(2) Centrifuge the eye drops at a speed of 25,000 revolutions per minute for 30 minutes and dilute a weighed quantity of the supernatant liquid with sufficient of the mobile phase to produce a solution expected to contain the equivalent of 0.01% w/v of betaxolol.

(3) 0.012% w/v *betaxolol hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS-2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of *water* containing 0.71% w/v *anhydrous disodium hydrogen orthophosphate* and 0.91% w/v of *dimethylamine hydrochloride*, adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the eye drops, Appendix V G, and calculate the content of $C_{18}H_{29}O_3$, weight in volume, in solutions (1) and (2) using the declared content of $C_{18}H_{29}O_3$ in *betaxolol hydrochloride BPCRS*. Calculate the content of bound betaxolol from the difference between the contents of betaxolol found in solutions (1) and (2).

LIMITS

45.0 to 65.0% of the stated content of betaxolol

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the eye drops to produce a solution containing the equivalent of 0.01% w/v of betaxolol. Mix thoroughly and centrifuge.

(2) 0.012% w/v of *betaxolol hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Bound betaxolol may be used.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the eye drops, Appendix V G, and calculate the content of $C_{18}H_{29}NO_3$, weight in volume, using the declared content of $C_{18}H_{29}NO_3$ in *betaxolol hydrochloride BPCRS*.

STORAGE

Betaxolol Eye Drops, Suspension should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of betaxolol.

Bezafibrate Tablets

Action and use

Fibrate; lipid-regulating drug.

DEFINITION

Bezafibrate Tablets contain Bezafibrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bezafibrate, $C_{19}H_{20}ClNO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.2 g of Bezafibrate with two 10-mL quantities of *acetone* for 10 minutes, combine and filter the extracts (a Whatman GF/C is suitable) and evaporate the filtrate to dryness. The infrared absorption spectrum of the residue, Appendix II A, is concordant with the reference spectrum of bezafibrate *(RS 419)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use as the medium, at a temperature of 37°, 900 mL of a pH 6.5 buffer solution prepared by dissolving 0.608 g of *sodium hydroxide* and 6.805 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 mL and adjusting the pH to 6.5 ± 0.05 using *sodium hydroxide solution* or *orthophosphoric acid*.

www.webofpharma.com

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium, filter and dilute 1 volume of the filtrate to 20 volumes with the dissolution medium and measure the *absorbance* at the maximum at 229 nm, Appendix II B, using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a 0.0011% w/v solution of *bezafibrate BPCRS* in the dissolution medium using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of bezafibrate, $C_{19}H_{20}ClNO_4$, in the medium from the absorbances obtained and using the declared content of $C_{19}H_{20}ClNO_4$ in *bezafibrate BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 100 mg of Bezafibrate with 15 mL of *methanol* for 2 minutes, shake for a further 10 minutes, cool, add sufficient of the mobile phase to produce 100 mL, mix and filter, discarding the first 20 mL of filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

(4) Dissolve sufficient quantities of *bezafibrate BPCRS* and *chlorobenzoyltyramine BPCRS* in the minimum quantity of *methanol* and dilute with mobile phase to produce a solution containing 0.0002% w/v of *bezafibrate BPCRS* and 0.0002% w/v of *chlorobenzoyltyramine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

(g) The retention time of bezafibrate is about 5 minutes. Allow the chromatography to proceed for four times the retention time of the principal peak.

MOBILE PHASE

3.9 volumes of 40% w/v of *tetrabutylammonium hydroxide*, 400 volumes of *acetonitrile* and 600 volumes of *water* and adjusting the final pH to 4.0 with 10% v/v *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to bezafibrate and chlorobenzoyltyramine is at least 7.0. If necessary, adjust the content of tetrabutylammonium hydroxide to obtain the required resolution.

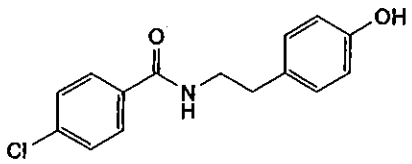
LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the total area of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.75%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.05%).



ASSAY

Weigh and powder 20 tablets. For solution (1) mix with the aid of ultrasound a quantity of the powdered tablets containing 100 mg of Bezafibrate with 70 mL of *methanol* for 2 minutes, shake for a further 10 minutes, cool, add sufficient *methanol* to produce 100 mL, mix and filter discarding the first 20 mL of filtrate; dilute 1 volume of the filtrate to 100 volumes with *methanol*. Solution (2) contains 0.001% w/v of *bezafibrate BPCRS* in *methanol*.

Measure the *absorbance* at the maximum at 229 nm, Appendix II B. Calculate the content of $C_{19}H_{20}ClNO_4$ in the tablets from the absorbances obtained and from the declared content of $C_{19}H_{20}ClNO_4$ in *bezafibrate BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include,

4-chloro-*N*-[2-(4-hydroxyphenyl)ethyl]benzamide (chlorobenzoyltyramine).

Bezafibrate Prolonged-release Tablets

Prolonged-release Bezafibrate Tablets

Bezafibrate Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Fibrate; lipid-regulating drug.

DEFINITION

Bezafibrate Prolonged-release Tablets contain Bezafibrate. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of bezafibrate. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bezafibrate, $C_{19}H_{20}ClNO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.2 g of Bezafibrate with two 10-mL quantities of *acetone* for 10 minutes, filter the combined extracts (Whatman GF/C is suitable) and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is

www.webofpharma.com

concordant with the *reference spectrum* of Bezafibrate *(RS 419)*.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 100 mg of Bezafibrate with 15 mL of *methanol* for 2 minutes, shake for a further 10 minutes, cool, add sufficient mobile phase to produce 100 mL, mix and filter, discarding the first 20 mL of filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve sufficient quantities of *bezafibrate BPCRS* and *chlorobenzoyltyramine BPCRS* in the minimum quantity of *methanol* and dilute with mobile phase to produce a solution containing 0.0002% w/v of *bezafibrate BPCRS* and 0.0002% w/v of *chlorobenzoyltyramine BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

The retention time of bezafibrate is about 5 minutes. Allow the chromatography to proceed for four times the retention time of the principal peak.

MOBILE PHASE

A mixture of 3.9 volumes of a 40% w/v solution of *tetrabutylammonium hydroxide*, 400 volumes of *acetonitrile* and 600 volumes of *water*, adjusting the final pH to 4.0 with 10% v/v *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to bezafibrate and chlorobenzoyltyramine is at least 7.0. If necessary adjust the content of tetrabutylammonium hydroxide to obtain the required resolution.

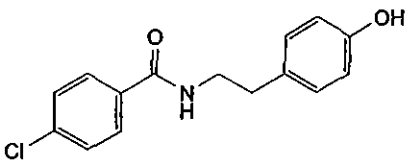
LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the total area of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.75%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.01%).



ASSAY

Weigh and powder 20 tablets. For solution (1) mix with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Bezafibrate with 70 mL of *methanol* for 2 minutes, shake for a further 10 minutes, cool, add sufficient *methanol* to produce 100 mL, mix and filter discarding the first 20 mL of filtrate. Dilute 1 volume to 100 volumes with *methanol*. Solution (2) is a 0.001% w/v solution of *bezafibrate BPCRS* in *methanol*.

Measure the *absorbance* of the resulting solutions at the maximum at about 230 nm, Appendix II B. Calculate the content of $C_{19}H_{20}ClNO_4$ from the declared content of $C_{19}H_{20}ClNO_4$ in *bezafibrate BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

4-chloro-*N*-[2-(4-hydroxyphenyl)ethyl]benzamide (chlorobenzoyltyramine).

Bicalutamide Tablets

Action and use

Antiandrogen; treatment of prostate cancer.

DEFINITION

Bicalutamide Tablets contain Bicalutamide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bicalutamide, $C_{18}H_{14}F_4N_2O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 0.1 g of Bicalutamide add 10 mL of *acetone*, shake and centrifuge. Filter the supernatant liquid (Whatman GF/C filter is suitable) and evaporate to dryness under a stream of nitrogen at 40° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of bicalutamide *(RS 466)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a 1.0% w/v solution of *sodium dodecyl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with *water* if necessary, to produce a solution expected to contain 0.0056% w/v of Bicalutamide, at the maximum at 272 nm, Appendix II B using the dissolution medium in the reference cell.

www.webofpharma.com

(2) Measure the *absorbance* of a 0.0056% w/v solution of *bicalutamide BPCRS* using the dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of bicalutamide, $C_{18}H_{14}F_4N_2O_4S$ in the medium from the absorbances obtained and using the declared content of $C_{18}H_{14}F_4N_2O_4S$ in *bicalutamide BPCRS*.

LIMITS

The amount of bicalutamide released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Prepare a mixture of 0.5 volumes *orthophosphoric acid*, 500 volumes of *acetonitrile R1* and 500 volumes of *water* (solvent A).

(1) Dissolve a quantity of the powdered tablets containing 25 mg of Bicalutamide in solvent A with the aid of ultrasound. Add sufficient solvent A to produce a solution containing 0.1% w/v of Bicalutamide and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A. Dilute 1 volume of this solution to 10 volumes.

(3) Dissolve 5 mg of *bicalutamide for system suitability EPCRS* (containing impurities B and C) in solvent A and dilute to 5.0 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 1.9 volumes of *orthophosphoric acid*, 100 volumes of *acetonitrile R1* and 1900 volumes of *water*.

Mobile phase B 1.9 volumes of *orthophosphoric acid*, 100 volumes of *water* and 1900 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	92	8	isocratic
3-23	92→67	8→33	linear gradient
23-43	67→50	33→50	linear gradient
43-55	50	50	isocratic
55-56	50→92	50→8	linear gradient
56-60	92	8	re-equilibration

Use the chromatogram supplied with *bicalutamide for system suitability EPCRS* and the chromatogram obtained with solution (3) to identify the peaks due to impurities B and C.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to bicalutamide (retention time about 38 minutes) are: impurity D, about 0.7; .impurity B, about 0.98 and impurity C, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak to valley ratio is at least 2.5, where H_p is the height above the baseline of the peak due to impurity B and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to bicalutamide.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.15%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Prepare a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile* (solvent B).

(1) To a quantity of the powdered tablets containing 0.25 g of Bicalutamide, add 40 mL of *water* and mix with the aid of ultrasound, add sufficient *acetonitrile* to produce 100 mL and mix. Centrifuge and dilute 1 volume of the supernatant liquid to 25 volumes with solvent B.

(2) 0.01% w/v of *bicalutamide BPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 270 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *trifluoroacetic acid*, 350 volumes of *acetonitrile* and 650 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency* determined on the peak due to bicalutamide is at least 2000 *theoretical plates*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{14}F_4N_2O_4S$ in the tablets using the declared content of $C_{18}H_{14}F_4N_2O_4S$ in *bicalutamide BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Bicalutamide.

www.webofpharma.com

Bisacodyl Suppositories

Action and use
Stimulant laxative.

DEFINITION
Bisacodyl Suppositories contain Bisacodyl in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of bisacodyl, $C_{22}H_{19}NO_4$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method described under Related substances applying to the plate 2 µL of each solution and using as solution (2) a 1% w/v solution of *bisacodyl BPCRS* in *acetone*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Dissolve a quantity of the suppositories containing 0.15 g of Bisacodyl as completely as possible in 150 mL of *petroleum spirit (boiling range, 40° to 60°)*, filter, wash the residue with *petroleum spirit (boiling range, 40° to 60°)* until free from fatty material and dry at about 100°. Wash with a very small quantity of warm *chloroform* and dissolve the residue in 10 mL of a 0.5% v/v solution of *sulfuric acid*. To 2 mL of the solution add 0.05 mL of *potassium tetraiodomercurate solution*. A white precipitate is produced.

C. To 2 mL of the solution obtained in test B add *sulfuric acid*. A reddish violet colour is produced.

D. Boil 2 mL of the solution obtained in test B with a little *nitric acid*; a yellow colour is produced. Cool and add 5M *sodium hydroxide*; the colour becomes yellowish brown.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of equal volumes of *butan-2-one* and *xylene* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) shake a quantity of the suppositories containing 20 mg of Bisacodyl with 20 mL of *petroleum spirit (boiling range, 40° to 60°)*, filter, wash the residue with *petroleum spirit (boiling range, 40° to 60°)* until free from fat and dissolve in 2 mL of *acetone*. For solution (2) dilute 3 volumes of solution (1) to 100 volumes with *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY
To a quantity of the suppositories containing 0.1 g of Bisacodyl add 80 mL of *anhydrous acetic acid* previously neutralised with *0.02M perchloric acid VS* to *1-naphthol-benzein solution*, warm gently until solution is complete and immediately carry out Method I for *non-aqueous titration*, Appendix VIII A, using *0.02M perchloric acid VS* and determining the end point potentiometrically. Each mL of *0.02M perchloric acid VS* is equivalent to 7.228 mg of $C_{22}H_{19}NO_4$. Calculate the average content of bisacodyl, $C_{22}H_{19}NO_4$, in the suppositories.

Bisacodyl Gastro-resistant Tablets

Gastro-resistant Bisacodyl Tablets
Bisacodyl Tablets

Action and use
Stimulant laxative.

DEFINITION
Bisacodyl Gastro-resistant Tablets contain Bisacodyl. They are made gastro-resistant by enteric coating or by other means.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bisacodyl, $C_{22}H_{19}NO_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

B. Extract a quantity of the powdered tablets containing 50 mg of Bisacodyl with 20 mL of *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 mL of a 0.5% v/v solution of *sulfuric acid*. To 2 mL of the solution obtained add *sulfuric acid*. A reddish violet colour is produced on addition of the concentrated acid.

C. Boil 2 mL of the solution obtained in test B with a little *nitric acid*; a yellow colour is produced. Cool and add 5M *sodium hydroxide*; the colour becomes yellowish brown.

TESTS
Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

First stage

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 500 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 2 hours, withdraw a 10-mL sample of the medium.

(2) Dissolve 50 mg of *bisacodyl BPCRS* in 50 mL of *methanol* containing a drop of *orthophosphoric acid*. Dilute with *0.1M hydrochloric acid* to produce a solution containing 0.00005% w/v of *bisacodyl BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

MOBILE PHASE

350 volumes of a 0.1% w/v solution of *ammonium acetate*, adjusted to pH 8.0 with *dilute ammonia solution* and 650 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the total content of $C_{22}H_{19}NO_4$ in the medium using the declared content of $C_{22}H_{19}NO_4$ in *bisacodyl BPCRS*.

LIMITS

The amount of bisacodyl released is not more than 5% of the stated amount.

After completion of the first stage, remove the basket from the vessel and dip once into a 100-mL beaker containing 80 mL of *water*. After the water has drained from the basket, transfer the tablet to Apparatus 2 and carry out the procedure described under Final stage.

Final stage

Dissolve 8.9 g of *disodium hydrogen orthophosphate* and 10 g of *sodium lauryl sulfate* in 800 mL of *water*. Adjust to pH 7.5 with 0.1M *hydrochloric acid* and dilute to 1000 mL with *water* (solution A).

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 900 mL of solution A, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 60 minutes, withdraw a 10-mL sample of the medium and filter through a 0.45-µm filter, discarding the first 3 mL.

(2) Dissolve 50 mg of *bisacodyl BPCRS* in 50 mL of *methanol* containing a drop of *orthophosphoric acid*. Dilute with solution A to produce a solution containing 0.00056% w/v of *bisacodyl BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution – First stage may be used.

DETERMINATION OF CONTENT

Calculate the total content of $C_{22}H_{19}NO_4$ in the medium using the declared content of $C_{22}H_{19}NO_4$ in *bisacodyl BPCRS*.

LIMITS

The amount of bisacodyl released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

A mixture of 4 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 66 volumes of *water* (solution B).

(1) Shake a quantity of the powdered tablets containing 25 mg of Bisacodyl with 40 mL of solution B, dilute to 50 mL with solution B and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution B.

(3) Dissolve the contents of a vial of *bisacodyl for system suitability EPCRS* in 1 mL of *acetonitrile* and mix with 1 mL of solution B.

(4) Dissolve 5 mg of *bisacodyl for peak identification EPCRS* in 2.5 mL of *acetonitrile* and dilute to 5 mL with solution B.

(5) Dilute 1 volume of solution (2) to 10 volumes with solution B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of 0.025M *ammonium formate* previously adjusted to pH 5.0 with *anhydrous formic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *bisacodyl for system suitability EPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity A and multiply the area of this peak by a correction factor of 0.7;

the area of any peak corresponding to impurity C is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of any peak corresponding to impurity A is not greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (2) (0.8%);

the area of any peak corresponding to impurity E is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity F is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any peak corresponding to impurity D is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other secondary peak is not greater than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%);

the sum of any other secondary peak, excluding impurities A and C, is not more than 0.5%.

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (5) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Bisacodyl with 40 mL of solution B, dilute to 50 mL and filter. Further dilute 1 volume to 4 volumes with solution B described under Related substances.

(2) 0.005% w/v of *bisacodyl BPCRS* in solution B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *bisacodyl for system suitability EPCRS*.

DETERMINATION OF CONTENT

Calculate the total content of bisacodyl, $C_{22}H_{19}NO_4$, in the tablets using the chromatogram obtained and the declared content of $C_{22}H_{19}NO_4$ in *bisacodyl BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Bisacodyl.

Bisoprolol Tablets

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Bisoprolol Tablets contain Bisoprolol Fumarate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bisoprolol fumarate, $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing 10 mg of Bisoprolol Fumarate in *methanol*, dilute to 10 mL with the same solvent, mix and filter (a 0.45-µm nylon syringe filter is suitable).

(2) 0.1% w/v of *bisoprolol fumarate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below and allow to equilibrate for 1 hour.

(c) Apply 25 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of *ethyl acetate*. At the bottom of the chromatography tank, place a beaker containing 15 mL of *concentrated ammonia*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Solution A Prepare a solution containing 2.5 volumes of *orthophosphoric acid*, 5 volumes of *triethylamine*, 35 volumes of *water* and 160 volumes of *methanol*.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium, filter and dilute with sufficient of solution A to produce a solution expected to contain 0.0001% w/v of bisoprolol fumarate.

(2) 0.0002% w/v of *bisoprolol fumarate BPCRS* in *water*. Dilute 1 volume of this solution to 2 volumes with solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (3.3 cm × 4.6 mm) packed with *octasilyl silica gel for chromatography* (3 µm) (Pecosphere 3CR C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 227 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

2 volumes of *triethylamine*, 68 volumes of *methanol* and 100 volumes of *water*, previously adjusted to pH 4.0 using *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the total content of bisoprolol fumarate, $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$, in the medium from the chromatograms obtained and using the declared content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$, in *bisoprolol fumarate BPCRS*.

LIMITS

The amount of bisoprolol fumarate released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 2 volumes of *acetonitrile* and 8 volumes of *water*.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 10 mg of Bisoprolol Fumarate. Add sufficient solvent to produce a 0.1% w/v solution of Bisoprolol Fumarate and filter (0.45-µm nylon syringe filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 5 volumes.

(4) Dissolve the contents of a vial of *bisoprolol for peak identification EPCRS* in 1.0 mL.

(5) Dissolve the contents of a vial of *bisoprolol for system suitability EPCRS* in 1.0 mL.

(6) 0.001% w/v of *bisoprolol impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Ace C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

www.webofpharma.com

(d) Use a column temperature of 20°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 1% w/v solution of *orthophosphoric acid.*

Mobile phase B 1% w/v solution of *orthophosphoric acid* in *acetonitrile R1.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-4	95	5	isocratic
4-8	95→80	5→20	linear gradient
8-15	80	20	isocratic
15-34	80→20	20→80	linear gradient
34-36	20	80	isocratic
36-37	20→95	80→5	linear gradient
37-46	95	5	re-equilibration

Use the chromatogram supplied with *bisoprolol for peak identification EPCRS* and the chromatogram obtained with solution (4) to identify the peaks due to fumaric acid and impurities A and E; use the chromatogram supplied with *bisoprolol for system suitability EPCRS* and the chromatogram obtained with solution (5) to identify the peak due to impurity G; use the chromatogram supplied with *bisoprolol impurity standard BPCRS* and the chromatogram obtained with solution (6) to identify the peaks due to impurities L, K and 1.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to bisoprolol (retention time about 22 minutes) are: impurity A, about 0.48; impurity L, about 0.55; impurity G, about 1.03; impurity K, about 1.05; impurity E, about 1.1; impurity 1, about 1.2 and impurity 2 (double peak), about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 2.5, where H_p is the height above the baseline of the peak due to impurity G and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to bisoprolol.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity K is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the area of any peak corresponding to impurity L is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to impurity 1 is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (3) (0.6%);

the area of any peaks corresponding to impurity 2 or G are not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5% of each);

the area of any peak corresponding to impurity A is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (3) (0.3%);

the area of any other secondary peak is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any *secondary peaks*, excluding the peaks due to impurity K and L, is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%) and any peak due to fumaric acid.

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Bisoprolol Fumarate comply with the requirement stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) To one tablet add 20 mL and mix with the aid of ultrasound. Dilute to produce a solution containing 0.005% w/v of Bisoprolol Fumarate and filter (0.45-µm nylon syringe filter is suitable).

(2) 0.005% w/v of *bisoprolol fumarate BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.0 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (LiChrospher RP-Select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volume of *glacial acetic acid* and 1000 volumes of 0.136% *sodium acetate trihydrate* in *methanol (50%).*

When the chromatograms are recorded under the prescribed conditions, the retention time of bisoprolol is about 5 minutes.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to bisoprolol is between 0.8 and 1.6.

DETERMINATION OF CONTENT

Calculate the content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ in each tablet using the declared content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ in *bisoprolol fumarate BPCRS.*

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Bisoprolol Fumarate

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Bisoprolol Fumarate

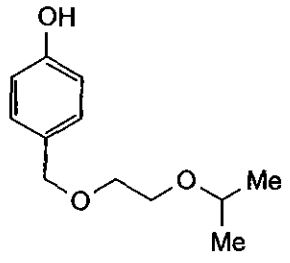
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) To a quantity of the powdered tablets containing 25 mg of Bisoprolol Fumarate add 45 mL and mix with the aid of ultrasound. Dilute to produce a solution containing 0.005% w/v of Bisoprolol Fumarate and filter (a 0.45-µm nylon syringe filter is suitable).

(2) 0.005% w/v of *bisoprolol fumarate BPCRS.*

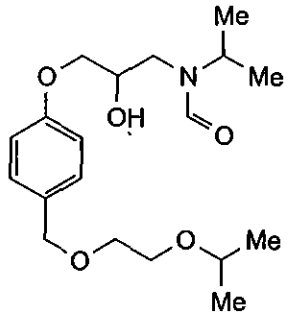
www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS



The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT



Calculate the content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ in the tablets using the declared content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ in *bisoprolol fumarate BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Bisoprolol Fumarate and:

1. 4-{[2-(propan-2-yloxy)ethoxy]methyl}phenol

2. *rac-N*-(propan-2-yl)-*N*-{2-hydroxy-3-[(4-{[2-(propan-2-yloxy)ethoxy]methyl}phenyl)oxy]propyl}formamide (bisoprolol *N*-aldehyde)

Bleomycin Injection

Bleomycin Sulphate for Injection

Action and use

Cytotoxic antibacterial.

DEFINITION

Bleomycin Injection is a sterile solution of Bleomycin Sulfate in a suitable liquid. It is prepared by dissolving Bleomycin Sulfate for Injection in the requisite amount of the liquid stated on the label before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Bleomycin Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

BLEOMYCIN SULFATE FOR INJECTION

DEFINITION

Bleomycin Sulfate for Injection is a sterile material consisting of Bleomycin Sulfate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of bleomycin sulfate *(RS 367)*.

B. In the test for Composition, the retention time and size of the two principal peaks in the chromatogram obtained with solution (1) are approximately the same as those of the two principal peaks in the chromatogram obtained with solution (2).

C. Yields the reactions characteristic of *sulfates*, Appendix VI.

TESTS

Acidity

Dissolve a quantity in sufficient *carbon dioxide-free water* to produce a solution containing 10,000 IU of bleomycin per mL. The pH of the resulting solution is 4.5 to 6.0, Appendix V L.

Colour of solution

Dissolve a quantity in sufficient *water* to produce a solution containing 40,000 IU of bleomycin per mL. The *absorbance* of the solution at 430 nm is not greater than 0.15, Appendix II B.

Loss on drying

When dried at 60° at a pressure not exceeding 0.7 kPa for 3 hours, lose not more than 6.0% of their weight. Use the combined contents of two containers.

Composition

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient *water* to produce a solution containing 1000 IU of bleomycin per mL.

(2) 0.05% w/v of *bleomycin sulfate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (7 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Use as the initial mobile phase a mixture of 10 volumes of *methanol* and 90 volumes of a mixture prepared in the following manner: dissolve 0.960 g of *sodium pentanesulfonate* in 900 mL of 0.08M *acetic acid*, add 1.86 g of *disodium edetate*, dilute to 1000 mL with 0.08M *acetic acid* and adjust to pH 4.3 with 18M *ammonia*. Maintain the initial mobile phase for 15 minutes, increase the proportion of *methanol* to 40 volumes over 60 minutes and maintain the final mobile phase until demethylbleomycin A_2 is eluted (about

www.webofpharma.com

20 minutes; retention time 1.5 to 2.5, relative to bleomycin A_2).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 5.

LIMITS

Using the chromatogram obtained with solution (1), calculate the percentage content of bleomycin components by *normalisation*. The proportions are within the following limits:

bleomycin A_2 (first principal peak), between 55% and 70%;

bleomycin B_2, between 25% and 32%;

the sum of the contents of bleomycin A_2 and bleomycin B_2 is not less than 85%;

demethylbleomycin A_2 (retention time 1.5 to 2.5, relative to bleomycin A_2), not greater than 8%;

the total content of other related substances is not greater than 9.5%.

Disregard any impurity present at less than 0.1%.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to produce a solution containing 15,000 IU of bleomycin per mL (solution A). The endotoxin limit concentration of solution A is 50 IU of endotoxin per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Mix the contents of the containers and carry out the *microbiological assay of antibiotics*, Appendix XIV A, Method A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

For a container of average content weight, the upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated number of IU.

STORAGE

The sealed container should be protected from light.

LABELLING

The label of the sealed container states the total number of IU (Units) contained in it.

Bromocriptine Capsules

Action and use

Dopamine receptor agonist.

DEFINITION

Bromocriptine Capsules contain Bromocriptine Mesilate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

PRODUCTION

Risk assessment should be used to evaluate the potential for genotoxic methanesulfonate esters to be formed in the presence of low molecular weight alcohols. If a risk of methanesulfonate ester formation is identified through risk assessment, these impurities should not exceed the threshold of toxicological concern.

Content of bromocriptine, $C_{32}H_{40}BrN_5O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 10 mg of bromocriptine with 50 mL of *methanol* for 30 minutes, centrifuge and dilute 5 mL of the supernatant liquid to 20 mL with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 380 nm exhibits a maximum at 305 nm and a minimum at 270 nm.

B. In the test for Related substances, the principal band in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (6).

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions, prepare the solutions in subdued light and immediately before use. Apply solution (1) as the last solution and develop the chromatograms immediately in an unsaturated tank.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 20 mg of bromocriptine with 10 mL of *methanol* for 20 minutes and centrifuge.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol*.

(3) Dilute 3 volumes of solution (1) to 100 volumes with *methanol*.

(4) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(5) Dilute 1 volume of solution (1) to 200 volumes with *methanol*.

(6) 0.023% w/v of *bromocriptine mesilate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution as 10-mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of cold air for 2 minutes, spray with *ammonium molybdate solution R3* and heat at 100° until bands appear (about 10 minutes).

MOBILE PHASE

0.1 volumes of 13.5M *ammonia*, 1.5 volumes of *water*, 3 volumes of *propan-2-ol*, 88 volumes of *dichloromethane* and 100 volumes of *ether*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary band* is not more intense than the band in the chromatogram obtained with solution (3) (3%);

not more than one such band is more intense than the band in the chromatogram obtained with solution (4) (1%);

not more than a further two such bands are more intense than the band in the chromatogram obtained with solution (5) (0.5%).

Disregard any band within 20 mm of the line of application.

www.webofpharma.com

ASSAY

Prepare the solutions in subdued light. Weigh and powder the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the capsule contents containing the equivalent of 10 mg of bromocriptine with 70 mL of *methanol (50%)* with the aid of ultrasound for 5 minutes, filter and dilute to 100 mL with the same solvent.

(2) 0.011% w/v of *bromocriptine mesilate BPCRS* in *methanol (50%)*.

(3) Heat a 0.011% w/v solution of *bromocriptine mesilate BPCRS* in a mixture of 1 volume of 1M *acetic acid* and 9 volumes of *methanol* at 60° for 90 minutes and cool to room temperature.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 300 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of a 0.08% w/v solution of *ammonium carbonate* and 55 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The assay is not valid unless the *resolution factor* between the two peaks obtained with solution (3) is not less than 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{32}H_{40}BrN_5O_5$ using the declared content of $C_{32}H_{40}BrN_5O_5$ in *bromocriptine mesilate BPCRS*.

STORAGE

Bromocriptine Capsules should be kept in an airtight container and protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of bromocriptine.

Bromocriptine Tablets

Action and use

Dopamine receptor agonist.

DEFINITION

Bromocriptine Tablets contain Bromocriptine Mesilate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

PRODUCTION

Risk assessment should be used to evaluate the potential for genotoxic methanesulfonate esters to be formed in the presence of low molecular weight alcohols. If a risk of methanesulfonate ester formation is identified through risk assessment, these impurities should not exceed the threshold of toxicological concern.

Content of bromocriptine, $C_{32}H_{40}BrN_5O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of bromocriptine with 50 mL of *methanol* for 30 minutes, centrifuge and dilute 5 mL of the supernatant liquid to 20 mL with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 380 nm exhibits a maximum at 305 nm and a minimum at 270 nm.

B. In the test for Related substances, the principal band in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (6).

C. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 10 mg of bromocriptine with 25 mL of a mixture of equal volumes of *chloroform* and *methanol* for 30 minutes, filter through a sintered-glass filter (ISO 4793, porosity grade 4, is suitable) and wash the residue with two 5-mL quantities of the solvent mixture. Evaporate the filtrate and washings to dryness at 25° at a pressure of 2 kPa, dissolve the residue in 2 mL of the solvent mixture and centrifuge.

(2) Dilute 1 volume of solution (1) to 10 volumes with a mixture of equal volumes of *chloroform* and *methanol*.

(3) Dilute 3 volumes of solution (2) to 10 volumes with a mixture of equal volumes of *chloroform* and *methanol*.

(4) Dilute 1 volume of solution (2) to 10 volumes with a mixture of equal volumes of *chloroform* and *methanol*.

(5) Dilute 1 volume of solution (2) to 20 volumes with a mixture of equal volumes of *chloroform* and *methanol*.

(6) 0.055% w/v of *bromocriptine mesilate BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution as 10-mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air for 2 minutes, spray with *ammonium molybdate solution R3* and heat at 100° until bands appear (about 10 minutes).

MOBILE PHASE

0.1 volumes of 13.5M *ammonia*, 1.5 volumes of *water*, 3 volumes of *propan-2-ol*, 88 volumes of *dichloromethane* and 100 volumes of *ether*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary band* is not more intense than the band in the chromatogram obtained with solution (3) (3%);

not more than one such band is more intense than the band in the chromatogram obtained with solution (4) (1%);

not more than a further two such bands are more intense than the band in the chromatogram obtained with solution (5) (0.5%).

Disregard any band within 20 mm of the line of application.

www.webofpharma.com

Uniformity of content
Tablets containing less than the equivalent of 2 mg and/or less than 2% w/w of bromocriptine comply with the requirements stated under Tablets using the following method of analysis. Mix one tablet with 50 mL of *ethanol (50%)* with the aid of ultrasound until disintegrated, shake for 30 minutes and centrifuge. Measure the *absorbance* of the supernatant liquid at the maximum at 305 nm, Appendix II B. Calculate the content of $C_{32}H_{40}BrN_5O_5$ taking 144 as the value of A(1%, 1 cm) at the maximum at 305 nm.

ASSAY
Prepare the solutions in subdued light. Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the powdered tablets containing the equivalent of 10 mg of bromocriptine with 70 mL of *methanol (50%)* with the aid of ultrasound for 5 minutes, shake for 30 minutes, filter and dilute to 100 mL with the same solvent.

(2) 0.011% w/v of *bromocriptine mesilate BPCRS* in *methanol (50%)*.

(3) Heat a 0.011% w/v solution of *bromocriptine mesilate BPCRS* in a mixture of 1 volume of 1M *acetic acid* and 9 volumes of *methanol* at 60° for 90 minutes and cool to room temperature.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 300 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of a 0.08% w/v solution of *ammonium carbonate* and 55 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The assay is not valid unless the *resolution factor* between the two peaks obtained with solution (3) is not less than 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the tablets using the declared content of $C_{32}H_{40}BrN_5O_5$ in *bromocriptine mesilate BPCRS*.

STORAGE
Bromocriptine Tablets should be kept in an airtight container and protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of bromocriptine.

Budesonide Aqueous Nasal Spray

Action and use
Glucocorticoid.

DEFINITION
Budesonide Aqueous Nasal Spray is an aqueous suspension of Budesonide in a suitable container fitted with an appropriate nasal delivery system.

The nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of budesonide, $C_{25}H_{34}O_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Dilute a quantity of the nasal spray with sufficient *water* to produce a solution containing 0.002% w/v of Budesonide and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 200 nm to 350 nm exhibits a maximum only at 247 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 4.0 to 5.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Solvent A 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

(1) To a quantity of the nasal spray containing 2 mg of Budesonide add 3.4 mL of *acetonitrile*. Mix with the aid of ultrasound and add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) Dilute 1 volume of solution (1) to 50 volumes in solvent A.

(3) 0.01% w/v of *budesonide impurity standard BPCRS* in solvent A.

(4) Dilute 1 volume of solution (2) to 20 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

Mobile phase B Equal volumes of *acetonitrile* and *phosphate buffer solution pH 3.2*.

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-38	100	0	isocratic
38-50	100→0	0→100	linear gradient
50-60	0	100	isocratic
60-61	0→100	100→0	linear gradient
61-70	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time relative to budesonide epimer B (retention time about 17 minutes) is epimer A, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5;

the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *budesonide impurity standard BPCRS;*

in the chromatogram obtained with solution (4), the *signal-to-noise ratio* of each of the peaks due to epimer A and epimer B is at least 10.

LIMITS

Identify any peaks (2 epimer peaks) due to impurity D in the chromatogram obtained with solution (1) using the chromatogram obtained with solution (3) and multiply the sum of the areas of these peaks by 1.8.

In the chromatogram obtained with solution (1):

the area of any peak due to Impurity D is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (2%);

the sum of the areas of any *secondary peaks* is not greater than 1.5 times the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (4) (0.1%).

Epimer A

In the chromatogram obtained with solution (1), as described under Assay, the content of epimer A (second peak) is 40.0% to 51.0% of the sum of the areas of the two epimer peaks of budesonide.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

(1) To a quantity of the nasal spray containing 1 mg of Budesonide add 3.4 mL of *acetonitrile*. Mix with the aid of ultrasound, add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) 0.01% w/v of *budesonide BPCRS* in solvent A (as described under Related substances).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{34}O_6$ in the nasal spray from the sum of the areas of the two budesonide epimer peaks and using the declared content of $C_{25}H_{34}O_6$ in *budesonide BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Budesonide.

Budesonide Nebuliser Suspension

Action and use

Glucocorticoid.

DEFINITION

Budesonide Nebuliser Suspension is a suspension of Budesonide in a suitable vehicle, intended to be converted into aerosols by a nebuliser.

The nebuliser suspension complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The active substance delivery rate and the total active substance delivered are determined using the methods described in Appendix XII C. 8. Preparations for Nebulisation: Characterisation. Where justified and authorised, a different apparatus and procedure may be used.

The particle-size distribution is determined using an apparatus and procedure described in Appendix XII C. 8. Preparations for Nebulisation: Characterisation. Where justified and authorised, a different apparatus and procedure may be used.

Content of budesonide, $C_{25}H_{34}O_6$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a quantity of the nebuliser suspension being examined with sufficient *water* to produce a solution containing 0.002% w/v of Budesonide and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 200 nm to 350 nm exhibits a maximum only at 247 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 5.0, Appendix V L.

www.webofpharma.com

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Solvent A 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

(1) To a quantity of the nebuliser suspension containing 2 mg of Budesonide add 3.4 mL of *acetonitrile.* Mix with the aid of ultrasound, add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 2 volumes of *ethanol,* 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

Mobile phase B Equal volumes of *acetonitrile* and *phosphate buffer solution pH 3.2.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-38	100	0	isocratic
38-50	100→0	0→100	linear gradient
50-60	0	100	isocratic
60-61	0→100	100→0	linear gradient
61-70	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time relative to budesonide epimer B (retention time about 17 minutes) is epimer A, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5;

in the chromatogram obtained with solution (3), the *signal-to-noise ratio* of each of the peaks due to epimer A and epimer B is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 3 times the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (3) (0.05%).

Epimer A
In the chromatogram obtained with solution (1), as described under Assay, the content of epimer A (second peak) is 40.0% to 51.0% of the sum of the areas of the two epimer peaks of budesonide.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

(1) To a quantity of the nebuliser suspension containing 1 mg of Budesonide add 3.4 mL of *acetonitrile.* Mix with the aid of ultrasound, add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) 0.01% w/v of *budesonide BPCRS* in solvent A (as described under Related substances).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *ethanol,* 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{34}O_6$ in the nebuliser suspension from the sum of the areas of the two budesonide epimer peaks and using the declared content of $C_{25}H_{34}O_6$ in *budesonide BPCRS.*

STORAGE
Budesonide Nebuliser Suspension should be protected from light.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Budesonide.

Budesonide Inhalation Powder

Budesonide Powder for Inhalation, metered dose powder inhaler

Action and use
Glucocorticoid.

DEFINITION
Budesonide Inhalation Powder consists of Budesonide in *microfine powder* or aerodynamically equivalent,either alone or combined with a suitable carrier. It is administered by a dry-powder inhaler.

The inhalation powder complies with the requirements stated under Preparations for Inhalation and with the following requirements.

www.webofpharma.com

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7. Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of budesonide, $C_{25}H_{34}O_6$
80.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Dilute a quantity of the inhalation powder with sufficient *water* to produce a solution containing 0.002% w/v of Budesonide and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 200 nm to 350 nm exhibits a maximum only at 247 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

C. *For products containing lactose* disperse 0.25 g of the inhalation powder in 5 mL of *water*. Add 5 mL of 6M *ammonia* and heat in a water bath at 80° for 10 minutes. An orange-red colour is produced.

TESTS

Uniformity of delivered dose

Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Solvent A 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient solvent A to produce a solution containing 0.001% w/v of Budesonide.

(2) 0.001% w/v of *budesonide BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5.

DETERMINATION OF CONTENT

Calculate the amount of budesonide, $C_{25}H_{34}O_6$, per delivered dose using the declared content of $C_{25}H_{34}O_6$ in *budesonide BPCRS*. Repeat the procedure as described for reservoir systems under Inhalation Powders, Uniformity of delivered dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Prepare a mixture of 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2* (solvent A).

(1) Dissolve a quantity of the inhalation powder containing 2 mg of Budesonide in 3.4 mL of *acetonitrile*. Mix with the aid of ultrasound, add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

Mobile phase B Equal volumes of *acetonitrile* and *phosphate buffer solution pH 3.2*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-38	100	0	isocratic
38-50	100→0	0→100	linear gradient
50-60	0	100	isocratic
60-61	0→100	100→0	linear gradient
61-70	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time relative to budesonide epimer B (retention time about 17 minutes) is epimer A, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5;

in the chromatogram obtained with solution (3), the *signal-to-noise ratio* of each of the peaks due to epimer A and epimer B is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (0.5%);

www.webofpharma.com

the sum of the areas of any *secondary peaks* is not greater than 3 times the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (3) (0.05%).

Epimer A

In the chromatogram obtained with solution (1), as described under Uniformity of delivered dose, the content of epimer A (second peak) is 40.0% to 51.0% of the sum of the areas of the two epimer peaks of budesonide.

ASSAY

Use the average of the individual results determined in the test for Uniformity of delivered dose.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Budesonide.

Budesonide Inhalation Powder, pre-metered

Budesonide Powder for Inhalation, pre-dispensed units

Action and use

Glucocorticoid.

DEFINITION

Budesonide Inhalation Powder, pre-metered consists of Budesonide in *microfine powder* either alone or combined with a suitable carrier. The pre-metered unit is loaded into a dry-powder inhaler to generate an aerosol.

The inhalation powder, pre-metered complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7. Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of budesonide, $C_{25}H_{34}O_6$

When supplied as disks, 90.0 to 110.0% of the stated amount per pre-metered unit. When supplied as capsules, 80.0 to 120.0% of the stated amount per pre-metered unit.

IDENTIFICATION

A. Dilute a quantity of the powder, with sufficient *water* to produce a solution containing 0.002% w/v of Budesonide and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 200 nm to 350 nm exhibits a maximum only at 247 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

C. *For products containing lactose* disperse 0.25 g of the powder for inhalation in 5 mL of *water*. Add 5 mL of 6M *ammonia* and heat in a water bath at 80° for 10 minutes. An orange-red colour is produced.

TESTS

Uniformity of delivered dose

Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Solvent A 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient solvent A to produce a solution containing 0.001% w/v of Budesonide.

(2) 0.001% w/v of *budesonide BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5.

DETERMINATION OF CONTENT

Calculate the amount of budesonide, $C_{25}H_{34}O_6$, per delivered dose inhalation from the sum of the areas of the two budesonide epimer peaks and using the declared content of $C_{25}H_{34}O_6$ in *budesonide BPCRS*. Repeat the procedure as described for pre-metered systems under Inhalation Powders, Uniformity of delivered dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Prepare a mixture of 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2* (solvent A).

(1) Dissolve a quantity of the powder, containing 2 mg of Budesonide in 3.4 mL of *acetonitrile*. Mix with the aid of ultrasound, add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

Mobile phase B Equal volumes of *acetonitrile* and *phosphate buffer solution pH 3.2.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-38	100	0	isocratic
38-50	100→0	0→100	linear gradient
50-60	0	100	isocratic
60-61	0→100	100→0	linear gradient
61-70	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time relative to budesonide epimer B (retention time about 17 minutes) is epimer A, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5;

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 3 times the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (3) (0.05%).

Epimer A

In the chromatogram obtained with solution (1), as described under Uniformity of delivered dose, the content of epimer A (second peak) is 40.0% to 51.0% of the sum of the areas of the two epimer peaks of budesonide.

ASSAY

Use the average of the individual results determined in the test for Uniformity of delivered dose.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Budesonide.

Budesonide Pressurised Inhalation

Action and use

Glucocorticoid.

DEFINITION

Budesonide Pressurised Inhalation is a suspension of Budesonide in a suitable liquid in a pressurised container fitted with a metering dose valve.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of preparations for inhalation are determined using the method described in Appendix XII C7. Preparations for inhalation: Aerodynamic Assessment of Fine Particles. The test and limits should be agreed with the competent authority.

The water content is controlled to ensure the performance of the product as justified and authorised by the competent authority.

Content of budesonide, $C_{25}H_{34}O_6$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. Dilute a quantity of the pressurised inhalation with sufficient *water* to produce a solution containing 0.002% w/v of Budesonide and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 200 nm to 350 nm exhibits a maximum only at 247 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

Solvent A 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2.*

(1) Freeze the pressurised container and carefully open the canister. Dissolve a quantity of the frozen contents containing 2 mg of Budesonide in 3.4 mL of *acetonitrile.* Mix with the aid of ultrasound and add sufficient *phosphate buffer solution pH 3.2* to produce 10 mL and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dilute 1 volume of solution (2) to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 100 µL of each solution.

www.webofpharma.com

MOBILE PHASE

Mobile phase A 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

Mobile phase B Equal volumes of *acetonitrile* and *phosphate buffer solution pH 3.2*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-38	100	0	isocratic
38-50	100→0	0→100	linear gradient
50-60	0	100	isocratic
60-61	0→100	100→0	linear gradient
61-70	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time relative to budesonide epimer B (retention time about 17 minutes) is epimer A, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5;

in the chromatogram obtained with solution (3), the *signal-to-noise ratio* of each of the peaks due to epimer A and epimer B is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 3 times the sum of the areas of the epimer peaks in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with solution (3) (0.05%).

Epimer A

In the chromatogram obtained with solution (1), as described under Assay, the content of epimer A (second peak) is 40.0% to 51.0% of the sum of the areas of the two epimer peaks of budesonide.

ASSAY

Protect the solutions from light.

Determine the content of active ingredient delivered by the first 10 successive combined actuations of the valve after priming. Carry out the procedure for Content of active ingredient delivered by actuation of the valve described under Appendix XII C, beginning at the words 'Remove the pressurised container from the actuator ...' and ending at the words '... to the volume specified in the monograph', using 32 mL of *acetonitrile* in the vessel. Transfer the combined solution and washings obtained from the set of 10 combined actuations to a flask so that, on dilution to volume with appropriate amounts of *acetonitrile* and *phosphate buffer solution pH 3.2*, the final solution contains 0.002% w/v of Budesonide in solvent A, as described under Related substances (solution A). Determine the content of active ingredient in the 10 combined actuations using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Solution A.

(2) 0.002% w/v of *budesonide BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer solution pH 3.2*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to epimer B and epimer A is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{34}O_6$ in the pressurised inhalation from the sum of the areas of the two budesonide epimer peaks and using the declared content of $C_{25}H_{34}O_6$ in *budesonide BPCRS*.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle 10 and on the last 10 successive combined actuations of the valve, as estimated from the number of deliveries available from the container as stated on the label. For each of the three determinations the average content of $C_{25}H_{34}O_6$ delivered by a single actuation of the valve is within the limits stated under Content of budesonide.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Budesonide.

Buffered Cream

DEFINITION

Emulsifying Ointment	300 g
Disodium Hydrogen Phosphate Dodecahydrate	25 g
Citric Acid Monohydrate	5 g
Chlorocresol	1 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

If another antimicrobial preservative replaces Chlorocresol in this formulation, the suitability of the Cream as a diluent should be confirmed before use.

Extemporaneous preparation

Melt the Emulsifying Ointment with the aid of gentle heat. In a vessel that can be closed, heat about 650 g of Purified Water to about 60°; add the Chlorocresol and, when it melts, vigorously shake the closed vessel to effect dissolution. Dissolve the Disodium Hydrogen Phosphate Dodecahydrate and the Citric Acid Monohydrate in the chlorocresol solution. Add the aqueous phase to the melted ointment when both are at about 60°. Stir gently until cool, add sufficient Purified Water to produce 1000 g and mix.

www.webofpharma.com

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

TESTS

Acidity

pH, 5.7 to 6.3, determined directly on the cream, Appendix V L.

STORAGE

If Buffered Cream is kept in aluminium tubes, their inner surfaces should be coated with a suitable lacquer.

Bumetanide Injection

Action and use

Loop diuretic.

DEFINITION

Bumetanide Injection is a sterile solution of Bumetanide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of bumetanide, $C_{17}H_{20}N_2O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the injection containing 10 mg of Bumetanide with 20 mL of *ether*, filter the ether layer through *anhydrous sodium sulfate* and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of bumetanide *(RS 033)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.8, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Adjust the pH of a quantity of the injection containing 5 mg of Bumetanide to 12 using 0.1M *sodium hydroxide* and extract with two 20 mL quantities of *ether*. Discard the ether, adjust the pH to 4 using 1M *acetic acid*, extract with two further 20 mL quantities of *ether*, dry the ether by filtering through *anhydrous sodium sulfate*, wash the filter with 5 mL of *ether* and evaporate the combined filtrate and washings to dryness using a rotary evaporator. Dissolve the residue in 5 mL of *methanol* and centrifuge. Evaporate the supernatant liquid to dryness using a rotary evaporator and dissolve the residue in 0.5 mL of *methanol*.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol* and further dilute 1 volume of this solution to 30 volumes with *methanol*.

(3) Dilute 1 volume of solution (2) to 3 volumes with *methanol*.

(4) 0.005% w/v of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 25 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* corresponding to 3-amino-4-phenoxy-5-sulfamoylbenzoic acid is not more intense than the spot in the chromatogram obtained with solution (4) (0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%);

and not more than two other such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection containing 2.5 mg of Bumetanide to 20 mL using a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol*.

(2) Dilute 10 mL of a 0.025% w/v solution of *bumetanide BPCRS* in a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol* to 20 mL with *water*.

(3) 0.0125% w/v of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 15.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{20}N_2O_5S$ using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

www.webofpharma.com

Bumetanide Oral Solution

Action and use
Loop diuretic.

DEFINITION
Bumetanide Oral Solution is a solution of Bumetanide in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of bumetanide, $C_{17}H_{20}N_2O_5S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (5).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform* as the mobile phase. Apply separately to the plate 25 µL of each of the following solutions. For solution (1) mix a quantity of the oral solution containing 2 mg of Bumetanide with 10 mL of *water* and 0.6 mL of 1M *hydrochloric acid*, add 5 mL of *ethyl acetate*, shake for 15 minutes, centrifuge and decant the ethyl acetate. Add a further 5 mL of *ethyl acetate* to the residue, shake for 15 minutes, centrifuge and decant the ethyl acetate. Evaporate the combined ethyl acetate extracts to dryness using a rotary evaporator and dissolve the residue in 0.5 mL of *methanol*. For solution (2) dilute 1 volume of solution (1) to 10 volumes with *methanol*. For solution (3) dilute 1 volume of solution (2) to 10 volumes with *methanol* and further dilute 1 volume of this solution to 3 volumes with *methanol*. For solution (4) dilute 1 volume of solution (2) to 100 volumes with *methanol*. Solution (5) contains 0.040% w/v of *bumetanide BPCRS* in *methanol*. Solution (6) contains 0.002% w/v of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (365 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) corresponding to 3-amino-4-phenoxy-5-sulfamoyl-benzoic acid is not more intense than the spot in the chromatogram obtained with solution (6) (0.5%), any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%) and not more than two other such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the oral solution containing 2.5 mg of Bumetanide with 12.5 mL of *water* and 0.8 mL of 1M *hydrochloric acid*, add 10 mL of *ethyl acetate*, shake for 15 minutes, centrifuge and decant the ethyl acetate. Repeat the extraction procedure twice using a further two 10-mL quantities of *ethyl acetate* and beginning at the words 'add 10 mL of ... '. Evaporate the combined ethyl acetate extracts to dryness using a rotary evaporator, dissolve the residue in 10 mL of a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol* and dilute to 20 mL with *water*. For solution (2) dilute 5 mL of a 0.025% w/v solution of *bumetanide BPCRS* in a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol* and dilute to 10 mL with *water*. Inject 20 µL of each solution. Solution (3) contains 0.0125% w/v of *3-amino-4-phenoxy-5-sulfamoyl-benzoic acid BPCRS* in solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak ODS is suitable), (b) a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 15.0.

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{17}H_{20}N_2O_5S$, weight in volume, using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

Bumetanide Tablets

Action and use
Loop diuretic.

DEFINITION
Bumetanide Tablets contain Bumetanide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bumetanide, $C_{17}H_{20}N_2O_5S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the powdered tablets containing 50 mg of Bumetanide with 25 mL of *ether*, filter through *anhydrous sodium sulfate* and evaporate the filtrate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of bumetanide *(RS 033)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake mechanically a quantity of the powdered tablets containing 12.5 mg of Bumetanide with 20 mL of a mixture of equal volumes of *acetonitrile* and *methanol* for 20 minutes, centrifuge for 10 minutes, decant and reserve the supernatant liquid. Extract the residue with 5 mL of a mixture of equal volumes of *acetonitrile* and *methanol*, shaking mechanically for 30 seconds, centrifuge for 10 minutes, decant and combine the extracts. Evaporate the combined extracts to dryness under reduced pressure, dissolve the residue in 0.5 mL of *methanol* and centrifuge for 10 minutes.

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol* and further dilute 3 volumes of this solution to 10 volumes with *methanol*.

(3) Dilute 1 volume of solution (1) to 10 volumes with *methanol* and further dilute 1 volume of this solution to 100 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a precoated TLC *silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1):

is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%);

and not more than three such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Bumetanide comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve one tablet in 10 mL of a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol*, shake with the aid of ultrasound for 5 minutes, dilute to 20 mL with *water*, filter and use the filtrate.

(2) Dilute 10 mL of a 0.010% w/v solution of *bumetanide BPCRS* in a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol* to 20 mL with *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{20}N_2O_5S$ in each tablet using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing 2.5 mg of Bumetanide in 10 mL of a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol*, shake with the aid of ultrasound for 5 minutes, dilute to 20 mL with *water*, filter and use the filtrate.

(2) Dilute 10 mL of a 0.025% w/v solution of *bumetanide BPCRS* in a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol* to 20 mL with *water*.

(3) 0.0125% w/v of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 15.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the tablets using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

Bumetanide and Potassium Prolonged-release Tablets

Bumetanide and Prolonged-release Potassium Tablets

Bumetanide and Potassium Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Loop diuretic.

DEFINITION

Bumetanide and Potassium Prolonged-release Tablets contain Bumetanide and Potassium Chloride. They are formulated so that the Potassium Chloride is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Potassium Chloride. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of bumetanide, $C_{17}H_{20}N_2O_5S$

92.5 to 107.5% of the stated amount.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances the spot in the chromatogram obtained with solution (1) is similar in position, size and intensity to the spot in the chromatogram obtained with solution (2).

B. Examine the filtrate obtained in the test for Uniformity of content by *fluorescence spectrophotometry*, Appendix II E, using an excitation wavelength of 350 nm. The solution emits light at 445 nm.

www.webofpharma.com

C. Dissolve a quantity of the powdered tablets containing 0.1 g of Potassium Chloride as completely as possible in 2 mL of *water* and filter. The filtrate yields reaction A characteristic of *potassium salts*, Appendix VI.

D. Dissolve a quantity of the powdered tablets containing 0.02 g of Potassium Chloride as completely as possible in 2 mL of *water* and filter. The filtrate yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Dissolution

For bumetanide

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of *water* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 10 mL of the medium, filter and measure the *fluorescence*, Appendix II E, using an excitation wavelength of 350 nm and an emission wavelength of 445 nm and *water* in the reference cell. Measure the *fluorescence* of a 0.04% w/v solution of *bumetanide BPCRS* in *ethanol (96%)* diluted to a suitable concentration with *water* under the same conditions and calculate the total content of $C_{17}H_{20}N_2O_5S$ in the medium from the fluorescences obtained and from the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a high-performance silica gel F_{254} plate (Merck 5629 plates are suitable) and a mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 8 cm above the line of application. Apply separately to the plate 10 µL of each of solutions (1) and (2) and 5 µL of solution (3). For solution (1) add 10 mL of a 0.1% w/v solution of *citric acid* to a number of whole tablets containing, in total, 1 mg of Bumetanide, shake for 10 minutes, remove and discard the cores, extract the solution with two 20-mL quantities of *ether*, evaporate the combined extracts to dryness under reduced pressure and dissolve the residue in 0.5 mL of *ethyl acetate*. For solution (2) add 2 mL of a 0.20% w/v solution of *bumetanide BPCRS* in *ethyl acetate* to 10 mL of a 0.1% w/v solution of *citric acid*, shake for 15 minutes, centrifuge and use the ethyl acetate layer. For solution (3) mix 1 mL of a 0.20% w/v solution of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in *ethyl acetate* and 1 mL of a 0.20% w/v solution of *bumetanide BPCRS* in *ethyl acetate*, add sufficient *ethyl acetate* to produce 100 mL, add 2 mL of this solution to 10 mL of a 0.1% w/v solution of *citric acid*, shake for 15 minutes and use the ethyl acetate layer. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (365 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) corresponding to 3-amino-4-phenoxy-5-sulfamoylbenzoic acid is not more intense than the corresponding spot in the chromatogram obtained with solution (3) (0.5%) and any other *secondary spot* is not more intense than the spot due to bumetanide in the chromatogram obtained with solution (3) (0.5%).

Uniformity of content

Tablets containing less than 2 mg of Bumetanide comply with the requirements stated below. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake one tablet in 0.5 mL of *methanol* for 3 minutes, add 9 mL of the mobile phase and shake for 30 minutes. Filter to remove the tablet core, add sufficient of the mobile phase to produce 10 mL, centrifuge for 15 minutes and use the supernatant liquid. If the supernatant liquid is cloudy, filter through a 0.45-µm membrane filter (Millipore Millex is suitable), discarding the first 2 mL of filtrate. For solution (2) dilute 5 mL of a 0.1% w/v solution of *bumetanide BPCRS* in *methanol* to 100 mL with the mobile phase.

The chromatographic procedure described under Assay may be used.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in each tablet using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*. The tablets comply with the test if not more than one of the individual values is outside the range 85% to 115% of the average value and none is outside the limits 75% to 125% of the average value. If two or three individual values are outside the limits 85% to 115% of the average value and none is outside the limits 75% to 125%, repeat the determination on a further 20 tablets taken at random. The tablets comply with the test if in the total number of tablets tested not more than three individual values are outside the limits 85% to 115% and none is outside the limits 75% to 125% of the average value.

ASSAY

For bumetanide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a number of whole tablets containing 5 mg of Bumetanide in 5 mL of *methanol* for 3 minutes, add 90 mL of the mobile phase and shake for 30 minutes. Filter to remove the tablet cores, add sufficient of the mobile phase to produce 100 mL, centrifuge for 15 minutes and use the supernatant liquid. If the supernatant liquid is cloudy, filter through a 0.45-µm membrane filter (Millipore Millex is suitable), discarding the first 2 mL of filtrate. For solution (2) dilute 5 mL of a 0.1% w/v solution of *bumetanide BPCRS* in *methanol* to 100 mL with the mobile phase. Solution (3) contains 0.005% w/v of *3-amino-4-phenoxy-5-sulfamoylbenzoic acid BPCRS* in solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable), (b) a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm. Inject separately 20 µL of each solution.

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 15.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the tablets using the declared content of $C_{17}H_{20}N_2O_5S$ in *bumetanide BPCRS*.

For potassium chloride

Shake 20 whole tablets with 800 mL of *water* for 15 minutes, heating on a water bath if necessary, and allow to stand for 24 hours. Add sufficient *water* to produce 1000 mL, filter and dilute a portion of the filtrate to a suitable concentration. Carry out the method for *atomic emission spectrophotometry*, Appendix II D, measuring at 766.5 nm and using *potassium standard solution (600 ppm K)*, suitably diluted with *water*, to prepare the standard solutions. Each mg of potassium is equivalent to 1.908 mg of KCl.

www.webofpharma.com

Bupivacaine Injection

Action and use
Local anaesthetic.

DEFINITION
Bupivacaine Injection is a sterile solution of Bupivacaine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous bupivacaine hydrochloride, $C_{18}H_{28}N_2O,HCl$
92.5 to 107.5% of the stated amount.

CHARACTERISTICS
A colourless or almost colourless solution.

IDENTIFICATION
A. To a volume of the injection containing the equivalent of 25 mg of anhydrous bupivacaine hydrochloride add 2 mL of 13.5M *ammonia*, shake and filter. Wash the precipitate with *water* and dry at 60° at a pressure of 2 kPa for 16 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of bupivacaine *(RS 034)*.

B. To a volume of the injection containing the equivalent of 50 mg of anhydrous bupivacaine hydrochloride add 2 mL of a 10% w/v solution of *disodium hydrogen orthophosphate* and sufficient *iodinated potassium iodide solution* to produce a distinct brown colour. Remove the excess iodine by adding 0.1M *sodium thiosulfate*. No pink colour is produced.

TESTS

Acidity
pH, 4.0 to 6.5, Appendix V L.

2,6-Dimethylaniline
To a volume of the injection containing the equivalent of 25 mg of anhydrous bupivacaine hydrochloride add sufficient *water*, if necessary, to produce 10 mL, add 2M *sodium hydroxide* until the solution is just alkaline and extract with three 5 mL quantities of *dichloromethane*. Dry the combined dichloromethane extracts over *anhydrous sodium sulfate*, filter, wash with a further 5 mL of *dishloromethane* and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in 2 mL of *methanol*, add 1 mL of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 mL of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. The yellow colour produced is not more intense than the colour produced by repeating the operation using 10 mL of a solution in *water* containing 1 µg of *2,6-dimethylaniline* per mL in place of the injection (400 ppm).

Bupivacaine-related bases
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 0.1 volume of 13.5M *ammonia* and 100 volumes of *methanol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) evaporate a volume of the injection containing the equivalent of 0.1 g of anhydrous bupivacaine hydrochloride using a rotary evaporator, add sufficient *methanol* to the residue to produce 2 mL, mix, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of the injection with sufficient of the mobile phase to produce a solution containing 0.0025% w/v of anhydrous bupivacaine hydrochloride. Solution (2) contains 0.0025% w/v of *bupivacaine hydrochloride BPCRS* in the mobile phase. For solution (3) prepare a 0.1% w/v solution of *2,6-dimethylaniline* in *acetonitrile*, dilute 10 volumes to 20 volumes with the mobile phase and then dilute 1 volume of the resulting solution to 100 volumes with solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 40 volumes of 0.02M *phosphate buffer pH 8.0* and 60 volumes of *acetonitrile* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 240 nm. Inject 20 µL of each solution.

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the two principal peaks is at least 8.

Calculate the content of $C_{18}H_{28}N_2O,HCl$ in the injection using the declared content of $C_{18}H_{28}N_2O,HCl$ in *bupivacaine hydrochloride BPCRS*.

LABELLING
The strength is stated in terms of the equivalent amount of anhydrous bupivacaine hydrochloride in a suitable dose-volume.

Bupivacaine Heavy Injection

Bupivacaine and Dextrose Injection; Bupivacaine and Glucose Injection

Action and use
Local anaesthetic.

DEFINITION
Bupivacaine Heavy Injection is a sterile solution of Bupivacaine Hydrochloride and either Glucose or Glucose Monohydrate in Water for Injections. No preservative is added. The inclusion of glucose in the formulation assists the gravitational flow of the injection when administered.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of bupivacaine hydrochloride, $C_{18}H_{28}N_2O,HCl,H_2O$
95.0 to 105.0% of the stated amount.

Content of glucose monohydrate, $C_6H_{12}O_6,H_2O$
72.0 to 88.0 mg per mL.

CHARACTERISTICS
A clear, colourless solution.

IDENTIFICATION
A. To a volume of the injection containing 50 mg of Bupivacaine Hydrochloride add sufficient 2M *sodium hydroxide* to obtain a pH of 11 and extract with 25 mL of *n-heptane*. Dry the heptane extract over *anhydrous sodium*

www.webofpharma.com

sulfate, filter, evaporate the filtrate to dryness using a rotary evaporator and dry at 60° at a pressure of 2 kPa for 16 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of bupivacaine *(RS 034)*.

B. Dip, for 1 second, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as *tetramethylbenzidine*, in the injection. Observe the colour of the reactive pad; within 60 seconds the colour changes from yellow to green or blue.

C. In the Assay for bupivacaine, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

D. When heated with *cupri-tartaric solution R1*, a copious precipitate of copper(I) oxide is produced.

TESTS

Acidity

pH, 4.0 to 6.0, Appendix V L.

2,6-Dimethylaniline

To 27.6 g of *sodium dihydrogen phosphate monohydrate* add 7 mL of a solution containing 8.9% w/v of *disodium hydrogen orthophosphate dihydrate* and add sufficient water to produce 1000 mL, if necessary adjust the pH to 5.0 using 1M *orthophosphoric acid* or 1M *sodium hydroxide* (buffer solution).

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the injection with mobile phase if necessary to contain 0.5% w/v of Bupivacaine Hydrochloride.

(2) 0.0004% w/v of *2,6-dimethylaniline*.

(3) 0.0002% w/v of *2,6-dimethylaniline* and 0.0002% w/v of *4-chloroaniline*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil Elite is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use ambient column temperature.

(e) Use an electrochemical detector (direct amperometry) with a glassy carbon working electrode, a silver-silver chloride reference electrode, held at + 0.9 V oxidation potential, and a detector sensitivity of 20 nA/V.

(f) Inject volume of 20 µL of each solution.

MOBILE PHASE

A mixture of 4 volumes of *acetonitrile* and 6 volumes of buffer solution containing 0.006% w/v *disodium edetate* and 0.055% w/v *tetrabutylammonium hydrogen sulfate R1*.

When the chromatogram is recorded under the prescribed conditions the retention time of 2,6-dimethylaniline is about 6.5 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to 2,6-dimethylaniline and 4-chloroaniline is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of any corresponding peak in the chromatogram obtained with solution (2) (800 ppm).

5-Hydroxymethylfurfural and light absorbing impurities

Dilute a volume of the injection containing 1.0 g of Glucose Monohydrate to 250 mL with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

Related substances

To 0.18 g of *sodium dihydrogen phosphate monohydrate* and 2.9 g of *disodium hydrogen orthophosphate dihydrate* add sufficient water to produce 1000 mL, if necessary adjust the pH to 8.0 using 1M *orthophosphoric acid* or 1M *sodium hydroxide* (buffer solution).

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection if necessary to contain 0.5% w/v of Bupivacaine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Flow rate of 1.5 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of 4 volumes of buffer solution and 6 volumes of *acetonitrile*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the total area of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.05%) and any peak corresponding to 2,6-dimethylaniline.

ASSAY

For bupivacaine hydrochloride

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the injection if necessary to contain 0.05% w/v of Bupivacaine Hydrochloride.

(2) 0.05% w/v of *bupivacaine hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

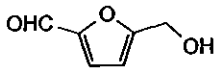
The chromatographic conditions described under Related substances may be used.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{28}N_2O,HCl,H_2O$ in the injection using the declared content of $C_{18}H_{28}N_2O,HCl,H_2O$ in *bupivacaine hydrochloride BPCRS*.

For glucose



To a quantity containing the equivalent of 2 to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 mL of 5M *ammonia* and sufficient *water* to produce 100 mL. Mix well, allow to stand for 30 minutes and measure the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight in g of glucose, $C_6H_{12}O_6$, in the quantity of the injection taken for assay.

LABELLING

The strength is stated in terms of the equivalent amount of bupivacaine hydrochloride and in terms of the equivalent amount of glucose, $C_6H_{12}O_6$ in a suitable dose-volume.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity F (2,6-dimethylaniline) listed under Bupivacaine Hydrochloride and

1. 5-hydroxymethylfurfural (5-(hydroxymethyl)furan-2-carbaldehyde).

Bupivacaine and Adrenaline Injection / Bupivacaine and Epinephrine Injection

Action and use

Local anaesthetic.

DEFINITION

Bupivacaine and Adrenaline Injection is a sterile solution of Bupivacaine Hydrochloride and Adrenaline Acid Tartrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous bupivacaine hydrochloride, $C_{18}H_{28}N_2O,HCl$

92.5 to 107.5% of the stated amount.

Content of adrenaline, $C_9H_{13}NO_3$

80.0 to 120.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel G60 plates are suitable) and a mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) dilute a quantity of the injection, if necessary, with *water* to produce a solution containing 0.2% w/v of Bupivacaine Hydrochloride. Solution (2) contains 0.2% w/v of *bupivacaine hydrochloride BPCRS* in *water*. Solution (3) contains 0.2% w/v of *bupivacaine hydrochloride BPCRS* and 0.2% w/v of *lidocaine hydrochloride BPCRS* in *water*. After removal of the plate, dry it in a current of cold air, heat at 110° for 1 hour, place the hot plate in a tank of chlorine gas prepared by the addition of *hydrochloric acid* to a 5% w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry the plate in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

B. In the Assay for adrenaline, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L.

2,6-Dimethylaniline; Related bases

Complies with the requirements stated under Bupivacaine Injection.

ASSAY

For anhydrous bupivacaine hydrochloride

Carry out the Assay described under Bupivacaine Injection.

For adrenaline

Dissolve 8.0 g of *tetramethylammonium hydrogen sulfate*, 2.2 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* in a mixture of 900 mL of *water* and 100 mL of *methanol*, adjust the pH to 3.5 with 1M *sodium hydroxide* and filter through glass micro fibre paper under reduced pressure (solution A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 5 mL of a 0.001% w/v solution of *adrenaline acid tartrate BPCRS* to 10 mL with solution A. For solution (2) dilute the injection, if necessary, to produce a solution containing the equivalent of 0.0005% w/v of adrenaline and dilute 5 mL of the resulting solution to 10 mL with solution A. For solution (3) mix 5 mL of solution (1) with 5 mL of a 0.001% w/v solution of *noradrenaline acid tartrate* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a solution prepared by adding 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* to a mixture of 950 mL of *water* and 50 mL of *methanol* and adjusting the pH of the mixture to 3.5 with 1M *sodium hydroxide* and (c) a detection wavelength of 205 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 2.0.

Calculate the content of $C_9H_{13}NO_3$ in the injection using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

STORAGE

Bupivacaine and Adrenaline Injection should be protected from light.

www.webofpharma.com

LABELLING
The quantities of the active ingredients are stated in terms of the equivalent amounts of anhydrous bupivacaine hydrochloride and adrenaline (epinephrine).

Bupivacaine and Diamorphine Injection

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Spinal anaesthetic; analgesic.

DEFINITION
Bupivacaine and Diamorphine Injection is a sterile solution of Bupivacaine Hydrochloride and Diamorphine Hydrochloride, made isotonic with Sodium Chloride, in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements. Where appropriate, the injection also complies with the requirements stated under Unlicensed Medicines.

Content of anhydrous bupivacaine hydrochloride, $C_{18}H_{28}N_2O$,HCl
95.0 to 105.0% of the stated amount.

Content of diamorphine hydrochloride, $C_{21}H_{23}NO_5$, HCl,H_2O
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. In the Assay, the retention times of the two principal peaks in the chromatogram obtained with solution (1) correspond to those in the chromatogram obtained with solution (4).

B. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS
Acidity
pH, 4.0 to 5.0, Appendix V L.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.9% w/v solution of *sodium chloride*.

(1) Dilute a quantity of the injection to produce a solution containing the equivalent of 0.04% w/v of anhydrous bupivacaine hydrochloride.

(2) 1% w/v of *bupivacaine hydrochloride BPCRS*.

(3) 0.03% w/v of *diamorphine hydrochloride BPCRS*.

(4) Mix 1 volume of solution (2) and 1 volume of solution (3) and add sufficient of a 0.9% w/v solution of *sodium chloride* to produce 25 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 260 nm.

(f) Inject 10 µL of each solution.

When the chromatograms are recorded under the prescribed conditions, the retention time of diamorphine hydrochloride is about 3.5 minutes and the retention time of bupivacaine hydrochloride is about 5.5 minutes.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of 0.01M *sodium heptanesulfonate*, containing 0.0075M N,N-*dimethyloctylamine*, which has been adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{28}N_2O$,HCl and of $C_{21}H_{23}NO_5$,HCl,H_2O in the injection using the declared content of $C_{18}H_{28}N_2O$,HCl in *bupivacaine hydrochloride BPCRS* and the declared content of $C_{21}H_{23}NO_5$,HCl,H_2O in *diamorphine hydrochloride BPCRS*.

STORAGE
Bupivacaine and Diamorphine Injection should be protected from light.

LABELLING
The label states that the injection is intended for epidural administration. The quantity of Bupivacaine Hydrochloride is stated in terms of the equivalent amount of anhydrous bupivacaine hydrochloride.

Bupivacaine and Fentanyl Injection

Action and use
Spinal anaesthetic; analgesic.

DEFINITION
Bupivacaine and Fentanyl Injection is a sterile solution of Bupivacaine Hydrochloride and Fentanyl Citrate, made isotonic with Sodium Chloride, in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous bupivacaine hydrochloride, $C_{18}H_{28}N_2O$,HCl
95.0 to 105.0% of the stated amount.

Content of fentanyl, $C_{22}H_{28}N_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, in the range 220 to 350 nm of the solution obtained in the Assay for anhydrous bupivacaine hydrochloride exhibits two maxima, at 263 nm and at 271 nm.

B. In the Assay for fentanyl, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Yields reaction A characteristic of *chlorides* and reaction B characteristic of *citrates*, Appendix VI.

TESTS
Acidity
pH, 4.0 to 6.5, Appendix V L.

Related substances (anhydrous bupivacaine hydrochloride)
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the injection being examined.

(2) 0.0004% w/v of *fentanyl citrate BPCRS* in a 0.9% w/v solution of *sodium chloride*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (ProntoSIL C18 EPS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 206 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.4 volumes of *orthophosphoric acid*, 30 volumes of *acetonitrile R1* and 70 volumes of *water*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.3% by *normalisation*;

the sum of the areas of any such peaks is not greater than 1.0% by *normalisation*.

Disregard any peak corresponding to the principal peak in the chromatogram obtained with solution (2).

ASSAY

For anhydrous bupivacaine hydrochloride

Dilute a quantity of the injection to contain the equivalent of 0.005% w/v of anhydrous bupivacaine hydrochloride with 0.01M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 263 nm, Appendix II B. Calculate the content of $C_{18}H_{28}N_2O$,HCl taking 14 as the value of A(1%, 1 cm) at the maximum at 263 nm.

For fentanyl

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection, if necessary, with sufficient of a 0.9% w/v solution of *sodium chloride* to produce a solution containing the equivalent of 0.0002% w/v of fentanyl.

(2) 0.0003% w/v of *fentanyl citrate BPCRS* in a 0.9% w/v solution of *sodium chloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Spherisorb CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 206 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

7 volumes of 0.1M *sodium heptanesulfonate* containing 0.011% w/v of N,N-*dimethyloctylamine*, adjusted to pH 3.0 with *orthophosphoric acid*, 30 volumes of *acetonitrile R1* and 63 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{28}N_2O$ in the injection using the declared content of $C_{22}H_{28}N_2O$ in *fentanyl citrate BPCRS*.

LABELLING

The quantities of the active ingredients are stated in terms of the equivalent amounts of anhydrous bupivacaine hydrochloride and fentanyl.

Buprenorphine Injection

Action and use

Opioid receptor partial agonist; analgesic.

DEFINITION

Buprenorphine Injection is a sterile solution containing Buprenorphine Hydrochloride.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of buprenorphine, $C_{29}H_{41}NO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the injection containing the equivalent of 0.3 mg of buprenorphine add 5 mL of *water*, add sufficient *dilute hydrochloric acid* to turn litmus paper red and add 1 mL of *potassium iodobismuthate solution*. An orange-red precipitate is formed.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH 3.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection, if necessary, with sufficient *methanol* to produce a solution containing the equivalent of 0.03% w/v of buprenorphine and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*, further dilute 1 volume of this solution to 2 volumes with *methanol*.

(3) 0.05% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

(4) Dilute 1 volume of solution (2) to 5 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (50 mm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters SunFire C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 10 volumes of *acetonitrile* and 90 volumes of a 0.544% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *dilute orthophosphoric acid*.

Mobile phase B *acetonitrile*

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	89	11	isocratic
2-12	89→64	11→36	linear gradient
12-15	64→41	36→59	isocratic
15-20	41→39	59→61	linear gradient
20-21	39→89	61→11	linear gradient
21-30	89	11	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

LIMITS

Identify any peak corresponding to impurity G using solution (3) and multiply the area of this peak by a correction factor of 0.3.

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any other *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection, if necessary, with sufficient *methanol* to produce a solution containing the equivalent of 0.01% w/v of buprenorphine and filter.

(2) 0.01% w/v of *buprenorphine hydrochloride BPCRS* in *methanol*.

(3) 0.05% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used. Inject 10 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{41}NO_4$ in the injection using the declared content of $C_{29}H_{41}NO_4$,HCl in *buprenorphine hydrochloride BPCRS*. Each mg of $C_{29}H_{41}NO_4$,HCl is equivalent to 0.9276 mg of $C_{29}H_{41}NO_4$.

LABELLING

The quantity of the active ingredient is stated in terms of the equivalent amount of buprenorphine.

Buprenorphine Transdermal Patches

Action and use

Opioid receptor partial agonist; analgesic.

DEFINITION

Buprenorphine Transdermal Patches contain Buprenorphine in a suitable matrix or reservoir presentation.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of buprenorphine.

The transdermal patches comply with the requirements stated under Transdermal Patches and with the following requirements.

Content of buprenorphine, $C_{29}H_{41}NO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Evaporate 10 mL of solution (1) obtained in the Assay to dryness. Dissolve the residue in 5 mL of *water*, add sufficient *dilute hydrochloric acid* to turn litmus paper red and add 1 mL of *potassium iodobismuthate solution*. An orange-red precipitate is formed.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Remove the release liners from the patches. Mix, with the aid of ultrasound, a quantity of whole patches with sufficient *methanol* to produce a solution containing 0.1% w/v of Buprenorphine.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) 0.1% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

(4) Dilute 1 volume of solution (2) to 10 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (50 mm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters Sunfire C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 10 volumes of *acetonitrile* and 90 volumes of a 0.544% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *dilute orthophosphoric acid*.

Mobile phase B *acetonitrile*

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	89	11	isocratic
2-12	89→64	11→36	linear gradient
12-15	64→41	36→59	isocratic
15-20	41→39	59→61	linear gradient
20-21	39→89	61→11	linear gradient
21-30	89	11	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to buprenorphine (retention time about 9 minutes) are impurity B, about 0.4; buprenorphine *N*-oxide, about 0.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity G using solution (3) and multiply the area of this peak by a correction factor of 0.3;

the area of any peak due to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peak due to buprenorphine *N*-oxide is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any other *secondary peaks* is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

Comply with the requirements stated under *uniformity of content*, Appendix XII C3, Test C, with respect to the individual content of each dosage unit and using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Remove the release liner from the patch. Place the patch in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of Buprenorphine, mix with the aid of ultrasound and filter.

(2) 0.01% w/v of *buprenorphine hydrochloride BPCRS* in methanol.

(3) 0.1% w/v of *buprenorphine for system suitability EPCRS* in methanol.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{41}NO_4$ in the transdermal patch using the declared content of $C_{29}H_{41}NO_4$,HCl in *buprenorphine hydrochloride BPCRS*. Each mg of $C_{29}H_{41}NO_4$, HCl is equivalent to 0.9276 mg of $C_{29}H_{41}NO_4$.

ASSAY

Use the average of the 10 results obtained in the test for Uniformity of content.

Buprenorphine Sublingual Tablets

Action and use

Opioid receptor partial agonist; analgesic.

DEFINITION

Buprenorphine Sublingual Tablets contain Buprenorphine Hydrochloride. They may be flavoured.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of buprenorphine, $C_{29}H_{41}NO_4$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Evaporate 10 mL of solution (1) obtained in the Assay to dryness. Dissolve the residue in 5 mL of *water*, add sufficient *dilute hydrochloric acid* to turn litmus paper red and add 1 mL of *potassium iodobismuthate solution*. An orange-red precipitate is formed.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing the equivalent of 4 mg of buprenorphine with 4 mL of *methanol* and filter.

(2) Dilute 2 volumes of solution (1) to 100 volumes with *methanol*.

(3) 0.1% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

(4) Dilute 1 volume of solution (2) to 20 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (50 mm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters Sunfire C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 10 volumes of *acetonitrile* and 90 volumes of a 0.544% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *dilute orthophosphoric acid*.

Mobile phase B *acetonitrile*

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	89	11	isocratic
2-12	89→64	11→36	linear gradient
12-15	64→41	36→59	isocratic
15-20	41→39	59→61	linear gradient
20-21	39→89	61→11	linear gradient
21-30	89	11	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

Identify any peak corresponding to impurity G using solution (3) and multiply the area of this peak by a correction factor of 0.3.

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of not more than one *secondary peak* is greater than half the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks* is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (6%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or 2% w/v of Buprenorphine Hydrochloride comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To one tablet add 1 mL of *methanol*, mix with the aid of ultrasound and add sufficient mobile phase to produce a solution containing the equivalent of 0.004% w/v of buprenorphine.

(2) 0.004% w/v of *buprenorphine hydrochloride BPCRS* in *methanol*.

(3) 0.1% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used. Inject 25 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{41}NO_4$ in each tablet using the declared content of $C_{29}H_{41}NO_4$,HCl in *buprenorphine hydrochloride BPCRS*. Each mg of $C_{29}H_{41}NO_4$,HCl is equivalent to 0.9276 mg of $C_{29}H_{41}NO_4$.

ASSAY

For tablets containing less than 2 mg and/or 2% w/v of Buprenorphine Hydrochloride

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing 2 mg or more, or 2% w/v or more of Buprenorphine Hydrochloride

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing the equivalent of 2 mg of buprenorphine with 10 mL of *methanol*, add sufficient *methanol* to produce 20 mL and filter.

(2) 0.01% w/v of *buprenorphine hydrochloride BPCRS* in *methanol*.

(3) 0.1% w/v of *buprenorphine for system suitability EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to buprenorphine and buprenorphine impurity J is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{41}NO_4$ in the tablets using the declared content of $C_{29}H_{41}NO_4$,HCl in *buprenorphine hydrochloride BPCRS*. Each mg of $C_{29}H_{41}NO_4$,HCl is equivalent to 0.9276 mg of $C_{29}H_{41}NO_4$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of buprenorphine.

Busulfan Tablets

Action and use

Cytotoxic alkylating agent.

DEFINITION

Busulfan Tablets contain Busulfan. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of busulfan, $C_6H_{14}O_6S_2$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 10 mg of Busulfan with 10 mL of hot *acetone*, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of busulfan *(RS 035)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (3) is similar to that of the principal peak in the chromatogram obtained with solution (1).

TESTS

Disintegration

Maximum time, 15 minutes, Appendix XII A1.

www.webofpharma.com

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Busulfan comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Prepare a 0.0001% w/v solution of *1,5-di-iodopentane* (internal standard) in *acetone* (solution A).

(1) Add 5 mL of a 30% w/v solution of *sodium iodide* in *acetone* to 5 mL of a 0.0001% w/v solution of *busulfan BPCRS* in *acetone*, stopper the flask lightly and heat in a water bath at 50° for 90 minutes. Cool, add 10 mL of solution A, mix, add 10 mL of *water* and 20 mL of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

(2) Prepare solution (2) in the same manner as solution (3) but using 10 mL of *acetone* in place of solution A.

(3) Add 1 mL of *water* to one tablet in a 50 mL graduated flask and mix with the aid of ultrasound until completely dispersed. Add 30 mL of *acetone*, shake for 15 minutes and dilute to 50 mL with *acetone*. Centrifuge and dilute a quantity of the supernatant liquid with *acetone* to produce a solution containing 0.0001% w/v of Busulfan. To 5 mL of the resulting solution add 5 mL of a 30% w/v solution of *sodium iodide* in *acetone*, stopper the flask lightly and heat in a water bath at 50° for 90 minutes. Cool, add 10 mL of solution A, mix, add 10 mL of *water* and 20 mL of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable).

(b) Use *helium* as the carrier gas at 1.7 mL per minute.

(c) Use isothermal conditions maintained at 140°.

(d) Use an inlet temperature of 160°.

(e) Use an electron capture detector.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_{14}O_6S_2$ using the declared content of $C_6H_{14}O_6S_2$ in *busulfan BPCRS*.

ASSAY
Weigh and powder 20 tablets. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Prepare a 0.0001% w/v solution of *1,5-di-iodopentane* (internal standard) in *acetone* (solution A).

(1) Add 5 mL of a 30% w/v solution of *sodium iodide* in *acetone* to 5 mL of a 0.0001% w/v solution of *busulfan BPCRS* in *acetone*, stopper the flask lightly and heat in a water bath at 50° for 90 minutes. Cool, add 10 mL of solution A, mix, add 10 mL of *water* and 20 mL of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

(2) Prepare solution (2) in the same manner as solution (3) but using 10 mL of *acetone* in place of solution A.

(3) Add 5 mL of *water* to a quantity of powdered tablets containing 2.5 mg of Busulfan and mix with the aid of ultrasound until completely dispersed. Add 150 mL of *acetone*, shake for 15 minutes and dilute to 250 mL with *acetone*. Centrifuge and dilute 10 mL of the supernatant liquid to 100 mL with *acetone*. To 5 mL of the resulting solution add 5 mL of a 30% w/v solution of *sodium iodide* in *acetone*, stopper the flask lightly and heat in a water bath at 50° for 90 minutes. Cool, add 10 mL of solution A, mix, add 10 mL of *water* and 20 mL of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_{14}O_6S_2$ using the declared content of $C_6H_{14}O_6S_2$ in *busulfan BPCRS*.

Cabergoline Tablets

Action and use
Dopamine D_2 receptor agonist.

DEFINITION
Cabergoline Tablets contain Cabergoline.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cabergoline, $C_{26}H_{37}N_5O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, in the range 210 to 400 nm of solution (1) in the Assay is concordant with that obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 15 minutes withdraw a sample of the medium and filter. Dilute the filtrate with dissolution medium, if necessary, to produce a solution expected to contain 0.0001% w/v of Cabergoline.

(2) 0.0001% w/v of *cabergoline EPCRS* in the dissolution medium.

(3) Suspend 25 mg of *cabergoline EPCRS* in 5 mL of 0.1M sodium hydroxide. Stir for about 15 minutes. To 1 mL of the suspension add 1 mL of 0.1M *hydrochloric acid* and dilute to 10 mL with the mobile phase. Mix with the aid of ultrasound until dissolution is complete and dilute 1 volume of this solution to 5 volumes with the mobile phase (*in-situ* degradation of cabergoline to produce impurity A).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.2 volumes of *triethylamine*, 16 volumes of *acetonitrile* and 84 volumes of a freshly prepared 0.68% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 2.0 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions, the retention times relative to cabergoline (retention time, about 12 minutes) are: impurity D, about 0.3; impurity B, about 0.6; impurity A, about 0.8; impurity C, about 2.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cabergoline and impurity A is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{37}N_5O_2$ in each tablet from the chromatograms obtained and using the declared content of $C_{26}H_{37}N_5O_2$ in *cabergoline EPCRS*.

LIMITS

The amount of cabergoline released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 2.5 mg of Cabergoline with 7 mL of the mobile phase, add sufficient mobile phase to produce 10 mL and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Suspend 25 mg of *cabergoline EPCRS* in 5 mL of 0.1M *sodium hydroxide*. Stir for about 15 minutes. To 1 mL of the suspension add 1 mL of 0.1M *hydrochloric acid* and dilute to 10 mL with the mobile phase. Mix with the aid of ultrasound until dissolution is complete and dilute 1 volume of this solution to 5 volumes with the mobile phase (*in-situ* degradation of cabergoline to produce impurity A).

(4) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used. For solution (1), allow the chromatography to run for four times the retention time of the peak due to cabergoline.

When the chromatograms are recorded under the prescribed conditions, the retention times relative to cabergoline (retention time, about 12 minutes) are: impurity D, about 0.3; impurity B, about 0.6; impurity A, about 0.8; impurity C, about 2.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cabergoline and impurity A is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A or impurity D is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of cabergoline comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse one tablet with the aid of ultrasound in 3 mL of the mobile phase. Allow to cool, add sufficient of the mobile phase to produce a solution expected to contain 0.025% w/v of Cabergoline and filter.

(2) 0.025% w/v of *cabergoline EPCRS* in the mobile phase.

(3) Suspend 25 mg of *cabergoline EPCRS* in 5 mL of 0.1M *sodium hydroxide*. Stir for about 15 minutes. To 1 mL of the suspension add 1 mL of 0.1M *hydrochloric acid* and dilute to 10 mL with the mobile phase. Mix with the aid of ultrasound until dissolution is complete and dilute 1 volume of this solution to 5 volumes with the mobile phase (*in-situ* degradation of cabergoline to produce impurity A).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, with an injection volume of 250 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cabergoline and impurity A is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{37}N_5O_2$ in each tablet from the chromatograms obtained and using the declared content of $C_{26}H_{37}N_5O_2$ in *cabergoline EPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of cabergoline

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of cabergoline

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 2.5 mg of Cabergoline with 7 mL of the mobile phase, add sufficient mobile phase to produce 10 mL and filter.

(2) 0.025% w/v of *cabergoline EPCRS* in the mobile phase.

(3) Suspend 25 mg of *cabergoline EPCRS* in 5 mL of 0.1M *sodium hydroxide*. Stir for about 15 minutes. To 1 mL of the suspension add 1 mL of 0.1M *hydrochloric acid* and dilute to 10 mL with the mobile phase. Mix with the aid of ultrasound until dissolution is complete and dilute 1 volume of this solution to 5 volumes with the mobile phase (*in-situ* degradation of cabergoline to produce impurity A).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cabergoline and impurity A is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{37}N_5O_2$ in the tablets from the chromatograms obtained and using the declared content of $C_{26}H_{37}N_5O_2$ in *cabergoline EPCRS*.

STORAGE

Cabergoline Tablets should be stored in accordance with the manufacturers instruction.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Cabergoline.

Caffeine Citrate Injection

Action and use

Respiratory and central nervous system stimulant.

DEFINITION

Caffeine Citrate Injection is a sterile solution of caffeine citrate, prepared by the interaction of Caffeine and Citric Acid Monohydrate, in Water for Injections. Sodium citrate may also be present.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of caffeine citrate, $C_8H_{10}N_4O_2,C_6H_8O_7$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions preparing a mixture containing 2 volumes of *methanol* and 3 volumes of *dichloromethane*.

(1) Dilute a volume of the injection containing the equivalent of 10 mg of caffeine to 100 mL.

(2) 0.01% w/v of *caffeine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light* (254 nm).

MOBILE PHASE

1 volume of *concentrated ammonia*, 3 volumes of *acetone*, 3 volumes of *dichloromethane* and 4 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Yields the reaction characteristic of *citrates*, Appendix VI.

TESTS

Acidity

pH, 2.0 to 5.2, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a volume of the injection containing the equivalent of 50 mg caffeine to 250 mL and filter through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of the resulting solution to 5 volumes.

(3) 0.02% w/v each of *theobromine*, *1,7-dimethyl-3,7-dihydro-1H-purine-2,6-dione* (impurity F), *theophylline BPCRS* and *caffeine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Waters C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 10 µL of each solution.

(g) Continue the chromatography for about 25 minutes.

MOBILE PHASE

4 volumes of *tetrahydrofuran*, 5 volumes of *acetonitrile* and 191 volumes of 0.01M *anhydrous sodium acetate*, previously adjusted to pH 4.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), there are 4 distinct peaks and the *resolution* between the peaks due to theophylline and caffeine is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a volume of the injection containing the equivalent of 50 mg caffeine to 250 mL and filter through a 0.45-µm filter.

(2) 0.02% w/v of *caffeine BPCRS*.

(3) 0.02% w/v each of *theobromine*, *1,7-dimethyl-3,7-dihydro-1H-purine-2,6-dione*, *theophylline BPCRS* and *caffeine BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, the chromatogram obtained with solution (3) has four distinct peaks and the *resolution* between the peaks due to theophylline and caffeine is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2,C_6H_8O_7$ in the injection using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS*. Each mg of $C_8H_{10}N_4O_2$ is equivalent to 1.989 mg of $C_8H_{10}N_4O_2,C_6H_8O_7$.

LABELLING

The label states the quantity of active ingredient in terms of the amount of caffeine citrate and the equivalent amount of caffeine.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B, C, D and F listed under Caffeine.

Caffeine Citrate Oral Solution

Action and use

Respiratory and central nervous system stimulant.

DEFINITION

Caffeine Citrate Oral Solution is a solution of caffeine citrate, prepared by the interaction of Caffeine and Citric Acid Monohydrate, in a suitable aqueous vehicle. Sodium citrate may also be present.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of caffeine citrate, $C_8H_{10}N_4O_2,C_6H_8O_7$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solution preparing a mixture containing 2 volumes of *methanol* and 3 volumes of *dichloromethane*.

(1) Dilute a volume of the oral solution containing the equivalent of 10 mg of caffeine to 100 mL.

(2) 0.01% w/v of *caffeine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light* (254 nm).

MOBILE PHASE

1 volume of *concentrated ammonia*, 3 volumes of *acetone*, 3 volumes of *dichloromethane* and 4 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Yields the reaction characteristic of *citrates*, Appendix VI.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a volume of the oral solution containing the equivalent of 50 mg caffeine to 250 mL and filter through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of the resulting solution to 5 volumes.

(3) 0.02% w/v each of *theobromine*, *1,7-dimethyl-3,7-dihydro-1H-purine-2,6-dione* (impurity F), *theophylline BPCRS* and *caffeine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Waters C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

4 volumes of *tetrahydrofuran*, 5 volumes of *acetonitrile* and 191 volumes of 0.01M *anhydrous sodium acetate*, previously adjusted to pH 4.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, the chromatogram obtained with solution (3) has 4 distinct peaks and the *resolution* between the peaks due to theophylline and caffeine is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a volume of the oral solution containing the equivalent of 50 mg caffeine to 250 mL and filter through a 0.45-µm filter.

(2) 0.02% w/v of *caffeine BPCRS*.

(3) 0.02% w/v each of *theobromine*, *1,7-dimethyl-3,7-dihydro-1H-purine-2,6-dione*, *theophylline BPCRS* and *caffeine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, the chromatogram obtained with solution (3) has 4 distinct peaks and the *resolution* between the peaks due to theophylline and caffeine is at least 6.0.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2,C_6H_8O_7$ in the oral solution using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS*. Each mg of $C_8H_{10}N_4O_2$ is equivalent to 1.989 mg of $C_8H_{10}N_4O_2,C_6H_8O_7$

LABELLING

The quantity of active ingredient is stated in terms of the amount of caffeine citrate and the equivalent amount of caffeine.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B, C, D and F listed under Caffeine.

Aqueous Calamine Cream

DEFINITION

Aqueous Calamine Cream contains 4% w/w of Calamine and 3% w/w of Zinc Oxide in a suitable oil-in-water emulsified basis.

Extemporaneous preparation

The following formula and directions apply.

Calamine	40 g
Zinc Oxide	30 g
Liquid Paraffin	200 g
Self-emulsifying Glyceryl Monostearate	50 g
Cetomacrogol Emulsifying Wax	50 g
Phenoxyethanol	5 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

Melt the Cetomacrogol Emulsifying Wax with the Self-emulsifying Glyceryl Monostearate, add the Liquid Paraffin and heat to about 60°. Dissolve the Phenoxyethanol in about 620 g of Purified Water at about 60°, add the oily phase to the phenoxyethanol solution and mix. Stir until cool, add sufficient Purified Water to produce 930 g and mix. Triturate the Calamine and the Zinc Oxide and incorporate in the cream.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of zinc, Zn

4.3 to 5.2% w/w.

IDENTIFICATION

The residue obtained in the Assay is yellow when hot and white when cool.

ASSAY

Gently heat 4 g, taking precautions to avoid loss caused by spitting, until the basis is completely volatilised or charred, increase the temperature until the carbon is removed and ignite the residue to constant weight. Each g of residue is equivalent to 0.8034 g of Zn.

Calamine Lotion

Calamine Cutaneous Suspension

DEFINITION

Calamine Lotion is a *cutaneous suspension*.

Calamine	150 g
Zinc Oxide	50 g
Bentonite	30 g
Sodium Citrate	5 g
Liquefied Phenol	5 mL
Glycerol	50 mL
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation

The following directions apply.

Triturate the Calamine, the Zinc Oxide and the Bentonite with a solution of the Sodium Citrate in about 700 mL of the Purified Water and add the Liquefied Phenol, the Glycerol and sufficient Purified Water to produce 1000 mL.

The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

IDENTIFICATION

A. To 2 mL add 2 mL of *periodic acid reagent*, shake, centrifuge and add 0.5 mL of the supernatant liquid to 2 mL of *ammoniacal silver nitrate solution* in a test tube. Heat on a water bath at 70° for 5 minutes. A silver mirror is produced on the side of the tube.

B. Mix 2 mL with 50 mL of *water*, centrifuge and decant the supernatant liquid. Suspend the residue in 20 mL of *water*, add 1 mL of *hydrochloric acid*, mix and filter. 5 mL of the filtrate, after neutralisation by drop wise addition of 2M *sodium hydroxide*, yields the reaction characteristic of *zinc salts*, Appendix VI.

Residue on ignition

14.5 to 18.0% w/w when determined by the following method. Evaporate 5 g to dryness and ignite until, after further ignition, two successive weighings do not differ by more than 0.2% of the weight of the residue.

Calamine Ointment

DEFINITION

Calamine Ointment contains 15% w/w of Calamine in a suitable hydrophobic basis.

Extemporaneous preparation

The following formula and directions apply.

Calamine, finely sifted	150 g
White Soft Paraffin	850 g

Triturate the Calamine with part of the White Soft Paraffin until smooth and gradually incorporate the remainder of the White Soft Paraffin.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of zinc, Zn

7.8 to 9.4% w/w.

IDENTIFICATION

The residue obtained in the Assay is yellow when hot and white when cool.

www.webofpharma.com

ASSAY
Gently heat 1 g until the basis is completely volatilised or charred, increase the heat until all the carbon is removed and ignite the residue until, after further ignition, two successive weighings do not differ by more than 0.2% of the weight of the residue. Each g of residue is equivalent to 0.8034 g of Zn.

Calamine and Coal Tar Ointment

Compound Calamine Ointment

DEFINITION
Calamine and Coal Tar Ointment contains 12.5% w/w each of Calamine and Zinc Oxide and 2.5% w/w of Strong Coal Tar Solution in a suitable water-emulsifying basis.

Extemporaneous preparation
The following formula and directions apply.

Calamine, finely sifted	125 g
Zinc Oxide, finely sifted	125 g
Strong Coal Tar Solution	25 g
Hydrous Wool Fat	250 g
White Soft Paraffin	475 g

Melt together the Hydrous Wool Fat and the White Soft Paraffin. Triturate the Calamine and Zinc Oxide in the melted basis and stir gently, when cooled, to about 40°. Gradually incorporate the Strong Coal Tar Solution and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of zinc compounds, calculated as ZnO
19.8 to 22.8% w/w.

IDENTIFICATION
The residue obtained in the Assay is yellow when hot and white when cool.

ASSAY
Gently heat 1 g until the basis is completely volatilised or charred. Increase the heat until the carbon is removed and ignite the residue of ZnO until, after further ignition, two successive weighings do not differ by more than 0.2% of the weight of the residue. Each g of residue is equivalent to 0.8034 g of Zn.

STORAGE
Calamine and Coal Tar Ointment should be kept in a container that minimises evaporation losses.

Calcipotriol and Betamethasone Cutaneous Foam

Action and use
Vitamin D analogue + glucocorticoid.

DEFINITION
Calcipotriol and Betamethasone Cutaneous Foam contains Calcipotriol Monohydrate and Betamethasone Dipropionate in a suitable basis.

The cutaneous foam complies with the requirements stated under Medicated Foams and with the followingrequirements.

Content of calcipotriol, $C_{27}H_{40}O_3$
92.0 to 105.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

Content of betamethasone, $C_{22}H_{29}FO_5$
92.0 to 105.0% of the stated amount.

IDENTIFICATION
A. *For calcipotriol* In the Assay, the *light absorption*, Appendix II B, of the peak due to calcipotriol in solution (1) in the range 220 to 360 nm is similar to the spectrum obtained with the principal peak in solution (2).

B. *For calcipotriol* In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

C. *For betamethasone* In the Assay, the *light absorption*, Appendix II B, of the peak due to betamethasone in solution (1) in the range 220 to 360 nm is similar to the spectrum obtained with the principal peak in solution (2).

D. *For betamethasone* In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (3) is similar to that of the peak in the chromatogram obtained with solution (4).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.132% w/v solution of *diammonium hydrogen orthophosphate* adjusted to pH 6.4 using 1M *orthophosphoric acid*

Solution B 60 volumes of *acetonitrile* and 40 volumes of solution A.

(1) On a water bath, disperse a quantity of foam containing the equivalent of 0.9 mg of calcipotriol in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(2) On a water bath, melt a quantity of foam containing the equivalent of 90 mg of betamethasone in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(3) 0.00075% w/v of *calcipotriol EPCRS* and 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

(4) 0.00075% w/v of *calcipotriol EPCRS* in mobile phase A.

(5) 0.097% w/v of *betamethasone dipropionate for system suitability A EPCRS* in mobile phase A.

(6) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A, and further dilute 1 volume to 20 volumes with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (150 mm × 2.1 mm) packed with *octadecylsilyl silica gel for chromatography (UHPLC)* (1.8 µm) (Zorbax Eclipse Plus RRHD is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.4 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a photodiode array (PDA) detector with a detection wavelength of 264 nm.

(f) Inject 15 µL of each solution.

www.webofpharma.com

MOBILE PHASE

Mobile phase A 40 volumes of *acetonitrile* and 60 volumes of solution A.

Mobile phase B 80 volumes of *acetonitrile* and 20 volumes of solution A.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	100	0	isocratic
2-38	100→10	0→90	linear gradient
38-39	10→0	90→100	linear gradient
39-43	0	100	isocratic
43-44	0→100	100→0	linear gradient
44-50	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retentions relative to calcipotriol (retention time, about 14 minutes) are about:

RRT	Impurity	RRT	Impurity
0.91	Pre-calcipotriol	1.16	Betamethasone unknown*
0.96	Caclipotriol impurity C	1.19	Betamethasone unknown*
1.12	Caclipotriol impurity D	1.23	Betamethasone impurity E
0.42	Betamethasone impurity B	1.27	Betamethasone unknown*
0.52	Betamethasone unknown*	1.43	Betamethasone unknown*
0.54	Betamethasone impurity C	1.47	Betamethasone unknown*
0.84	Betamethasone impurity D	1.51	Betamethasone unknown*
1.05	Betamethasone unknown*	1.58	Betamethasone unknown*

* UV scan from a PDA detector, or response ratios from a dual wavelength detector, should be used in conjunction with the information above to attribute unknown peaks to the relevant active ingredient.
*Where Betamethasone impurities are indicated, these relate to Betamethasone dipropionate impurities.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley* ratio is at least 1.5, where H_p is the height above the baseline of the peak due to calcipotriol impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to betamethasone dipropionate.

LIMITS

Identify any secondary peaks and attribute to the correct API using solutions (4) and (5) and the information included in the above table.

For calcipotriol

Calculate the results by *normalisation*, using all peaks attributed to calcipotriol. Any secondary peak that cannot be attributed to an impurity of betamethasone dipropionate should be calculated with respect to calcipotriol.

In the chromatogram obtained with solution (1):

the area of any peak due to calcipotriol impurity C is not more than 1.5%;

the area of any peak due to calcipotriol impurity D is not more than 1%.

the area of any other *secondary peak* is not greater than 0.5%;

the sum of the areas of all secondary peaks is not greater than 1.5%.

Disregard any peak with an area less than 0.1% and any peak due to betamethasone dipropionate or related impurities.

For betamethasone dipropionate

Calculate the results by *normalisation*, using all peaks attributed to betamethasone dipropionate.

In the chromatogram obtained with solution (2):

the area of any peak due to betamethasone impurity B is not more than 0.8%;

the area of any peak due to betamethasone impurity C is not more than 0.8%;

the area of any other *secondary peak* is not greater than 0.5%;

the sum of the areas of all secondary peaks, excluding impurities B and C, is not greater than 1%.

Disregard any peak with an area less than 0.1% and any peak attributed to calcipotriol and pre-calcipotriol or related impurities.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.132% w/v solution of *diammonium hydrogen orthophosphate* adjusted to pH 6.4 using 1M *orthophosphoric acid.*

Solution B 40 volumes of solution A and 60 volumes of *acetonitrile.*

(1) On a *water bath*, melt a quantity of cutaneous foam containing the equivalent of 0.9 mg of calcipotriol in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(2) 0.00075% w/v of *calcipotriol EPCRS* in mobile phase A.

(3) On a *water bath*, melt a quantity of cutaneous foam containing the equivalent of 90 mg of betamethasone in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(4) 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

(5) 0.00075% w/v of *calcipotriol EPCRS* and 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley* ratio is at least 1.5, where H_p is the height above the baseline of the peak due to calcipotriol impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to betamethasone dipropionate.

DETERMINATION OF CONTENT

For calcipotriol

Combine the peaks due to calcipotriol and pre-calcipotriol. Calculate the content of $C_{27}H_{40}O_3$ in the cutaneous foam using the declared content of $C_{27}H_{40}O_3$ in *calcipotriol EPCRS.*

For betamethasone

Calculate the content of betamethasone ($C_{22}H_{29}FO_5$) in the cutaneous foam using the declared content of betamethasone dipropionate ($C_{28}H_{37}FO_7$) in betamethasone dipropionate EPCRS. Each mg of $C_{28}H_{37}FO_7$ is equivalent to 0.7778 mg of $C_{22}H_{29}FO_5$.

LABELLING

The quantity of active ingredients are stated in terms of the equivalent amount of calcipotriol and the equivalent amount of betamethasone.

www.webofpharma.com

IMPURITIES

The impurities limited by the requirements of this monograph include the following impurities stated under Calcipotriol Monohydrate and Betamethasone Dipropionate:

calcipotriol impurity C

calcipotriol impurity D

betamethasone dipropionate impurity B

betamethasone dipropionate impurity C

betamethasone dipropionate impurity D

betamethasone dipropionate impurity E

Calcipotriol and Betamethasone Gel

Action and use

Vitamin D analogue + glucocorticoid.

DEFINITION

Calcipotriol and Betamethasone Gel contains Calcipotriol Monohydrate and Betamethasone Dipropionate in a suitable basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of calcipotriol, $C_{27}H_{40}O_3$

92.0 to 105.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

Content of betamethasone, $C_{22}H_{29}FO_5$

92.0 to 105.0% of the stated amount.

IDENTIFICATION

A. *For calcipotriol* In the Assay, the *light absorption*, Appendix II B, of the peak due to calcipotriol in solution (1) in the range 220 to 360 nm is similar to the spectrum obtained with solution (2).

B. *For calcipotriol* In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

C. *For betamethasone* In the Assay, the *light absorption*, Appendix II B, of the peak due to betamethasone in solution (1) in the range 220 to 360 nm is similar to the spectrum obtained with the principal peak in solution (2).

D. *For betamethasone* In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (3) is similar to that of the peak in the chromatogram obtained with solution (4).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.132% w/v solution of *diammonium hydrogen orthophosphate* adjusted to pH 6.4 using 1M *orthophosphoric acid*

Solution B 60 volumes of *acetonitrile* and 40 volumes of solution A.

(1) On a water bath, disperse a quantity of gel containing the equivalent of 0.9 mg of betamethasone in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(2) On a water bath, melt a quantity of gel containing the equivalent of 90 mg of betamethasone in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(3) 0.00075% w/v of *calcipotriol EPCRS* and 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

(4) 0.00075% w/v of *calcipotriol EPCRS* in mobile phase A.

(5) 0.097% w/v of *betamethasone dipropionate for system suitability A EPCRS* in mobile phase A.

(6) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A, and further dilute 1 volume to 20 volumes with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (150 mm × 2.1 mm) packed with *octadecylsilyl silica gel for chromatography (UHPLC)* (1.8 µm) (Zorbax Eclipse Plus RRHD is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.4 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a photodiode array (PDA) detector with a detection wavelength of 264 nm.

(f) Inject 15 µL of each solution.

MOBILE PHASE

Mobile phase A 40 volumes of *acetonitrile* and 60 volumes of solution A.

Mobile phase B 80 volumes of *acetonitrile* and 20 volumes of solution A.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	100	0	isocratic
2-38	100→10	0→90	linear gradient
38-39	10→0	90→100	linear gradient
39-43	0	100	isocratic
43-44	0→100	100→0	linear gradient
44-50	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retentions relative to calcipotriol (retention time, about 14 minutes) are about:

RRT	Impurity	RRT	Impurity
0.91	Pre-calcipotriol	1.16	Betamethasone unknown*
0.96	Caclipotriol impurity C	1.19	Betamethasone unknown*
1.12	Caclipotriol impurity D	1.23	Betamethasone impurity E
0.42	Betamethasone impurity B	1.27	Betamethasone unknown*
0.52	Betamethasone unknown*	1.43	Betamethasone unknown*
0.54	Betamethasone impurity C	1.47	Betamethasone unknown*
0.84	Betamethasone impurity D	1.51	Betamethasone unknown*
1.05	Betamethasone unknown*	1.58	Betamethasone unknown*

* UV scan from a PDA detector, or response ratios from a dual wavelength detector, should be used in conjunction with the information above to attribute unknown peaks to the relevant active ingredient.

*Where Betamethasone impurities are indicated, these relate to Betamethasone dipropionate impurities.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak-to-valley ratio is at least 1.5, where H_p is the height above the baseline of the peak due to calcipotriol impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to betamethasone dipropionate.

LIMITS

Identify any secondary peaks and attribute to the correct API using solutions (4) and (5) and the information included in the above table.

For calcipotriol

Calculate the results by *normalisation*, using all peaks attributed to calcipotriol. Any secondary peak that cannot be attributed to an impurity of betamethasone dipropionate should be calculated with respect to calcipotriol.

In the chromatogram obtained with solution (1):

the area of any peak due to calcipotriol impurity C is not more than 1.5%;

the area of any peak due to calcipotriol impurity D is not more than 1%.

the area of any other *secondary peak* is not greater than 0.5%;

the sum of the areas of all secondary peaks is not greater than 1.5%.

Disregard any peak with an area less than 0.05% and any peak due to betamethasone dipropionate.

For betamethasone dipropionate

Calculate the results by *normalisation*, using all peaks attributed to betamethasone dipropionate.

In the chromatogram obtained with solution (2):

the area of any peak due to betamethasone impurity B is not more than 0.8%;

the area of any peak due to betamethasone impurity C is not more than 0.8%;

the area of any other *secondary peak* is not greater than 0.50%;

the sum of the areas of all *secondary peaks*, excluding impurities B and C, is not greater than 1.0%.

Disregard any peak with an area less than 0.1% and any peak attributed to calcipotriol and pre-calcipotriol or related impurities.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A 0.132% w/v solution of *diammonium hydrogen orthophosphate* adjusted to pH 6.4 using 1M *orthophosphoric acid*

Solution B 40 volumes of solution A and 60 volumes of *acetonitrile*.

(1) On a water bath, melt a quantity of gel containing the equivalent of 0.9 mg of calcipotriol in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(2) 0.00075% w/v of *calcipotriol EPCRS* in mobile phase A.

(3) On a water batch melt a quantity of gel containing the equivalent of 90 mg of betamethasone in 10 mL of n-*heptane*. Add 8 mL of solution B and shake for 15 minutes. Allow to separate and add 4 mL of the lower (aqueous) layer to 2 mL of solution A, centrifuge and use the clear lower layer.

(4) 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

(5) 0.00075% w/v of *calcipotriol EPCRS* and 0.097% w/v of *betamethasone dipropionate EPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 1.5, where H_p is the height above the baseline of the peak due to calcipotriol impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to betamethasone dipropionate.

DETERMINATION OF CONTENT

For calcipotriol

Combine the areas of the peaks due to calcipotriol and pre-calcipotriol. Calculate the content of $C_{27}H_{40}O_3$ in the gel using the declared content of $C_{27}H_{40}O_3$ in *calcipotriol EPCRS*.

For betamethasone

Calculate the content of betamethasone ($C_{22}H_{29}FO_5$) in the gel using the declared content of betamethasone dipropionate ($C_{28}H_{37}FO_7$) in betamethasone dipropionate EPCRS. Each mg of $C_{28}H_{37}FO_7$ is equivalent to 0.7778 mg of $C_{22}H_{29}FO_5$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcipotriol and the equivalent amount of betamethasone.

IMPURITIES

The impurities limited by the requirements of this monograph include the following impurities stated under Calcipotriol Monohydrate and Betamethasone Dipropionate:

calcipotriol impurity C

calcipotriol impurity D

betamethasone dipropionate impurity B

betamethasone dipropionate impurity C

betamethasone dipropionate impurity D

betamethasone dipropionate impurity E

Calcipotriol and Betamethasone Ointment

Action and use

Vitamin D analogue + glucocorticoid.

DEFINITION

Calcipotriol and Betamethasone Ointment contains Calcipotriol Monohydrate and Betamethasone Dipropionate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of calcipotriol, $C_{27}H_{40}O_3$

92.0 to 105.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

Content of betamethasone, $C_{22}H_{29}FO_5$

92.0 to 105.0% of the stated amount.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 1.5, where H_p is the height above the baseline of the peak due to calcipotriol impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to betamethasone dipropionate.

DETERMINATION OF CONTENT

For calcipotriol

Combine the areas of the peaks due to calcipotriol and pre-calcipotriol. Calculate the content of $C_{27}H_{40}O_3$ in the ointment using the declared content of $C_{27}H_{40}O_3$ in *calcipotriol EPCRS*.

For betamethasone

Calculate the content of betamethasone ($C_{22}H_{29}FO_5$) in the ointment using the declared content of betamethasone dipropionate ($C_{28}H_{37}FO_7$) in betamethasone dipropionate EPCRS. Each mg of $C_{28}H_{37}FO_7$ is equivalent to 0.7778 mg of $C_{22}H_{29}FO_5$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcipotriol and the equivalent amount of betamethasone.

IMPURITIES

The impurities limited by the requirements of this monograph include the following impurities stated under Calcipotriol Monohydrate and Betamethasone Dipropionate:

calcipotriol impurity C

calcipotriol impurity D

betamethasone dipropionate impurity B

betamethasone dipropionate impurity C

betamethasone dipropionate impurity D

betamethasone dipropionate impurity E

Calcipotriol Cream

Action and use

Vitamin D analogue.

DEFINITION

Calcipotriol Cream contains either Calcipotriol or Calcipotriol Monohydrate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of calcipotriol, $C_{27}H_{40}O_3$

95.0 to 105.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

Solvent A 1 volume of *triethylamine* and 9 volumes of *dichloromethane*.

(1) To a quantity of the cream containing the equivalent of 0.5 mg of calcipotriol, add 50 mL of *absolute ethanol* and shake vigorously. Cool in ice and filter. Evaporate the filtrate to dryness at a temperature not exceeding 30° and dissolve the residue in 1 mL of solvent A.

(2) 0.05% w/v of *calcipotriol monohydrate EPCRS* in solvent A.

(3) Place 2 mg of *calcipotriol monohydrate EPCRS* in a vial and dissolve in 200 µL of solvent A. Close the vial and keep it in a water bath at 60° for 2 hours (generation of pre-calcipotriol).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and then heat at 140° for 10 minutes. Whilst hot, spray the plate with an *alcoholic solution of sulfuric acid*, dry at 140° for not more than 1 minute and examine in *ultraviolet light (366 nm)*.

MOBILE PHASE

20 volumes of *2-methylpropanol* and 80 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

www.webofpharma.com

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). A secondary spot in the chromatogram obtained with solution (1) corresponds in position and colour to the pre-calcipotriol spot in solution (3).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to calcipotriol in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions prepared in solvent B.

Solvent B 30 volumes of 0.01M *ammonium phosphate* and 70 volumes of *methanol*.

(1) To a quantity of the cream containing the equivalent of 0.5 mg of calcipotriol, add 10 mL of *methanol* and shake vigorously. Cool in ice, centrifuge and filter. Evaporate 5 mL of the filtrate to dryness at a temperature not exceeding 30° and dissolve the residue in 2 mL of solvent B.

(2) Dilute 0.1 mL of solution (1) to 10 mL.

(3) 0.004% w/v of *calcipotriol monohydrate EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 2 times the retention time of calcipotriol.

MOBILE PHASE

30 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to calcipotriol (retention time, about 13.5 minutes) are: pre-calcipotriol, about 0.86; impurity C, about 0.92 and impurity D, about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to impurity D is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions.

(1) To a quantity of the cream containing the equivalent of 0.25 mg of calcipotriol, add 7 mL of *methanol* and shake vigorously. Dilute to 20 mL with 0.01M *ammonium phosphate*. Cool in ice, centrifuge and filter.

(2) 0.0013% w/v of *calcipotriol monohydrate EPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with an injection volume of 200 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{40}O_3$ in the cream using the combined areas of the peaks due to calcipotriol and pre-calcipotriol in the chromatograms obtained with solutions (1) and (2) and the declared content of $C_{27}H_{40}O_3$ in *calcipotriol monohydrate EPCRS*.

STORAGE

Calcipotriol Cream should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcipotriol.

Calcipotriol Ointment

Action and use

Vitamin D analogue.

DEFINITION

Calcipotriol Ointment contains either Calcipotriol or Calcipotriol Monohydrate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of calcipotriol, $C_{27}H_{40}O_3$

95.0 to 105.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

Solvent A

1 volume of *triethylamine* and 9 volumes of *dichloromethane*.

(1) To a quantity of the ointment containing the equivalent of 0.5 mg of calcipotriol, add 50 mL of *absolute ethanol* and shake vigorously. Cool in ice and filter. Evaporate the filtrate

www.webofpharma.com

to dryness at a temperature not exceeding 30° and dissolve the residue in 1 mL of solvent A.

(2) 0.05% w/v of *calcipotriol monohydrate EPCRS* in solvent A.

(3) Place 2 mg of *calcipotriol monohydrate EPCRS* in a vial and dissolve in 200 µL of solvent A. Close the vial and keep it in a water bath at 60° for 2 hours (generation of pre-calcipotriol).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and then heat at 140° for 10 minutes. Whilst hot, spray the plate with an *alcoholic solution of sulfuric acid*, dry at 140° for not more than 1 minute and examine in *ultraviolet light (365 nm)*.

MOBILE PHASE

20 volumes of *2-methylpropanol* and 80 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). A secondary spot in the chromatogram obtained with solution (1) corresponds in position and colour to the pre-calcipotriol spot in solution (3).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to calcipotriol in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions prepared in solvent B.

Solvent B 30 volumes of 0.01M *ammonium phosphate* and 70 volumes of *methanol*.

(1) To a quantity of the ointment containing the equivalent of 0.5 mg of calcipotriol, add 10 mL of *methanol* and shake vigorously. Cool in ice, centrifuge and filter. Evaporate 5 mL of the filtrate to dryness at a temperature not exceeding 30° and dissolve the residue in 2 mL.

(2) Dilute 0.1 mL of solution (1) to 10 mL.

(3) 0.004% w/v of *calcipotriol monohydrate EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 2 times the retention time of calcipotriol.

MOBILE PHASE

30 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to calcipotriol (retention time, about 13.5 minutes) are: impurity B, about 0.86; impurity C, about 0.92 and impurity D, about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to impurity D is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions.

(1) To a quantity of the ointment containing the equivalent of 0.25 mg of calcipotriol, add 7 mL of *methanol* and shake vigorously. Dilute to 20 mL with 0.01M *ammonium phosphate*. Cool in ice, centrifuge and filter.

(2) 0.0013% w/v of *calcipotriol monohydrate EPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with an injection volume of 200 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

DETERMINATION OF CONTENT

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

Calculate the content of $C_{27}H_{40}O_3$ in the ointment using the chromatograms obtained with solutions (1) and (2) and the declared content of $C_{27}H_{40}O_3$ in *calcipotriol monohydrate EPCRS*.

STORAGE

Calcipotriol Ointment should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcipotriol.

www.webofpharma.com

Calcipotriol Scalp Application

Action and use
Vitamin D analogue.

DEFINITION

Calcipotriol Scalp Application contains either Calcipotriol or Calcipotriol Monohydrate in a suitable basis.

The scalp application complies with the requirements stated under Liquids For Cutaneous Application and with the following requirements.

Content of calcipotriol, $C_{27}H_{40}O_3$
90.0 to 110.0% of the stated amount.

A reversible isomerisation to pre-calcipotriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using the following solutions.

Solvent A

1 volume of *triethylamine* and 9 volumes of *dichloromethane*.

(1) Evaporate a quantity of the scalp application containing the equivalent of 0.5 mg of calcipotriol to dryness at a temperature not exceeding 30° and dissolve the residue in 1 mL of solvent A.

(2) 0.05% w/v of *calcipotriol monohydrate EPCRS* in solvent A.

(3) Place 2 mg of *calcipotriol monohydrate EPCRS* in a vial and dissolve in 200 µL of solvent A. Close the vial and keep it in a water bath at 60° for 2 hours (generation of pre-calcipotriol).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and then heat at 140° for 10 minutes. Whilst hot, spray the plate with an *alcoholic solution of sulfuric acid*, dry at 140° for not more than 1 minute and examine in *ultraviolet light (365 nm)*.

MOBILE PHASE

20 volumes of *2-methylpropanol* and 80 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). A secondary spot in the chromatogram obtained with solution (1) corresponds in position and colour to the pre-calcipotriol spot in solution (3).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to calcipotriol in the chromatogram obtained with solution (2).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions prepared in solvent B.

Solvent B 30 volumes of 0.01M *ammonium phosphate* and 70 volumes of *methanol*.

(1) Evaporate a quantity of the scalp application containing the equivalent of 0.5 mg of calcipotriol to dryness at a temperature not exceeding 30° and dissolve the residue in 4 mL.

(2) Dilute 0.1 mL of solution (1) to 10 mL.

(3) 0.004% w/v of *calcipotriol monohydrate EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 2 times the retention time of calcipotriol.

MOBILE PHASE

30 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to calcipotriol (retention time, about 13.5 minutes) are: pre-calcipotriol, about 0.86; impurity C, about 0.92 and impurity D, about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to impurity D is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions prepared in solvent B, as described under Related substances.

www.webofpharma.com

(1) Dilute a weight of the scalp application containing the equivalent of 0.35 mg of calcipotriol to 10 mL.

(2) 0.0037% w/v of *calcipotriol monohydrate EPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *peak-to-valley ratio* between calcipotriol and impurity C is at least 5.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{40}O_3$ in the scalp application using the combined areas of the peaks due to calcipotriol and pre-calcipotriol in the chromatograms obtained with solutions (1) and (2) and the declared content of $C_{27}H_{40}O_3$ in *calcipotriol monohydrate EPCRS.*

STORAGE

Calcipotriol Scalp Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcipotriol.

Calcitonin (Salmon) Injection

Action and use

Hormone.

DEFINITION

Calcitonin (Salmon) Injection is a sterile solution of Calcitonin (Salmon) in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of calcitonin (salmon), $C_{145}H_{240}N_{44}O_{48}S_2$

90.0 to 115.0% of the stated amount of the peptide.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.9 to 4.5, Appendix V L.

Calcitonin C

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute the injection, if necessary, with a 0.1M solution of *sodium dihydrogen orthophosphate* adjusted to pH 4.0 with *orthophosphoric acid* to give a final concentration of 10 µg of calcitonin (salmon) per mL.

(2) 10 µg of *calcitonin (salmon) EPCRS* per mL in a 0.1M solution of *sodium dihydrogen orthophosphate* adjusted to pH 4.0 with *orthophosphoric acid.*

(3) Heat the injection at 75° for 15 hours and, if necessary, dilute as described for solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Vydac C18, 300 Å wide pore column for proteins and peptides is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

Mobile phase A 100 volumes of a 0.363% w/v solution of *tetramethylammonium hydroxide pentahydrate* and 150 volumes of *acetonitrile* adjusted to pH 2.5 with *orthophosphoric acid.*

Mobile phase B 50 volumes of *acetonitrile* and 450 volumes of a 0.402% w/v solution of *tetramethyl-ammonium hydroxide pentahydrate* adjusted to pH 2.5 with *orthophosphoric acid.*

Use the following gradient.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-21	35→57	65→43	linear gradient
21-22	57→35	43→65	linear gradient
22-30	35	65	re-equilibration

In the chromatogram obtained with solution (3) the peak due to calcitonin C is the largest peak to elute after the injection buffer salts and before the principal peak with a relative retention to that of calcitonin (salmon) of between 0.5 and 0.6.

SYSTEM SUITABILITY

The test is not valid unless the *resolution factor* between the peaks due to calcitonin C and calcitonin (salmon) in the chromatogram obtained with solution (3) is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to calcitonin C is not greater than 7% by *normalisation.*

Related peptides

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute the injection, if necessary, with mobile phase A to give a final concentration of 10 µg of calcitonin (salmon) per mL.

(2) Dissolve the contents of a vial of *N-acetyl-cys[1]calcitonin EPCRS* in 0.4 mL of mobile phase A, dilute to 40 mL with mobile phase A and add 0.1 mL of solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 65°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 3.26 g of *tetramethylammonium hydroxide pentahydrate* in 900 mL of *water,* adjust the pH to 2.5 with *orthophosphoric acid* and mix with 100 mL of *acetonitrile for chromatography.*

www.webofpharma.com

Mobile phase B Dissolve 1.45 g of *tetramethylammonium hydroxide pentahydrate* in 400 mL of *water*, adjust the pH to 2.5 with *orthophosphoric acid* and mix with 600 mL of *acetonitrile for chromatography*.

Use the following gradient.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-30	72→48	28→52	linear gradient
30-32	48→72	52→28	linear gradient
32-55	72	28	re-equilibration

When the chromatogram for solution (2) is recorded in the prescribed conditions, the relative retention time of *N*-acetyl-cys[1] calcitonin is about 1.15 relative to the principal peak.

SYSTEM SUITABILITY

The test is not valid unless the *resolution factor* between the peaks corresponding to calcitonin and *N*-acetyl-cys[1] calcitonin is at least 5.0 and the *symmetry factor* for the *N*-acetyl-cys[1] calcitonin peak is not greater than 2.5. If necessary, adjust the initial ratio of A:B in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 3% of the total area of all the peaks;

the sum of the areas of any such peaks is not greater than 5% of the total area of all the peaks by *normalisation*;

disregard any peak with an area less than 0.1 % of that of the principal peak.

ASSAY

Carry out the method described under the test for Calcitonin C.

Calculate the content of calcitonin (salmon) from the areas of the peak due to calcitonin (salmon) and that of any peak due to calcitonin C, using the declared content of $C_{145}H_{240}N_{44}O_{48}S_2$ in *calcitonin (salmon) EPCRS*.

STORAGE

Calcitonin (Salmon) Injection should be protected from light and stored at a temperature of 2° to 8°.

LABELLING

The label states the strength as the number of IU (Units) per mL. The label also states the equivalent number of micrograms of the peptide per mL.

Calcitriol Capsules

Action and use

Vitamin D analogue.

DEFINITION

Calcitriol Capsules contain a solution of Calcitriol in a suitable fixed oil.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of calcitriol, $C_{27}H_{44}O_3$

90.0 to 110.0% of the stated amount.

A reversible isomerisation to pre-calcitriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to calcitriol in the chromatogram obtained with solution (2).

ASSAY

Mix the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For capsules containing 0.25 µg of Calcitriol or less, prepare solution (1) in the following manner:

(1) Use an undiluted quantity of the mixed capsule content.

For capsules containing more than 0.25 µg of Calcitriol, prepare solution (1) in the following manner:

(1) To a quantity of the mixed capsule content containing 1.5 µg of Calcitriol, add sufficient mobile phase to produce 1 mL.

(2) 0.00015% w/v of *calcitriol EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µL of each solution.

(g) If necessary, adjust the composition of the mobile phase so that the principal peak in the chromatogram obtained with solution (1) is clearly separated from the tail of the peak due to the excipient (fixed oil).

MOBILE PHASE

1 volume of *propan-1-ol*, 2 volumes of *methanol*, 40 volumes of *hexane* and 60 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (1), the peak due to calcitriol is clearly separated from the peak due to the fixed oil.

DETERMINATION OF CONTENT

Combine the peak areas of calcitriol and pre-calcitriol in solutions (1) and (2) respectively. Calculate the content of calcitriol, $C_{27}H_{44}O_3$ in the capsules, using the declared content of $C_{27}H_{44}O_3$ in *calcitriol EPCRS*.

Calcium and Colecalciferol Tablets

DEFINITION

Calcium and Colecalciferol Tablets contain Calcium Carbonate and Colecalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium

85.0 to 115.0% of the stated amount.

Content of colecalciferol, $C_{27}H_{44}O$

90.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the powdered tablets containing 20 µg of Colecalciferol with 20 mL of the mobile phase with the aid of ultrasound for 15 minutes, cool to room temperature, centrifuge and use the supernatant liquid.

(2) 0.0001% w/v each of *colecalciferol BPCRS* and *ergocalciferol BPCRS* in the mobile phase.

(3) 0.0001% w/v of *colecalciferol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

10 volumes of *water* and 90 volumes of *methanol.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.4. If necessary, adjust the composition of the mobile phase to obtain the required resolution.

CONFIRMATION

A peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to colecalciferol in the chromatogram obtained with solution (3).

B. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of calcium with 50 mL of *water* and filter. The solution yields reaction A characteristic of *calcium salts*, Appendix VI.

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Colecalciferol comply with the requirements stated under Tablets, with respect to the content of Colecalciferol, using the following method of analysis. Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 15 mL of *methanol (90%)*, mix with the aid of ultrasound until the tablet is dispersed and then for a further 5 minutes, dilute to 20 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *colecalciferol BPCRS* in *methanol (90%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{44}O$ in each tablet using the declared content of $C_{27}H_{44}O$ in *colecalciferol BPCRS.*

ASSAY

For calcium

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 50 mg of calcium add 50 mL of *water* and 5 mL of *hydrochloric acid.* Heat the dispersion gently to boiling and continue to boil for about 2 minutes. Allow to cool and add 50 mL of 0.05M *disodium edetate VS.* Neutralise the solution using 2M *sodium hydroxide*, add 10 mL of *ammonia buffer pH 10.9* and 50 mL of *water.* Titrate the excess of disodium edetate with 0.05M *zinc chloride VS* using *mordant black II solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

For colecalciferol

Carry out the following procedure protected from light. Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 mg of Colecalciferol with about 170 mL of *methanol (90%)* for 5 minutes and then mix with ultrasound for 5 minutes, dilute to 200 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *colecalciferol BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

3 volumes of *water* and 97 volumes of *methanol.*

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{44}O$ in the tablets using the declared content of $C_{27}H_{44}O$ in *colecalciferol BPCRS.*

LABELLING

The label states (1) the equivalent number of IU (Units) of antirachitic activity (vitamin D); (2) the equivalent amount of calcium.

Each microgram of Colecalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

Calcium and Colecalciferol Chewable Tablets

Chewable Calcium and Colecalciferol Tablets

DEFINITION

Calcium and Colecalciferol Chewable Tablets contain Calcium Carbonate and Colecalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium

85.0 to 115.0% of the stated amount.

Content of colecalciferol, $C_{27}H_{44}O$

90.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the powdered tablets containing 20 µg of colecalciferol with 20 mL of the mobile phase with the aid of ultrasound for 15 minutes, cool to room temperature, centrifuge and use the supernatant liquid.

(2) 0.0001% w/v each of *colecalciferol BPCRS* and *ergocalciferol BPCRS* in the mobile phase.

(3) 0.0001% w/v of *colecalciferol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

10 volumes of *water* and 90 volumes of *methanol.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.4. If necessary, adjust the composition of the mobile phase to obtain the required resolution.

CONFIRMATION

A peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to colecalciferol in the chromatogram obtained with solution (3).

B. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of calcium with 50 mL of *water* and filter. The solution yields reaction A characteristic of *calcium salts*, Appendix VI.

TESTS

Disintegration

The requirement for Disintegration does not apply to Calcium and Colecalciferol Chewable Tablets.

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Colecalciferol comply with the requirements stated under Tablets, with respect to the content of Colecalciferol, using the following method of analysis. Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 15 mL of *methanol (90%)*, mix with the aid of ultrasound until the tablet is dispersed and then for a further 5 minutes, dilute to 20 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *colecalciferol BPCRS* in *methanol (90%).*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{44}O$ in each tablet using the declared content of $C_{27}H_{44}O$ in *colecalciferol BPCRS.*

ASSAY

For calcium

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 50 mg of calcium add 50 mL of *water* and 5 mL of *hydrochloric acid.* Heat the dispersion gently to boiling and continue to boil for about 2 minutes. Allow to cool and add 50 mL of 0.05M *disodium edetate VS.* Neutralise the solution using 2M *sodium hydroxide,* add 10 mL of *ammonia buffer pH 10.9* and 50 mL of *water.* Titrate the excess of disodium edetate with 0.05M *zinc chloride VS* using *mordant black II solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

For colecalciferol

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, protect from light throughout the procedure and using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 mg of Colecalciferol with about 170 mL of *methanol (90%)* for 5 minutes and then mix with ultrasound for 5 minutes, dilute to 200 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *colecalciferol BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

3 volumes of *water* and 97 volumes of *methanol.*

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{44}O$ in the tablets using the declared content of $C_{27}H_{44}O$ in *colecalciferol BPCRS.*

LABELLING

The label states (1) the equivalent number of IU (Units) of antirachitic activity (vitamin D); (2) the equivalent amount of calcium.

Each microgram of Colecalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

Calcium and Ergocalciferol Tablets

DEFINITION

Calcium and Ergocalciferol Tablets contain Calcium Lactate Pentahydrate, Calcium Phosphate and Ergocalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium

85.0 to 115.0% of the stated amount.

Content of ergocalciferol, $C_{28}H_{44}O$

90.0 to 120.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 µg of Ergocalciferol with 20 mL of the mobile phase with the aid of ultrasound for 15 minutes, cool to room temperature, centrifuge and use the supernatant liquid.

(2) 0.0001% w/v each of *colecalciferol BPCRS* and *ergocalciferol BPCRS* in the mobile phase.

(3) 0.0001% w/v of *ergocalciferol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

10 volumes of *water* and 90 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.4. If necessary, adjust the composition of the mobile phase to obtain the required resolution.

CONFIRMATION

The chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to ergocalciferol in the chromatogram obtained with solution (3).

B. Disperse a quantity of the powdered tablets containing the equivalent of 10 mg of calcium in 5 mL of *water* and filter. The filtrate yields reaction A characteristic of *lactates*, Appendix VI.

C. Warm a quantity of the powdered tablets containing the equivalent of 90 mg of calcium with 10 mL of 2M *nitric acid*, cool and filter. Add 10 mL of *ammonium molybdate solution* to the filtrate. A yellow precipitate is produced, characteristic of phosphates.

D. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of calcium with 50 mL of *water* and filter. The solution yields reaction A characteristic of *calcium salts*, Appendix VI.

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Ergocalciferol comply with the requirements stated under Tablets, with respect to the content of Ergocalciferol, using the following method of analysis. Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 15 mL of *methanol (90%)*, mix with the aid of ultrasound until the tablet is dispersed and then for a further 5 minutes, dilute to 20 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *ergocalciferol BPCRS* in *methanol (90%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay for ergocalciferol may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{44}O$ in each tablet using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS*.

ASSAY

For calcium

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 50 mg of calcium add 50 mL of *water* and 5 mL of *hydrochloric acid*. Heat the dispersion gently to boiling and continue for about 2 minutes. Allow to cool and add 50 mL of 0.05M *disodium edetate VS*. Neutralise the solution using 2M *sodium hydroxide*, add 10 mL of *ammonia buffer pH 10.9* and 50 mL of *water*. Titrate the excess of disodium edetate with 0.05M *zinc chloride VS* using *mordant black II solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

For ergocalciferol

Carry out the following procedure protected from light. Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 mg of Ergocalciferol with about 170 mL of *methanol (90%)* for 5 minutes. Mix with the aid of ultrasound for a further 5 minutes, dilute to 200 mL with *methanol (90%)*, centrifuge and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *ergocalciferol BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

3 volumes of *water* and 97 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{44}O$ in the tablets using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS*.

LABELLING

The label states (1) the equivalent number of IU (Units) of antirachitic activity (vitamin D); (2) the equivalent amount of calcium.

Each microgram of Ergocalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

www.webofpharma.com

Calcium and Ergocalciferol Chewable Tablets

Chewable Calcium and Ergocalciferol Tablets

DEFINITION

Calcium and Ergocalciferol Chewable Tablets contain Calcium Lactate Pentahydrate, Calcium Phosphate and Ergocalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium
85.0 to 115.0% of the stated amount.

Content of ergocalciferol, $C_{28}H_{44}O$
90.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for liquid chromatography, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 µg of ergocalciferol with 20 mL of the mobile phase with the aid of ultrasound for 15 minutes, cool to room temperature, centrifuge and use the supernatant liquid.

(2) 0.0001% w/v each of *colecalciferol BPCRS* and *ergocalciferol BPCRS* in the mobile phase.

(3) 0.0001% w/v of *ergocalciferol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

10 volumes of *water* and 90 volumes of *methanol.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.4. If necessary, adjust the composition of the mobile phase to obtain the required resolution.

CONFIRMATION

The chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to ergocalciferol in the chromatogram obtained with solution (3).

B. Disperse a quantity of the powdered tablets containing the equivalent of 10 mg of calcium in 5 mL of *water* and filter. The filtrate yields reaction A characteristic of *lactates*, Appendix VI.

C. Warm a quantity of the powdered tablets containing the equivalent of 90 mg of calcium with 10 mL of 2M *nitric acid*, cool and filter. Add 10 mL of *ammonium molybdate solution* to the filtrate. A yellow precipitate is produced, characteristic of phosphates.

D. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of calcium with 50 mL of *water* and filter. The solution yields reaction A characteristic of *calcium salts*, Appendix VI.

TESTS

Disintegration
The requirement for Disintegration does not apply to Calcium and Ergocalciferol Chewable Tablets.

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Ergocalciferol comply with the requirements stated under Tablets, with respect to the content of Ergocalciferol, using the following method of analysis. Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 15 mL of *methanol (90%)*, mix with the aid of ultrasound until the tablet is dispersed and then for a further 5 minutes, dilute to 20 mL with *methanol (90%)*, mix, centrifuge and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *ergocalciferol BPCRS* in *methanol (90%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay for ergocalciferol may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{44}O$ in each tablet using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS.*

ASSAY

For calcium
Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 50 mg of calcium add 50 mL of *water* and 5 mL of *hydrochloric acid.* Heat the dispersion gently to boiling and continue for about 2 minutes. Allow to cool and add 50 mL of 0.05M *disodium edetate VS.* Neutralise the solution using 2M *sodium hydroxide*, add 10 mL of *ammonia buffer pH 10.9* and 50 mL of *water.* Titrate the excess of disodium edetate with 0.05M *zinc chloride VS* using *mordant black II solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

For ergocalciferol
Carry out the following procedure protected from light. Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 mg of Ergocalciferol with about 170 mL of *methanol (90%)* for 5 minutes. Mix with the aid of ultrasound for a further 5 minutes, dilute to 200 mL with *methanol (90%)*, centrifuge and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.00005% w/v of *ergocalciferol BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

3 volumes of *water* and 97 volumes of *methanol.*

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{28}H_{44}O$ in the tablets using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS*.

LABELLING

The label states (1) the equivalent number of IU (Units) of antirachitic activity (vitamin D); (2) the equivalent amount of calcium.

Each microgram of Ergocalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

Calcium Carbonate Chewable Tablets

Chewable Calcium Carbonate Tablets

DEFINITION

Calcium Carbonate Chewable Tablets contain Calcium Carbonate. They may be flavoured.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium, Ca

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The powdered tablets yield reaction B characteristic of *calcium salts*, Appendix VI.

B. The powdered tablets yield the reactions characteristic of *carbonates*, Appendix VI.

TESTS

Disintegration

The requirement for Disintegration does not apply to Calcium Carbonate Chewable Tablets.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 0.25 g of calcium add 50 mL of *water* and 5 mL of *hydrochloric acid*. Heat the dispersion gently to boiling and continue to boil for about 2 minutes. Allow to cool, add sufficient *water* to produce 250 mL and filter, if necessary. To 50 mL of this solution add 50 mL of 0.05M *disodium edetate VS*. Neutralise the solution using 2M *sodium hydroxide* and add 10 mL of *ammonia buffer pH 10.9* and 50 mL of *water*. Titrate the excess of disodium edetate with 0.05M *zinc chloride VS* using *mordant black II solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

STORAGE

Calcium Carbonate Chewable Tablets should be protected from moisture.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of calcium.

Calcium Carbonate and Heavy Magnesium Carbonate Chewable Tablets

Chewable Calcium Carbonate and Heavy Magnesium Carbonate Tablets

Action and use

Antacid.

DEFINITION

Calcium Carbonate and Heavy Magnesium Carbonate Chewable Tablets contain Calcium Carbonate and Heavy Magnesium Carbonate. They may be flavoured.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of Calcium, Ca

95.0 to 105.0% of the stated amount.

Content of magnesium, Mg

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, solution (1) exhibits a similar absorption to the standard solutions at 422.7 nm (calcium).

B. In the Assay, solution (3) exhibits a similar absorption to the standard solutions at 285.2 nm (magnesium).

C. The powdered tablets yield reaction B characteristic of *calcium salts*, Appendix VI.

D. The powdered tablets yield reaction B characteristic of *magnesium and magnesium salts*, Appendix VI.

E. The powdered tablets yield the reactions characteristic of *carbonates*, Appendix VI.

TESTS

Disintegration

The requirement for Disintegration does not apply to Calcium Carbonate and Heavy Magnesium Carbonate Chewable Tablets.

ASSAY

For calcium

Weigh and powder 20 tablets. For solution (1) disperse a quantity of the powdered tablets containing the equivalent of 0.272 g of calcium in 10 mL of 6M *hydrochloric acid*, stir for 15 minutes, and add sufficient *water* to produce 500 mL, mix and filter. To 1 volume of the filtrate add 5 volumes of *lanthanum trioxide solution* and dilute to 100 volumes with *water*.

Prepare the standard solutions using a suitable volume of *calcium standard solution (1000 ppm Ca)* add 10 mL of 6M *hydrochloric acid*, and sufficient *water* to produce 500 mL, mix and filter. To 1 volume of the filtrate add 5 volumes of *lanthanum trioxide solution* and dilute to 100 volumes with *water*.

For solution (2) to 10 mL of 6M *hydrochloric acid* add sufficient *water* to produce 500 mL, mix and filter. To 1 volume of the filtrate add 5 volumes of *lanthanum trioxide solution* and dilute to 100 volumes with *water*.

Determine the total content of calcium in solution (1) by Method I for *atomic absorption spectrophotometry*, Appendix II D, measuring at 422.7 nm using the standard solutions and solution (2) as the blank.

For magnesium

Weigh and powder 20 tablets. For solution (3) disperse a quantity of the powdered tablets containing the equivalent of 22 mg of magnesium in 10 mL of 6M *hydrochloric acid*, stir

www.webofpharma.com

for 15 minutes and add sufficient *water* to produce 500 mL, mix and filter. To 1 volume of the filtrate add 5 volumes of *lanthanum trioxide solution* and dilute to 100 volumes with *water*.

Prepare the standard solutions using a suitable volume of *magnesium standard solution (100 ppm Mg)*, add 10 mL of *6M hydrochloric acid* and sufficient *water* to produce 500 mL, mix and filter. To 1 volume of the filtrate add 5 volumes of *lanthanum trioxide solution* and dilute to 100 volumes with *water*.

Determine the total content of magnesium in solution (3) by Method I for *atomic absorption spectrophotometry*, Appendix II D, measuring at 285.2 nm using the standard solutions and solution (2) as the blank.

STORAGE
Calcium Carbonate and Heavy Magnesium Carbonate Chewable Tablets should be protected from moisture.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of calcium and magnesium.

Calcium Carbonate Oral Suspension

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Phosphate binder; treatment of hyperphosphataemia.

DEFINITION
Calcium Carbonate Oral Suspension is a suspension of Calcium Carbonate in a suitable vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral suspension also complies with the requirements stated under Unlicensed Medicines.

Content of calcium carbonate, $CaCO_3$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
It may be necessary to add a drop of a suitable antifoaming agent to a volume of the oral suspension before carrying out the following tests.

A. Mix 1 volume of the oral suspension with 1 volume of *water* and filter. The filtrate yields reaction C characteristic of *calcium salts*, Appendix VI.

B. Dilute a volume of the oral suspension containing 0.6 g of Calcium Carbonate to 2 volumes with *2M hydrochloric acid*. The resulting solution yields reaction A characteristic of *carbonates*, Appendix VI.

TESTS
Acidity or alkalinity
pH 7.0 to 8.7, Appendix V L.

Dissolution
Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions. Use a volume of the oral suspension containing one dose.

ASSAY
It may be necessary to add one or two drops of a suitable antifoaming agent to the oral suspension before carrying out the Assay.

To a weighed quantity of the oral suspension containing 0.15 g of Calcium Carbonate add 3 mL of *dilute hydrochloric acid* and 20 mL of *water*. Boil for 2 minutes, allow to cool and dilute to 50 mL with *water*. Carry out the *complexometric titration of calcium*, Appendix VIII D. Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $CaCO_3$, weight in volume.

Each mL of *0.1M sodium edetate* is equivalent to 10.01 mg of $CaCO_3$.

Calcium Chloride Injection

DEFINITION
Calcium Chloride Injection is a sterile solution of Calcium Chloride Dihydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of calcium chloride dihydrate, $CaCl_2,2H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. 1 mL yields reaction C characteristic of *calcium salts*, Appendix VI.

B. Dilute 1 volume of the injection to 50 mL with *water*. The resulting solution yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS
Acidity or alkalinity
pH 5.0 to 8.0, Appendix V L.

Colour of solution
The injection is not more intensely coloured than *reference solution BY_6*, Appendix IV B, Method II.

ASSAY
Carry out the *complexometric titration of calcium*, Appendix VIII D. Use a volume of the injection containing about 0.3 g of Calcium Chloride Dihydrate. Each mL of *0.1M sodium edetate* is equivalent to 14.70 mg of $CaCl_2,2H_2O$.

LABELLING
The label states (1) the percentage w/v of Calcium Chloride Dihydrate; (2) the concentration of calcium ion as millimoles in a suitable volume; (3) the concentration of chloride ion as millimoles in a suitable volume; (4) that solutions containing visible solid particles must not be used.

When calcium chloride intravenous infusion is prescribed or demanded, Calcium Chloride Injection shall be dispensed or supplied.

Calcium Folinate Injection

Action and use
Vitamin B component.

DEFINITION
Calcium Folinate Injection is a sterile solution of Calcium Folinate Hydrate. It is either supplied as a ready-to-use solution or it is prepared by dissolving Calcium Folinate for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations and, when supplied as a ready-to-use solution, with the following requirements.

www.webofpharma.com

Content of folinic acid, $C_{20}H_{23}N_7O_7$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing the equivalent of 20 mg of folinic acid add 40 mL of *acetone*, mix, allow to stand and then centrifuge, discarding the solvent. Suspend the residue in 40 mL of *acetone* and centrifuge. Dry the residue in a stream of nitrogen and then at a pressure of 0.7 kPa for 2 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of calcium folinate *(RS 368)*.

B. Yields reaction B characteristic of *calcium salts*, Appendix VI.

TESTS

Acidity or alkalinity
pH, 6.5 to 8.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Dilute with *water*, if necessary, a volume of the injection to produce a solution containing the equivalent of 0.1% w/v of folinic acid.

(2) Dilute 1 volume of solution (1) to 100 volumes with *water*.

(3) 0.1% w/v of *calcium folinate BPCRS* in *water*.

(4) Dilute 1 volume of solution (2) to 10 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 2.5 times the retention time of folinate.

MOBILE PHASE

220 mL of *methanol* and 780 mL of a solution containing 2.0 mL of *tetrabutylammonium hydroxide solution* and 2.2 g of *disodium hydrogen orthophosphate*, previously adjusted to pH 7.5 with 10% v/v *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions, the retention times of calcium folinate and formyl folic acid are about 12 minutes and 21 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to folinate and formylfolic acid is at least 2.2. If necessary, adjust the methanol content in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to formylfolic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks*, excluding the peak corresponding to formylfolic acid, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection with *water* to produce a solution containing the equivalent of 0.01% w/v of folinic acid.

(2) 0.011% w/v of *calcium folinate BPCRS* in *water*.

(3) 0.1% w/v of *calcium folinate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to folinate and formylfolic acid is at least 2.2. If necessary, adjust the methanol content in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{23}N_7O_7$ in the injection using the declared content of $C_{20}H_{21}CaN_7O_7$ in *calcium folinate BPCRS*. Each mg of $C_{20}H_{21}CaN_7O_7$ is equivalent to 0.9255 mg of $C_{20}H_{23}N_7O_7$.

STORAGE

When supplied as a ready-to-use solution, Calcium Folinate Injection should be protected from light and stored at a temperature of 2° to 8°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of folinic acid.

CALCIUM FOLINATE FOR INJECTION

DEFINITION

Calcium Folinate for Injection is a sterile material consisting of Calcium Folinate Hydrate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of folinic acid, $C_{20}H_{23}N_7O_7$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of calcium folinate *(RS 368)*. If the spectra are not concordant prepare a solution containing 1% w/v of Calcium Folinate and carry out Identification Test A for the ready-to-use solution.

B. Yield reaction B characteristic of *calcium salts*, Appendix VI.

www.webofpharma.com

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 1.0% w/v of folinic acid, 6.5 to 8.5, Appendix V L.

Related substances

Carry out the test described for the ready-to-use solution but using the following solution as solution (1). Dissolve sufficient of the mixed contents of 10 containers in *water* to produce a solution containing the equivalent of 0.1% w/v of folinic acid.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Carry out the Assay described for the ready-to-use solution but using the following solution as solution (1). Dissolve sufficient of the mixed contents of the 10 containers in *water* to produce a solution containing the equivalent of 0.01% w/v of folinic acid.

Calculate the content of $C_{20}H_{23}N_7O$ in a container of average content weight using the declared content of $C_{20}H_{21}CaN_7O_7$ in *calcium folinate BPCRS*. Each mg of $C_{20}H_{21}CaN_7O_7$ is equivalent to 0.9255 mg of $C_{20}H_{23}N_7O_7$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of folinic acid.

Calcium Folinate Tablets

Action and use

Vitamin B component.

DEFINITION

Calcium Folinate Tablets contain Calcium Folinate Hydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of folinic acid, $C_{20}H_{23}N_7O_7$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing the equivalent of 180 mg of folinic acid add 10 mL of *water*, mix with the aid of ultrasound, and filter. Add 125 mg of *ammonium oxalate* to the filtrate, shake, and centrifuge until a clear supernatant liquid is obtained. To the supernatant add 1 mL of *methanol* and 3 drops of *hydrochloric acid*, and shake. If the preparation is cloudy, add *methanol* until a clear solution is obtained and filter, if necessary, to remove any undissolved material. Cool the preparation at 0° until a precipitate forms and centrifuge. The cooling and centrifuging steps may be repeated, if necessary, to increase the amount of precipitate collected. Decant the supernatant liquid and dissolve the precipitate in 2 mL of *methanol*. Evaporate to dryness under a current of air and dry the residue at 50° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of calcium folinate *(RS 368)*.

B. The powdered tablets yield reaction B characteristic of *calcium salts*, Appendix VI.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Add 20 mL of *water* to a quantity of the powdered tablets containing the equivalent of 25 mg of folinic acid, shake for 15 minutes and dilute to 25 mL with *water*. Filter through a glass fibre filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with *water*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *water*.

(3) 0.1% w/v of *calcium folinate BPCRS* in *water*.

(4) Dilute 1 volume of solution (2) to 10 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 2.5 times the retention time of folinate.

MOBILE PHASE

220 mL of *methanol* and 780 mL of a solution containing 2.0 mL of *tetrabutylammonium hydroxide solution* and 2.2 g of *disodium hydrogen orthophosphate*, previously adjusted to pH 7.5 with 10% v/v *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to folinate and formylfolic acid is at least 2.2. If necessary, adjust the methanol content in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to formylfolic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks*, excluding the peak corresponding to formylfolic acid, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Protect the solutions from light. Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 200 mL of *water* to a quantity of the powdered tablets containing the equivalent of 25 mg of folinic acid,

www.webofpharma.com

shake for 15 minutes and dilute to 250 mL with *water*. Filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.011% w/v of *calcium folinate BPCRS* in *water*.

(3) 0.1% w/v of *calcium folinate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to folinate and formylfolic acid is at least 2.2. If necessary, adjust the methanol content in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{23}N_7O_7$ in the tablets using the declared content of $C_{20}H_{21}CaN_7O_7$ in *calcium folinate BPCRS*. Each mg of $C_{20}H_{21}CaN_7O_7$ is equivalent to 0.9255 mg of $C_{20}H_{23}N_7O_7$.

STORAGE

Calcium Folinate Tablets should be stored at a temperature not exceeding 30°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of folinic acid.

Calcium Gluconate Injection

DEFINITION

Calcium Gluconate Injection is a sterile solution of Calcium Gluconate for Injection in Water for Injections. Not more than 5.0% of the Calcium Gluconate may be replaced with calcium M-saccharate, or other suitable calcium salt, as a stabilising agent.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of calcium, Ca

8.5 to 9.4% of the content of Calcium Gluconate stated on the label.

IDENTIFICATION

A. To 1 mL add 0.05 mL of *iron(III) chloride solution R1*. An intense yellow colour is produced.

B. Warm a volume containing the equivalent of 0.5 g of Calcium Gluconate, add 0.65 mL of *glacial acetic acid* and 1 mL of *phenylhydrazine*. Heat on a water bath for 30 minutes, allow to cool and induce crystallisation. Filter, dissolve the residue in 10 mL of hot *water*, add a few mg of *activated charcoal*, shake, filter, allow the filtrate to cool and induce crystallisation. A white, crystalline precipitate is produced. The *melting point* of the crystals, after drying, is about 200°, with decomposition, Appendix V A.

C. Yields the reactions characteristic of *calcium salts*, Appendix VI.

TESTS

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection in *water BET* if necessary to give a solution containing 100 mg of Calcium Gluconate per millilitre (solution A). The endotoxin limit concentration of solution A is 16.7 IU per mL.

ASSAY

To a volume containing the equivalent of 0.5 g of Calcium Gluconate add 300 mL of *water* and carry out the *complexometric titration of calcium*, Appendix VIII D, beginning at the words 'add 6 mL of ...'.

LABELLING

The label states (1) the percentage w/v of Calcium Gluconate equivalent to the total amount of calcium present; (2) that solutions containing visible solid particles must not be used; (3) the name and the percentage of any added stabilising agent.

Calcium Gluconate Tablets

DEFINITION

Calcium Gluconate Tablets contain Calcium Gluconate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium gluconate, $C_{12}H_{22}CaO_{14},H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract five tablets, finely powdered, with two 25-mL quantities of *petroleum spirit (boiling range, 40° to 60°)*, discard the extracts and repeat the extraction with three 10-mL quantities of *water*, again discarding the extracts. Dissolve the residue as completely as possible in 30 mL of hot *water*, filter and to 0.5 mL of the filtrate add 0.05 mL of *iron(III) chloride solution R1*. An intense yellow colour is produced.

B. To a volume of the filtrate obtained in test A containing 0.5 g of Calcium Gluconate add 0.65 mL of *glacial acetic acid* and 1 mL of *phenylhydrazine*, heat on a water bath for 30 minutes, cool and induce crystallisation. Filter, dissolve the residue in 10 mL of hot *water*, add a few mg of *activated charcoal*, shake, filter, allow the filtrate to cool and induce crystallisation. A white, crystalline precipitate is produced. The *melting point* of the crystals, after drying, is about 201°, with decomposition, Appendix V A.

C. The powdered tablets yield the reactions characteristic of *calcium salts*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of *water* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 20 mL of the medium and filter. Carry out the method for *atomic absorption spectrophotometry*, Appendix II D, measuring at 422.7 nm using a calcium hollow-cathode lamp as the radiation source, an air-acetylene flame and the following solutions.

Test solution Use the filtered dissolution medium diluted, if necessary, with *water* to give a concentration suitable for the instrument used.

Standard solutions Use *calcium standard solution (100 ppm Ca)* suitably diluted with *water*.

Determine the total content of calcium in the dissolution medium and calculate the total content of calcium gluconate taking each mg of calcium to be equivalent to 11.21 mg of $C_{12}H_{22}CaO_{14},H_2O$.

www.webofpharma.com

ASSAY
Weigh and powder 20 tablets. Ignite a quantity of the powder containing 0.5 g of Calcium Gluconate, cool and dissolve the residue with gentle heat in 5 mL of 2M *hydrochloric acid*. Filter, wash the residue on the filter with *water* and dilute the combined filtrate and washings to 50 mL with *water*. Neutralise with 5M *ammonia*, using *methyl orange solution* as indicator, add 5 mL of 8M *sodium hydroxide* and titrate with 0.05M *disodium edetate VS* using *calconcarboxylic acid triturate* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14},H_2O$.

Calcium Gluconate Chewable Tablets

Chewable Calcium Gluconate Tablets

DEFINITION
Calcium Gluconate Chewable Tablets contain Calcium Gluconate in a Chocolate Basis or other suitable basis with a chocolate flavour.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium gluconate, $C_{12}H_{22}CaO_{14},H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract five tablets, finely powdered, with two 25-mL quantities of *petroleum spirit (boiling range, 40° to 60°)*, discard the extracts and repeat the extraction with three 10-mL quantities of *water*, again discarding the extracts. Dissolve the residue as completely as possible in 30 mL of hot *water*, filter and to 0.5 mL of the filtrate add 0.05 mL of *iron(III) chloride solution R1*. An intense yellow colour is produced.

B. To a volume of the filtrate obtained in test A containing 0.5 g of Calcium Gluconate add 0.65 mL of *glacial acetic acid* and 1 mL of *phenylhydrazine*, heat on a water bath for 30 minutes, cool and induce crystallisation. Filter, dissolve the residue in 10 mL of hot *water*, add a few mg of *activated charcoal*, shake, filter, allow the filtrate to cool and induce crystallisation. A white, crystalline precipitate is produced. The *melting point* of the crystals, after drying, is about 201°, with decomposition, Appendix V A.

C. The powdered tablets yield the reactions characteristic of *calcium salts*, Appendix VI.

TESTS
Disintegration
The requirement for Disintegration does not apply to Calcium Gluconate Chewable Tablets.

ASSAY
Weigh and powder 20 tablets. Ignite a quantity of the powder containing 0.5 g of Calcium Gluconate, cool and dissolve the residue with gentle heat in 5 mL of 2M *hydrochloric acid*. Filter, wash the residue on the filter with *water* and dilute the combined filtrate and washings to 50 mL with *water*. Neutralise with 5M *ammonia*, using *methyl orange solution* as indicator, add 5 mL of 8M *sodium hydroxide* and titrate with 0.05M *disodium edetate VS* using *calconcarboxylic acid triturate* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14},H_2O$.

Calcium Gluconate Effervescent Tablets

Effervescent Calcium Gluconate Tablets

DEFINITION
Calcium Gluconate Effervescent Tablets contain Calcium Gluconate in a suitable effervescent basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium gluconate, $C_{12}H_{22}CaO_{14},H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dissolve a quantity of the powdered tablets containing 1 g of Calcium Gluconate in 20 mL of hot *water*, cool and filter. To 0.5 mL of the filtrate add 0.05 mL of *iron(III) chloride solution R1*. An intense yellow colour is produced.

B. To 5 mL of the filtrate obtained in test A add 0.65 mL of *glacial acetic acid* and 1 mL of *phenylhydrazine*, heat on a water bath for 30 minutes, allow to cool and induce crystallisation. Filter, dissolve the residue in 10 mL of hot *water*, add a suitable quantity of *activated charcoal*, shake, filter, allow the filtrate to cool and induce crystallisation. A white, crystalline precipitate is produced. The *melting point* of the crystals, after drying, is about 201°, with decomposition, Appendix V A.

C. The powdered tablets yield reaction B characteristic of *calcium salts*, Appendix VI.

D. The tablets effervesce on the addition of *water*.

ASSAY
Weigh and powder 20 tablets. Ignite a quantity of the powder containing 0.5 g of Calcium Gluconate, cool and dissolve the residue with gentle heat in 5 mL of 2M *hydrochloric acid*. Filter, wash the residue on the filter with *water* and dilute the combined filtrate and washings to 50 mL with *water*. Neutralise with 5M *ammonia*, using *methyl orange solution* as indicator, add 5 mL of 8M *sodium hydroxide* and titrate with 0.05M *disodium edetate VS* using *calconcarboxylic acid triturate* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14},H_2O$.

Calcium Hydroxide Solution

Lime Water

DEFINITION

Calcium Hydroxide	10 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.

Shake together thoroughly and repeatedly; allow to stand until clear. Siphon off the clear solution as required.

Content of calcium hydroxide, $Ca(OH)_2$
Not less than 0.15% w/v.

CHARACTERISTICS
A colourless liquid. It absorbs carbon dioxide from the air, a film of calcium carbonate being formed on the surface of the liquid. It becomes turbid when boiled and clear again on cooling.

IDENTIFICATION
Yields the reactions characteristic of *calcium salts*, Appendix VI.

www.webofpharma.com

ASSAY
Titrate 25 mL with *0.1M hydrochloric acid VS* using *phenolphthalein solution R1* as indicator. Each mL of *0.1M hydrochloric acid VS* is equivalent to 3.705 mg of $Ca(OH)_2$.

STORAGE
Calcium Hydroxide Solution should be kept in a well-filled container.

Calcium Lactate Tablets

DEFINITION
Calcium Lactate Tablets contain Calcium Lactate Pentahydrate or Calcium Lactate Trihydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of calcium lactate, calculated as $C_6H_{10}CaO_6,5H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Triturate a quantity of the powdered tablets containing 0.3 g of Calcium Lactate Pentahydrate or its equivalent with 5 mL of *methanol* and filter. To 0.2 mL of the filtrate add 2 mL of *sulfuric acid*, heat at 85° for 2 minutes, cool and add 4 mg of *4-hydroxybiphenyl*. A violet-red colour is produced.

B. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a brick red colour to the flame.

Disintegration
Maximum time, 30 minutes, Appendix XII A1.

ASSAY
Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.3 g of Calcium Lactate Pentahydrate or its equivalent as completely as possible in 50 mL of *water* and titrate with 0.05M *disodium edetate VS* to within a few millilitres of the expected end point. Add 8 mL of 5M *sodium hydroxide* and 0.1 g of *solochrome dark blue mixture* and continue the titration until the colour changes from pink to full blue. Each mL of 0.05M *disodium edetate VS* is equivalent to 15.41 mg of $C_6H_{10}CaO_6,5H_2O$.

LABELLING
When the active ingredient is Calcium Lactate Trihydrate the quantity is stated in terms of the equivalent amount of Calcium Lactate Pentahydrate.

Concentrated Camphor Water

DEFINITION

Racemic Camphor	40 g
Ethanol (90 per cent)	600 mL
Water	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.

Dissolve the Racemic Camphor in the Ethanol (90 per cent) and add, gradually, with vigorous shaking after each addition, sufficient Water to produce 1000 mL.

The water complies with the requirements stated under Aromatic Waters and with the following requirement.

Ethanol content
51 to 55% v/v, Appendix VIII F.

Candesartan Tablets

Action and use
Angiotensin II (AT_1) receptor antagonist.

DEFINITION
Candesartan Tablets contain Candesartan Cilexetil.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of candesartan cilexetil, $C_{33}H_{34}N_6O_6$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 20 mg of Candesartan Cilexetil with 20 mL of *water* until the tablets have disintegrated and filter (a Whatman GF/C filter is suitable). Add the filter paper to 20 mL of *ethyl acetate*, mix with the aid of ultrasound and repeat the filtering process. Evaporate the filtrate to dryness under a stream of nitrogen. *The infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of candesartan cilexetil *(RS 494)*.

TESTS
Dissolution
For tablets containing 16 mg or less of candesartan cilexetil

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a solution containing 0.35% w/v of *polysorbate 20* in *phosphate buffer pH 6.5*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter (a Acrodisc GHP 25 0.45-µm filter is suitable). Dilute the filtered medium, if necessary, with sufficient dissolution medium to produce a solution expected to contain 0.00022% w/v of Candesartan Cilexetil.

(2) 0.00022% w/v of *candesartan cilexetil BPCRS* in the dissolution medium.

(3) 0.00022% w/v of *candesartan cilexetil for system suitability EPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Nova-Pak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 43 volumes of *water* and 57 volumes of *acetonitrile*.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and impurity B is at least 4.0.

DETERMINATION OF CONTENT

Calculate the total content of candesartan cilexetil, $C_{33}H_{34}N_6O_6$, in the medium from the chromatograms obtained and using the declared content of $C_{33}H_{34}N_6O_6$ in *candesartan cilexetil BPCRS*.

LIMITS

The amount of candesartan cilexetil released is not less than 75% (Q) of the stated amount.

For tablets containing more than 16 mg of candesartan cilexetil

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a solution containing 0.70% w/v of *polysorbate 20* in *phosphate buffer pH 6.5*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter (a 0.45-µm Acrodisc GHP 25 filter is suitable). Dilute the filtered medium, if necessary, with sufficient dissolution medium to produce a solution expected to contain 0.00022% w/v of Candesartan Cilexetil.

(2) 0.00022% w/v of *candesartan cilexetil BPCRS* in the dissolution medium.

(3) 0.00022% w/v of *candesartan cilexetil for system suitability EPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the Dissolution test for tablets containing 16 mg or less of candesartan cilexetil may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and impurity B is at least 4.0.

DETERMINATION OF CONTENT

Calculate the total content of candesartan cilexetil, $C_{33}H_{34}N_6O_6$, in the medium from the chromatograms obtained and using the declared content of $C_{33}H_{34}N_6O_6$ in *candesartan cilexetil BPCRS*.

LIMITS

The amount of candesartan cilexetil released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 60% v/v *acetonitrile* prepared immediately before use.

(1) To a quantity of the powdered tablets containing 20 mg of Candesartan Cilexetil, add 80 mL of 60% v/v *acetonitrile* and mix with the aid of ultrasound. Add sufficient 60% v/v *acetonitrile* to produce 100 mL and filter (a 0.45-µm PTFE filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.05% w/v of *candesartan cilexetil for system suitability EPCRS*.

(4) 0.05% w/v of *candesartan cilexetil for peak identification EPCRS*.

(5) 0.05% w/v of *candesartan cilexetil impurity standard BPCRS*.

(6) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Nova-Pak C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 1 volume of *glacial acetic acid*, 43 volumes of *water* and 57 volumes of *acetonitrile*.

Mobile phase B 1 volume of *glacial acetic acid*, 10 volumes of *water* and 90 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	100	0	isocratic
3-33	100→0	0→100	linear gradient
33-45	0	100	isocratic
45-47	0→100	100→0	linear gradient
47-55	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to candesartan cilexetil (retention time about 10 minutes) are: impurity G, about 0.2; impurity A, about 0.3; impurity B, about 0.5; impurity C, about 0.8; impurity D, about 1.2; impurity E, about 1.5; impurity F, about 2.0; impurity H, about 3.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 2.6, where *Hp* is the height above the baseline of the peak due to impurity D and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to candesartan cilexetil.

LIMITS

Use the chromatograms obtained with solutions (3) and (5) to identify the peaks due to impurities B, D and F.

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities A, G and H using solutions (3) and (4) and multiply the area of these peaks by the corresponding correction factors: impurity A, 0.7; impurity G, 0.7; impurity H, 1.6.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to impurity C, D or E is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5% of each);

www.webofpharma.com

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (6) (0.2%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (6) (0.1%).

For tablets containing 16 mg or less of candesartan cilexetil

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the sum of the areas of any *secondary peaks*, excluding the peak due to impurity B, is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3.0%).

For tablets containing more than 16 mg of candesartan cilexetil

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (1.2%);

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of candesartan cilexetil must comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 60% v/v *acetonitrile*.

(1) Disperse one tablet in 25 mL of 60% v/v *acetonitrile* and mix with the aid of ultrasound for 10 minutes. Add sufficient 60% v/v *acetonitrile* to produce 50 mL and filter (a 0.45-µm PTFE filter is suitable). If necessary, dilute the filtrate with 60% v/v *acetonitrile* to produce a solution containing 0.0002% w/v of Candesartan Cilexetil.

(2) 0.0002 % w/v of *candesartan cilexetil BPCRS*.

(3) 0.015 % w/v of *candesartan cilexetil for system suitability EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and impurity B is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{33}H_{34}N_6O_6$ in each tablet using the declared content of $C_{33}H_{34}N_6O_6$ in *candesartan cilexetil BPCRS*.

ASSAY

For tablets containing 2 mg or less and/or less than 2% w/w of candesartan cilexetil

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing more than 2 mg and 2% w/w or more of candesartan cilexetil

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) To a quantity of the powdered tablets containing 20 mg of Candesartan Cilexetil, add 80 mL of 60% v/v *acetonitrile* and mix with the aid of ultrasound for 10 minutes. Dilute to 100 mL with 60% v/v *acetonitrile* and filter (a 0.45-µm PTFE filter is suitable). Add sufficient 60% v/v *acetonitrile* to the filtrate to produce a solution containing 0.002% w/v of Candesartan Cilexetil.

(2) 0.0002% w/v of *candesartan cilexetil BPCRS* in 60% v/v *acetonitrile*.

(3) 0.015% w/v of *candesartan cilexetil for system suitability EPCRS* in 60% v/v *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and impurity B is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{33}H_{34}N_6O_6$ in the tablets using the declared content of $C_{33}H_{34}N_6O_6$ in *candesartan cilexetil BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Candesartan Cilexetil.

Capecitabine Tablets

Action and use

Pyrimidine analogue; cytotoxic; treatment of cancer.

DEFINITION

Capecitabine Tablets contain Capecitabine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of capecitabine, $C_{15}H_{22}FN_3O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.05 g of Capecitabine with 4 mL of *ethanol* and filter. Evaporate the filtrate to dryness, under a stream of nitrogen, on a water bath at 65°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the reference spectrum of *capecitabine BPCRS* treated in the same manner.

TESTS

Dissolution

Carry out the following procedure protected from light. Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 6.8*, at a temperature of 37°, as the medium.

www.webofpharma.com

PROCEDURE

(1) After 30 minutes withdraw a sample of the dissolution medium and filter. Use the filtered medium, diluted with *phosphate buffer pH 6.8*, if necessary, to produce a solution expected to contain 0.017% w/v of Capecitabine.

(2) 0.017% w/v of *capecitabine BPCRS* in *phosphate buffer pH 6.8*.

(3) 0.017% w/v of *capecitabine BPCRS* and 0.000025% w/v of *capecitabine impurity D EPCRS* in *phosphate buffer pH 6.8*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax Eclipse XDB-C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 250 nm.

(f) Inject 40 µL of each solution.

MOBILE PHASE

Mobile phase A 5 volumes of *acetonitrile*, 35 volumes of *methanol* and 60 volumes of a 0.1% v/v solution of *glacial acetic acid*.

Mobile phase B 5 volumes of *acetonitrile*, 80 volumes of *methanol* and 15 volumes of a 0.1% v/v solution of *glacial acetic acid*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	100	0	isocratic
5-20	100→49	0→51	linear gradient
20-30	49	51	isocratic
30-32	49→100	51→0	linear gradient
32-40	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and capecitabine is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{22}FN_3O_6$ in the medium using the declared content of $C_{15}H_{22}FN_3O_6$ in *capecitabine BPCRS*.

LIMITS

The amount of capecitabine released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. *Prepare the solutions immediately before use.*

Solvent A 5 volumes of *acetonitrile*, 35 volumes of *methanol* and 60 volumes of *water*.

(1) Shake a quantity of powdered tablets containing 60 mg of Capecitabine with 80 mL of solvent A, dilute to 100 mL with the solvent A and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A.

(3) Dilut1 2 volume of solution (2) to 5 volumes with solvent A.

(4) 0.06% w/v of *capecitabine BPCRS* and 0.0001% w/v each of *capecitabine impurity A EPCRS*, *capecitabine impurity B EPCRS* and *capecitabine impurity D EPCRS* in solvent A.

The chromatographic conditions described under Dissolution may be used with an injection volume of 10 µL.

When chromatograms are recorded under the prescribed conditions, the retention times relative to capecitabine (retention time, about 16 minutes) are: impurity A, about 0.16; impurity B, about 0.18; impurities D and E (co-elute), 0.94.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the *resolution* between the peaks due to impurity A and impurity B is at least 1.5;

the *resolution* between the peaks due to impurity D and capecitabine is at least 2.0.

LIMITS

Identify any peak corresponding to impurity B using the chromatogram obtained with solution (4) and multiply the peak area by the *correction factor* of 1.3.

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A or impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any peak due to impurities D and E is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. *Prepare the solutions immediately before use.*

Solvent A 5 volumes of *acetonitrile*, 35 volumes of *methanol* and 60 volumes of *water*.

(1) Shake a quantity of powdered tablets containing 60 mg of Capecitabine with 80 mL of solvent A, dilute to 100 mL with the solvent A and filter.

(2) 0.06% w/v of *capecitabine BPCRS* in solvent A.

(3) 0.06% w/v of *capecitabine BPCRS* and 0.0001% w/v of *capecitabine impurity D EPCRS* in solvent A.

The chromatographic conditions described under Dissolution may be used with an injection volume of 10 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and capecitabine is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{22}FN_3O_6$ in the tablets using the declared content of $C_{15}H_{22}FN_3O_6$ in *capecitabine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under *Capecitabine*.

www.webofpharma.com

Captopril Oral Solution

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Angiotensin-converting enzyme inhibitor.

DEFINITION
Captopril Oral Solution is a solution containing Captopril in a suitable flavoured vehicle. It is supplied as a ready-to-use solution or it is prepared by dissolving Captopril Powder for Oral Solution in the requisite volume of the vehicle provided just before issue for use.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate the oral solution also complies with the requirements stated under Unlicensed Medicines.

STORAGE
The oral solution should be stored at the temperature and used within the period stated on the label.

When supplied as a ready-to-use solution, the oral solution complies with the following requirements.

Content of captopril, $C_9H_{15}NO_3S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Add 10 mL of *dichloromethane* to a quantity of the oral solution containing 0.1 g of Captopril and shake gently (take care to avoid forming an emulsion). Remove the lower organic layer, repeat the extraction with two further 10-mL quantities of *dichloromethane*, combine the organic extracts and filter through *anhydrous sodium sulfate*. Mix 1 mL of the filtrate with 0.5 g of *potassium bromide*, dry at room temperature at a pressure of 2 kPa, grind to a uniform mixture and prepare a disc. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of captopril (*RS 038*).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to captopril in the chromatogram obtained with solution (2).

TESTS

Captopril disulfide
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the oral solution containing 25 mg of Captopril to 50 mL with *methanol* and mix.

(2) 0.0015% w/v of *captopril disulfide BPCRS* in *methanol*.

(3) Dilute 1 volume of solution (1) to 100 volumes with solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 450 volumes of *water* and 550 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to captopril and captopril disulfide is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak corresponding to captopril disulfide is not greater than the area of the peak in the chromatogram obtained with solution (2) (3%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution containing 25 mg of Captopril to 50 mL with mobile phase, mix and dilute 1 volume of the resulting solution to 5 volumes with the mobile phase.

(2) 0.01% w/v of *captopril BPCRS* and 0.0005% w/v of *captopril disulfide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 450 volumes of *water* and 550 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to captopril and captopril disulfide is at least 2.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_9H_{15}NO_3S$, weight in volume, using the declared content of $C_9H_{15}NO_3S$ in *captopril BPCRS*.

CAPTOPRIL POWDER FOR ORAL SOLUTION

DEFINITION
Captopril Powder for Oral Solution is a dry powder consisting of Captopril with or without excipients. It is supplied in a sealed container.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids. Where appropriate, the dry ingredients also comply with the requirements stated under Unlicensed Medicines.

Content of captopril, $C_9H_{15}NO_3S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of captopril (*RS 038*).

www.webofpharma.com

TESTS

Acidity

pH of a solution containing 2% w/v of Captopril, 2.0 to 2.6, Appendix V L.

Clarity of solution

A solution containing 2% w/v of Captopril in *carbon dioxide-free water* is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method II.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of the sealed container containing 50 mg of Captopril in the mobile phase and add sufficient mobile phase to produce 100 mL.

(2) Dilute 2 volumes of solution (1) to 100 volumes with the mobile phase.

(3) Dissolve a quantity of the contents of the sealed container containing 10 mg of Captopril in mobile phase, add 0.25 mL of 0.05M *iodine* and sufficient mobile phase to produce 100 mL. Dilute 10 volumes of the resulting solution to 100 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Nucleosil C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 3 times the retention time of Captopril.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 500 volumes of *methanol* and 500 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows three principal peaks and the *resolution* between the last two eluting principal peaks is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and any peak with a retention time less than 1.4 minutes.

ASSAY

Mix the contents of 10 containers and dissolve a quantity of the mixed contents containing 0.15 g of Captopril in 30 mL of *water*. Titrate with 0.05M *iodine*, determining the end-point potentiometrically, Appendix VIII B, using a combined platinum electrode.

Each mL of 0.05M *iodine* is equivalent to 21.73 mg of $C_9H_{15}NO_3S$.

Captopril Tablets

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Captopril Tablets contain Captopril.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of captopril, $C_9H_{15}NO_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Captopril in 25 mL of *methanol* with the aid of ultrasound and filter. Mix 1 mL of the filtrate with 0.5 g of *potassium bromide*, dry at room temperature at 2 kPa, grind to a uniform mixture and prepare a disc. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of captopril *(RS 038)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to captopril in the chromatogram obtained with solution (2).

TESTS

Captopril disulfide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Transfer a quantity of the powdered tablets containing 25 mg of Captopril to a centrifuge tube, add 25 mL of *methanol*, centrifuge for 15 minutes and use the supernatant liquid.

(2) 0.0030% w/v of *captopril disulfide BPCRS* in *methanol*.

(3) Dilute 1 volume of solution (1) to 100 volumes with solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Ace C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 450 volumes of *water* and 550 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to captopril and captopril disulfide is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to captopril disulfide is not greater than the area of the peak in the chromatogram obtained with solution (2) (3%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Transfer a quantity of the powdered tablets containing 25 mg of Captopril to a centrifuge tube, add 25 mL of the mobile phase, mix with the aid of ultrasound for 15 minutes and centrifuge. Dilute 1 volume of the supernatant liquid to 10 volumes with the mobile phase.

(2) 0.01% w/v of *captopril BPCRS* and 0.0005% w/v of *captopril disulfide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to captopril and captopril disulfide is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{15}NO_3S$ in the tablets using the declared content of $C_9H_{15}NO_3S$ in *captopril BPCRS*.

Carbamazepine Oral Suspension

Carbamazepine Oral Suspensions from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, unless justified and authorised.

Action and use
Antiepileptic.

DEFINITION
Carbamazepine Oral Suspension is a suspension of Carbamazepine in a suitable vehicle.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Carbamazepine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of carbamazepine, $C_{15}H_{12}N_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
To a quantity of the oral suspension containing 100 mg of Carbamazepine add 20 mL of 0.1M *sodium hydroxide* and extract with 3 successive 20-mL quantities of *dichloromethane*. Dry the combined extracts over *anhydrous sodium sulfate* and evaporate the *dichloromethane*. The *infrared absorption spectrum* of the residue, is concordant with the *reference spectrum* of carbamazepine (*RS 406*).

TESTS

Acidity
pH, 3.5 to 4.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake, with the aid of ultrasound, a quantity of the oral suspension containing 0.2 g of Carbamazepine with 50 mL of *methanol*, cool and dilute to 100 mL with *water*. Centrifuge 10 mL of the solution, transfer 5 mL of the supernatant liquid to a 10-mL volumetric flask and dilute to volume with *methanol (50%)*.

(2) Dilute 1 volume of solution (1) to 50 volumes with *methanol (50%)* and dilute 1 volume of the resulting solution to 10 volumes with *methanol (50%)*.

(3) Dilute 5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol (50%)* and dilute to 50 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (10 µm) (Nucleosil CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

(g) Inject solution (1) and allow the chromatography to proceed for 10 times the retention time of carbamazepine.

MOBILE PHASE

30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, adding 0.2 volumes of *anhydrous formic acid* and 0.5 volumes of *trimethylamine* to 1000 volumes of the solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not more than 2.5 times the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a weighed quantity of the oral suspension containing 0.2 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50%)*.

(2) Prepare a 0.2% w/v solution of *carbamazepine BPCRS* in *methanol* and dilute 1 volume of this solution to 2 volumes with *water*. Dilute 1 volume of the resulting solution to 5 volumes with *methanol (50%)*.

(3) 5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol (50%)* and dilute to 50 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The conditions described under Related substances may be used.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{12}N_2O$, weight in volume, using the declared content of $C_{15}H_{12}N_2O$ in *carbamazepine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Carbamazepine.

Carbamazepine Tablets

Carbamazepine Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable.

Action and use

Antiepileptic.

DEFINITION

Carbamazepine Tablets contain Carbamazepine.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Carbamazepine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of carbamazepine, $C_{15}H_{12}N_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Boil a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 15 mL of *acetone*, filter the hot solution, wash the residue with two 5-mL quantities of hot *acetone*, cool in ice and evaporate the combined filtrates to dryness. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of carbamazepine (*RS 406*).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix and filter.

(2) Dilute 1 volume of solution (1) to 500 volumes with *methanol (50%)*.

(3) Dissolve 7.5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 100 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (10 µm) (Nucleosil 10 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 10 times the retention time of carbamazepine.

MOBILE PHASE

30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, adding 0.2 volume of *anhydrous formic acid* and 0.5 volume of *triethylamine* to 1000 volumes of the solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50%)*.

(2) 0.03% w/v of *carbamazepine BPCRS* in *methanol (50%)*.

(3) Dissolve 7.5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 100 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used, with the exception of the run time.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{12}N_2O$ in the tablets using the declared content of $C_{15}H_{12}N_2O$ in *carbamazepine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Carbamazepine.

www.webofpharma.com

Carbamazepine Chewable Tablets

Chewable Carbamazepine Tablets

Carbamazepine Chewable Tablets from different manufacturers, whilst complying with the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Antiepileptic.

DEFINITION
Carbamazepine Chewable Tablets contain Carbamazepine.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Carbamazepine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of carbamazepine, $C_{15}H_{12}N_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Boil a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 15 mL of *acetone*, filter the hot solution, wash the residue with two 5-mL quantities of hot *acetone*, cool in ice and evaporate the combined filtrates to dryness. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of carbamazepine (*RS 406*).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix and filter.

(2) Dilute 1 volume of solution (1) to 50 volumes with *methanol (50%)* and dilute 1 volume of the resulting solution to 10 volumes with *methanol (50%)*.

(3) Dilute 5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 50 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (10 µm) (Nucleosil CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 10 times the retention time of carbamazepine.

MOBILE PHASE

30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, adding 0.2 volumes of *anhydrous formic acid* and 0.5 volumes of *triethylamine* to 1000 volumes of the solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not more than 2.5 times the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50%)*.

(2) Prepare a 0.2% w/v solution of *carbamazepine BPCRS* in *methanol* and dilute 1 volume of this solution to 2 volumes with *water*. Dilute 1 volume of the resulting solution to 5 volumes with *methanol (50%)*.

(3) 5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 50 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used, with the exception of the run time.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{12}N_2O$, in the tablets from the chromatograms obtained and using the declared content of $C_{15}H_{12}N_2O$ in *carbamazepine BPCRS*.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Carbamazepine.

Carbamazepine Prolonged-release Tablets

Prolonged-release Carbamazepine Tablets

Carbamazepine Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Antiepileptic.

DEFINITION
Carbamazepine Prolonged-release Tablets contain Carbamazepine. They are formulated so that the medicament is released over a period of several hours.

www.webofpharma.com

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Carbamazepine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of carbamazepine, $C_{15}H_{12}N_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Boil a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 15 mL of *acetone*, filter the hot solution, wash the residue with two 5-mL quantities of hot *acetone*, cool in ice and evaporate the combined filtrates to dryness. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of carbamazepine (*RS 406*).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (50%)* and dilute 1 volume of the resulting solution to 5 volumes with the same solvent.

(3) Dissolve 7.5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 100 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (10 µm) (Nucleosil 10 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 10 times the retention time of carbamazepine.

MOBILE PHASE

30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, adding 0.2 volumes of *anhydrous formic acid* and 0.5 volume of *triethylamine* to 1000 volumes of the solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the peak due to carbamazepine in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 mL of *methanol* for 15 minutes. Dilute to 200 mL with *water*, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50%)*.

(2) Prepare a 0.3% w/v solution of *carbamazepine BPCRS* in *methanol* and dilute 1 volume of this solution to 2 volumes with *water*. Dilute 1 volume of the resulting solution to 5 volumes with *methanol (50%)*.

(3) Dissolve 7.5 mg each of *carbamazepine BPCRS* and *carbamazepine impurity A EPCRS* in *methanol* and dilute to 100 mL with the same solvent. Dilute 1.0 mL of the resulting solution to 50 mL with *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used, with the exception of the run time.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbamazepine and carbamazepine impurity A is at least 1.7.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{12}N_2O$ in the tablets using the declared content of $C_{15}H_{12}N_2O$ in *carbamazepine BPCRS*.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Carbamazepine.

Carbimazole Tablets

Action and use
Thionamide antithyroid drug.

DEFINITION
Carbimazole Tablets contain Carbimazole.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of carbimazole, $C_7H_{10}N_2O_2S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Extract a quantity of the powdered tablets containing 50 mg of Carbimazole with two 5-mL quantities of *dichloromethane*. Combine the dichloromethane extracts, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum*, Appendix II A, of the residue after drying at 60° at a pressure not exceeding 0.7 kPa for 30 minutes is concordant with the *reference spectrum* of carbimazole (*RS 042*).

Thiamazole and other related substances
Carry out the test protected from light and prepare the solutions immediately before use.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 20 mg of Carbimazole in 10 mL of *acetonitrile* with the aid of ultrasound for 5 minutes, filter through a nylon syringe, filter and dilute 1 volume of the filtrate to 20 volumes with *water*.

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 200 volumes with mobile phase A.

(3) 0.00025% w/v of *thiamazole* in mobile phase A.

(4) 0.002% w/v of *carbimazole BPCRS* and 0.0001% w/v of *thiamazole* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 5 volumes of *acetonitrile* and 95 volumes of *water.*

Mobile phase B 20 volumes of *acetonitrile* and 80 volumes of *water.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-4.5	100	0	isocratic
4.5-4.6	100→0	0→100	linear gradient
4.6-30	0	100	isocratic
30-30.1	0→100	100→0	linear gradient
30.1-40	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to carbimazole and thiamazole is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to thiamazole is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the test protected from light and prepare the solutions immediately before use.

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 20 mg of Carbimazole in 10 mL of *acetonitrile* with the aid of ultrasound for 5 minutes, filter through a nylon syringe filter and dilute 1 volume of this solution to 40 volumes with a 5% v/v solution of *acetonitrile.*

(2) 0.005% w/v of *carbimazole BPCRS* in mobile phase A.

(3) 0.01% w/v of *carbimazole BPCRS* and 0.0005% w/v of *thiamazole* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to carbimazole and thiamazole is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_7H_{10}N_2O_2S$ in the tablets using the declared content of $C_7H_{10}N_2O_2S$ in *carbimazole BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Carbimazole.

Carbomer Eye Drops

Action and use

Stabilizer in pharmaceutical products.

DEFINITION

Carbomer Eye Drops are a sterile viscous solution of Carbomer 940 or Carbomer 980 in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

A. Add 15 g of the eye drops to 85 mL of *water* and mix thoroughly. To 3 mL add 1 mL of *calcium chloride solution*, a fine white precipitate is produced.

B. Add 0.5 mL of *thymol blue solution* to 10 g of the eye drops. A yellow colour is produced. Add 0.5 mL of *cresol red solution* to 10 g of the eye drops. A yellow colour is produced.

TESTS

Acidity or alkalinity

pH, 6.6 to 7.1, Appendix V L.

Apparent viscosity

75 to 125% of the declared value when determined by the following method. Empty the contents of sufficient containers to obtain 200 g of the eye drops, taking care to avoid incorporation of air bubbles, and homogenise. Allow to stand at 25° for 60 minutes. Immerse the appropriate spindle of a rotational viscometer, switch on after 5 minutes and determine the *viscosity* at 25°, Appendix V H, Method III, using a shear speed of 5 per second.

Clarity of solution

The eye drops are not more opalescent than *reference suspension III*, Appendix IV A.

LABELLING

The label states the nominal viscosity in millipascal seconds.

Carboplatin Injection

Action and use

Platinum-containing cytotoxic.

DEFINITION

Carboplatin Injection is a sterile solution of Carboplatin in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of carboplatin, $C_6H_{12}N_2O_4Pt$

90.0 to 105.0% of the stated amount.

www.webofpharma.com

Carry out the following procedures protected from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions within 2 hours of preparation.

(1) Use the injection diluted, if necessary, with *water* to produce a solution containing 0.1% w/v of Carboplatin.

(2) 0.1% w/v of *carboplatin BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air for 2 hours. Spray the plate with a solution prepared immediately before use by dissolving 5.6 g of *tin(II)chloride* in 10 mL of *hydrochloric acid* (dissolution may not be complete, filter if necessary), adding 90 mL of *water* and 1 g of *potassium iodide* and stirring. Heat the plate at 100° for 10 minutes and examine in daylight.

MOBILE PHASE

20 volumes of *water* and 80 volumes of *acetone*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.0 to 7.0, Appendix V L.

Cyclobutane-1,1-dicarboxylic acid

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the injection with *water* to produce a solution containing 0.1% w/v of Carboplatin; use within 2 hours of preparation.

(2) 0.001% w/v of *cyclobutane-1,1-dicarboxylic acid* in *water*.

(3) Mix 1 volume of solution (1) with 1 volume of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless-steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µ-Bondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 100 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 2.5 times the retention time of the principal peak.

MOBILE PHASE

20 volumes of solution A prepared as described below, 100 volumes of *acetonitrile* and 880 volumes of *water*.
To prepare solution A dissolve 8.5 g of *tetrabutylammonium hydrogen sulfate* in 80 mL of *water*, add 3.4 mL of *orthophosphoric acid* and adjust the pH to 7.55 with 10M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peak due to carboplatin and that due to cyclobutane-1,1-dicarboxylic acid is at least 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to cyclobutane-1,1-dicarboxylic acid is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection with *water BET*, if necessary, to contain 10 mg of Carboplatin per mL (solution A). The endotoxin limit concentration of solution A is 5.4 IU of endotoxin per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions within 2 hours of preparation.

(1) Dilute the injection with *water* to produce a solution containing 0.1% w/v of Carboplatin.

(2) 0.1% w/v of *carboplatin BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless-steel column (30 cm × 3.9 mm) packed with *aminopropylsilyl silica gel for chromatography* (10 µm) (µ-Bondapak-NH_2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

130 volumes of *water* and 870 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (1), the *capacity factor* is not less than 4.0, the number of *theoretical plates* is not less than 5000 and the *symmetry factor* is not more than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_{12}N_2O_4Pt$ in the injection using the declared content of $C_6H_{12}N_2O_4Pt$ in *carboplatin BPCRS*.

STORAGE

Carboplatin Injection should be protected from light and free from contact with metals.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Carboplatin.

www.webofpharma.com

Carmellose Sodium Eye Drops

Action and use
Used in the treatment of tear deficiency.

DEFINITION
Carmellose Sodium Eye Drops are a sterile colloidal solution of Carmellose Sodium in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of carmellose sodium
95.0 to 115.0% of the stated amount.

IDENTIFICATION
A. To 10 mL of the eye drops, add 1 mL of *copper sulfate solution*. A blue, cotton-like precipitate is formed.

B. In the Assay, the spectrum obtained with solution (1) shows maxima at about 295, 366, 519 and 635 nm. The spectrum obtained with solution (1) corresponds to the spectrum obtained with solution (2).

TESTS
Clarity and colour of solution
The eye drops are *clear*, Appendix IV A, and are not more intensely coloured than *reference solution* Y_6, Appendix IV B, Method II.

Acidity or alkalinity
pH, 6.0 to 8.0, Appendix V L.

Osmolality
The osmolality of the eye drops is 270 to 350 mosmol/kg, Appendix V N.

ASSAY
Dissolve 3.75 g of *diphenylamine* in 150 mL of *glacial acetic acid*, add 90 mL of *hydrochloric acid* and mix well (solution A).

For solution (1), use the eye drops, diluted if necessary, with *water* to contain 0.01% w/v of Carmellose Sodium. Pipette 2 mL of this solution into a glass stoppered test tube, add 5 mL of solution A, mix and immediately immerse the test tube in an oil bath maintained at 105° to 110° for 30 minutes, the bath temperature being kept uniform to within 0.1° during this time. Remove the test tube, place in an ice bath until cooled and allow to equilibrate to room temperature for not more than 1 hour. For solution (2), prepare a solution containing 0.01% w/v of *carmellose sodium BPCRS* in *water* and treat at the same time and in the same manner as solution (1), starting at the words "pipette 2 mL of this solution ....". For solution (3), use *water* and treat at the same time and in the same manner as solution (1), starting at the words "pipette 2 mL of this solution....".

Measure the *absorbance* of solution (1) and solution (2) at the maximum at about 635 nm, Appendix II B, using solution (3) in the reference cell. Calculate the content of Carmellose Sodium in the eye drops from the values of the absorbances obtained and using the declared content of Carmellose Sodium in *carmellose sodium BPCRS*.

Carteolol Eye Drops

Action and use
Beta-adrenoceptor antagonist.

DEFINITION
Carteolol Eye Drops are a sterile solution of Carteolol Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of carteolol hydrochloride, $C_{16}H_{24}N_2O_3,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the eye drops with *water*, if necessary, to contain 0.5% w/v of Carteolol Hydrochloride.

(2) 0.5% w/v of *carteolol hydrochloride BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 20 volumes of *methanol* and 50 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 6.2 to 7.2, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the eye drops with the mobile phase to contain 0.20% w/v of Carteolol Hydrochloride.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (YMC-Pack ODS-A is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate such that the retention time of carteolol hydrochloride is about 14 minutes (1 mL per minute may be suitable).

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 252 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

MOBILE PHASE

1 volume of *methanol*, 20 volumes of *acetonitrile* and 79 volumes of a 0.282% w/v solution of *sodium hexanesulfonate*.

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (2) the *column efficiency*, determined on the principal peak, is at least 6000 *theoretical plates* per metre.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the area of not more than one such peak is greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%);

the sum of the areas of all such peaks is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.6%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the eye drops to contain 0.002% w/v of Carteolol Hydrochloride.

(2) 0.002% w/v of *carteolol hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Lichrospher C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 252 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1.0 g of *potassium dihydrogen orthophosphate* in a mixture of 80 mL of *acetonitrile* and 400 mL of *water*.

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (2) the *column efficiency*, determined on the principal peak, is at least 6000 *theoretical plates* per metre.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{24}N_2O_3$,HCl in the eye drops using the declared content of $C_{16}H_{24}N_2O_3$,HCl in *carteolol hydrochloride BPCRS*.

Carvedilol Tablets

Action and use

Beta-adrenoceptor antagonist; arteriolar vasodilator.

DEFINITION

Carvedilol Tablets contain Carvedilol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of Carvedilol, $C_{24}H_{26}N_2O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of powdered tablets containing 50 mg of Carvedilol with 20 mL of *dichloromethane* for 15 minutes. Filter (a GF/C filter is suitable), evaporate the filtrate to dryness under a stream of nitrogen and dry at 60° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *infrared absorption spectrum* of *Carvedilol BPCRS* prepared in the same manner. Compare the spectra between 1500 cm^{-1} and 400 cm^{-1}.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a 0.7% v/v solution of *hydrochloric acid* adjusted to pH 1.5 using *sodium hydroxide (50%)*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10-mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, to produce a solution expected to contain 0.00035% w/v of Carvedilol, at 285 nm and 380 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a 0.00035% w/v solution of *carvedilol BPCRS* at 285 nm and 380 nm in dissolution medium, using dissolution medium in the reference cell.

Calculate the corrected absorbance from the following expression:

$$A_{CORR} = A_{285} - A_{380}$$

Where:

A_{CORR} = the corrected absorbance

A_{285} = the absorbance at 285 nm

A_{380} = the absorbance at 380 nm

DETERMINATION OF CONTENT

Calculate the total content of carvedilol, $C_{24}H_{26}N_2O_4$, in the medium from the corrected absorbances obtained and using the declared content of $C_{24}H_{26}N_2O_4$, in *carvedilol BPCRS*.

LIMITS

The amount of carvedilol released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a mixture of 1 volume of 1M *hydrochloric acid* and 9 volumes of *methanol* (diluent).

(1) Shake a quantity of the powdered tablets containing 25 mg of Carvedilol in 10 mL of *water* for 20 minutes. Add 70 mL of diluent and mix with the aid of ultrasound for 30 minutes. Dilute to 100 mL with diluent, mix and centrifuge. Dilute 1 volume of the supernatant liquid to 2 volumes with *water* and filter (a 0.45-µm filter is suitable).

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with diluent. Dilute 1 volume of this solution to 10 volumes with diluent.

(3) Dissolve 3.125 mg of *carvedilol impurity C EPCRS* in a solution consisting of 1 volume of *water* and 9 volumes of diluent. Dilute to 250 mL with *methanol (50%)*. Dilute 10 mL of this solution to 100 mL with a solution consisting of 1 volume of diluent and 1 volume of *water*. Dilute 1 volume of this solution to 50 volumes with a solution consisting of 1 volume of diluent and 1 volume of water.

(4) 0.1% w/v of *carvedilol for system suitability EPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (5 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (3 µm) (Hypersil MOS-1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Buffer solution

10 volumes of *triethylamine* and 500 volumes of a 0.14% w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.0 using *orthophosphoric acid*.

Mobile phase A 75 volumes of a 0.69% w/v solution of *sodium dodecyl sulfate* in buffer solution and 360 volumes of *acetonitrile* diluted to 1000 volumes with *water*.

Mobile phase B 75 volumes of a 0.69% w/v solution of *sodium dodecyl sulfate* in buffer solution and 450 volumes of *acetonitrile* diluted to 1000 volumes with *water*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	100	0	isocratic
20-25	100→0	0→100	linear gradient
25-45	0	100	isocratic
45-46	0→100	100→0	linear gradient
46-60	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to carvedilol (retention time about 12 minutes) are: impurity A, about 2.6; impurity C, about 2.5; impurity D, about 2.7.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *peak-to-valley* ratio is at least 3.5, where H_p is the height above the baseline of the peak due to impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity D;

in the chromatogram obtained with solution (3), the *signal-to-noise* ratio of the peak due to impurity C is at least 10.

LIMITS

Identify any peak in the chromatogram obtained with solution (1) corresponding to impurity A using the chromatogram obtained with solution (4). Multiply the area of this peak by a correction factor of 2.0

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.02%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks*, excluding the peak due to impurity C, is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the powdered tablets containing 31.25 mg of Carvedilol in 150 mL for 20 minutes and mix with the aid of ultrasound for 30 minutes. Dilute to 250 mL and filter (a 0.7-µm glass microfilter is suitable).

(2) 0.0125% w/v of *carvedilol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil 100-C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 285 nm.

(f) Inject 160 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of 0.1M *orthophosphoric acid* adjusted to pH 2.0 with 0.1M *potassium dihydrogen orthophosphate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to carvedilol is between 0.8 and 1.8.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{26}N_2O_4$ in the tablets using the declared content of $C_{24}H_{26}N_2O_4$ in *carvedilol BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, C and D listed under Carvedilol.

Cefaclor Capsules

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefaclor Capsules contain Cefaclor.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of anhydrous cefaclor, $C_{15}H_{14}ClN_3O_4S$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 0.3 g of anhydrous cefaclor with 100 mL of *water*, filter and dilute 1 mL of the filtrate to 100 mL with *water*. The *light absorption*, Appendix II B, in the range 190 nm to 310 nm, of the final solution exhibits a maximum only at 264 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium, filter and dilute the filtered solution, if necessary, with sufficient *water* to produce a solution expected to contain the equivalent of about 0.025% w/v of anhydrous cefaclor. Measure the *absorbance* of the filtered sample at the maximum at 264 nm, Appendix II B, using *water* in the reference cell.

(2) Measure the *absorbance* of a 0.025% w/v solution of *cefaclor BPCRS* in *water* using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of anhydrous cefaclor, $C_{15}H_{14}ClN_3O_4S$, in the medium from the absorbances obtained and using the declared content of $C_{15}H_{14}ClN_3O_4S$ in *cefaclor BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.27% w/v solution of *sodium dihydrogen orthophosphate* which has been adjusted to pH 2.5, if necessary, with *orthophosphoric acid* (solution A). The solutions should be freshly prepared.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 0.5 g of anhydrous cefaclor with 200 mL of solution A, add sufficient of solution A to produce 250 mL and filter.

(2) 0.002% w/v of *cefaclor BPCRS*.

(3) 0.0025% w/v of *cefaclor BPCRS* and 0.005% w/v of *delta-3-cefaclor BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS-2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.78% w/v solution of *sodium dihydrogen orthophosphate* adjusted to pH 4.0 with *orthophosphoric acid*.

Mobile phase B Mix 450 volumes of *acetonitrile* with 550 volumes of mobile phase A.

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes. Inject the solutions and carry out the following gradient elution.

Time (min)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 → 30	95 → 75	5 → 25	linear gradient
30 → 45	75 → 0	25 → 100	linear gradient
45 → 55	0	100	isocratic
55 → 70	0 → 95	100 → 5	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.0. If necessary, adjust the proportion of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered, mixed contents of 20 capsules containing the equivalent of 75 mg of anhydrous cefaclor with the mobile phase, add sufficient mobile phase to produce 250 mL and filter.

(2) 0.03% w/v of *cefaclor BPCRS* in the mobile phase.

(3) 0.03% w/v of each of *cefaclor BPCRS* and *delta-3-cefaclor BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Beckman Ultrasphere ODS and Supelcosil LC-18-DB are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 1 g of *sodium pentanesulfonate* in a mixture of 780 mL of *water* and 10 mL of *triethylamine*, adjust the pH to 2.5 using *orthophosphoric acid*, add 220 mL of *methanol* and mix.

www.webofpharma.com

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.5 and the *symmetry factor* of the peak due to cefaclor is at most 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{14}ClN_3O_4S$ in the capsules from the chromatograms obtained and using the declared content of $C_{15}H_{14}ClN_3O_4S$ in *cefaclor BPCRS*.

STORAGE

Cefaclor Capsules should be stored at a temperature not exceeding 30°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefaclor.

Cefaclor Oral Suspension

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefaclor Oral Suspension is a suspension of Cefaclor in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

STORAGE

The dry ingredients should be protected from light and stored at a temperature not exceeding 30°.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous cefaclor, $C_{15}H_{14}ClN_3O_4S$

When freshly constituted, not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing the equivalent of 0.3 g of anhydrous cefaclor with 500 mL of *water*, filter and use the filtrate. The *light absorption*, Appendix II B, in the range 190 nm to 310 nm, of the final solution exhibits a maximum only at 264 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.27% w/v solution of *sodium dihydrogen orthophosphate* which has been adjusted to pH 2.5, if necessary, with *orthophosphoric acid* (solution A). The solutions should be freshly prepared.

(1) Shake a quantity of the oral suspension containing the equivalent of 0.25 g of anhydrous cefaclor with 200 mL of solution A, add sufficient of solution A to produce 250 mL and filter.

(2) 0.001% w/v of *cefaclor BPCRS*.

(3) 0.0025% w/v of *cefaclor BPCRS* and 0.005% w/v of *delta-3-cefaclor BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS-2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.78% w/v solution of *sodium dihydrogen orthophosphate* adjusted to pH 4.0 with *orthophosphoric acid*.

Mobile phase B Mix 450 volumes of *acetonitrile* with 550 volumes of mobile phase A.

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes. Inject the solutions and carry out the following gradient elution.

Time (min)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 → 30	95 → 75	5 → 25	linear gradient
30 → 45	75 → 0	25 → 100	linear gradient
45 → 55	0	100	isocratic
55 → 70	0 → 95	100 → 5	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.0. If necessary, adjust the proportion of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than 0.1 times that of the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the oral suspension containing the equivalent of 75 mg of anhydrous cefaclor with 200 mL of the mobile phase, add sufficient of the mobile phase to produce 250 mL and filter.

(2) 0.03% w/v of *cefaclor BPCRS* in the mobile phase.

(3) 0.03% w/v of each of *cefaclor BPCRS* and *delta-3-cefaclor BPCRS* in the mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Beckman Ultrasphere ODS and Supelcosil LC-18-DB are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 1 g of *sodium pentanesulfonate* in a mixture of 780 mL of *water* and 10 mL of *triethylamine*, adjust the pH to 2.5 using *orthophosphoric acid*, add 220 mL of *methanol* and mix.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.5 and the *symmetry factor* of the peak due to cefaclor is at most 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{14}ClN_3O_4S$, weight in volume, using the declared content of $C_{15}H_{14}ClN_3O_4S$ in *cefaclor BPCRS*.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be stored at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefaclor.

Cefaclor Prolonged-release Tablets

Prolonged-release Cefaclor Tablets

Cefaclor Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefaclor Prolonged-release Tablets contain Cefaclor. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Cefaclor. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous cefaclor, $C_{15}H_{14}ClN_3O_4S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 0.3 g of anhydrous cefaclor with 100 mL of *water*, filter and dilute 1 mL of the filtrate to 100 mL with *water*. The *light absorption*, Appendix II B, in the range 190 nm to 310 nm, of the final solution exhibits a maximum only at 264 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.27% w/v solution of *sodium dihydrogen orthophosphate* which has been adjusted to pH 2.5, if necessary, with *orthophosphoric acid* (solution A). The solutions should be freshly prepared.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.75 g of anhydrous cefaclor with 200 mL of solution A, add sufficient of solution A to produce 250 mL and filter.

(2) 0.003% w/v of *cefaclor BPCRS*.

(3) 0.0025% w/v of *cefaclor BPCRS* and 0.005% w/v of *delta-3-cefaclor EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS-2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.78% w/v solution of *sodium dihydrogen orthophosphate* adjusted to pH 4.0 with *orthophosphoric acid*.

Mobile phase B Mix 450 volumes of *acetonitrile* with 550 volumes of mobile phase A.

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes. Inject the solutions and carry out the following gradient elution.

Time (min)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 → 30	95 → 75	5 → 25	linear gradient
30 → 45	75 → 0	25 → 100	linear gradient
45 → 55	0	100	isocratic
55 → 70	0 → 95	100 → 5	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.0. If necessary, adjust the proportion of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any *secondary peak* is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.6%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.1 times that of the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 75 mg of anhydrous cefaclor with 200 mL of the mobile phase, add sufficient of the mobile phase to produce 250 mL and filter.

(2) 0.03% w/v of *cefaclor BPCRS* in the mobile phase.

(3) 0.03% w/v of each of *cefaclor BPCRS* and *delta-3-cefaclor EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Beckman Ultrasphere ODS and Supelcosil LC-18-DB are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 1 g of *sodium pentanesulfonate* in a mixture of 780 mL of *water* and 10 mL of *triethylamine*, adjust the pH to 2.5 using *orthophosphoric acid*, add 220 mL of *methanol* and mix.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefaclor and delta-3-cefaclor is at least 2.5 and the *symmetry factor* of the peak due to cefaclor is at most 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{14}ClN_3O_4S$ in the tablets from the chromatograms obtained and using the declared content of $C_{15}H_{14}ClN_3O_4S$ in *cefaclor BPCRS*.

STORAGE

Cefaclor Prolonged-release Tablets should be stored at a temperature not exceeding 30°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefaclor.

Cefadroxil Capsules

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefadroxil Capsules contain Cefadroxil Monohydrate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of anhydrous cefadroxil, $C_{16}H_{17}N_3O_5S$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 plates are suitable) and a mixture of 3 volumes of a 6.7% w/v solution of *ninhydrin* in *acetone*, 80 volumes of a 0.1M solution of *disodium hydrogen orthophosphate* and 120 volumes of a 0.1M solution of *citric acid* as the mobile phase. Impregnate the plate by development with a 5% v/v solution of *n-tetradecane* in *hexane*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) stir a quantity of the contents of the capsules containing the equivalent of 0.2 g of anhydrous cefadroxil with 100 mL of *water*, filter and use the filtrate. Solution (2) contains 0.2% w/v of *cefadroxil BPCRS* in *water*. After removal of the plate allow it to dry in air, spray with a 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat the plate at 110° for 10 minutes and allow to cool. The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 mL of *water* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 mL of the medium and filter. Measure the *absorbance* of the filtered medium, diluted if necessary with *water*, at the maximum at 263 nm using *water* in the reference cell, Appendix II B. Calculate the total content of anhydrous cefadroxil, $C_{16}H_{17}N_3O_5S$, in the medium from the *absorbance* obtained from a 0.003% w/v solution of *cefadroxil BPCRS* in *water* and using the declared content of $C_{16}H_{17}N_3O_5S$ in *cefadroxil BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. For solution (1) add 50 mL of the mobile phase to a quantity of the contents of the capsules containing the equivalent of 0.5 g of anhydrous cefadroxil, mix, stir magnetically for 10 minutes, filter and use the filtrate. Solution (2) contains 0.01% w/v of *cefadroxil BPCRS* in the mobile phase. Solution (3) contains 0.01% w/v of *D-α-(4-hydroxyphenyl)glycine BPCRS* (cefadroxil impurity A) in the mobile phase. Solution (4) contains 0.01% w/v of *7-aminodesacetoxycephalosporanic acid BPCRS* (cefadroxil impurity B) in the mobile phase.

www.webofpharma.com

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. For the mobile phase add 200 mL of 1M *potassium hydroxide*, 40 mL of *0.4M tetrabutylammonium hydroxide* and 80 mL of *methanol* to 1600 mL of *water*, mix, add sufficient *water* to produce 2000 mL and adjust the pH to 7.0, if necessary, with *orthophosphoric acid*. For solution (1) allow the chromatography to proceed for 6 times the retention time of the principal peak.

When the chromatograms are recorded under the conditions described above the retention time of cefadroxil is 8 to 12 minutes. If necessary, adjust the composition of the mobile phase (increasing the methanol content decreases the retention time, decreasing the methanol content increases the retention time).

The test is not valid unless the *column efficiency*, determined on the peak due to cefadroxil in the chromatogram obtained with solution (2), is at least 1500 *theoretical plates* per metre and the *symmetry factor* of the principal peak is at most 1.6.

Inject solution (2) five times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 2.0%.

In the chromatogram obtained with solution (1) the area of any peak corresponding to cefadroxil impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%), the area of any peak corresponding to cefadroxil impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (1%) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 0.5 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the mixed contents of 20 capsules containing the equivalent of 0.2 g of anhydrous cefadroxil with 150 mL of a phosphate buffer prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 2000 mL and adjusting the pH, if necessary, to 5.0 with 10M *potassium hydroxide* for 5 minutes. Add sufficient of the buffer solution to produce 200 mL and filter. Solution (2) contains 0.1% w/v of *cefadroxil BPCRS* in the buffer solution. Solution (3) contains 0.005% w/v of *cefadroxil BPCRS* and 0.05% w/v of *amoxicillin trihydrate BPCRS* in the buffer solution.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm or 10 µm) (Hypersil ODS is suitable), (b) as the mobile phase at a flow rate of 1.0 mL per minute a mixture of 4 volumes of *acetonitrile* and 96 volumes of a 0.272% w/v solution of *potassium dihydrogen orthophosphate* and (c) a detection wavelength of 254 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefadroxil and amoxicillin is at least 5.0. If necessary, adjust the *acetonitrile* content in the mobile phase.

Calculate the content of $C_{16}H_{17}N_3O_5S$ in the capsules using the declared content of $C_{16}H_{17}N_3O_5S$ in *cefadroxil BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefadroxil.

Cefadroxil Oral Suspension

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefadroxil Oral Suspension is a suspension of Cefadroxil Monohydrate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

STORAGE

The dry ingredients should be stored at a temperature not exceeding 30°.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous cefadroxil, $C_{16}H_{17}N_3O_5S$

When freshly constituted not more than 110.0% of the stated amount. When stored at the temperature and for the period stated on the label, during which the Oral Suspension may be expected to be satisfactory for use, not less than 90.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 plates are suitable) and a mixture of 3 volumes of a 6.7% w/v solution of *ninhydrin* in *acetone*, 80 volumes of a 0.1M solution of *disodium hydrogen orthophosphate* and 120 volumes of a 0.1M solution of *citric acid* as the mobile phase. Impregnate the plate by development with a 5% v/v solution of n-*tetradecane* in *hexane*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) dilute a volume of the oral suspension containing the equivalent of 0.2 g of anhydrous cefadroxil to 100 mL with *water*, filter and use the filtrate. Solution (2) contains 0.2% w/v of *cefadroxil BPCRS* in *water*. After removal of the plate, allow it to dry in air, spray with a 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat the plate at 110° for 10 minutes and allow to cool. The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the

www.webofpharma.com

principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the oral suspension with sufficient of mobile phase A to produce a solution containing the equivalent of 0.1% w/v of anhydrous cefadroxil, mix, stir magnetically for 10 minutes, filter through a 0.45-µm filter and use the filtrate. Solution (2) contains 0.001% w/v of *cefadroxil BPCRS* in mobile phase A. Solution (3) contains 0.001% w/v of *D-α-(4-hydroxyphenyl)glycine BPCRS* (cefadroxil impurity A) in mobile phase A. Solution (4) contains 0.001% w/v of *7-aminodesacetoxycephalosporanic acid BPCRS* (cefadroxil impurity B) in mobile phase A.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP-18 is suitable), (b) as mobile phases A and B with a flow rate of 1 mL per minute the solutions described below and (c) a detection wavelength of 254 nm.

Mobile phase A Dissolve 5.44 g of *potassium dihydrogen orthophosphate* in 2000 mL of *water* and adjust the pH, if necessary, to 5.0 with a 1% w/v solution of *potassium hydroxide*.

Mobile phase B Add 400 mL of *acetonitrile* to 600 mL of mobile phase A and adjust the pH, if necessary, to 5.0 with a 2% v/v solution of *orthophosphoric acid*.

Inject 20 µL of each solution and record the chromatograms under the following conditions. Elute initially with mobile phase A. After 5 minutes, use linear gradient elution increasing the concentration of mobile phase B to 32% after 35 minutes. Elute isocratically for 25 minutes with a mixture of 32% of mobile phase B and 68% of mobile phase A. Carry out a linear gradient elution for 1 minute to 100% of mobile phase A and elute for a further 9 minutes with mobile phase A.

When the chromatograms are recorded under the conditions described above the retention time of cefadroxil is 14 to 20 minutes. If necessary, adjust the proportion of mobile phase A to mobile phase B to achieve the stated retention time.

The test is not valid unless the *column efficiency*, determined on the peak due to cefadroxil in the chromatogram obtained with solution (2), is at least 2000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is at most 1.5.

Inject solution (2) five times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 2.0%.

In the chromatogram obtained with solution (1) the area of any peak corresponding to cefadroxil impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%), the area of any peak corresponding to cefadroxil impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (1%) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a weighed quantity of the oral suspension containing the equivalent of 0.25 g of anhydrous cefadroxil with 250 mL of a phosphate buffer prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 2000 mL and adjusting the pH, if necessary, to 5.0 with 10M *potassium hydroxide* for 5 minutes; filter and use the filtrate. Solution (2) contains 0.1% w/v of *cefadroxil BPCRS* in the buffer solution. Solution (3) contains 0.005% w/v of *cefadroxil BPCRS* and 0.05% w/v of *amoxicillin trihydrate BPCRS* in the buffer solution.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm or 10 µm) (Hypersil ODS is suitable), (b) as the mobile phase at a flow rate of 1.0 mL per minute a mixture of 4 volumes of *acetonitrile* and 96 volumes of a 0.272% w/v solution of *potassium dihydrogen orthophosphate* and (c) a detection wavelength of 254 nm.

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefadroxil and amoxicillin is at least 5.0. If necessary, adjust the *acetonitrile* content in the mobile phase.

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{17}N_3O_5S$, weight in volume, using the declared content of $C_{16}H_{17}N_3O_5S$ in *cefadroxil BPCRS*.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

Cefadroxil Oral Suspension should be kept at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefadroxil.

Cefalexin Capsules

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefalexin Capsules contain Cefalexin Monohydrate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of anhydrous cefalexin, $C_{16}H_{17}N_3O_4S$

92.5 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 0.5 g of anhydrous cefalexin with 1 mL of *water* and 1.4 mL of 1M *hydrochloric acid*, filter and wash the filter with 1 mL of *water*. Add slowly to the filtrate a saturated solution of *sodium acetate* until precipitation occurs. Add 5 mL of *methanol*, filter, wash the precipitate with two 1-mL quantities of *methanol* and dry the residue at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the dried residue, Appendix II A, is

www.webofpharma.com

concordant with the *reference spectrum* of cefalexin (*RS 049*). Retain the dried residue for use in test C.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 0.2 g of anhydrous cefalexin with 25 mL, dilute to 50 mL, filter and use the filtrate.

(2) 0.4% w/v of *cefalexin BPCRS*.

(3) 0.4% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *acetone* and 85 volumes of a 15.4% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with 5M *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

C. Mix 20 mg of the dried residue obtained in test A with 0.25 mL of a 1% v/v solution of *glacial acetic acid* and add 0.1 mL of a 1% w/v solution of *copper(II) sulfate* and 0.1 mL of 2M *sodium hydroxide*. An olive-green colour is produced.

TESTS

Disintegration

Maximum time, 15 minutes, using a 0.6% v/v solution of *hydrochloric acid* in place of *water*, Appendix XII A1.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in 2M *hydrochloric acid*.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 0.25 g of anhydrous cefalexin with 10 mL, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.025% w/v of *7-aminodesacetoxycephalosporanic acid BPCRS*.

(4) 0.025% w/v of DL-*phenylglycine*.

(5) 2.5% w/v of *cefalexin BPCRS* and 0.025% w/v of each of *7-aminodesacetoxycephalosporanic acid BPCRS* and DL-*phenylglycine*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel HF precoated plate (Analtech plates are suitable). Impregnate the plate by development with a 5% v/v solution of n-*tetradecane* in *hexane*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 90° for 3 minutes; spray the hot plate with a 0.1% w/v solution of *ninhydrin* in the mobile phase, heat the plate at 90° for 15 minutes and allow to cool.

MOBILE PHASE

3 volumes of *acetone*, 80 volumes of a 7.2% w/v solution of *disodium hydrogen orthophosphate* and 120 volumes of a 2.1% w/v solution of *citric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows three clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 7-aminodesacetoxycephalosporanic acid is not more intense than the spot in the chromatogram obtained with solution (3) (1%);

any spot corresponding to DL-phenylglycine is not more intense than the spot in the chromatogram obtained with solution (4) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake a quantity of the powdered, mixed contents of 20 capsules containing the equivalent of 0.25 g of anhydrous cefalexin with 100 mL of *water* for 30 minutes. Add sufficient *water* to produce 250 mL, filter and dilute 25 mL of the filtrate to 50 mL.

(2) 0.05% w/v of *cefalexin BPCRS*.

(3) 0.01% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* and 83 volumes of *water*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefalexin and cefradine is at least 4.0; if necessary, adjust the *acetonitrile* content of the mobile phase.

Inject solution (2) six times. The Assay is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0%.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{17}N_3O_4S$ in the capsules using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*.

www.webofpharma.com

STORAGE
Cefalexin Capsules should be stored at a temperature not exceeding 30°.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefalexin.

Cefalexin Oral Suspension

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefalexin Oral Suspension is a suspension of Cefalexin Monohydrate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

STORAGE
The dry ingredients should be protected from light and stored at a temperature not exceeding 30°.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous cefalexin, $C_{16}H_{17}N_3O_4S$
When freshly constituted, not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the oral suspension containing the equivalent of 0.2 g of anhydrous cefalexin with 70 mL of *methanol*, filter, evaporate to dryness using a rotary evaporator and dissolve the residue in sufficient 0.5M *hydrochloric acid* to produce 50 mL.

(2) 0.4% w/v of *cefalexin BPCRS* in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

(3) 0.4% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS* in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *acetone* and 85 volumes of a 15.4% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with 5M *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the oral suspension containing the equivalent of 0.1 g of anhydrous cefalexin with 70 mL of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in the minimum volume of a 1% v/v solution of *glacial acetic acid*, decolourise if necessary by the addition of sufficient *activated charcoal*, shake and filter. To 0.25 mL of the resulting solution add 0.1 mL of a 1% w/v solution of *copper(II) sulfate* and 0.05 mL of 2M *sodium hydroxide*. An olive-green colour is produced.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake a weighed quantity of the oral suspension containing the equivalent of 0.25 g of anhydrous cefalexin with 100 mL of *water* for 30 minutes. Add sufficient *water* to produce 250 mL, filter and dilute 25 mL of the filtrate to 50 mL.

(2) 0.05% w/v of *cefalexin BPCRS*.

(3) 0.01% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* and 83 volumes of *water*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefalexin and cefradine is at least 4.0; if necessary, adjust the *acetonitrile* content of the mobile phase.

Inject solution (2) six times. The Assay is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0%.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{17}N_3O_4S$, weight in volume, using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

www.webofpharma.com

STORAGE
The Oral Suspension should be stored at the temperature and used within the period stated on the label.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefalexin.

Cefalexin Tablets

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefalexin Tablets contain Cefalexin Monohydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous cefalexin, $C_{16}H_{17}N_3O_4S$
92.5 to 110.0% of the stated amount.

IDENTIFICATION
Remove any coating. Shake a quantity of the powdered tablet cores containing the equivalent of 0.5 g of anhydrous cefalexin with 1 mL of *water* and 1.4 mL of 1M *hydrochloric acid*, add 0.1 g of *activated charcoal*, shake, filter and wash the filter with 1 mL of *water*. Add slowly to the filtrate a saturated solution of *sodium acetate* until precipitation occurs. Add 5 mL of *methanol*, filter and wash the precipitate with two 1-mL quantities of *methanol*. The residue, after drying at a pressure not exceeding 0.7 kPa, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of cefalexin *(RS 049)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

(1) Shake 0.2 g with 25 mL, dilute to 50 mL, filter and use the filtrate.

(2) 0.4% w/v of *cefalexin BPCRS*.

(3) 0.4% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *acetone* and 85 volumes of a 15.4% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with 5M *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

C. Mix 20 mg with 0.25 mL of a 1% v/v solution of *glacial acetic acid* and add 0.1 mL of a 1% w/v solution of *copper(II) sulfate* and 0.1 mL of 2M *sodium hydroxide*. An olive-green colour is produced.

TESTS

Disintegration
Maximum time, 30 minutes, Appendix XII A1.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in 2M *hydrochloric acid*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of anhydrous cefalexin with 10 mL, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.025% w/v of *7-aminodesacetoxycephalosporanic acid BPCRS*.

(4) 0.025% w/v of DL-*phenylglycine*.

(5) 2.5% w/v of *cefalexin BPCRS* and 0.025% w/v of each of *7-aminodesacetoxycephalosporanic acid BPCRS* and DL-*phenylglycine*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel HF precoated plate (Analtech plates are suitable). Impregnate the plate by development with a 5% v/v solution of n-*tetradecane* in *hexane*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 90° for 3 minutes; spray the hot plate with a 0.1% w/v solution of *ninhydrin* in the mobile phase, heat the plate at 90° for 15 minutes and allow to cool.

MOBILE PHASE

3 volumes of *acetone*, 80 volumes of a 7.2% w/v solution of *disodium hydrogen orthophosphate* and 120 volumes of a 2.1% w/v solution of *citric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows three clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 7-aminodesacetoxycephalosporanic acid is not more intense than the spot in the chromatogram obtained with solution (3) (1%);

any spot corresponding to DL-phenylglycine is not more intense than the spot in the chromatogram obtained with solution (4) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.25 g of anhydrous cefalexin with 100 mL of *water* for 30 minutes. Add sufficient *water* to produce 250 mL, filter and dilute 25 mL of the filtrate to 50 mL.

(2) 0.05% w/v of *cefalexin BPCRS*.

www.webofpharma.com

(3) 0.01% w/v of each of *cefalexin BPCRS* and *cefradine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* and 83 volumes of *water*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefalexin and cefradine is at least 4.0; if necessary, adjust the *acetonitrile* content of the mobile phase.

Inject solution (2) six times. The Assay is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0%.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{17}N_3O_4S$ in the tablets using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*.

STORAGE

Cefalexin Tablets should be stored at a temperature not exceeding 30°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefalexin.

Cefazolin Injection

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefazolin Injection is a sterile solution of Cefazolin Sodium in Water for Injections. It is prepared by dissolving Cefazolin Sodium for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Cefazolin Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

CEFAZOLIN SODIUM FOR INJECTION

DEFINITION

Cefazolin Sodium for Injection is a sterile material consisting of Cefazolin Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cefazolin, $C_{14}H_{14}N_8O_4S_3$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient of a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0* to produce a solution containing the equivalent of 0.4% w/v of cefazolin.

(2) 0.4% w/v of *cefazolin sodium BPCRS* in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

(3) 0.4% w/v each of *cefazolin sodium BPCRS* and *cefoxitin sodium BPCRS* in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *acetonitrile* and 85 volumes of a 15% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with 5M *acetic acid*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

B. Yield reaction A characteristic *of sodium salts*, Appendix VI.

TESTS

Acidity

pH of a solution containing the equivalent of 10.0% w/v of cefazolin, 4.0 to 6.0, Appendix V L.

Clarity of solution

A solution containing the equivalent of 10.0% w/v of cefazolin in *carbon dioxide-free water* is *clear*, Appendix IV A. The *absorbance* of the solution measured at 430 nm is not greater than 0.15, Appendix II B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve the contents of a sealed container in sufficient mobile phase A to produce a solution containing the equivalent of 0.25% w/v of cefazolin.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Dissolve 20 mg of *cefazolin sodium BPCRS* in 10 mL of a 0.2% w/v solution of *sodium hydroxide*, allow to stand for 15 to 30 minutes and dilute 1 volume to 20 volumes with mobile phase A.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Nucleosil 120-3 C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A A solution containing 1.454% w/v of *disodium hydrogen orthophosphate* and 0.353% w/v of *potassium dihydrogen orthophosphate.*

Mobile phase B *acetonitrile for chromatography.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	98	2	isocratic
2-4	98 → 85	2 → 15	linear gradient
4-10	85 → 60	15 → 40	linear gradient
10-11.5	60 → 35	40 → 65	linear gradient
11.5-12	35	65	isocratic
12-15	35 → 98	65 → 2	linear gradient
15-21	98	2	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefazolin and the peak with a retention time relative to cefazolin of about 1.1 (cefazolin impurity L) is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3.5%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Water

Not more than 6.0% w/w, Appendix IX C, Method I. Use 0.3 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of cefazolin per mL (solution A). The endotoxin limit concentration of solution A is 1.5 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.1% w/v of cefazolin.

(2) 0.1% w/v of *cefazolin sodium BPCRS.*

(3) 0.005% w/v of *cefuroxime sodium BPCRS* and 0.01% w/v of *cefazolin sodium BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of 10 volumes of *acetonitrile* and 90 volumes of a solution containing 0.277% w/v of *disodium hydrogen orthophosphate* and 0.186% w/v of *citric acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to cefazolin and cefuroxime is at least 2.0. If necessary, adjust the concentration of *acetonitrile* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{14}N_8O_4S_3$ in a container of average content weight from the declared content of $C_{14}H_{14}N_8O_4S_3$ in *cefazolin sodium BPCRS.*

STORAGE

The sealed container should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The label on the sealed container states the quantity of Cefazolin Sodium contained in it in terms of the equivalent amount of cefazolin.

Cefotaxime Injection

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefotaxime Injection is a sterile solution of Cefotaxime Sodium in Water for Injections. It is prepared by dissolving Cefotaxime Sodium for Injection in the requisite amount of Water for Injections before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Cefotaxime Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

www.webofpharma.com

CEFOTAXIME SODIUM FOR INJECTION

DEFINITION

Cefotaxime Sodium for Injection is a sterile material consisting of Cefotaxime Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cefotaxime, $C_{16}H_{17}N_5O_7S_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of cefotaxime sodium *(RS 044)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient of a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0* (solution A) to produce a solution containing the equivalent of 0.4% w/v of cefotaxime.

(2) 0.4% w/v of *cefotaxime sodium EPCRS* in solution A.

(3) 0.4% w/v of each of *cefotaxime sodium EPCRS* and *cefoxitin sodium BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *acetone* and 85 volumes of a 15.4% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity
pH of a solution containing the equivalent of 10.0% w/v of cefotaxime, 4.5 to 6.5, Appendix V L.

Clarity and colour of solution
A solution containing the equivalent of 10.0% w/v of cefotaxime in *carbon dioxide-free water* is *clear*, Appendix IV A. The *absorbance* of the solution at 430 nm is not greater than 0.60, Appendix II B.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient of the mobile phase to produce a solution containing the equivalent of 0.1% w/v of cefotaxime.

(2) 0.001% w/v of *cefotaxime acid EPCRS* in the mobile phase.

(3) Dilute 1 mL of solution (1) to 10 mL with the mobile phase. To 4 mL of this solution add 1 mL of 2M *hydrochloric acid*, heat the solution at 40° for 2 hours, add 5 mL of *phosphate buffer pH 6.6* and 1 mL of 2M *sodium hydroxide* and mix.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 µm ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for at least 8 times the retention time of cefotaxime.

MOBILE PHASE

Dissolve 3.5 g of *potassium dihydrogen orthophosphate* and 11.6 g of *disodium hydrogen orthophosphate* in 1000 mL of *water* at pH 7.0 and add 375 mL of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of cefotaxime is about 6 minutes. If necessary, use another stationary phase or adjust the concentration of *methanol* in the mobile phase.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), cefotaxime is eluted as the second of the principal peaks and the *resolution factor* between the two principal peaks is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Ethanol
Not more than 1.0% w/v, Appendix VIII L, System A.

Water
Not more than 3.0% w/v, Appendix IX C. Use 0.300 g.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of cefotaxime per mL (solution A). The endotoxin limit concentration of solution A is 0.5 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions.

(1) Dissolve a quantity of the mixed contents of the 10 containers in sufficient of the mobile phase to produce a

www.webofpharma.com

solution containing the equivalent of 0.01% w/v of cefotaxime.

(2) 0.01% w/v of *cefotaxime acid EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 µm ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Dissolve 3.5 g of *potassium dihydrogen orthophosphate* and 11.6 g of *disodium hydrogen orthophosphate* in 1000 mL of *water* at pH 7.0 and add 375 mL of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is less than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{17}N_5O_7S_2$ in a container of average content weight from the declared content of $C_{16}H_{17}N_5O_7S_2$ in *cefotaxime acid EPCRS*.

STORAGE

The sealed container should be protected from light.

LABELLING

The label of the sealed container states the quantity of Cefotaxime Sodium contained in it in terms of the equivalent amount of cefotaxime.

Cefoxitin Injection

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefoxitin Injection is a sterile solution of Cefoxitin Sodium in Water for Injections. It is prepared by dissolving Cefoxitin Sodium for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Cefoxitin Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

CEFOXITIN SODIUM FOR INJECTION

DEFINITION

Cefoxitin Sodium for Injection is a sterile material consisting of Cefoxitin Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cefoxitin, $C_{16}H_{17}N_3O_7S_2$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of cefoxitin sodium *(RS 045)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient of a mixture of equal volumes of *methanol* and *0.067M mixed phosphate buffer pH 7.0* (solution A) to produce a solution containing the equivalent of 0.4% w/v of cefoxitin.

(2) 0.4% w/v of *cefoxitin sodium BPCRS* in solution A.

(3) 0.4% w/v of each of *cefoxitin sodium BPCRS* and *cefazolin sodium BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *tetrahydrofuran* and 90 volumes of a 15.4% w/v solution of *ammonium acetate* previously adjusted to pH 6.2 with 5M *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 1.0% w/v of cefoxitin, 4.2 to 7.0, Appendix V L.

Clarity and colour of solution

A solution containing the equivalent of 10.0% w/v of cefoxitin in *carbon dioxide-free water* is *clear*, Appendix IV A, and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour, Appendix IV B, Method II.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use. Dilute 20 mL of a 3.48% w/v solution of *dipotassium hydrogen orthophosphate*, adjusted to pH 6.8 with *orthophosphoric acid*, to 1000 mL with *water* (solution B).

(1) Dissolve a quantity of the contents of a sealed container in sufficient of solution B to produce a solution containing the equivalent of 0.5% w/v of cefoxitin.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution B.

(3) Add 7 mL of *water* and 2 mL of *methanol* to 1 mL of a 0.5% w/v solution of *cefoxitin sodium BPCRS* in solution B. Add 25 mg of *sodium carbonate*, stir for 10 minutes at room

www.webofpharma.com

temperature, heat in a water-bath at 70° for 30 minutes and allow to cool. Add 3 drops of *glacial acetic acid* and 0.4 mL of a 0.5% w/v solution of *cefoxitin sodium BPCRS* in solution B and mix (generation of cefoxitin lactone).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *phenylsilyl silica gel for chromatography* (5 µm) (Zorbax SB Phenyl is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A *water*, which has been adjusted to pH 2.7 with *anhydrous formic acid*.

Mobile phase B *acetonitrile*.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 12	90	10
12 - 37	90 → 80	10 → 20
37 - 50	80 → 60	20 → 40
50 - 55	60 → 20	40 → 80
55 - 60	20	80
60 - 62	20 → 90	80 → 10
62 - 70	90	10

When the chromatograms are recorded under the prescribed conditions the retention time of cefoxitin is about 34 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peak due to cefoxitin and the peak with a retention time relative to cefoxitin of about 1.31 (cefoxitin lactone) is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of not more than three such peaks is greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Water

Not more than 1.0% w/w, Appendix IX C, Method I. Use 0.5 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of cefoxitin per mL (solution A). The endotoxin limit concentration of solution A is 1.3 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.1% w/v of cefoxitin.

(2) 0.1% w/v of *cefoxitin sodium BPCRS*.

(3) 0.08% w/v of *2-(2-thienyl)acetic acid*.

(4) Mix 1 volume of solution (2) and 5 volumes of solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm to 10 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of 5M *acetic acid*, 19 volumes of *acetonitrile* and 81 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{17}N_3O_7S_2$ in a container of average content weight from the declared content of $C_{16}H_{16}N_3NaO_7S_2$ in *cefoxitin sodium BPCRS*. Each mg of $C_{16}H_{16}N_3NaO_7S_2$ is equivalent to 0.9510 mg of $C_{16}H_{17}N_3O_7S_2$.

STORAGE

The sealed container should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The label of the sealed container states the quantity of Cefoxitin Sodium contained in it in terms of the equivalent amount of cefoxitin.

Cefradine Capsules

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefradine Capsules contain Cefradine.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of cephalosporins, calculated as the sum of cefradine ($C_{16}H_{19}N_3O_4S$), cefalexin ($C_{16}H_{17}N_3O_4S$) and 4′,5′-dihydrocefradine ($C_{16}H_{21}N_3O_4S$)

90.0 to 105.0% of the stated amount of Cefradine.

www.webofpharma.com

IDENTIFICATION

A. The *infrared absorption spectrum* of the contents of the capsules, Appendix II A, is concordant with the *reference spectrum* of cefradine *(RS 050)*. If the spectra are not concordant, dissolve a quantity of the capsule contents containing 30 mg of Cefradine in 10 mL of *methanol*, evaporate to dryness at 40° at a pressure of 2 kPa and prepare a new spectrum.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 0.1 g of Cefradine with 25 mL of 0.01M *ammonia* for 45 minutes and dilute 1 mL of the resulting solution to 10 mL with 0.01M *ammonia*.

(2) 0.040% w/v of *cefradine BPCRS* in 0.01M *ammonia*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Analtech plates are suitable). Impregnate the plate by placing it in a tank containing a shallow layer of a 5% v/v solution of n-*tetradecane* in n-*hexane*, allowing the impregnating solvent to ascend to the top, removing the plate from the tank and allowing the solvent to evaporate; use with the flow of the mobile phase in the same direction that the impregnation was carried out.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat at 90° for 2 to 3 minutes and spray the hot plate with a 0.1% w/v solution of *ninhydrin* in the mobile phase. Heat at 90° for 15 minutes in a circulating air oven with the plates parallel to the airflow, cool for 15 minutes protected from light and examine in daylight.

MOBILE PHASE

3 volume of *acetone*, 80 volumes of 0.2M *anhydrous disodium hydrogen orthophosphate* and 120 volumes of 0.1M *citric acid*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.12M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium, filter and dilute the filtered solution, if necessary, with sufficient 0.12M *hydrochloric acid* to produce a solution expected to contain about 0.0025% w/v of Cefradine. Measure the *absorbance* of the filtered sample at the maximum at 255 nm, Appendix II B, using 0.12M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a 0.0025% w/v solution of *cefradine BPCRS* in 0.12M *hydrochloric acid* using 0.12M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of cephalosporins, as the sum of the contents of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ in the medium from the *absorbance* obtained and using the declared content of total cephalosporins in *cefradine BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 0.3 g of Cefradine in mobile phase A, add sufficient mobile phase A to produce 50 mL and filter through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) 0.012% w/v of each of *cefradine BPCRS* and *cefalexin BPCRS* in mobile phase A.

(4) 0.003% w/v of *cyclohexa-1,4-dienylglycine EPCRS* (impurity B) in mobile phase A.

(5) Dissolve 6 mg of *cefradine for peak identification EPCRS* (containing impurities C, D and E) in 1 mL of mobile phase A.

(6) Dissolve the contents of a vial of *cefradine impurity mixture EPCRS* (containing impurities A and G) in 1 mL of mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Varian Chrompack Inertsil ODS-3 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Mobile phase A 0.272% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *dilute orthophosphoric acid*.

Mobile phase B *methanol R2*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2.5	99.5→97	0.5→3	linear gradient
2.5-11	97→75	3→25	linear gradient
11-13	75→60	25→40	linear gradient
13-16	60	40	isocratic
16-19	60→20	40→80	linear gradient
19-19.1	20→99.5	80→0.5	linear gradient
19.1-25	99.5	0.5	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to Cefradine (retention time = about 15 minutes) are: impurity A = about 0.27; impurity B = about 0.32; impurity C = about 0.53; impurity D = about 0.63; impurity E = about 0.80; impurity F = about 0.92; cefalexin = about 0.95; 4′,5′-dihydrocefradine = about 1.06; impurity G = about 1.32.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefalexin and cefradine is at least 4.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) due to impurities C, D and E using the chromatogram obtained with solution (5) and the chromatogram supplied with *cefradine for peak identification EPCRS*. Identify any peaks in the chromatogram obtained with solution (1) due to impurities A and G using the chromatogram obtained with solution (6) and the chromatogram supplied with *cefradine impurity mixture EPCRS*. Identify any peak in the chromatogram obtained with solution (1) due to impurity B using the chromatogram obtained with solution (4). Multiply the area of any peak corresponding to impurity B by the following correction factor: 3.4.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A, B, D, F or G is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25% for each);

the area of any peak corresponding to impurity C is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity E is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard the peaks due to cefalexin, and 4′,5′-dihydrocefradine and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Cefalexin

Not more than 10.0%, calculated as the percentage of $C_{16}H_{17}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

4′,5′-Dihydrocefradine

Not more than 2.0%, calculated as the percentage of $C_{16}H_{21}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

Loss on drying

The contents of the capsules, when dried at 60° at a pressure not exceeding 0.7 kPa for 3 hours, lose not more than 7.0% of their weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 3 volumes of 0.7M *glacial acetic acid*, 15 volumes of 0.5M *sodium acetate*, 200 volumes of *methanol* and 782 volumes of *water* (solution A).

(1) Dissolve a quantity of the powdered mixed contents of 20 capsules to produce a solution containing 0.05% w/v of Cefradine.

(2) 0.05% w/v of *cefradine BPCRS*.

(3) 0.005% w/v of *cefalexin BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes with solution A. Mix equal volumes of this solution and solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

25 volumes of *methanol* and 75 volumes of *phosphate buffer solution pH 5.0*.

When the chromatograms are recorded under the prescribed conditions, the retention time of the peak due to 4′,5′-dihydrocefradine relative to that of cefradine is about 1.6.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to cefradine and cefalexin is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of cephalosporins in the capsules by determining the sum of the contents of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$. Calculate the content of $C_{16}H_{19}N_3O_4S$ (cefradine) using the declared content of $C_{16}H_{19}N_3O_4S$ in *cefradine BPCRS*. Calculate the content of $C_{16}H_{17}N_3O_4S$ (cefalexin) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*. Calculate the content of $C_{16}H_{21}N_3O_4S$ (4′,5′-dihydrocefradine) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS* and multiplying the area of the peak due to 4′,5′-dihydrocefradine by a correction factor of 1.6.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Cefradine.

Cefradine Injection

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefradine Injection is a sterile solution of Cefradine in Water for Injections. It is prepared by dissolving Cefradine for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Cefradine Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

www.webofpharma.com

CEFRADINE FOR INJECTION

DEFINITION

Cefradine for Injection is a sterile material consisting of Cefradine with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cephalosporins, calculated as the sum of cefradine ($C_{16}H_{19}N_3O_4S$), cefalexin ($C_{16}H_{17}N_3O_4S$) and 4′,5′-dihydrocefradine ($C_{16}H_{21}N_3O_4S$)
95.0 to 110.0% of the stated amount of Cefradine.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient *water* to produce a solution containing 0.3% w/v of Cefradine.

(2) 0.3% w/v of *cefradine BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Analtech plates are suitable). Impregnate the plate by placing it in a tank containing a shallow layer of a 5% v/v solution of n-*tetradecane* in n-*hexane*, allowing the impregnating solvent to ascend to the top, removing the plate from the tank and allowing the solvent to evaporate; use with the flow of the mobile phase in the same direction that the impregnation was carried out.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry at 105° and examine in daylight.

MOBILE PHASE

3 volumes of a 6.7% w/v solution of *ninhydrin* in *acetone*, 80 volumes of 0.1M *anhydrous disodium hydrogen orthophosphate* and 120 volumes of 0.1M *citric acid*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity
pH of a solution containing 1% w/v of Cefradine, 8.0 to 9.6, Appendix V L.

Clarity and colour of solution
A solution containing 13.6% w/v of Cefradine in *water* is *clear*, Appendix IV A. The *absorbance* of the solution at 450 nm is not greater than 0.6, Appendix II B.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container containing 0.3 g of Cefradine in mobile phase A and add sufficient mobile phase A to produce 50 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) 0.012% w/v of each of *cefradine BPCRS* and *cefalexin BPCRS* in mobile phase A.

(4) 0.003% w/v of *cyclohexa-1,4-dienylglycine EPCRS* (impurity B) in mobile phase A.

(5) Dissolve 6 mg of *cefradine for peak identification EPCRS* (containing impurities C, D and E) in 1 mL of mobile phase A.

(6) Dissolve the contents of a vial of *cefradine impurity mixture EPCRS* (containing impurities A and G) in 1 mL of mobile phase A.

(7) 0.1% w/v of *arginine* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Varian Chrompack Inertsil ODS-3 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Mobile phase A 0.272% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *dilute orthophosphoric acid*.

Mobile phase B *methanol R2*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2.5	99.5→97	0.5→3	linear gradient
2.5-11	97→75	3→25	linear gradient
11-13	75→60	25→40	linear gradient
13-16	60	40	isocratic
16-19	60→20	40→80	linear gradient
19-19.1	20→99.5	80→0.5	linear gradient
19.1-25	99.5	0.5	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to Cefradine (retention time = about 15 minutes) are: impurity A = about 0.27; impurity B = about 0.32; impurity C = about 0.53; impurity D = about 0.63; impurity E = about 0.80; impurity F = about 0.92; cefalexin = about 0.95; 4′,5′-dihydrocefradine = about 1.06; impurity G = about 1.32.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefalexin and cefradine is at least 4.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) due to impurities C, D and E using the chromatogram obtained with solution (5) and the chromatogram supplied with *cefradine for peak identification EPCRS*. Identify any peaks in the chromatogram obtained with solution (1) due to impurities A and G using the chromatogram obtained with solution (6) and the chromatogram supplied with *cefradine impurity mixture EPCRS*. Identify any peak in the chromatogram obtained with solution (1) due to impurity B using the chromatogram obtained with solution (4). Multiply

www.webofpharma.com

the area of any peak corresponding to impurity B by the following correction factor: 3.4.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A, B, C, D, E, F or G is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25% for each);

the area of any other *secondary peak* is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard the peaks due to cefalexin, 4′,5′-dihydrocefradine and any peak corresponding to the principal peak in the chromatogram obtained with solution (7) (arginine) and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Cefalexin
Not more than 5.0%, calculated as the percentage of $C_{16}H_{17}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

4′,5′-Dihydrocefradine
Not more than 2.0%, calculated as the percentage of $C_{16}H_{21}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

Water
Not more than 5.0% w/w, Appendix IX C. Use 0.4 g.

ASSAY
Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parental Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 3 volumes of 0.7M *glacial acetic acid*, 15 volumes of 0.5M *sodium acetate*, 200 volumes of *methanol* and 782 volumes of *water* (solution A).

(1) Dissolve a quantity of the mixed contents of the 10 containers in sufficient of solution A to produce a solution containing 0.05% w/v of Cefradine.

(2) 0.05% w/v of *cefradine BPCRS*.

(3) 0.005% w/v of *cefalexin BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes with solution A. Mix equal volumes of this solution and solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

25 volumes of *methanol* and 75 volumes of *phosphate buffer solution pH 5.0*.

When the chromatograms are recorded under the prescribed conditions, the retention time of the peak due to 4′,5′-dihydrocefradine relative to that of cefradine is about 1.6.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to cefradine and cefalexin is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of cephalosporins in a container of average content weight by determining the sum of the contents of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$. Calculate the content of $C_{16}H_{19}N_3O_4S$ (cefradine) using the declared content of $C_{16}H_{19}N_3O_4S$ in *cefradine BPCRS*. Calculate the content of $C_{16}H_{17}N_3O_4S$ (cefalexin) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*. Calculate the content of $C_{16}H_{21}N_3O_4S$ (4′,5′-dihydrocefradine) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS* and multiplying the area of the peak due to 4′,5′-dihydrocefradine by a correction factor of 1.6.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Cefradine.

Cefradine Oral Suspension

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefradine Oral Suspension is a suspension of Cefradine in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for the Preparation of Oral Liquids stated under Oral Liquids.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cephalosporins, calculated as the sum of cefradine ($C_{16}H_{19}N_3O_4S$), cefalexin ($C_{16}H_{17}N_3O_4S$) and 4′,5′-dihydrocefradine ($C_{16}H_{21}N_3O_4S$)
When freshly constituted, not more than 110.0% of the stated amount of Cefradine. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 90.0% of the stated amount of Cefradine.

IDENTIFICATION
A. Shake a quantity of the oral suspension containing 25 mg of Cefradine with 100 mL of *water*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 261 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the oral suspension with sufficient *water* to produce a solution containing 0.3% w/v of Cefradine, filter and use the filtrate.

(2) 0.3% w/v of *cefradine BPCRS* in *water*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Analtech plates are suitable). Impregnate the plate by placing it in a tank containing a shallow layer of a 5% v/v solution of n-*tetradecane* in n-*hexane*, allowing the impregnating solvent to ascend to the top, removing the plate from the tank and allowing the solvent to evaporate; use with the flow of the mobile phase in the same direction that the impregnation was carried out.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate allow it to dry at 105° and examine in daylight.

MOBILE PHASE

3 volumes of a 6.7% w/v solution of *ninhydrin* in *acetone*, 80 volumes of 0.1M *anhydrous disodium hydrogen orthophosphate* and 120 volumes of 0.1M *citric acid*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the oral suspension containing 0.3 g of Cefradine in mobile phase A, add sufficient mobile phase A to produce 50 mL and filter through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) 0.012% w/v of each of *cefradine BPCRS* and *cefalexin BPCRS* in mobile phase A.

(4) 0.003% w/v of *cyclohexa-1,4-dienylglycine EPCRS* (impurity B) in mobile phase A.

(5) Dissolve 6 mg of *cefradine for peak identification EPCRS* (containing impurities C, D and E) in 1 mL of mobile phase A.

(6) Dissolve the contents of a vial of *cefradine impurity mixture EPCRS* (containing impurities A and G) in 1 mL of mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Varian Chrompack Inertsil ODS-3 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Mobile phase A 0.272% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *dilute orthophosphoric acid*.

Mobile phase B *methanol R2*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2.5	99.5→97	0.5→3	linear gradient
2.5-11	97→75	3→25	linear gradient
11-13	75→60	25→40	linear gradient
13-16	60	40	isocratic

19-19.1	20→99.5	80→0.5	linear gradient
19.1-25	99.5	0.5	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to Cefradine (retention time = about 15 minutes) are: impurity A = about 0.27; impurity B = about 0.32; impurity C = about 0.53; impurity D = about 0.63; impurity E = about 0.80; impurity F = about 0.92; cefalexin = about 0.95; 4′,5′-dihydrocefradine = about 1.06; impurity G = about 1.32.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cefalexin and cefradine is at least 4.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) due to impurities C, D and E using the chromatogram obtained with solution (5) and the chromatogram supplied with *cefradine for peak identification EPCRS*. Identify any peaks in the chromatogram obtained with solution (1) due to impurities A and G using the chromatogram obtained with solution (6) and the chromatogram supplied with *cefradine impurity mixture EPCRS*. Identify any peak in the chromatogram obtained with solution (1) due to impurity B using the chromatogram obtained with solution (4). Multiply the area of any peak corresponding to impurity B by the following correction factor: 3.4.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A, B, C, D, F or G is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25% for each);

the area of any peak corresponding to impurity E is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard the peaks due to cefalexin, and 4′,5′-dihydrocefradine and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Cefalexin

Not more than 10.0%, calculated as the percentage of $C_{16}H_{17}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

4′,5′-Dihydrocefradine

Not more than 2.0%, calculated as the percentage of $C_{16}H_{21}N_3O_4S$ in the sum of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$ determined in the Assay.

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 3 volumes of 0.7M *glacial acetic acid*, 15 volumes of 0.5M *sodium acetate*, 200 volumes of *methanol* and 782 volumes of *water* (solution A).

(1) Shake a weighed quantity of the oral suspension with sufficient of the mobile phase to produce a solution containing 0.05% w/v of Cefradine and filter through a 0.5-µm filter, discarding the first few mL of filtrate.

(2) 0.05% w/v of *cefradine BPCRS*.

(3) 0.005% w/v of *cefalexin BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes with solution A. Mix equal volumes of this solution and solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

25 volumes of *methanol* and 75 volumes of *phosphate buffer solution pH 5.0*.

When the chromatograms are recorded under the prescribed conditions, the retention time of the peak due to 4',5'-dihydrocefradine relative to that of cefradine is about 1.6.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to cefradine and cefalexin is at least 4.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of cephalosporins, weight in volume, by determining the sum of the contents of $C_{16}H_{19}N_3O_4S$, $C_{16}H_{17}N_3O_4S$ and $C_{16}H_{21}N_3O_4S$. Calculate the content of $C_{16}H_{19}N_3O_4S$ (cefradine) using the declared content of $C_{16}H_{19}N_3O_4S$ in *cefradine BPCRS*. Calculate the content of $C_{16}H_{17}N_3O_4S$ (cefalexin) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS*. Calculate the content of $C_{16}H_{21}N_3O_4S$ (4',5'-dihydrocefradine) using the declared content of $C_{16}H_{17}N_3O_4S$ in *cefalexin BPCRS* and multiplying the area of the peak due to 4',5'-dihydrocefradine by a correction factor of 1.6.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be stored at the temperature and used within the period stated on the label.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Cefradine.

Ceftazidime Eye Drops

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Cephalosporin antibacterial.

DEFINITION

Ceftazidime Eye Drops are a sterile solution of Ceftazidime Pentahydrate and Sodium Carbonate in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of ceftazidime, $C_{22}H_{22}N_6O_7S_2$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless or pale yellow solution.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

B. Yields reaction A characteristic of *carbonates* and reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 6.0 to 8.0, Appendix V L.

Pyridine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

(1) Dilute a volume of the eye drops, if necessary, to produce a solution containing the equivalent of 0.5% w/v of ceftazidime in a mixture of 1 volume of *acetonitrile* and 40 volumes of mobile phase A.

(2) 0.00025% w/v of *pyridine* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS 2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 3.6 g of *disodium hydrogen orthophosphate* and 1.4 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 3.4 with a 10% v/v solution of *orthophosphoric acid*.

Mobile phase B acetonitrile.

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-4	96→89	4→11	linear gradient
4-7	89	11	isocratic
7-10	89→84	11→16	linear gradient
10-13	84→80	16→20	linear gradient
13-17	80→50	20→50	linear gradient
17-20	50→20	50→80	linear gradient
20-24	20	80	isocratic
24-25	20→96	80→4	linear gradient
25-33	96	4→11	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time of ceftazidime is about 8 minutes and the retention of pyridine relative to ceftazidime is about 0.4.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to pyridine is not greater than 10 times the area of the peak due to pyridine in the chromatogram obtained with solution (2) (0.5%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *acetonitrile* and 20 volumes of mobile phase A, protected from light.

(1) Dilute a volume of the eye drops, if necessary, to produce a solution containing the equivalent of 0.1% w/v of ceftazidime.

(2) Dilute 3 volumes of solution (1) to 50 volumes and further dilute 1 volume to 20 volumes.

(3) Heat 20 mL of a 0.1% w/v solution of *ceftazidime EPCRS* at 80° for 15 minutes (generation of impurity A).

(4) Dilute 2 volumes of solution (2) to 3 volumes.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Pyridine may be used, but using an injection volume of 5 µL.

When the chromatograms are recorded under the prescribed conditions the retention time of ceftazidime is about 8 minutes. The retentions relative to ceftazidime are: impurity A, about 0.9; impurity B, about 1.4; impurity F (pyridine), about 0.4; impurity G, about 0.8.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and ceftazidime is at least 2.0.

LIMITS

Identify any peak in the chromatogram obtained with solution (1) corresponding to impurity G and multiply the area of any such peak by the following correction factor: 3.0.

In the chromatogram obtained with solution (1):

the areas of any peaks corresponding to impurities A and B are not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.3% of each);

the area of any peak corresponding to impurity G is not greater than 3.3 times the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (4) (0.05%) and any peak due to pyridine (impurity F).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *acetonitrile* and 20 volumes of mobile phase A, protected from light.

(1) Dilute a volume of the eye drops, if necessary, to produce a solution containing the equivalent of 0.1% w/v of ceftazidime.

(2) 0.1% w/v of *ceftazidime EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Pyridine may be used, but using an injection volume of 5 µL.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{22}N_6O_7S_2$ in the eye drops using the declared content of $C_{22}H_{22}N_6O_7S_2$ in *ceftazidime EPCRS*.

STORAGE

Ceftazidime Eye Drops should be protected from light and stored at a temperature not exceeding -20°. When thawed, Ceftazidime Eye Drops should be stored at a temperature of 2° to 8° and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ceftazidime.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ceftazidime Pentahydrate and under Ceftazidime Pentahydrate with Sodium Carbonate for Injection.

Ceftazidime Injection

Ceftazidime Infusion

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Cephalosporin antibacterial.

DEFINITION

Ceftazidime Injection is a sterile solution containing Ceftazidime Pentahydrate and Sodium Carbonate in a suitable diluent. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements. Where appropriate, the injection also complies with the requirements stated under Unlicensed Medicines.

Content of ceftazidime, $C_{22}H_{22}N_6O_7S_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the injection with a mixture containing 1 volume of 2M *hydrochloric acid* and 39 volumes of *water* to produce a solution containing the equivalent of 0.0015% w/v

www.webofpharma.com

of ceftazidime. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at about 260 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 8.0, Appendix V L.

Pyridine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Dilute a quantity of the injection with sufficient of a 10% v/v solution of *phosphate buffer solution pH 7.0 R4* to produce a solution containing the equivalent of 0.5% w/v of ceftazidime.

(2) To 1 volume of a solution containing 0.025% w/v of *pyridine* in *water*, add 10 volumes of *phosphate buffer solution pH 7.0 R4* and dilute to 100 volumes with *water*.

(3) Dilute 1 volume of solution (1) to 200 volumes with a 10% v/v solution of *phosphate buffer solution pH 7.0 R4*. To 1 volume of this solution add 20 volumes of solution (2) and dilute to 200 volumes with a 10% v/v solution of *phosphate buffer solution pH 7.0 R4*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb S5 ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 255 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

8 volumes of a 2.88% w/v solution of *ammonium dihydrogen orthophosphate*, previously adjusted to pH 7.0 with *ammonia*, 24 volumes of *acetonitrile* and 68 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to ceftazidime and pyridine is at least 7.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to pyridine is not greater than 10 times the area of the peak due to pyridine in the chromatogram obtained with solution (2) (0.5%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection to produce a solution containing the equivalent of 0.15% w/v of ceftazidime by dispersing in 5 volumes of *acetonitrile* and then adding sufficient *water* to produce 100 volumes.

(2) To 1 volume of solution (1) add 5 volumes of *acetonitrile* and add sufficient *water* to produce 100 volumes. Dilute 1 volume of this solution to 5 volumes with *water*.

(3) Expose 5 mL of solution (1) to *ultraviolet light (254 nm)* for 24 hours (generation of impurity B).

(4) Disperse 3 mg of *ceftazidime for peak identification EPCRS* (containing impurities A and G) in 0.5 mL of *acetonitrile*, dissolve by adding *water* and add sufficient *water* to produce 2 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Bakerbond BDC and Inertsil ODS 3 are suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 3.6 g of *disodium hydrogen orthophosphate* and 1.4 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 3.4 with a 10% v/v solution of *orthophosphoric acid*.

Mobile phase B *acetonitrile for chromatography*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-4	96→89	4→11	linear gradient
4-5	89	11	isocratic
5-8	89→84	11→16	linear gradient
8-11	84→80	16→20	linear gradient
11-15	80→50	20→50	linear gradient
15-18	50→20	50→80	linear gradient
18-22	20	80	isocratic

When the chromatograms are recorded under the prescribed conditions the retention times relative to ceftazidime (retention time, about 8 minutes) are: impurity F, about 0.4; impurity G, about 0.8; impurity A, about 0.9; impurity B, about 1.4.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity A and ceftazidime is at least 4.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities A, B and G using the chromatograms obtained with solutions (3) and (4) and the chromatogram supplied with *ceftazidime for peak identification EPCRS*. Multiply the area of any peak corresponding to impurity G by the following correction factor: 3.0.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A or B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2% of each);

the area of any peak corresponding to impurity G is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

www.webofpharma.com

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%) and any peak due to impurity F (pyridine).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing the equivalent of 10 mg per mL of ceftazidime (solution A). The endotoxin limit concentration of solution A is 1.0 IU per mL.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection with sufficient of the mobile phase to produce a solution containing the equivalent of 0.1% w/v of ceftazidime.

(2) 0.1% w/v of *ceftazidime EPCRS* in the mobile phase.

(3) 0.1% w/v of *ceftazidime for peak identification EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *hexylsilyl silica gel for chromatography* (5 µm) (Spherisorb hexyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 245 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *acetonitrile* and 98 volumes of a solution containing equal volumes of 0.43% w/v *disodium hydrogen orthophosphate* and 0.27% w/v *potassium dihydrogen orthophosphate*.

When the chromatograms are recorded under the prescribed conditions the retention time of ceftazidime is about 4.5 minutes and the retention of impurity A relative to that of ceftazidime is about 0.7.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and ceftazidime is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{22}N_6O_7S_2$ in the injection from the chromatograms obtained and from the declared content of $C_{22}H_{22}N_6O_7S_2$ in *ceftazidime EPCRS*.

STORAGE
Ceftazidime Injection should be stored at a temperature of 2° to 8°.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of ceftazidime.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Ceftazidime Pentahydrate and under Ceftazidime Pentahydrate with Sodium Carbonate for Injection.

Ceftazidime for Injection

Action and use
Cephalosporin antibacterial.

DEFINITION
Ceftazidime for Injection is a sterile mixture of Ceftazidime Pentahydrate and Sodium Carbonate. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ceftazidime, $C_{22}H_{22}N_6O_7S_2$
90.0 to 110.0% of the stated amount.

Content of sodium carbonate, Na_2CO_3
8.0 to 10.0% w/w.

CHARACTERISTICS
White or slightly yellow powder.

IDENTIFICATION
A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

B. Yields reaction A characteristic of *carbonates* and reaction A characteristic of *sodium salts*, Appendix VI.

TESTS
Acidity or alkalinity
pH of a solution containing the equivalent of 10% w/v of ceftazidime, 5.0 to 7.5, Appendix V L.

Clarity of solution
A solution containing the equivalent of 10% w/v of ceftazidime in *carbon dioxide-free water* is *clear*, Appendix IV A.

Pyridine
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Disperse a quantity of the contents of a sealed container containing the equivalent of 0.5 g of ceftazidime in 10 mL of a 10% v/v solution of *phosphate buffer solution pH 7.0 R4* and add sufficient of the same buffer solution to produce 100 mL.

(2) To 1 volume of a solution containing 0.025% w/v of *pyridine* in *water*, add 10 volumes of *phosphate buffer solution pH 7.0 R4* and dilute to 100 volumes with *water*.

(3) Dilute 1 volume of solution (1) to 200 volumes with a 10% v/v solution of *phosphate buffer solution pH 7.0 R4*. To 1 volume of this solution add 20 volumes of solution (2) and dilute to 200 volumes with a 10% v/v solution of *phosphate buffer solution pH 7.0 R4*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb S5 ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 255 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

MOBILE PHASE

8 volumes of a 2.88% w/v solution of *ammonium dihydrogen orthophosphate*, previously adjusted to pH 7.0 with *ammonia*, 24 volumes of *acetonitrile* and 68 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to ceftazidime and pyridine is at least 7.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to pyridine is not greater than 10 times the area of the peak due to pyridine in the chromatogram obtained with solution (2) (0.5%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the contents of a sealed container containing the equivalent of 0.15 g of ceftazidime in 5 mL of *acetonitrile*, dissolve by adding *water* and add sufficient *water* to produce 100 mL.

(2) To 1 volume of solution (1) add 5 volumes of *acetonitrile* and add sufficient *water* to produce 100 volumes. Dilute 1 volume of this solution to 5 volumes with *water*.

(3) Expose 5 mL of solution (1) to *ultraviolet light (254 nm)* for 24 hours (generation of impurity B).

(4) Disperse 3 mg of *ceftazidime for peak identification EPCRS* (containing impurities A and G) in 0.5 mL of *acetonitrile*, dissolve by adding *water* and add sufficient *water* to produce 2 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Bakerbond BDC and Inertsil ODS 3 are suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 3.6 g of *disodium hydrogen orthophosphate* and 1.4 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 3.4 with a 10% v/v solution of *orthophosphoric acid*.

Mobile phase B *acetonitrile* for chromatography.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 - 4	96 → 89	4 → 11	linear gradient
4 - 5	89	11	isocratic
5 - 8	89 → 84	11 → 16	linear gradient
8 - 11	84 → 80	16 → 20	linear gradient
11 - 15	80 → 50	20 → 50	linear gradient
15 - 18	50 → 20	50 → 80	linear gradient
18 - 22	20	80	isocratic

When the chromatograms are recorded under the prescribed conditions the retention times relative to ceftazidime (retention time, about 8 minutes) are: impurity F, about 0.4; impurity G, about 0.8; impurity A, about 0.9; impurity B, about 1.4.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity A and ceftazidime is at least 4.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities A, B and G using the chromatograms obtained with solutions (3) and (4) and the chromatogram supplied with *ceftazidime for peak identification EPCRS*. Multiply the area of any peak corresponding to impurity G by the following correction factor: 3.0.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A, B or G is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2% for each);

the area of any other *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any such peaks is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%) and any peak due to impurity F (pyridine).

Loss on drying

When dried *in vacuo* at 25° at a pressure not exceeding 0.67 kPa for 4 hours, lose not more than 13.5% of their weight. Use 0.3 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg per mL of ceftazidime (solution A). The endotoxin limit concentration of solution A is 1.0 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

For ceftazidime

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the mixed contents of the 10 containers containing the equivalent of 0.1 g of ceftazidime in 10 mL of the mobile phase and add sufficient mobile phase to produce 100 mL.

(2) 0.1% w/v of *ceftazidime EPCRS* in the mobile phase.

(3) 0.1% w/v of *ceftazidime for peak identification EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *hexylsilyl silica gel for chromatography* (5 µm) (Spherisorb hexyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 245 nm.

www.webofpharma.com

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of *acetonitrile* and 98 volumes of a solution containing equal volumes of 0.43% w/v of *disodium hydrogen orthophosphate* and 0.27% w/v of *potassium dihydrogen orthophosphate.*

When the chromatograms are recorded under the prescribed conditions the retention time of ceftazidime is about 4.5 minutes and the retention time of impurity A relative to that of ceftazidime is about 0.7.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and ceftazidime is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{22}N_6O_7S_2$ in a container of average content weight from the chromatograms obtained and from the declared content of $C_{22}H_{22}N_6O_7S_2$ in *ceftazidime EPCRS.*

For sodium carbonate

Carry out the method for *atomic absorption spectrophotometry,* Appendix II D, using the following solutions.

Test solution Dissolve a quantity of the mixed contents of the 10 containers in sufficient *water* to produce a solution containing the equivalent of 0.65% w/v of ceftazidime. To 10 mL of this solution add 5 mL of a caesium chloride buffer solution, prepared by adding 500 mL of *water* and 86 mL of *hydrochloric acid* to 12.7 g of *caesium chloride* and diluting to 1000 mL with *water*; dilute this solution to 50 mL with *water.*

Reference solution Transfer 20 mL of the caesium chloride buffer solution into each of 4 identical flasks. Add 0 mL, 5 mL, 10 mL and 15 mL, respectively, of a sodium standard solution (containing 1000 mg per litre) into the flasks and add sufficient *water* to produce 200 mL. To prepare the sodium standard solution dissolve 3.7 g of *sodium nitrate* in *water* and add sufficient *water* to produce 500 mL; add 48.5 g of *nitric acid* and dilute to 1000 mL with *water.*

Measure the absorbance at 330 nm using a sodium hollow-cathode lamp and an air-acetylene flame. Each mg of sodium is equivalent to 4.6087 mg of Na_2CO_3.

STORAGE

The sealed container should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ceftazidime.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ceftazidime Pentahydrate and under Ceftazidime Pentahydrate with Sodium Carbonate for Injection.

Ceftriaxone Injection

Action and use

Cephalosporin antibacterial.

DEFINITION

Ceftriaxone Injection is a sterile solution of Ceftriaxone Sodium in Water for Injections. It is prepared by dissolving Ceftriaxone Sodium for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Ceftriaxone Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

CEFTRIAXONE SODIUM FOR INJECTION

DEFINITION

Ceftriaxone Sodium for Injection is a sterile material prepared from Ceftriaxone Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ceftriaxone, $C_{18}H_{18}N_8O_7S_3$

92.0 to 108.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum,* Appendix II A, is concordant with the *reference spectrum* of ceftriaxone sodium *(RS 046).*

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic *of sodium salts,* Appendix VI.

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 12.0% w/v of ceftriaxone, 6.0 to 8.0, Appendix V L.

Clarity and colour of solution

A solution containing the equivalent of 1.20% w/v of ceftriaxone in *carbon dioxide-free water* is *clear,* Appendix IV A, and not more intensely coloured than *reference solution* Y_5 or BY_5, Appendix IV B.

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.030% w/v of ceftriaxone.

(2) 0.0050% w/v each of *ceftriaxone sodium BPCRS* and *ceftriaxone impurity A EPCRS.*

(3) Dilute 1 volume of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher RP-18 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of solutions (1), (3) and (4).

(g) Allow the chromatography to proceed for twice the retention time of the peak due to ceftriaxone sodium.

MOBILE PHASE

Dissolve 2 g of *tetradecylammonium bromide* and 2 g of *tetraheptylammonium bromide* in a mixture of 440 mL of *water*, 55 mL of 0.067M *mixed phosphate buffer pH 7.0*, 5 mL of a citrate buffer solution pH 5.0 prepared by dissolving 20.17 g of *citric acid* in 800 mL of *water*, adjusting to pH 5.0 with 10M *sodium hydroxide* and diluting to 1000 mL with *water*, and 500 mL of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to ceftriaxone sodium and ceftriaxone sodium *E*-isomer is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (3) (5%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

Water

Not more than 11.0% w/w, Appendix IX C, Method I. Use 0.1 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of ceftriaxone per mL (solution A). The endotoxin limit concentration of solution A is 0.8 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.030% w/v of ceftriaxone.

(2) 0.030% w/v of *ceftriaxone sodium BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{18}N_8O_7S_3$ in a container of average content weight from the declared content of $C_{18}H_{16}N_8Na_2O_7S_3$ in *ceftriaxone sodium BPCRS*.

STORAGE

The sealed container should be stored at a temperature not exceeding 30°.

LABELLING

The label of the sealed container states the quantity of Ceftriaxone Sodium contained in it in terms of the equivalent amount of ceftriaxone.

Cefuroxime Eye Drops

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Cephalosporin antibacterial.

DEFINITION

Cefuroxime Eye Drops are a sterile solution of Cefuroxime Sodium in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of cefuroxime, $C_{16}H_{16}N_4O_8S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

B. Yield reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 5.5 to 8.5, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops containing the equivalent of 55 mg of cefuroxime with sufficient *water* to produce 100 mL.

(2) 0.058% w/v of *cefuroxime sodium BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 274 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Dissolve 1.3609 g of *potassium dihydrogen orthophosphate* and 0.7708 g of *ammonium acetate* in 160 mL of *methanol* and add sufficient *water* to produce 1000 mL.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{16}N_4O_8S$ in the eye drops using the declared content of $C_{16}H_{15}N_4NaO_8S$ in *cefuroxime*

www.webofpharma.com

sodium BPCRS. Each mg of $C_{16}H_{15}N_4NaO_8S$ is equivalent to 0.9508 mg of $C_{16}H_{16}N_4O_8S$.

STORAGE
Cefuroxime Eye Drops should be protected from light and stored at a temperature not exceeding −20°. When thawed, Cefuroxime Eye Drops should be stored at a temperature of 2° to 8° and used within the period stated on the label.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of cefuroxime.

Cefuroxime Injection

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefuroxime Injection is a sterile solution or suspension of Cefuroxime Sodium in Water for Injections. It is prepared by dissolving or suspending Cefuroxime Sodium for Injection in the requisite amount of Water for Injections before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE
Cefuroxime Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

CEFUROXIME SODIUM FOR INJECTION

DEFINITION
Cefuroxime Sodium for Injection is a sterile material consisting of Cefuroxime Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cefuroxime, $C_{16}H_{16}N_4O_8S$
90.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of cefuroxime sodium *(RS 048)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient of a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0* (solution A) to produce a solution containing the equivalent of 0.4% w/v of cefuroxime.

(2) 0.4% w/v of *cefuroxime sodium BPCRS* in solution A.

(3) 0.4% w/v of each of *cefuroxime sodium BPCRS* and *cefoxitin sodium BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel HF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *tetrahydrofuran* and 90 volumes of a 15.0% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic *of sodium salts*, Appendix VI.

TESTS

Acidity or Alkalinity
pH of a solution containing the equivalent of 10.0% w/v of cefuroxime, 5.5 to 8.5, Appendix V L.

Clarity of solution
A solution containing the equivalent of 10.0% w/v of cefuroxime in *carbon dioxide-free water* is not more opalescent than *reference suspension II*, Appendix IV A.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dissolve a quantity of the contents of a sealed container to produce a solution containing the equivalent of 0.1% w/v of cefuroxime.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Heat 20 mL of a 0.1% w/v solution of *cefuroxime sodium BPCRS* in a water bath at 60° for 10 minutes, cool and inject immediately (generation of descarbamoylcefuroxime).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with particles of silica the surface of which has been modified with chemically-bonded hexylsilyl groups (5 µm) (Spherisorb S5 C6 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for at least 3 times the retention time of the principal peak.

MOBILE PHASE

1 volume of *acetonitrile* and 99 volumes of *acetate buffer pH 3.4*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to cefuroxime and descarbamoylcefuroxime is at least 2.0. If necessary, adjust the concentration of *acetonitrile* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any peak corresponding to descarbamoylcefuroxime (located by comparison with the chromatogram obtained with solution (3)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Water
Not more than 3.5% w/w, Appendix IX C. Use 0.4 g.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of cefuroxime per mL (solution A). The endotoxin limit concentration of solution A is 1.0 IU per mL.

ASSAY
Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dissolve a quantity of the mixed contents of the 10 containers to produce a solution containing the equivalent of 0.1% w/v of cefuroxime.

(2) 0.1% w/v of *cefuroxime sodium BPCRS*.

(3) Heat 20 mL of a 0.1% w/v solution of *cefuroxime sodium BPCRS* in a water bath at 60° for 10 minutes, cool and inject immediately (generation of descarbamoylcefuroxime).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with particles of silica the surface of which has been modified with chemically-bonded hexylsilyl groups (5 µm) (Spherisorb S5 C6 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 273 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *acetonitrile* and 99 volumes of *acetate buffer pH 3.4*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to cefuroxime and descarbamoylcefuroxime is at least 2.0. If necessary, adjust the concentration of *acetonitrile* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{16}N_4O_8S$ in a container of average content weight from the declared content of $C_{16}H_{15}N_4NaO_8S$ in *cefuroxime sodium BPCRS*. Each mg of $C_{16}H_{15}N_4NaO_8S$ is equivalent to 0.9508 mg of $C_{16}H_{16}N_4O_8S$.

STORAGE
The sealed container should be protected from light.

LABELLING
The label on the sealed container states the quantity of Cefuroxime Sodium contained in it in terms of the equivalent amount of cefuroxime.

Cefuroxime Intracameral Injection

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefuroxime Intracameral Injection is a sterile solution containing Cefuroxime Sodium in a suitable diluent. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements. Where appropriate, the injection also complies with the requirements stated under Unlicensed Medicines.

Content of cefuroxime, $C_{16}H_{16}N_4O_8S$
90.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Complies with the test for Osmolality.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *methanol* and 0.067M *mixed phosphate buffer pH 7.0* (solution A).

(1) Dilute a quantity of the injection in sufficient of solution A to produce a solution containing the equivalent of 0.4% w/v of cefuroxime.

(2) 0.4% w/v of *cefuroxime sodium BPCRS* in solution A.

(3) 0.4% w/v of each of *cefuroxime sodium BPCRS* and *cefoxitin sodium BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silanised silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of warm air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *tetrahydrofuran* and 90 volumes of a 15.0% w/v solution of *ammonium acetate*, previously adjusted to pH 6.2 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as

www.webofpharma.com

that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 10.0% w/v of cefuroxime, 5.5 to 8.5, Appendix V L.

Clarity of solution

A solution containing the equivalent of 10.0% w/v of cefuroxime in *carbon dioxide-free water* is not more opalescent than *reference suspension II*, Appendix IV A.

Osmolality

The osmolality of the injection is 240 to 380 mosmol/kg, Appendix V N.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*. Prepare the solutions immediately before use or store at 2° to 8°.

(1) Dilute a quantity of the injection to produce a solution containing the equivalent of 0.05% w/v of cefuroxime.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Heat 20 mL of a 0.05% w/v solution of *cefuroxime sodium BPCRS* in a water bath at 80° for 15 minutes, cool and inject immediately (generation of descarbamoylcefuroxime).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 274 nm.

(f) Inject 15 µL of each solution.

MOBILE PHASE

17 volumes of *methanol* and 83 volumes of a buffer solution prepared by dissolving 0.7708 g of *ammonium acetate* in 996 mL of *water*, adding 4 mL of *triethylamine* and adjusting the pH to 3.6 with *acetic acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of cefuroxime is about 8.4 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to cefuroxime and descarbamoylcefuroxime is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to descarbamoylcefuroxime (located by comparison with the chromatogram obtained with solution (3)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, in *water BET* to give a solution containing the equivalent of 10 mg of cefuroxime per mL (solution A). The endotoxin limit concentration of solution A is 1.0 IU per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*. Prepare the solutions immediately before use or store at 2° to 8°.

(1) Dilute a quantity of the injection to produce a solution containing the equivalent of 0.05% w/v of cefuroxime.

(2) 0.055% w/v of *cefuroxime sodium BPCRS*.

(3) Heat 20 mL of solution (2) in a water bath at 80° for 15 minutes, cool and inject immediately (generation of descarbamoylcefuroxime).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 274 nm.

(f) Inject 15 µL of each solution.

MOBILE PHASE

17 volumes of *methanol* and 83 volumes of a buffer solution prepared by dissolving 0.7708 g of *ammonium acetate* in 996 mL of *water*, adding 4 mL of *triethylamine* and adjusting the pH to 3.6 with *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to cefuroxime and descarbamoylcefuroxime is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{16}N_4O_8S$ in the injection from the declared content of $C_{16}H_{15}N_4NaO_8S$ in *cefuroxime sodium BPCRS*. Each mg of $C_{16}H_{15}N_4NaO_8S$ is equivalent to 0.9508 mg of $C_{16}H_{16}N_4O_8S$.

STORAGE

Cefuroxime Intracameral Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of cefuroxime.

www.webofpharma.com

Cefuroxime Axetil Oral Suspension

Action and use
Cephalosporin antibacterial.

DEFINITION
Cefuroxime Axetil Oral Suspension is a suspension of Cefuroxime Axetil in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the Oral Suspension as directed on the label. The suspension, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cefuroxime, $C_{16}H_{16}N_4O_8S$
When freshly constituted not more than 110.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the Oral Suspension may be expected to be satisfactory for use, not less than 90.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the oral suspension with sufficient *methanol* to produce a solution containing the equivalent of 0.00131% w/v of cefuroxime. The *light absorption* of the solution, Appendix II B, in the range 230 to 320 nm exhibits a maximum at 276 nm.

B. In the Assay, the retention times of the principal peaks in the chromatogram obtained with solution (1) correspond to those of the peaks due to diastereoisomers A and B of cefuroxime axetil in the chromatogram obtained with solution (2).

TESTS
Acidity or alkalinity
pH, 3.5 to 7.0, Appendix V L.

Dissolution
Carry out the test for dissolution described under *dissolution test for tablets and capsules*, Appendix XII B1.

Prepare a solution containing 1.43% w/v of *disodium hydrogen orthophosphate* and 0.42% w/v of *sodium dihydrogen orthophosphate* and adjust the pH to 7.0 with 20% v/v *orthophosphoric acid* or 1M *sodium hydroxide*, as necessary (solution A).

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of solution A, at a temperature of 37°, as the medium.

PROCEDURE

(1) Shake the container containing the oral suspension being examined for 30 seconds and accurately remove a volume containing one dose at a depth of 1 cm below the meniscus. Introduce the dose to the medium in the dissolution vessel. After 30 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 282 nm, Appendix II B, using solution A in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *cefuroxime axetil BPCRS*, prepared by dissolving *cefuroxime axetil BPCRS* in 5 volumes of *methanol* and then diluting to 100 volumes with solution A, using solution A in the reference cell. The equivalent concentration of cefuroxime in the final solution should be the same as that expected for solution (1).

DETERMINATION OF CONTENT

Calculate the total content of cefuroxime, $C_{16}H_{16}N_4O_8S$, in the medium from the absorbances obtained and using the declared content of $C_{20}H_{22}N_4O_{10}S$ in *cefuroxime axetil BPCRS*. Each mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

LIMITS

The amount of cefuroxime released is not less than 60% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the *normalisation procedure*.

(1) Shake a weighed quantity of the oral suspension with sufficient *methanol* to produce a solution containing the equivalent of 0.25% w/v of cefuroxime and mix with the aid of ultrasound for 5 minutes with occasional swirling. Allow to cool to room temperature, shake vigorously and allow to stand for 10 minutes. Dilute 10 volumes of the resulting solution to 50 volumes with *methanol (23%)* and filter through a 0.45-µm PTFE filter, discarding the first 5 mL of filtrate. The solution should be used immediately or stored in the dark at a temperature of 2° to 8° before analysis.

(2) Heat a quantity of solution (1) at 60° for 1 hour or until sufficient impurities (Δ^3-isomers) have been generated.

(3) Expose a quantity of solution (1) to *ultraviolet light (254 nm)* for 24 hours or until sufficient impurities (*E*-isomers) have been generated.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with particles of silica (5 µm) the surface of which has been modified by chemically-bonded trimethylsilyl groups (Hypersil SAS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

38 volumes of *methanol* and 62 volumes of 0.2M *ammonium dihydrogen orthophosphate*.

When the chromatograms are recorded under the prescribed conditions the retention time of cefuroxime axetil diastereoisomer A is 7 to 11 minutes. The retention times relative to cefuroxime axetil diastereoisomer A are: cefuroxime, about 0.35; cefuroxime axetil diastereoisomer B, about 0.9; cefuroxime axetil Δ^3-isomers (impurity A), about 1.2; *E*-isomers (impurity B), about 1.7 and 2.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to cefuroxime axetil diastereoisomer A and cefuroxime axetil Δ^3-isomer is at least 1.5 (if necessary, adjust the composition of the mobile phase).

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any peak corresponding to cefuroxime is not greater that 1.0%;

the sum of the areas of the pair of peaks corresponding to the *E*-isomers in the chromatogram obtained with solution (3) is not greater than 1.5%;

the sum of the areas of any peaks corresponding to the Δ^3-isomers in the chromatogram obtained with solution (2) is not greater than 2.0%;

the area of any other *secondary peak* is not greater than 0.5%;

the sum of the areas of all the *secondary peaks* is not greater than 4.5%.

Disregard any peak with an area less than 0.05%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be used immediately or stored in the dark at a temperature of 2° to 8° before analysis.

(1) Shake a weighed quantity of the oral suspension with sufficient *methanol* to produce a solution containing the equivalent of 0.25% w/v of cefuroxime and mix with the aid of ultrasound for 5 minutes with occasional swirling. Allow to cool to room temperature, shake vigorously and allow to stand for 10 minutes. Dilute 10 volumes of the resulting solution to 50 volumes with *methanol (23%)* and filter through a 0.45-µm PTFE filter, discarding the first 5 mL of filtrate.

(2) Dilute 10 volumes of a 0.3% w/v solution of *cefuroxime axetil BPCRS* in *methanol* to 50 volumes with *methanol (23%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks corresponding to cefuroxime axetil diastereoisomers A and B is at least 1.5 (if necessary, adjust the composition of the mobile phase).

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{16}N_4O_8S$, weight in volume, as the sum of the areas of the two peaks corresponding to diastereoisomers A and B of cefuroxime axetil using the declared content of $C_{20}H_{22}N_4O_{10}S$ in *cefuroxime axetil BPCRS*. Each mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Suspension should be kept at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of cefuroxime.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Cefuroxime Axetil.

Cefuroxime Axetil Tablets

Action and use
Cephalosporin antibacterial.

DEFINITION

Cefuroxime Axetil Tablets contain Cefuroxime Axetil. They may be coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cefuroxime, $C_{16}H_{16}N_4O_8S$
92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing the equivalent of 0.1 g of cefuroxime with 5 mL of *dichloromethane*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cefuroxime axetil *(RS 047)*.

B. In the Assay, the retention times of the principal peaks in the chromatogram obtained with solution (1) correspond to those of the peaks due to diastereoisomers A and B of cefuroxime axetil in the chromatogram obtained with solution (4).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using solutions (1) to (3) described under Assay.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The requirements stated under Assay apply.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of the pair of peaks corresponding to the *E*-isomers in the chromatogram obtained with solution (3) is not greater than 1.5% by *normalisation*;

the sum of the areas of any peaks corresponding to the Δ^3-isomers in the chromatogram obtained with solution (2) is not greater than 2.0% by *normalisation*;

the area of any other *secondary peak* is not greater than 1.0% by *normalisation*.

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, diluted with *0.1M hydrochloric acid* to produce a solution expected to contain the equivalent of 10 to 20 µg of cefuroxime per mL, at the maximum at 278 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell.

www.webofpharma.com

(2) Measure the *absorbance* of a solution of *cefuroxime axetil BPCRS* in 0.1M *hydrochloric acid* containing the equivalent of 10 to 20 µg of cefuroxime per mL and using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of cefuroxime axetil, $C_{16}H_{16}N_4O_8S$, in the medium from the absorbances obtained and using the declared content of $C_{20}H_{22}N_4O_{10}S$ in *cefuroxime axetil BPCRS*. Each mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be used immediately or stored in the dark at a temperature of 2° to 8° before analysis.

(1) Disperse 5 tablets in 0.2M *ammonium dihydrogen orthophosphate*, previously adjusted to pH 2.4 with *orthophosphoric acid*, using 10 mL per g of the stated content of cefuroxime. Immediately add 375 mL of *methanol* and shake vigorously for 10 minutes. Mix with the aid of ultrasound for a further 10 minutes and add sufficient *methanol* to produce 500 mL. Centrifuge a portion of the solution for at least 5 minutes at 2500 rpm and then dilute a quantity of the supernatant liquid with sufficient of the mobile phase to produce a solution containing the equivalent of 0.025% w/v of cefuroxime.

(2) Heat a quantity of solution (1) at 60° for 1 hour or until sufficient impurities (Δ^3-isomers) have been generated.

(3) Expose a quantity of solution (1) to *ultraviolet light (254 nm)* for 24 hours or until sufficient impurities (*E*-isomers) have been generated.

(4) 0.03% w/v of *cefuroxime axetil BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with particles of silica (5 µm) the surface of which has been modified by chemically-bonded trimethylsilyl groups (Hypersil SAS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

38 volumes of *methanol* and 62 volumes of 0.2M *ammonium dihydrogen orthophosphate*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to cefuroxime axetil diastereoisomer A are approximately 0.9 for cefuroxime axetil diastereoisomer B, 1.2 for the cefuroxime axetil Δ^3-isomers and 1.7 and 2.1 for the *E*-isomers.

SYSTEM SUITABILITY

The Assay is not valid unless:

in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to cefuroxime axetil diastereoisomer A and the cefuroxime axetil Δ^3-isomer is at least 1.5 (if necessary, adjust the composition of the mobile phase);

in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to cefuroxime axetil diastereoisomers A and B is at least 1.5 (if necessary, adjust the composition of the mobile phase).

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{16}N_4O_8S$ as the sum of the areas of the two peaks corresponding to diastereoisomers A and B of cefuroxime axetil and using the declared content of $C_{20}H_{22}N_4O_{10}S$ in *cefuroxime axetil BPCRS*. Each mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of cefuroxime.

Celecoxib Capsules

Action and use

Cyclo-oxygenase (COX-2) inhibitor; analgesic; anti-inflammatory.

DEFINITION

Celecoxib Capsules contain Celecoxib.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of celecoxib, $C_{17}H_{14}F_3N_3O_2S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing 0.1 g of Celecoxib with 25 mL of *ether*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the reference spectrum of celecoxib *(RS497)*.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 1000 mL of a solution containing 1% w/v of *sodium dodecyl sulfate* in 0.04M *anhydrous trisodium orthophosphate*, adjusted to pH 12 with *orthophosphoric acid* or *strong sodium hydroxide solution*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Dilute the filtrate, if necessary, with dissolution medium to produce a solution expected to contain 0.005% w/v of Celecoxib.

(2) 0.005% w/v of *celecoxib BPCRS* in the dissolution medium.

(3) 0.048% w/v of *celecoxib BPCRS*, 0.00024% w/v of *celecoxib impurity A EPCRS* and 0.00024% w/v of *celecoxib Impurity B EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped phenylsilyl silica gel for chromatography* (5 µm) (Supelco Supelcosil LC-DP is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

www.webofpharma.com

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 215 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

10 volumes of *acetonitrile R1*, 30 volumes of *methanol R1* and 60 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity A and celecoxib is at least 1.5;

the *resolution* between the peaks due to celecoxib and impurity B is at least 1.8.

DETERMINATION OF CONTENT

Calculate the total content of celecoxib, $C_{17}H_{14}F_3N_3O_2S$, in the medium from the chromatograms obtained and using the declared content of $C_{17}H_{14}F_3N_3O_2S$, in *celecoxib BPCRS*.

LIMITS

The amount of celecoxib released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (75%)*.

(1) Shake a quantity of the powdered capsule contents with a sufficient volume to produce a solution containing 0.05% w/v of Celecoxib. Filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes. Dilute 1 volume of the resulting solution to 5 volumes.

(3) 0.048% w/v of *celecoxib BPCRS*, 0.00024% w/v of *celecoxib impurity A EPCRS* and 0.00024% w/v of *celecoxib Impurity B EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to celecoxib (retention time about 19 minutes) are: impurity 1, about 0.8; impurity A, about 0.9; impurity B, about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity A and celecoxib is at least 1.5;

the *resolution* between the peaks due to celecoxib and impurity B is at least 1.8.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh the contents of 20 capsules and mix. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (75%)*.

(1) Mix a quantity of the capsules containing 200 mg of Celecoxib with 80 mL with the aid of ultrasound for 10 minutes, shake for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume of the resulting solution to 4 volumes.

(2) 0.05% w/v of *celecoxib BPCRS*.

(3) 0.048% w/v of *celecoxib BPCRS*, 0.00024% w/v of *impurity A EPCRS* and 0.00024% w/v of *impurity B EPCRS*.

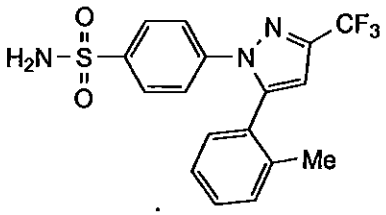
CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity A and celecoxib is at least 1.5;



the *resolution* between the peaks due to celecoxib and impurity B is at least 1.8.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{14}F_3N_3O_2S$, in the capsules from the chromatograms obtained and using the declared content of $C_{17}H_{14}F_3N_3O_2S$, in *celecoxib BPCRS*..

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under *Celecoxib* and:

1. 4-[5-(2-methylphenyl)-3-trifluoromethyl-1*H*-pyrazol-1-yl] benzenesulfonamide

Celiprolol Tablets

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Celiprolol Tablets contain Celiprolol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of celiprolol hydrochloride, $C_{20}H_{33}N_3O_4$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix with the aid of ultrasound a quantity of the powdered tablets containing 200 mg of Celiprolol Hydrochloride with 100 mL of *dichloromethane* for 30 minutes, filter (Whatman filter paper No. 42 is suitable), remove the dichloromethane using a rotary evaporator and dry the residue over *phosphorus*

www.webofpharma.com

pentoxide at 110° at a pressure not exceeding 2 kPa for 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of celiprolol hydrochloride (*RS 420*).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water* at a temperature of 37° as the medium.

PROCEDURE

(1) Withdraw a sample of 10 mL of the medium and filter; to 1 volume of the filtrate add sufficient *water* to produce 20 volumes and filter using a 0.45 µm membrane filter. Measure the *absorbance* of the filtrate, suitably diluted with *water* if necessary, at the maximum at 231 nm, Appendix II B, using *water* in the reference cell.

(2) Measure the *absorbance* of a 0.011% w/v solution of *celiprolol hydrochloride BPCRS* in the dissolution medium at the maximum at 231 nm, Appendix II B, using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of celiprolol hydrochloride, $C_{20}H_{33}N_3O_4$,HCl, in the medium using the declared content of $C_{20}H_{33}N_3O_4$,HCl in *celiprolol hydrochloride BPCRS*.

Related substances

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Celiprolol Hydrochloride in 100 mL of the mobile phase for 15 minutes with occasional shaking, cool and filter using a 0.45-µm membrane filter.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase and further dilute 1 volume of this solution to 20 volumes with the mobile phase.

(3) Prepare a solution containing 0.1% w/v of *celiprolol hydrochloride BPCRS* in *water*, add 5 drops of 5M *sodium hydroxide* and heat at 70° for 20 minutes (generation of impurity A).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Waters µBondapak is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 233 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

A mixture of 25 volumes of *acetonitrile* and 75 volumes of 0.025M *sodium dihydrogen phosphate monohydrate* adjusted to pH 3.0 with 3M *orthophosphoric acid*. If necessary adjust the composition of the mobile phase so that, in the chromatogram obtained with solution (3), the peak due to celiprolol impurity A is resolved from the solvent front.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak due to celiprolol impurity A is resolved from the solvent front.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to celiprolol impurity A is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

not more than one such peak has an area not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the areas of any *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area of less than a fifth of the area of the peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

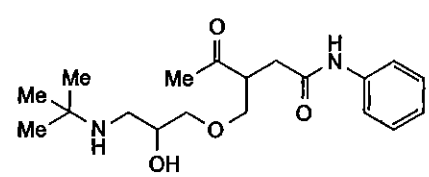
(1) Disperse with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Celiprolol Hydrochloride in 100 mL of the mobile phase for 15 minutes, cool and filter. Dilute 1 volume of the filtrate to 50 volumes with the mobile phase and filter using a 0.45 µm membrane filter.

(2) 0.002% w/v solution of *celiprolol hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT



Calculate the content of $C_{20}H_{33}N_3O_4$,HCl in the tablets using the declared content of $C_{20}H_{33}N_3O_4$,HCl in *celiprolol hydrochloride BPCRS*.

STORAGE

Celiprolol Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Celiprolol Hydrochloride and the following:

1. 3-acetyl-4-{3-(1,1-dimethyl-ethylamino)-2-hydroxy} propoxybutyranilide

www.webofpharma.com

Cetirizine Capsules

Action and use
Histamine H_1 receptor antagonist; antihistamine.

DEFINITION
Cetirizine Capsules contain Cetirizine Hydrochloride in a suitable aqueous vehicle.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of cetirizine hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the capsule contents, if necessary, to contain 0.1% w/v of Cetirizine Hydrochloride, filter through a 0.45-µm nylon filter and use the filtrate.

(2) 0.1% w/v of *cetirizine hydrochloride BPCRS*.

(3) 0.1% w/v of *cetirizine hydrochloride BPCRS* and 0.1% w/v of *chlorphenamine maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 18M *ammonia*, 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, and rotate the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of 10 mL of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.00050% w/v of Cetirizine Hydrochloride. Measure the *absorbance* of this solution, Appendix II B, at the maximum wavelengths at 230 nm and at 260 nm using the dissolution medium in the reference cell and calculate the difference between the two readings (ΔA) for each measurement.

(2) Measure the *absorbance* of a 0.00050% w/v solution of *cetirizine hydrochloride BPCRS* in *water* at the maximum wavelengths at 230 nm and 260 nm using the dissolution medium in the reference cell and calculate the difference between the two readings (ΔA) for each measurement.

DETERMINATION OF CONTENT

Calculate the total content of Cetirizine hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$, in the medium using the values of ΔA and from the declared content of $C_{21}H_{25}ClN_2O_3,2HCl$ in *cetirizine hydrochloride BPCRS*.

LIMITS

The amount of cetirizine hydrochloride released is not less than 80% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Dilute a quantity of the capsule contents, if necessary, to produce a solution containing 0.02% w/v of Cetirizine Hydrochloride and filter through a 0.45-µm nylon filter.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 10 volumes.

(3) 0.02% w/v of *cetirizine impurity standard BPCRS*.

(4) 0.00006% w/v of *cetirizine* N-*oxide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 17 volumes of *acetonitrile* and 83 volumes of *water* previously adjusted to pH to 1.5 with *orthophosphoric acid*.

Mobile phase B 35 volumes of *acetonitrile* and 65 volumes of *water* previously adjusted to pH 1.5 with *orthophosphoric acid*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-50	100→0	0→100	linear gradient
50-53	0	100	isocratic
53-54	0→100	100→0	linear gradient
54-60	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cetirizine and cetirizine impurity B is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity A using solution (3) and the chromatogram supplied with *cetirizine impurity standard BPCRS* and multiply the area of this peak by a correction factor of 0.7.

www.webofpharma.com

the area of any peak due to cetirizine *N*-oxide is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the total content of impurities is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%)

ASSAY

Mix the content of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the mixed contents of 20 capsules to produce a solution containing 0.002% w/v of Cetirizine Hydrochloride and filter through a 0.45-µm nylon filter.

(2) 0.002% w/v of *cetirizine hydrochloride BPCRS*.

(3) 0.02% w/v of *cetirizine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

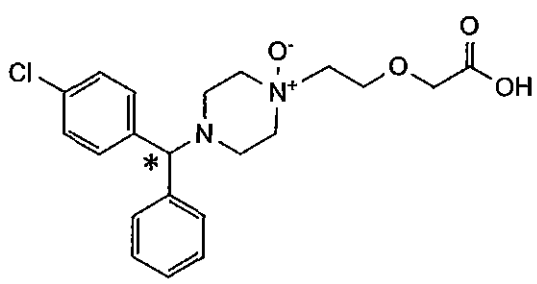
(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of 0.0025M *potassium dihydrogen orthophosphate*, previously adjusted to pH 1.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY



The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cetirizine and cetirizine impurity B is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$ in the capsules using the declared content of $C_{21}H_{25}ClN_2O_3,2HCl$ in *cetirizine hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and G listed under Cetirizine Hydrochloride and the following.

rac-1-[2-(carboxymethoxy)ethyl]-4-[(4-chlorophenyl)(phenyl)methyl]piperazine N^1-oxide (Cetirizine *N*-oxide.)

Cetirizine Oral Solution

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cetirizine Oral Solution is a solution of Cetirizine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cetirizine hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral solution, if necessary, to contain 0.1% w/v of Cetirizine Hydrochloride, filter through a 0.45-µm nylon filter and use the filtrate.

(2) 0.1% w/v of *cetirizine hydrochloride BPCRS*.

(3) 0.1% w/v of *cetirizine hydrochloride BPCRS* and 0.1% w/v of *chlorphenamine maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 18M *ammonia*, 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

Disregard any spots due to excipients.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Dilute a weighed quantity of the oral solution, if necessary, to contain 0.02% w/v of Cetirizine Hydrochloride and filter through a 0.45-µm nylon filter.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 2 volumes of the resulting solution to 10 volumes.

(3) Dilute 1 volume of solution (2) to 4 volumes.

(4) 0.02% w/v of *cetirizine impurity standard BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 17 volumes of *acetonitrile* and 83 volumes of *water* previously adjusted to pH to 1.5 with *orthophosphoric acid.*

Mobile phase B 35 volumes of *acetonitrile* and 65 volumes of *water* previously adjusted to pH 1.5 with *orthophosphoric acid.*

Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-50	100→0	0→100	linear gradient
50-53	0	100	isocratic
53-54	0→100	100→0	linear gradient
54-60	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to cetirizine and cetirizine impurity B is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity A using solution (4) and the chromatogram supplied with *cetirizine impurity standard BPCRS* and multiply the area of this peak by a correction factor of 0.7.

the areas of any peaks corresponding to impurities A, B or G are not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the total content of impurities is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution to contain 0.002% w/v of Cetirizine Hydrochloride and filter through a 0.45-µm nylon filter.

(2) 0.002% w/v of *cetirizine hydrochloride BPCRS.*

(3) 0.02% w/v of *cetirizine impurity standard BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of 0.0025M *potassium dihydrogen orthophosphate,* previously adjusted to pH 1.5 with *orthophosphoric acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cetirizine and cetirizine impurity B is at least 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$, weight in volume, using the declared content of $C_{21}H_{25}ClN_2O_3,2HCl$ in *cetirizine hydrochloride BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and G listed under Cetirizine Hydrochloride.

Cetirizine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cetirizine Tablets contain Cetirizine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cetirizine hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 50 mg of Cetirizine Hydrochloride with 20 mL of *absolute ethanol,* filter (Whatman GF/C is suitable), evaporate the filtrate and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cetirizine hydrochloride *(RS 456).*

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules,* Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water,* at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of 10 mL of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.00050% w/v of Cetirizine Hydrochloride. Measure the *absorbance* of this solution, Appendix II B, at the

www.webofpharma.com

maximum wavelengths at 230 nm and at 260 nm using the dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *cetirizine hydrochloride BPCRS* in *water* at the maximum wavelengths at 230 nm and 260 nm using the dissolution medium in the reference cell and calculate the difference between the two readings (ΔA) for each measurement.

DETERMINATION OF CONTENT

Calculate the total content of Cetirizine Hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$, in the medium using the values of ΔA and from the declared content of $C_{21}H_{25}ClN_2O_3,2HCl$ in *cetirizine hydrochloride BPCRS*.

LIMITS

The amount of cetirizine hydrochloride released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Shake a quantity of the powdered tablets containing 20 mg of Cetirizine Hydrochloride with 20 mL of the mobile phase A, filter through a 0.45-µm nylon filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of the resulting solution to 5 volumes.

(3) Dilute 1 volume of solution (2) to 2 volumes.

(4) 0.02% w/v of *cetirizine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 17 volumes of *acetonitrile* and 83 volumes of *water* previously adjusted to pH 1.5 with *orthophosphoric acid*.

Mobile phase B 35 volumes of *acetonitrile* and 65 volumes of *water* previously adjusted to pH 1.5 with *orthophosphoric acid*.

Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-50	100→0	0→100	linear gradient
50-53	0	100	isocratic
53-54	0→100	100→0	linear gradient
54-60	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to cetirizine and impurity B is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurity A, impurity B and impurity G using solution (4) and the chromatogram supplied with *cetirizine impurity standard BPCRS*.Multiply the area of any peak corresponding to impurity A by a correction factor of 0.7.

the areas of any peaks corresponding to impurities A, B or G are not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of all impurities is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%)

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the powdered tablets containing 20 mg of Cetirizine Hydrochloride in 100 mL and filter through a 0.45-µm nylon filter. Dilute 10 mL of the filtrate to 100 mL with the mobile phase.

(2) 0.002% w/v of *cetirizine hydrochloride BPCRS*.

(3) 0.02% w/v of *cetirizine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of 0.0025M *potassium dihydrogen orthophosphate*, previously adjusted to pH 1.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cetirizine and cetirizine impurity B is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$ in the tablets using the declared content of $C_{21}H_{25}ClN_2O_3,2HCl$ in *cetirizine hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and G listed under Cetirizine Hydrochloride.

www.webofpharma.com

Cetomacrogol Emulsifying Ointment

Action and use
Emulsifying agent.

DEFINITION

White Soft Paraffin	500 g
Cetomacrogol Emulsifying Wax	300 g
Liquid Paraffin	200 g

Extemporaneous preparation
The following directions apply.

Melt together and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations.

Cetomacrogol Emulsifying Wax

Non-ionic Emulsifying Wax

Action and use
Emulsifying agent.

DEFINITION

Cetostearyl Alcohol	800 g
Macrogol Cetostearyl Ether (22)	200 g

Extemporaneous preparation
The following directions apply.

Melt together and stir until cold.

CHARACTERISTICS
A white or almost white, waxy solid or flakes melting when heated to a clear almost colourless liquid.

Practically insoluble in *water*, producing an emulsion; moderately soluble in *ethanol (96%)*; partly soluble in *ether*.

IDENTIFICATION
A. Incinerate at a temperature not exceeding 450° until free from carbon and cool. The residue is negligible (distinction from Emulsifying Wax).

B. Complies with the test for Sulfated ash.

TESTS

Acid value
Not more than 0.5, Appendix X B.

Refractive index
At 60°, 1.435 to 1.439, Appendix V E.

Solidifying point
45° to 53°, Appendix V B, using the following modifications. Place in the inner test tube sufficient of the melted substance to fill the tube to a depth of about 50 mm. Stir the substance gently and steadily, without scraping the wall of the tube, while the tube and its contents are allowed to cool. The temperature at which the level of the mercury in the thermometer remains stationary for a short time is regarded as the solidifying point.

Alkalinity
Dissolve 10 g in 10 mL of *water* and 10 mL of *ethanol (96%)*. Not more than 0.5 mL of *0.1M hydrochloric acid VS* is required for neutralisation using *phenolphthalein solution R1* as indicator.

Hydroxyl value
175 to 192, Appendix X D. Use 3.5 g.

Saponification value
Not more than 2.0, Appendix X G. Use 20 g.

Sulfated ash
Not more than 0.1%, Appendix IX A.

Cetrimide Cream

Action and use
Antiseptic.

DEFINITION
Cetrimide Cream contains the stated percentage w/w of Cetrimide in a suitable basis.

Extemporaneous preparation
The following formula and directions apply.

Cetrimide	5 g, or a sufficient quantity
Cetostearyl Alcohol	50 g
Liquid Paraffin	500 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

Melt the Cetostearyl Alcohol and heat with the Liquid Paraffin to about 60°. Dissolve the Cetrimide in sufficient Purified Water to produce about 450 g. Add the aqueous solution to the oily phase when both are at about 60° and mix. Stir gently until cool, add sufficient of the Purified Water to produce 1000 g and mix.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of cetrimide, $C_{17}H_{38}BrN$
88.0 to 106.0% of the stated amount.

IDENTIFICATION
Mix 1 g with 50 mL of *water*. The diluted cream complies with the following tests.

A. To 10 mL add 2 mL of *potassium hexacyanoferrate(III) solution*. A yellow precipitate is produced.

B. Shake 3 mL of *water* with 1 mL of 1M *sulfuric acid*, 2 mL of *chloroform* and 0.5 mL of *methyl orange solution*. Add 2 mL of the diluted cream, shake and allow to separate. A yellow colour develops in the chloroform layer.

ASSAY
To a quantity containing 5 mg of Cetrimide add 10 mL of hot *water* and shake gently until dispersed. Add 5 mL of 1M *sulfuric acid*, 20 mL of *chloroform* and 0.25 mL of *dimethyl yellow solution* and titrate with 0.001M *dioctyl sodium sulfosuccinate VS*. Each mL of 0.001M *dioctyl sodium sulfosuccinate VS* is equivalent to 0.3364 mg of $C_{17}H_{38}BrN$.

LABELLING
The strength is stated as the percentage w/w of Cetrimide.

When Cetrimide Cream is prescribed or demanded, no strength being stated, a cream containing 0.5% w/w shall be dispensed or supplied.

www.webofpharma.com

Cetrimide Emulsifying Ointment

Action and use
Antiseptic.

DEFINITION

White Soft Paraffin	500 g
Cetostearyl Alcohol	270 g
Liquid Paraffin	200 g
Cetrimide	30 g

Extemporaneous preparation
The following directions apply.

Melt together the White Soft Paraffin, Cetostearyl Alcohol and Liquid Paraffin, add the Cetrimide and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of cetrimide, $C_{17}H_{38}BrN$
2.5 to 3.3% w/w.

ASSAY
To 0.3 g in a stoppered cylinder, add 10 mL of hot *water* and shake until the solid is dispersed. Add 5 mL of 1M *sulfuric acid*, 20 mL of *chloroform* and 1 mL of *dimethyl yellow and oracet blue 2R solution* and titrate with 0.001M *sodium dodecyl sulfate VS*. Each mL of 0.001M *sodium dodecyl sulfate VS* is equivalent to 0.3364 mg of $C_{17}H_{38}BrN$.

Cetrimide Solution

Cetrimide Cutaneous Solution

Sterile Cetrimide Cutaneous Solution

Action and use
Antiseptic.

DEFINITION
Cetrimide Solution is a *cutaneous solution* of cetrimide prepared by appropriately diluting Strong Cetrimide Solution with Purified Water.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of cetrimide, $C_{17}H_{38}BrN$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity containing 100 mg of Cetrimide, add 2 mL of a 5% w/v solution of *potassium hexacyanoferrate(III)*. A yellow precipitate is produced.

B. Shake together 5 mL of *water*, 1 mL of 1M *sulfuric acid*, 2 mL of *chloroform* and 0.05 mL of *methyl orange solution*; the chloroform layer is colourless. Add a quantity of the solution being examined containing 20 mg of Cetrimide and shake. A yellow colour is produced slowly in the chloroform layer.

C. Yields reaction A characteristic *of bromides*, Appendix VI.

ASSAY
To a quantity of the solution containing 1 g of Cetrimide add 25 mL of *chloroform*, 10 mL of 0.1M *sodium hydroxide* and 10 mL of a freshly prepared 8.0% w/v solution of *potassium iodide*. Shake well, allow to separate and discard the chloroform layer. Wash the aqueous layer with three 10-mL quantities of *chloroform* and discard the washings. Add 40 mL of *hydrochloric acid*, cool and titrate with *0.05M potassium iodate VS* until the deep brown colour is almost discharged. Add 2 mL of *chloroform* and continue the titration, with shaking, until the chloroform layer no longer changes colour. Carry out a blank titration on a mixture of 10 mL of the freshly prepared 8.0% w/v potassium iodide solution, 20 mL of *water* and 40 mL of *hydrochloric acid*. The difference between the titrations represents the amount of potassium iodate required. Each mL of *0.05M potassium iodate VS* is equivalent to 0.03364 g of $C_{17}H_{38}BrN$.

STERILE CETRIMIDE SOLUTION

DEFINITION
Sterile Cetrimide Solution is Cetrimide Solution that has been sterilised by *heating in an autoclave*.

Content of cetrimide; Identification
Complies with the requirements stated under Cetrimide Solution.

ASSAY
Carry out the Assay described under Cetrimide Solution.

Sterility
Complies with the *test for sterility*, Appendix XVI A.

Chloral Hydrate Oral Solution

Action and use
Hypnotic.

DEFINITION
Chloral Hydrate Oral Solution is a solution of Chloral Hydrate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements. Where appropriate, the oral solution also complies with the requirements stated under Unlicensed Medicines.

Content of chloral hydrate, $C_2H_3Cl_3O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To 1 mL of the oral solution add 2 mL of *sodium sulfide solution*; a yellow colour is produced which quickly becomes reddish-brown. On standing for a short time a red precipitate may be formed.

B. Dilute a quantity of the oral solution with sufficient *water* to produce a solution containing 0.01% w/v of Chloral Hydrate. To 10 mL of this solution add 10 mL of a 1.5% w/v solution of *1-ethylquinaldinium iodide* which has been filtered through a 0.45-µm filter; add 60 mL of *propan-2-ol*, 5 mL of 0.1M *ethanolamine* and 15 mL of *water*. Mix and heat in a water bath at 60° for 15 minutes; a blue colour is produced.

ASSAY
To a weighed quantity of the oral solution containing 0.125 g of Chloral Hydrate add 2.5 g of *zinc powder*, 15 mL of *glacial acetic acid* and 30 mL of *water*. Boil under a reflux condenser for 30 minutes, cool, filter through absorbent cotton and wash the residue with *water*. Combine the filtrate and washings, add 20 mL of 2M *nitric acid* and 30 mL of 0.1M *silver nitrate VS*, shake vigorously and filter. Wash the residue with *water* and titrate the excess of silver nitrate in the combined filtrate and washings with *0.1M ammonium thiocyanate VS* using *ammonium iron(III) sulfate solution R2* as indicator. Each mL of *0.1M silver nitrate VS* is equivalent to 5.513 mg of $C_2H_3Cl_3O_2$. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_2H_3Cl_3O_2$, weight in volume.

www.webofpharma.com

Chlorambucil Tablets

Action and use
Cytotoxic alkylating agent.

DEFINITION
Chlorambucil Tablets contain Chlorambucil. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chlorambucil, $C_{14}H_{19}Cl_2NO_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 10 mg of Chlorambucil with 10 mL of 2M *hydrochloric acid*, allow to stand for 30 minutes, shaking occasionally, and filter. To 5 mL of the filtrate add 0.5 mL of *potassium tetraiodomercurate solution*; a precipitate is produced. To the remainder of the filtrate add 0.15 mL of *dilute potassium permanganate solution*; the colour of the permanganate is discharged.

TESTS

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Chlorambucil comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve one tablet as completely as possible in 10 mL of 0.1M *hydrochloric acid*, add 40 mL of *acetonitrile* and mix for 5 minutes with the aid of ultrasound. Add sufficient *acetonitrile* to produce a solution containing 0.002% w/v of chlorambucil, filter through a glass microfibre filter (Whatman GF/C is suitable), discarding the first 20 mL of filtrate, and use the filtrate.

(2) 0.0020% w/v of *chlorambucil BPCRS* in a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of 0.02M *potassium dihydrogen orthophosphate* and 60 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{19}Cl_2NO_2$ in the tablet using the declared content of $C_{14}H_{19}Cl_2NO_2$ in *chlorambucil BPCRS*.

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve as completely as possible a quantity of the powdered tablets containing 10 mg of Chlorambucil in a mixture of 25 mL of 0.1M *hydrochloric acid* and 100 mL of *acetonitrile* by mixing for 10 minutes with the aid of ultrasound. Dilute to 250 mL with *acetonitrile*, filter through a glass microfibre filter (Whatman GF/C is suitable), discarding the first 20 mL of filtrate, and dilute 50 mL to 100 mL with a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *acetonitrile*.

(2) 0.0020% w/v of *chlorambucil BPCRS* in a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{19}Cl_2NO_2$ in the tablets using the declared content of $C_{14}H_{19}Cl_2NO_2$ in *chlorambucil BPCRS*.

Chloramphenicol Capsules

Action and use
Antibacterial.

DEFINITION
Chloramphenicol Capsules contain Chloramphenicol.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Suspend a quantity of the contents of the capsules containing 0.1 g of Chloramphenicol in 60 mL of *water* and extract with two 20-mL quantities of *petroleum spirit (boiling range, 120° to 160°)*. Wash the combined extracts with two 15-mL quantities of *water*, add the washings to the aqueous layer, extract with four 50-mL quantities of *ether* and evaporate the combined ether extracts. The residue complies with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) 1% w/v of the residue.

(2) 1% w/v of *chloramphenicol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *water*, 10 volumes of *methanol* and 90 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Dissolve 10 mg of the residue in 2 mL of *ethanol (50%)*, add 4.5 mL of 1M *sulfuric acid* and 50 mg of *zinc powder* and

www.webofpharma.com

allow to stand for 10 minutes. Decant the supernatant liquid or filter if necessary. Cool the resulting solution in ice and add 0.5 mL of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 mL of *2-naphthol solution* and 2 mL of 10M *sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with *0.1M hydrochloric acid* if necessary, at the maximum at 278 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$, in the medium taking 297 as the value of A(1%, 1 cm) at the maximum at 278 nm.

2-Amino-1-(4-nitrophenyl)propane-1,3-diol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 40 mg of Chloramphenicol with 100 mL of the mobile phase for 10 minutes, add sufficient mobile phase to produce 200 mL, mix and filter.

(2) 0.0002% w/v of *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-amino-1-(4-nitrophenyl)-propane-1,3-diol is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of 20 capsules containing 0.2 g of Chloramphenicol in 800 mL of *water*, warming if necessary to effect solution, and add sufficient *water* to produce 1000 mL. Dilute 25 mL of this solution to 50 mL with the mobile phase.

(2) Dilute 1 volume of a 0.1% w/v solution of *chloramphenicol BPCRS* in *water* to 10 volumes with the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 15 volumes of *acetonitrile* and 85 volumes of a 0.21% w/v solution of *sodium pentanesulfonate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the capsules using the declared content of $C_{11}H_{12}Cl_2N_2O_5$ in *chloramphenicol BPCRS*.

Chloramphenicol Ear Drops

Action and use

Antibacterial.

DEFINITION

Chloramphenicol Ear Drops are a solution of Chloramphenicol in a suitable vehicle.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) Dilute a volume of the ear drops containing 0.1 g of Chloramphenicol to 10 mL.

(2) 1% w/v of *chloramphenicol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

www.webofpharma.com

MOBILE PHASE

1 volume of *water*, 10 volumes of *methanol* and 90 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Dilute a volume of the ear drops containing 50 mg of Chloramphenicol to 10 mL with *ethanol (50%)*. To 2 mL add 4.5 mL of 1M *sulfuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Decant the supernatant liquid or filter if necessary. Cool the resulting solution in ice and add 0.5 mL of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 mL of *2-naphthol solution* and 2 mL of 10M *sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

TESTS

2-Amino-1-(4-nitrophenyl)propane-1,3-diol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the ear drops with sufficient of the mobile phase to produce a solution containing 0.050% w/v of Chloramphenicol.

(2) 0.0025% w/v of *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-amino-1-(4-nitrophenyl)-propane-1,3-diol is not greater than the area of the peak in the chromatogram obtained with solution (2) (5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the ear drops containing 25 mg of Chloramphenicol to 50 mL with water, mix and dilute 1 volume of the resulting solution to 5 volumes with the mobile phase.

(2) Dilute 1 volume of a 0.1% w/v solution of *chloramphenicol BPCRS* in *water* to 10 volumes with the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 15 volumes of *acetonitrile* and 85 volumes of a 0.21% w/v solution of *sodium pentanesulfonate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the ear drops using the declared content of $C_{11}H_{12}Cl_2N_2O_5$ in *chloramphenicol BPCRS*.

STORAGE

Chloramphenicol Ear Drops should be protected from light.

Chloramphenicol Eye Drops

Action and use

Antibacterial.

DEFINITION

Chloramphenicol Eye Drops are a sterile solution of Chloramphenicol in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a volume of the eye drops containing 50 mg of Chloramphenicol add 15 mL of *water* and extract with four 25-mL quantities of *ether*. Combine the extracts and evaporate to dryness. The dried residue complies with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) 1% w/v of the residue.

(2) 1% w/v of *chloramphenicol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *water*, 10 volumes of *methanol* and 90 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

www.webofpharma.com

B. Dissolve 10 mg of the residue in 2 mL of *ethanol (50%)*, add 4.5 mL of 1M *sulfuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Decant the supernatant liquid or filter if necessary. Cool the resulting solution in ice and add 0.5 mL of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 mL of *2-naphthol solution* and 2 mL of 10M *sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

TESTS

Acidity or alkalinity
pH, 7.0 to 7.5, Appendix V L.

2-Amino-1-(4-nitrophenyl)propane-1,3-diol
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing 0.05% w/v of Chloramphenicol.

(2) 0.004% w/v of *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-amino-1-(4-nitrophenyl)-propane-1,3-diol is not greater than the area of the peak in the chromatogram obtained with solution (2) (8%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops containing 5 mg of Chloramphenicol to 50 mL with the mobile phase.

(2) Dilute 1 volume of a 0.1% w/v solution of *chloramphenicol BPCRS* in *water* to 10 volumes with the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 15 volumes of *acetonitrile* and 85 volumes of a 0.21% w/v solution of *sodium pentanesulfonate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the eye drops using the declared content of $C_{11}H_{12}Cl_2N_2O_5$ in *chloramphenicol BPCRS*.

STORAGE

Chloramphenicol Eye Drops should be protected from light.

Chloramphenicol Eye Ointment

Action and use
Antibacterial.

DEFINITION

Chloramphenicol Eye Ointment is a sterile preparation containing Chloramphenicol in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a quantity of the eye ointment containing 30 mg of Chloramphenicol with 10 mL of *petroleum spirit (boiling range, 40° to 60°)*, centrifuge and discard the supernatant liquid. Repeat this procedure using three 10-mL quantities of the same solvent. The dried residue complies with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) 1% w/v of the residue.

(2) 1% w/v of *chloramphenicol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *water*, 10 volumes of *methanol* and 90 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Dissolve 10 mg of the residue in 2 mL of *ethanol (50%)*, add 4.5 mL of 1M *sulfuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Decant the supernatant liquid or filter if necessary. Cool the resulting solution in ice and add 0.5 mL of *sodium nitrite solution* and, after 2 minutes, 1 g

www.webofpharma.com

of *urea* followed by 1 mL of *2-naphthol solution* and 2 mL of 10M *sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

TESTS

2-Amino-1-(4-nitrophenyl)propane-1,3-diol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Suspend a quantity of the eye ointment containing 40 mg of Chloramphenicol in 50 mL of *petroleum spirit (boiling range, 40° to 60°)* and extract with successive quantities of 25, 25, 15 and 15 mL of a warm 0.21% w/v solution of *sodium pentanesulfonate*. Combine the extracts, add 15 mL of *acetonitrile* and 1 mL of *glacial acetic acid*, mix and dilute to 100 mL with a 0.21% w/v solution of *sodium pentanesulfonate*. Filter the resulting cooled solution through a 0.7-µm glass filter and then through a 0.45-µm nylon filter.

(2) Dilute 1 volume of a 0.04% w/v solution of *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in *water* to 100 volumes with the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-amino-1-(4-nitrophenyl)-propane-1,3-diol is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Suspend a quantity of the eye ointment containing 10 mg of Chloramphenicol in 50 mL of *petroleum spirit (boiling range, 40° to 60°)* and extract with successive quantities of 25, 25, 15 and 15 mL of a warm 0.21% w/v solution of *sodium pentanesulfonate*. Combine the extracts, add 15 mL of *acetonitrile* and 1 mL of *glacial acetic acid*, mix and dilute to 100 mL with a 0.21% w/v solution of *sodium pentanesulfonate*. Filter the resulting cooled solution through a 0.7-µm glass filter and then through a 0.45-µm nylon filter.

(2) Dilute 1 volume of a 0.1% w/v solution of *chloramphenicol BPCRS* in *water* to 10 volumes with the mobile phase.

(3) 0.005% w/v of each of *chloramphenicol BPCRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 278 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 15 volumes of *acetonitrile* and 85 volumes of a 0.21% w/v solution of *sodium pentanesulfonate*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chloramphenicol and 2-amino-1-(4-nitrophenyl)propane-1,3-diol is at least 8.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the eye ointment using the declared content of $C_{11}H_{12}Cl_2N_2O_5$ in *chloramphenicol BPCRS*.

Chloramphenicol Sodium Succinate Injection

Action and use

Antibacterial.

DEFINITION

Chloramphenicol Sodium Succinate Injection is a sterile solution of Chloramphenicol Sodium Succinate in Water for Injections. It is prepared by dissolving Chloramphenicol Sodium Succinate for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Chloramphenicol Sodium Succinate Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

CHLORAMPHENICOL SODIUM SUCCINATE FOR INJECTION

DEFINITION

Chloramphenicol Sodium Succinate for Injection is a sterile material consisting of Chloramphenicol Sodium Succinate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of chloramphenicol sodium succinate, calculated as $C_{11}H_{12}Cl_2N_2O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.

(1) Dissolve a sufficient quantity of the contents of the sealed container to produce a solution containing the equivalent of 1% w/v of chloramphenicol.

(2) 1% w/v of *chloramphenicol sodium succinate BPCRS*.

(3) 1% w/v of *chloramphenicol BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 2M *acetic acid*, 14 volumes of *methanol* and 85 volumes of *chloroform*.

CONFIRMATION

The two principal spots in the chromatogram obtained with solution (1) are similar in position and size to those in the chromatogram obtained with solution (2) and their positions are different from that of the principal spot in the chromatogram obtained with solution (3).

B. Dissolve 10 mg in 1 mL of *ethanol (50%)*, add 3 mL of a 1% w/v solution of *calcium chloride* and 50 mg of *zinc powder* and heat on a water bath for 10 minutes. Filter the hot solution, allow to cool, add 0.1 mL of *benzoyl chloride* and shake for 1 minute. Add 0.5 mL of *iron(III) chloride solution R1* and 2 mL of *chloroform* and shake. The aqueous layer is light violet-red to purple.

C. Yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 20.0% w/v of chloramphenicol, 6.0 to 7.0, Appendix V L.

Chloramphenicol and chloramphenicol disodium disuccinate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a sufficient quantity of the contents of the sealed container to give a solution containing the equivalent of 0.018% w/v of chloramphenicol.

(2) 0.00050% w/v of *chloramphenicol BPCRS*.

(3) 0.00050% w/v of *chloramphenicol disodium disuccinate EPCRS*.

(4) 0.00050% w/v of each of *chloramphenicol disodium disuccinate EPCRS* and *chloramphenicol BPCRS* and a sufficient quantity of the contents of the sealed container to give a solution containing the equivalent of 0.025% w/v of chloramphenicol.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (LiChrosorb RP-18, Hypersil ODS and Polygosil C18 5 µm are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of a 2% w/v solution of *orthophosphoric acid*, 40 volumes of *methanol* and 55 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the two peaks in the chromatogram obtained with solution (4) corresponding to those in the chromatograms obtained with solutions (2) and (3) are clearly separated from the peaks corresponding to the two principal peaks in the chromatogram obtained with solution (1). If necessary, adjust the methanol content of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the areas of any peaks corresponding to chloramphenicol and chloramphenicol disodium disuccinate are not greater than those of the principal peaks in the chromatograms obtained with solutions (2) and (3) respectively (2% of each).

Water

Not more than 5.0% w/w, Appendix IX C. Use 0.5 g.

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 10 mg per mL (solution A). The endotoxin limit of solution A is 2.0 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Dissolve a quantity of the mixed contents of the 10 containers containing the equivalent of 0.2 g of chloramphenicol in *water* and add sufficient *water* to produce 500 mL. Dilute 5 mL of this solution to 100 mL with *water* and measure the *absorbance* of the resulting solution at the maximum at 276 nm, Appendix II B. Calculate the content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$, in a container of average content weight taking 297 as the value of A(1%, 1 cm) at the maximum at 276 nm.

STORAGE

The sealed container should be protected from light.

LABELLING

The label of the sealed container states the quantity of Chloramphenicol Sodium Succinate contained in it in terms of the equivalent amount of chloramphenicol.

Chlordiazepoxide Capsules

Action and use

Benzodiazepine.

DEFINITION

Chlordiazepoxide Capsules contain Chlordiazepoxide Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of chlordiazepoxide hydrochloride, $C_{16}H_{14}ClN_3O,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the following procedure protected from light. Shake a quantity of the mixed capsule contents containing 20 mg of Chlordiazepoxide Hydrochloride with 150 mL of *0.1M hydrochloric acid* for 20 minutes. Add sufficient 0.1 M *hydrochloric acid* to produce 200 mL and filter. Dilute 10 mL of the filtrate to 100 mL with *0.1M hydrochloric acid*. The *light*

www.webofpharma.com

absorption, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 246 nm and 308 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a sample of the medium and measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 308 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of chlordiazepoxide hydrochloride, $C_{16}H_{14}ClN_3O,HCl$, in the medium taking 292 as the value of A(1%, 1 cm) at the maximum at 308 nm.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use and protected from light.

(1) Shake a quantity of the mixed capsule contents containing 20 mg of Chlordiazepoxide Hydrochloride with 50 mL of the mobile phase, dilute to 100 mL with the mobile phase and filter.

(2) Dilute 3 volumes of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 2 volumes of solution (1) to 100 volumes with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase.

(4) 0.00004% w/v of *aminochlorobenzophenone*(impurity C) in the mobile phase.

(5) 0.0002% w/v of *chlordiazepoxide impurity A EPCRS* and 0.0002% w/v of *chlordiazepoxide hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

(g) For solutions (1) and (4) allow the chromatography to proceed for 6 times the retention time of the peak due to chlordiazepoxide.

MOBILE PHASE

Equal volumes of *acetonitrile* and *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity A and chlordiazepoxide is at least 5.0.

When the chromatograms are recorded under the prescribed conditions the retention times relative to chlordiazepoxide (retention time about 3.6 min) are impurity A, about 0.7 and impurity C, about 3.9.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the area of any peak due to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the impurities is not greater than 3.4%.

Disregard any peak with an area less than half the area of the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use and protected from light.

(1) Shake a quantity of the mixed contents of 20 capsules containing 20 mg of Chlordiazepoxide Hydrochloride with 50 mL of the mobile phase, dilute to 100 mL with the mobile phase and filter. Dilute 10 mL of this solution to 100 mL with the mobile phase.

(2) 0.002% w/v of *chlordiazepoxide hydrochloride BPCRS* in the mobile phase.

(3) 0.0002% w/v of *chlordiazepoxide impurity A EPCRS* and 0.0002% w/v *chlordiazepoxide hydrochloride BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and chlordiazepoxide is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{14}ClN_3O,HCl$ in the capsules using the declared content of $C_{16}H_{14}ClN_3O,HCl$ in *chlordiazepoxide hydrochloride BPCRS*.

STORAGE

Chlordiazepoxide Capsules should be protected from light.

www.webofpharma.com

Chlordiazepoxide Tablets

Chlordiazepoxide Hydrochloride Tablets

Action and use
Benzodiazepine.

DEFINITION
Chlordiazepoxide Tablets contain Chlordiazepoxide Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chlordiazepoxide, $C_{16}H_{14}ClN_3O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake 10 whole tablets with 150 mL of *0.1M hydrochloric acid* for 20 minutes, add sufficient *0.1M hydrochloric acid* to produce 250 mL and filter. Dilute 10 mL of the filtrate with sufficient *0.1M hydrochloric acid* to produce a solution containing the equivalent of 0.0010% w/v of chlordiazepoxide. The *light absorption*, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 246 nm and 308 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 308 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of chlordiazepoxide, $C_{16}H_{14}ClN_3O$, in the medium taking 327 as the value of A(1%, 1 cm) at the maximum at 308 nm.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use and protected from light.

(1) Shake a quantity of powdered tablets containing the equivalent of 20 mg of chlordiazepoxide with 50 mL of the mobile phase, dilute to 100 mL with the mobile phase and filter.

(2) Dilute 3 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 2 volumes of solution (1) to 100 volumes with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase.

(4) 0.00004% w/v of *aminochlorobenzophenone* in the mobile phase.

(5) 0.0002% w/v of *chlordiazepoxide impurity A EPCRS* and 0.0002% w/v of *chlordiazepoxide hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

(g) For solutions (1) and (4) allow the chromatography to proceed for 6 times the retention time of the peak due to chlordiazepoxide.

MOBILE PHASE

Equal volumes of *acetonitrile* and *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution* between the peaks due to impurity A and chlordiazepoxide is at least 5.0.

When the chromatograms are recorded under the prescribed conditions the retention times relative to chlordiazepoxide (retention time about 3.6 min) are impurity A, about 0.7 and aminochlorobenzophenone, about 3.9.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the area of any peak due to aminochlorobenzophenone is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of all impurities is not greater than 3.4%.

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use and protected from light.

(1) Weigh and powder 20 tablets. Shake a quantity of powdered tablets containing the equivalent of 20 mg of chlordiazepoxide with 50 mL of the mobile phase, dilute to 100 mL with the mobile phase and filter. Dilute 10 mL of this solution to 100 mL with the mobile phase.

(2) 0.002% w/v of *chlordiazepoxide hydrochloride BPCRS* in the mobile phase.

(3) 0.0002% w/v of *chlordiazepoxide impurity A EPCRS* and 0.0002% w/v of *chlordiazepoxide hydrochloride BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and chlordiazepoxide is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{14}ClN_3O$ in the tablets using the declared content of $C_{16}H_{14}ClN_3O,HCl$ in *chlordiazepoxide hydrochloride BPCRS*. Each mg of $C_{16}H_{14}ClN_3O,HCl$ is equivalent to 0.8916 mg of $C_{16}H_{14}ClN_3O$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of chlordiazepoxide.

Chlorhexidine Gluconate Eye Drops

Chlorhexidine Digluconate Eye Drops

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use

Antiseptic.

DEFINITION

Chlorhexidine Gluconate Eye Drops are a sterile solution of Chlorhexidine Gluconate in Purified Water. They are usually prepared from Chlorhexidine Gluconate Solution.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of chlorhexidine gluconate, $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$

95.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Add 10 mL of *concentrated ammonia*, drop wise, to a volume of the eye drops containing the equivalent of 20 mg of chlorhexidine gluconate which has previously been cooled in ice. Centrifuge at 3000 rpm for 10 minutes, discard the supernatant liquid and transfer the residue to a filter which has previously been treated with *water* (Whatman GF/F paper is suitable); allow to stand until the ammonia has evaporated. Wash the residue with 10 mL of *water* and dissolve in *ethanol (70%)*. Evaporate the solvent under a stream of *nitrogen* and dry the residue at 105° for one hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of chlorhexidine *(RS 449)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to chlorhexidine in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 5.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the eye drops, if necessary, to produce a solution containing the equivalent of 0.02% w/v of chlorhexidine gluconate.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 10 volumes.

(4) 0.001% w/v of *4-chloroaniline*.

(5) Dilute 1 volume of solution (4) and 2 volumes of a 0.0035% w/v solution of *chlorhexidine acetate BPCRS* to 20 volumes.

When the chromatograms are recorded under the prescribed conditions the retention time of chlorhexidine is about 13 minutes and the relative retention of 4-chloroaniline is about 0.3.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18(2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 6 times the retention time of chlorhexidine.

Equilibrate the column with mobile phase for at least 1 hour.

MOBILE PHASE

120 volumes of *glacial acetic acid*, 270 volumes of *water* and 730 volumes of *methanol* containing 0.2% w/v of *sodium octanesulfonate*.

SYSTEM SUITABILITY

Use the chromatogram obtained with solution (4) to identify the peak due to 4-chloroaniline.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution* between the two principal peaks is at least 23.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to 4-chloroaniline is not greater that the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of not more than one *secondary peak* is greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.02% w/v of chlorhexidine gluconate.

(2) 0.014% w/v of *chlorhexidine acetate BPCRS* in *water*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *perchloric acid,* 35 volumes of *methanol* and 64 volumes of *water.*

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ in the eye drops using the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS.* Each mg of $C_{22}H_{30}Cl_2N_{10}$ is equivalent to 1.776 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

STORAGE

Chlorhexidine Gluconate Eye Drops should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of chlorhexidine gluconate.

Chlorhexidine Gluconate Dental Gel

Chlorhexidine Gluconate Gel

Action and use

Antiseptic.

DEFINITION

Chlorhexidine Gluconate Dental Gel is a solution of Chlorhexidine Gluconate in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of chlorhexidine gluconate, $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the gel containing 5 mg of Chlorhexidine Gluconate in 10 mL of *water,* mix and dilute to 500 mL with *water.* The *light absorption* of the resulting solution, Appendix II B, in the range 200 to 320 nm exhibits two maxima, at 231 nm and 255 nm, and two minima, at 222 nm and 242 nm.

B. Place a quantity of the gel on a white tile and add a drop of *bromine water.* A reddish-yellow colour is produced.

C. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to chlorhexidine in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 5.0 to 7.0, Appendix V L.

4-Chloroaniline

Carry out the method for *gas chromatography,* Appendix III B, using the following solutions.

Dissolve 80 mg of *2,6-dimethylaniline* (internal standard) in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100 mL and dilute 1 volume of this solution to 100 volumes with 0.01M *hydrochloric acid* (solvent A).

(1) Shake a quantity of the gel containing 0.5 g of Chlorhexidine Gluconate with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution,* allow to separate and discard the lower layer. Shake the upper layer with *anhydrous sodium sulfate* and filter through silica-treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution,* shake, allow to separate and use the upper layer.

(2) Add 2 mL of solvent A to a quantity of the gel containing 0.5 g of Chlorhexidine Gluconate, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution,* allow to separate and discard the lower layer. Shake the upper layer with *anhydrous sodium sulfate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution,* shake, allow to separate and use the upper layer.

REFERENCE SOLUTIONS

Prepare a series of reference solutions in the following manner. Dissolve 25 mg of *4-chloroaniline* in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 mL and dilute 1 volume to 10 volumes with the same solvent. To separate 0, 2, 4, 6 and 8 mL volumes of this solution (containing 0, 25, 50, 75 and 100 µg of 4-chloroaniline) add 2 mL of solvent A and sufficient *water* to produce 50 mL, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane,* and 5 mL of 0.6M *sodium hydrogen carbonate solution* allow to separate and discard the lower layer. Shake the upper layer with *anhydrous sodium sulfate* and filter through silica-treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution,* shake, allow to separate and use the upper layer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *silanised diatomaceous support* (100 to 120 mesh) coated with 15% w/w of cyanopropylmethylphenyl methyl silicone fluid (OV-225 is suitable).

(b) Use a flow rate of 50 mL per minute.

(c) Use a column temperature of 190°.

(d) Use an inlet port temperature of 200°.

(e) Use a detector temperature of 270°.

(f) Use *nitrogen* as the carrier gas.

(g) Use an electron capture detector.

(h) Inject 1 µL of each solution.

Inject the reference solutions and construct a calibration curve of the concentration of 4-chloroaniline against the ratio of the area of the peak corresponding to 4-chloroaniline to the area of the peak due to the internal standard.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (2) determine the ratio of the area of any peak due to 4-chloroaniline to the area of the peak due to the internal standard and hence calculate the content of 4-chloroaniline in the gel. Not more than 20 ppm.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 mL of a 0.080% w/v solution of *diphenylamine* (internal standard) in the mobile phase to 5 mL of a 0.070% w/v solution of *chlorhexidine acetate BPCRS* in the mobile phase and dilute to 100 mL with the mobile phase.

(2) Mix a quantity of the gel containing 5 mg of Chlorhexidine Gluconate with sufficient of the mobile phase to produce 100 mL.

(3) Prepare in the same manner as solution (2) but add 5 mL of the internal standard solution before diluting to 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.01M *sodium octanesulfonate* in *methanol (73%)* adjusted to pH 3.0 with *glacial acetic acid.*

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ in the gel from the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS*. Each mg of $C_{22}H_{30}Cl_2N_{10}$ is equivalent to 1.776 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

Chlorhexidine Irrigation Solution

Action and use

Antiseptic.

DEFINITION

Chlorhexidine Irrigation Solution is a sterile solution of Chlorhexidine Acetate in Water for Irrigation.

The solution complies with the requirements stated under Preparations for Irrigation and with the following requirements.

Content of chlorhexidine acetate, $C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to chlorhexidine in the chromatogram obtained with solution (2).

B. To a volume of the irrigation solution containing 2 mg of Chlorhexidine Acetate, add 5 mL of a warm 1% w/v solution *of cetrimide*, 1 mL of 5M *sodium hydroxide* and 1 mL of *bromine water*. A deep red colour is produced.

C. Evaporate or dilute a volume of the irrigation solution containing 6 mg of Chlorhexidine Acetate to about 5 mL. The resulting solution yields reaction B characteristic of *acetates*, Appendix VI.

TESTS

Acidity

pH, 5.0 to 6.5, Appendix V L.

4-Chloroaniline

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

Dissolve 80 mg of *2,6-dimethylaniline* (internal standard) in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100 mL and dilute 1 volume of this solution to 100 volumes with 0.01M *hydrochloric acid* (solution A).

(1) Shake a volume of the irrigation solution containing 124 mg of Chlorhexidine Acetate with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution*, allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulfate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer.

(2) Add 2 mL of solution A to a volume of the irrigation solution containing 124 mg of Chlorhexidine Acetate, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'.

REFERENCE SOLUTIONS

Prepare a series of reference solutions in the following manner. Dissolve 25 mg of *4-chloroaniline* in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 mL and dilute 1 volume to 10 volumes with the same solvent. To separate 0, 2, 4, 6 and 8 mL volumes of this solution (containing 0, 25, 50, 75 and 100 µg of 4-chloroaniline) add 2 mL of solution A and sufficient *water* to produce 50 mL, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 15% w/w of *cyanopropylmethylphenyl methyl silicone fluid* (OV-225 is suitable).

(b) Use a flow rate of 50 mL per minute.

(c) Use a column temperature of 190°.

(d) Use an inlet port temperature of 200°.

(e) Use a detector temperature of 270°.

(f) Use *nitrogen* as the carrier gas.

(g) Use an electron capture detector.

(h) Inject 1 µL of each solution.

Inject the reference solutions and construct a calibration curve of the concentration of 4-chloroaniline against the ratio of the area of the peak corresponding to 4-chloroaniline to the area of the peak due to the internal standard.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (2) determine the ratio of the area of any peak due to 4-chloroaniline to the area of the peak due to the internal standard and hence calculate the content of 4-chloroaniline in the irrigation solution. Not more than 1.5 ppm is detected.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the irrigation solution with *water*, if necessary, to produce a solution containing 0.02% w/v of Chlorhexidine Acetate.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Dissolve the contents of a vial of *chlorhexidine for system suitability EPCRS* in 10 mL of mobile phase A.

(4) Dilute 1 volume of solution (2) to 10 volumes with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 20 volumes of a 0.1% v/v solution of *trifluoroacetic acid* in *acetonitrile* and 80 volumes of a 0.1% v/v solution of *trifluoroacetic acid* in *water*.

Mobile phase B 10 volumes of a 0.1% v/v solution of *trifluoroacetic acid* in *water* and 90 volumes of a 0.1% v/v solution of *trifluoroacetic acid* in *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	100	0	isocratic
2-32	100→80	0→20	linear gradient
32-37	80	20	isocratic
37-47	80→70	20→30	linear gradient
47-54	70	30	isocratic
54-55	70→100	30→0	linear gradient
55-60	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the retention times relative to chlorhexidine (retention time about 35 minutes) are: impurity L, about 0.23; impurity Q, about 0.24; impurity G, about 0.25; impurity N, about 0.35; impurity B, about 0.36; impurity F, about 0.5; impurity A, about 0.6; impurity H, about 0.85; impurity O, about 0.90; impurity I, about 0.91; impurity J, about 0.96 and impurity K, about 1.4.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity L and impurity G is at least 3.0;

the *peak-to-valley ratio* is at least 2.0, where H_p is the height above the baseline of the peak due to impurity B and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity N.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity N is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to impurity H is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity A, J or K is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4% of each);

the sum of the areas of any peaks corresponding to impurities I and O is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of any peak corresponding to impurity G is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the solution being examined containing 4 mg of Chlorhexidine Acetate with sufficient of the mobile phase to produce 50 mL.

(2) 0.008% w/v of *chlorhexidine acetate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.20% w/v of *sodium octanesulfonate* in a mixture of 120 volumes of *glacial acetic acid*, 270 volumes of *water* and 730 volumes of *methanol*.

DETERMINATION OF CONTENT

Determine the weight per mL of the irrigation solution, Appendix V G, and calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$ from the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS*. Each mg of $C_{22}H_{30}Cl_2N_{10}$ is equivalent to 1.238 mg of $C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$.

www.webofpharma.com

STORAGE
Chlorhexidine Irrigation Solution should be protected from light.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Chlorhexidine Acetate.

Chlorhexidine Mouthwash

Action and use
Antiseptic.

DEFINITION
Chlorhexidine Mouthwash contains Chlorhexidine Gluconate Solution in a suitable flavoured and coloured vehicle.

The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of chlorhexidine gluconate, $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to chlorhexidine in the chromatogram obtained with solution (2).

TESTS
4-Chloroaniline
Not more than 0.3% of the content of chlorhexidine gluconate when determined in the following manner. Dissolve 80 mg of *2,6-dimethylaniline* (internal standard) in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100 mL and dilute 1 volume of this solution to 100 volumes with 0.01M *hydrochloric acid* (solution A). Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) dilute a volume of the mouthwash containing the equivalent of 25 mg of chlorhexidine gluconate to 50 mL with *water*, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution*, allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulfate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer. For solution (2) dilute a volume of the mouthwash containing the equivalent of 25 mg of chlorhexidine gluconate to 50 mL with *water*, add 2 mL of solution A, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'. Prepare a series of reference solutions in the following manner. Dissolve 25 mg of *4-chloroaniline* in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 mL and dilute 1 volume to 10 volumes with the same solvent. To separate 0, 2, 4, 6 and 8 mL volumes of this solution (containing 0, 25, 50, 75 and 100 µg of 4-chloroaniline) add 2 mL of solution A and sufficient *water* to produce 50 mL, shake with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'.

The chromatographic procedure may be carried out using (a) a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 15% w/w of cyanopropylmethylphenyl methyl silicone fluid (OV-225 is suitable) at a temperature of 190° with the inlet port at 200° and the detector at 270°, (b) *nitrogen* as the carrier gas at a flow rate of 50 mL per minute and (c) an electron capture detector.

Inject the reference solutions and construct a calibration curve of the concentration of 4-chloroaniline against the ratio of the area of the peak corresponding to 4-chloroaniline to the area of the peak due to the internal standard. In the chromatogram obtained with solution (2) determine the ratio of the area of any peak due to 4-chloroaniline to the area of the peak due to the internal standard and hence calculate the content of 4-chloroaniline in the mouthwash with respect to the labelled content of chlorhexidine gluconate.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of the mouthwash with sufficient of the mobile phase to produce a solution containing 0.01% w/v of chlorhexidine gluconate. Solution (2) contains 0.008% w/v of *chlorhexidine acetate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a solution containing 2 g of *sodium octanesulfonate* in a mixture of 120 mL of *glacial acetic acid*, 270 mL of *water* and 730 mL of *methanol* and (c) a detection wavelength of 254 nm.

Equilibrate the column with the mobile phase for at least 1 hour.

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ from the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS*. Each mg of $C_{22}H_{30}Cl_2N_{10}$, is equivalent to 1.776 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

STORAGE
Chlorhexidine Mouthwash should be protected from light.

Chloroquine Phosphate Tablets

Action and use
Antiprotozoal (malaria).

DEFINITION
Chloroquine Phosphate Tablets contain Chloroquine Phosphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chloroquine phosphate, $C_{18}H_{26}ClN_3,2H_3PO_4$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
A. Dissolve a quantity of the powdered tablets containing 0.1 g of Chloroquine Phosphate in a mixture of 10 mL of *water* and 2 mL of 2M *sodium hydroxide* and extract with two 20-mL quantities of *chloroform*. Wash the chloroform extracts with *water*, dry with *anhydrous sodium sulfate*, evaporate to dryness and dissolve the residue in 2 mL of *chloroform IR*.

www.webofpharma.com

The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of chloroquine *(RS 054)*.

B. Extract a quantity of the powdered tablets containing 25 mg of Chloroquine Phosphate with 20 mL of *water*, filter and add 8 mL of *picric acid solution R1* to the filtrate. The *melting point* of the precipitate, after washing successively with *water*, *ethanol (96%)* and *ether*, is about 207°, Appendix V A.

C. Extract a quantity of the powdered tablets containing 0.5 g of Chloroquine Phosphate with 25 mL of *water* and filter. To the filtrate add 2.5 mL of 5M *sodium hydroxide* and extract with three 10 mL quantities of *ether*. The aqueous layer, after neutralisation with 2M *nitric acid*, yields the reactions characteristic *of phosphates*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 mL of *0.1M hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 mL of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 344 nm, Appendix II B. Calculate the total content of chloroquine phosphate, $C_{18}H_{26}ClN_3,2H_3PO_4$, in the medium taking 371 as the value of A(1%, 1 cm) at the maximum at 344 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 50 volumes of *chloroform*, 40 volumes of *cyclohexane* and 10 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 1 g of Chloroquine Phosphate with 20 mL of *water* for 30 minutes, centrifuge and use the supernatant liquid; if necessary filter through a glass fibre paper. For solution (2) dilute 1 mL of solution (1) to 100 mL with *water*. For solution (3) dilute 25 mL of solution (2) to 50 mL with *water*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Chloroquine Phosphate in 20 mL of 1M *sodium hydroxide* and extract with four 25-mL quantities of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 mL. Add 40 mL of *anhydrous acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, determining the end point potentiometrically. Each mL of *0.1M perchloric acid VS* is equivalent to 25.79 mg of $C_{18}H_{26}ClN_3,2H_3PO_4$.

250 mg of Chloroquine Phosphate is approximately equivalent to 155 mg of chloroquine.

Chloroquine Sulfate Tablets

Chloroquine Sulphate Tablets

Action and use

Antiprotozoal (malaria).

DEFINITION

Chloroquine Sulfate Tablets contain Chloroquine Sulfate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chloroquine sulfate, $C_{18}H_{26}ClN_3,H_2SO_4,H_2O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Chloroquine Sulfate in a mixture of 10 mL of *water* and 2 mL of 2M *sodium hydroxide* and extract with two 20-mL quantities of *chloroform*. Wash the chloroform extracts with *water*, dry with *anhydrous sodium sulfate*, evaporate to dryness and dissolve the residue in 2 mL of *chloroform IR*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of chloroquine *(RS 054)*.

B. Shake a quantity of the powdered tablets containing 0.1 g of Chloroquine Sulfate with 10 mL of *water* and 1 mL of 2M *hydrochloric acid* and filter. To the filtrate add 1 mL of *barium chloride solution*. A white precipitate is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 344 nm, Appendix II B using 0.01M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of chloroquine sulfate, $C_{18}H_{26}ClN_3,H_2SO_4,H_2O$, in the medium taking 450 as the value of A(1%, 1 cm) at the maximum at 344 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 2.0 g of Chloroquine Sulfate with 50 mL of *water* for 30 minutes, centrifuge and use the supernatant liquid; if necessary filter through a glass fibre paper.

(2) Dilute 1 mL of solution (1) to 100 mL with *water*.

(3) Dilute 25 mL of solution (2) to 50 mL with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

www.webofpharma.com

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *diethylamine*, 40 volumes of *cyclohexane* and 50 volumes of *chloroform*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Chloroquine Sulfate in 20 mL of 1M *sodium hydroxide* and extract with four 25-mL quantities of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 mL. Add 40 mL of *anhydrous acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, determining the end point potentiometrically. Each mL of *0.1M perchloric acid VS* is equivalent to 20.90 mg of $C_{18}H_{26}ClN_3,H_2SO_4$.

200 mg of Chloroquine Sulfate is approximately equivalent to 146 mg of chloroquine.

Chloroxylenol Solution

Chloroxylenol Cutaneous Solution

Action and use

Antiseptic.

DEFINITION

Chloroxylenol Solution is a *cutaneous solution*.

Chloroxylenol	50.0 g
Potassium Hydroxide	13.6 g
Oleic Acid	7.5 mL
Virgin Castor Oil	63.0 g
Terpineol	100 mL
Ethanol (96 per cent)	200 mL
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

In making Chloroxylenol Solution, the Ethanol (96 per cent) may be replaced by Industrial Methylated Spirit[1].

Extemporaneous preparation

The following directions apply.

Dissolve the Potassium Hydroxide in 15 mL of Purified Water, add a solution of the Virgin Castor Oil in 63 mL of Ethanol (96 per cent), mix, allow to stand for 1 hour or until a small portion of the mixture remains clear when diluted with 19 times its volume of Purified Water and then add the Oleic Acid. Mix the Terpineol with a solution of the Chloroxylenol in the remainder of the Ethanol (96 per cent), pour into the soap solution and add sufficient Purified Water to produce 1000 mL.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of chloroxylenol, C_8H_9ClO

4.75 to 5.25% w/v.

TESTS

Ethanol content

16 to 21% v/v, Appendix VIII F.

ASSAY

Dissolve 0.4 g of *4-chloro-o-cresol* (internal standard) in sufficient *chloroform* to produce 50 mL (solution A). Carry out the method for *gas chromatography*, Appendix III B, using solutions prepared in the following manner. For solution (1) dissolve 0.10 g of *chloroxylenol BPCRS* in 10 mL of solution A and dilute to 20 mL with *chloroform*. For solution (2) place 4 mL of the solution being examined in a separating funnel, add 20 mL of *chloroform*, mix, add 4 mL of 2M *hydrochloric acid* and shake. Extract with two further 10-mL quantities of *chloroform*. Combine the chloroform extracts, dry by shaking with *anhydrous sodium sulfate* and filter. Prepare solution (3) in the same manner as solution (2) but adding 20 mL of solution A in place of the 20 mL of chloroform.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of polyethylene glycol (Carbowax 20M is suitable) and maintained at 160°.

Calculate the content of C_8H_9ClO using the declared content of C_8H_9ClO in *chloroxylenol BPCRS*.

Chlorphenamine Injection

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Chlorphenamine Injection is a sterile solution of Chlorphenamine Maleate in Water for Injections free from dissolved air.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of chlorphenamine maleate, $C_{16}H_{19}ClN_2$, $C_4H_4O_4$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 20 volumes of 1M *acetic acid*, 30 volumes of *methanol* and 50 volumes of *ethyl acetate* as the mobile phase. Heat the plate at 105° for 30 minutes before use. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) evaporate an appropriate volume to dryness in a current of nitrogen using the minimum amount of heat, dissolve the residue as completely as possible in sufficient *chloroform* to produce a solution containing 0.5% w/v of Chlorphenamine Maleate and centrifuge. Solution (2) contains 0.5% w/v of *chlorphenamine maleate BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The two principal spots in the chromatogram obtained with solution (1) correspond to those in the chromatogram obtained with solution (2). Spray the plate with *dilute potassium iodobismuthate solution*. The principal spot

[1] *The law and statutory regulations governing the use of Industrial Methylated Spirit must be observed.*

www.webofpharma.com

in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 5.2, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *diethylamine*, 40 volumes of *chloroform* and 50 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) evaporate a suitable volume of the injection to dryness in a current of nitrogen using the minimum amount of heat, dissolve the residue as completely as possible in sufficient *chloroform* to produce a solution containing 5% w/v of Chlorphenamine Maleate and centrifuge. For solution (2) dilute 1 volume of solution (1) to 500 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%). Disregard any spot remaining on the line of application.

ASSAY

Dilute a volume containing 10 mg of Chlorphenamine Maleate to 500 mL with 0.25M *sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 265 nm, Appendix II B. Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ taking 212 as the value of A(1%, 1 cm) at the maximum at 265 nm.

STORAGE

Chlorphenamine Injection should be protected from light.

Chlorphenamine Oral Solution

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Chlorphenamine Oral Solution is a solution of Chlorphenamine Maleate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of chlorphenamine maleate, $C_{16}H_{19}ClN_2$, $C_4H_4O_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

In the test for Related substances, the principal spot in the chromatogram obtained with solution (3) corresponds to the spot in the chromatogram obtained with solution (4).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the oral solution containing 10 mg of Chlorphenamine Maleate with an equal volume of *water*, add 20 mL of a 10% w/v solution of *sodium hydroxide* and extract with four 15 mL quantities of *chloroform*. Add 1 g of *anhydrous sodium sulfate* to the combined extracts, filter, evaporate at a temperature not exceeding 40° at a pressure of 2 kPa and dissolve the residue in 1 mL of *chloroform*.

(2) Dilute 1 volume of solution (1) to 500 volumes with *chloroform*.

(3) Dilute 1 volume of solution (1) to 10 volumes with *chloroform*.

(4) 0.1% w/v of *chlorphenamine maleate BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

20 volumes of 1M *acetic acid*, 30 volumes of *methanol* and 50 volumes of *ethyl acetate*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B.

(1) Add 10 mL of a 10% w/v solution of *sodium hydroxide* in *methanol* and 5 mL of a 0.060% w/v solution of N-*phenylcarbazole* (internal standard) in *chloroform* to a quantity of the oral solution containing 3 mg of Chlorphenamine Maleate, extract with four 25 mL quantities of *chloroform* and wash each extract with the same 10 mL of *water*. Combine the chloroform extracts, shake with *anhydrous sodium sulfate*, filter, evaporate at a temperature not exceeding 40° at a pressure of 2 kPa and dissolve the residue in 2 mL of *chloroform*.

(2) Prepared in the same manner as solution (1), but omitting the internal standard.

(3) 0.15% w/v of *chlorphenamine maleate BPCRS* and 0.15% w/v of N-*phenylcarbazole* (internal standard) in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) (Gas Chrom Q or Diatomite CQ is suitable) coated with 3% w/w of dimethyl silicone fluid (OV-101 is suitable).

(b) Use *nitrogen* as the carrier gas at 50 mL per minute.

(c) Use isothermal conditions maintained at 220°.

(d) Use an inlet temperature of 250°.

(e) Use a flame ionisation detector at a temperature of 300°.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ using the declared content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ in *chlorphenamine maleate BPCRS*.

STORAGE

Chlorphenamine Oral Solution should be protected from light.

www.webofpharma.com

Chlorphenamine Tablets

Action and use
Histamine H_1 receptor antagonist; antihistamine.

DEFINITION
Chlorphenamine Tablets contain Chlorphenamine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chlorphenamine maleate, $C_{16}H_{19}ClN_2$, $C_4H_4O_4$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
Comply with the test described under Chlorphenamine Injection using as solution (1) a solution prepared in the following manner. Extract a quantity of the powdered tablets containing 5 mg of Chlorphenamine Maleate with *chloroform*, filter, evaporate to dryness and dissolve the residue in 1 mL of *chloroform*.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *diethylamine*, 40 volumes of *chloroform* and 50 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 50 mg of Chlorphenamine Maleate with *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 mL of *chloroform*. For solution (2) dilute 1 volume of solution (1) to 500 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%). Disregard any spot remaining on the line of application.

ASSAY
Weigh and powder 20 tablets. Shake a quantity of the powder containing 3 mg of Chlorphenamine Maleate with 20 mL of 0.05M *sulfuric acid* for 5 minutes, add 20 mL of *ether*, shake carefully and filter the acid layer into a second separating funnel. Extract the ether layer with two 10-mL quantities of 0.05M *sulfuric acid*, filter each acid layer into the second separating funnel and wash the filter with 0.05M *sulfuric acid*. Make the combined acid extracts and washings just alkaline to *litmus paper* with 1M *sodium hydroxide*, add 2 mL in excess and extract with two 50 mL quantities of *ether*. Wash each ether extract with the same 20 mL of *water* and extract with successive quantities of 20, 20 and 5 mL of 0.25M *sulfuric acid*. Dilute the combined acid extracts to 50 mL with 0.25M *sulfuric acid*, dilute 10 mL to 25 mL with 0.25M *sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 265 nm, Appendix II B. Calculate the content of $C_{16}H_{19}ClN_2$, $C_4H_4O_4$ taking 212 as the value of A(1%, 1 cm) at the maximum at 265 nm.

Chlorpromazine Injection

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Chlorpromazine Injection is a sterile solution of Chlorpromazine Hydrochloride in Water for Injections free from dissolved air.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S,HCl$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A colourless or almost colourless solution.

IDENTIFICATION
A. To a volume containing 0.1 g of Chlorpromazine Hydrochloride add 20 mL of *water* and 2 mL of 10M *sodium hydroxide*. Shake and extract with 25 mL of *ether*. Wash the ether layer with two 5 mL quantities of *water*, dry with *anhydrous sodium sulfate*, evaporate the ether and dissolve the residue in 1 mL of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of chlorpromazine *(RS 056)*.

B. Complies with the test for *identification of phenothiazines*, Appendix III A. For solution (1) dilute the injection with *water* to give a solution containing 0.2% w/v of Chlorpromazine Hydrochloride.

TESTS
Acidity
pH, 5.0 to 6.5, Appendix V L.

Related substances
Carry out the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and applying separately to the plate 20 µL of each of the following freshly prepared solutions. For solution (1) dilute a volume of the injection, if necessary, with sufficient of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to produce a solution containing 0.5% w/v of Chlorpromazine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 20 volumes with the same solvent. For solution (3) dilute 1 volume of solution (1) to 200 volumes with the same solvent. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY
Carry out the following procedure protected from light. Dilute a suitable volume with sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.0005% w/v of Chlorpromazine Hydrochloride and measure the *absorbance* at the maximum at 254 nm, Appendix II B. Calculate the content of $C_{17}H_{19}ClN_2S,HCl$ taking 915 as the value of A(1%, 1 cm) at the maximum at 254 nm.

STORAGE
Chlorpromazine Injection should be protected from light.

www.webofpharma.com

Chlorpromazine Oral Solution

Chlorpromazine Elixir

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Chlorpromazine Oral Solution is a solution of Chlorpromazine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S,HCl$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Carry out the method for *identification of phenothiazines*, Appendix III A. For solution (1) dilute a suitable volume of the oral solution with *water* to give a solution containing 0.2% w/v of Chlorpromazine Hydrochloride.

TESTS
Related substances
Carry out the procedure protected from light under an atmosphere of nitrogen. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 40 mL of *water* and 5 mL of a 20% w/v solution of *sodium hydroxide* to a quantity of the oral solution containing 20 mg of Chlorpromazine Hydrochloride in a separating funnel and swirl to mix. Extract with two 25-mL quantities of *chloroform*, combine the chloroform extracts and filter through *anhydrous sodium sulfate*. Wash the sodium sulfate with a further 25 mL of *chloroform* and evaporate the combined filtrate and washings to dryness at about 30° in a gentle current of *nitrogen*. Dissolve the residue in 2 mL of a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*.

(3) 0.030% w/v solution of *chlorpromazine sulfoxide BPCRS* in a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase as described below. Use an atmosphere of nitrogen.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry in air, spray with 20% w/w solution of *perchloric acid* and heat at 100° for 5 minutes.

MOBILE PHASE

10 volumes of *acetone*, 10 volumes of *diethylamine* and 80 volumes of *cyclohexane*.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to chlorpromazine sulfoxide is not more intense than the spot in the chromatogram obtained with solution (3);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2).

Disregard any spot remaining on the line of application.

ASSAY
Carry out the following procedure protected from light. Dilute a quantity containing 0.1 g of Chlorpromazine Hydrochloride to 500 mL with 2M *hydrochloric acid*. To 10 mL of this solution add 20 mL of *water*, make distinctly alkaline to *litmus paper* with 13.5M *ammonia* and extract with six 25 mL quantities of *ether*. Extract the combined ether solutions with four 25 mL quantities of a mixture containing 1 volume of *hydrochloric acid* and 99 volumes of *water*, discard the ether, remove any dissolved ether from the combined extracts with a current of air and dilute to 250 mL with a mixture containing 1 volume of *hydrochloric acid* and 99 volumes of *water*. Measure the *absorbance* of the resulting solution at the maximum at 254 nm, Appendix II B. Calculate the content of $C_{17}H_{19}ClN_2S,HCl$ taking 914 as the value of A(1%, 1 cm) at the maximum at 254 nm.

STORAGE
Chlorpromazine Oral Solution should be protected from light.

Chlorpromazine Suppositories

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Chlorpromazine Suppositories contain Chlorpromazine in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of chlorpromazine, $C_{17}H_{19}ClN_2S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Comply with the test for *identification of phenothiazines*, Appendix III A. For solution (1) dissolve a quantity of the suppositories containing 0.1 g of Chlorpromazine in 50 mL of *chloroform*. Use *chlorpromazine hydrochloride BPCRS* to prepare solution (2).

TESTS
Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using the following solutions.

(1) Dissolve a quantity of the suppositories containing 0.2 g of Chlorpromazine in sufficient *chloroform* to produce 20 mL.

(2) Dilute 1 volume of solution (1) to 200 volumes with *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *acetone*, 10 volumes of *diethylamine* and 80 volumes of *cyclohexane*.

www.webofpharma.com

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Disregard any spot remaining on the line of application.

ASSAY

Weigh five suppositories. Dissolve a quantity containing 0.5 g of Chlorpromazine in sufficient *chloroform* to produce 100 mL and dilute 20 mL to 100 mL with *ethanol (96%)*. Dilute 10 mL of this solution to 100 mL with *ethanol (96%)* and further dilute 5 mL of this solution to 100 mL with the same solvent. Measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B, using *ethanol (96%)* in the reference cell. Calculate the content of $C_{17}H_{19}ClN_2S$ taking 1150 as the value of A(1%, 1 cm) at the maximum at 258 nm.

STORAGE

Chlorpromazine Suppositories should be protected from light.

Chlorpromazine Tablets

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Chlorpromazine Tablets contain Chlorpromazine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 40 mg of Chlorpromazine Hydrochloride add 10 mL of *water* and 2 mL of 10M *sodium hydroxide*. Shake and extract with 15 mL of *ether*. Wash the ether layer with two 5-mL quantities of *water*, dry with *anhydrous sodium sulfate* and evaporate the ether. Dissolve the residue in 0.4 mL of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of chlorpromazine *(RS 056)*.

B. Comply with the test for *identification of phenothiazines*, Appendix III A. For solution (1) shake a quantity of the powdered tablets with sufficient *chloroform* to produce a solution containing 0.20% w/v of Chlorpromazine Hydrochloride, centrifuge and use the supernatant liquid.

TESTS

Related substances

Comply with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and the following freshly prepared solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Chlorpromazine Hydrochloride with 10 mL of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent mixture.

Dissolution

Carry out the procedure protected from light. Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium to produce a solution containing 0.0005% % w/v of Chlorpromazine Hydrochloride, at the maximum at 254 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of $C_{17}H_{19}ClN_2S,HCl$, in the medium taking 914 as the value of A(1%, 1 cm) at the maximum at 254 nm.

ASSAY

Carry out the following procedure protected from light. Powder 10 tablets without loss, triturate the powder with 10 mL of *absolute ethanol*, add about 300 mL of 0.1M *hydrochloric acid* and shake for 15 minutes. Add sufficient 0.1M *hydrochloric acid* to produce 500 mL, filter, dilute a volume of the filtrate containing 5 mg of Chlorpromazine Hydrochloride to 100 mL with 0.1M *hydrochloric acid* and further dilute 10 mL to 100 mL with the same solvent. Measure the *absorbance* of the resulting solution at the maximum at 254 nm, Appendix II B. Calculate the content of $C_{17}H_{19}ClN_2S,HCl$ taking 915 as the value of A(1%, 1 cm) at the maximum at 254 nm.

Chlortalidone Tablets

Action and use

Thiazide-like diuretic.

DEFINITION

Chlortalidone Tablets contain Chlortalidone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of chlortalidone, $C_{14}H_{11}ClN_2O_4S$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Heat a quantity of the powdered tablets containing 0.2 g of Chlortalidone with 20 mL of *acetone* on a water bath for 10 minutes, cool and filter. Add 40 mL of *water* to the filtrate and heat on a water bath for 20 minutes using a gentle current of air to remove the acetone. Cool the solution to room temperature, allow to stand, filter and dry the crystals at 105° for 4 hours. The *infrared spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of chlortalidone *(RS 058)*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 5 volumes of *toluene*, 10 volumes of *xylene*, 20 volumes of 18M *ammonia*, 30 volumes of *1,4-dioxan* and 30 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate

www.webofpharma.com

5 µL of each of the following solutions. For solution (1) add a quantity of the powdered tablets containing 0.1 g of Chlortalidone to 5 mL of *ethanol (96%)*, mix with the aid of ultrasound for 15 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *ethanol (96%)*. Solution (3) contains 0.020% w/v of *2-(4-chloro-3-sulfamoylbenzoyl)benzoic acid BPCRS* in *ethanol (96%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to 2-(4-chloro-3-sulfamoylbenzoyl)benzoic acid in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Boil a quantity of the powder containing 0.1 g of Chlortalidone under a reflux condenser with 30 mL of *methanol* for 5 minutes, shake vigorously for 15 minutes, cool and filter. Wash the residue and filter with *methanol* and dilute the combined filtrate and washings to 100 mL with *methanol*. To 5 mL add 2 mL of 1M *hydrochloric acid* and sufficient *methanol* to produce 50 mL and measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_{14}H_{11}ClN_2O_4S$ taking 57.4 as the value of A(1%, 1 cm) at the maximum at 275 nm.

Chlortetracycline Eye Ointment

Action and use

Tetracycline antibacterial.

DEFINITION

Chlortetracycline Eye Ointment is a sterile preparation containing Chlortetracycline Hydrochloride in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of chlortetracycline hydrochloride, $C_{22}H_{23}ClN_2O_8,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the eye ointment containing 10 mg of Chlortetracycline Hydrochloride in 10 mL of *dichloromethane*, extract with two 10-mL quantities of 0.01M *hydrochloric acid*, filter and dilute the filtrate to 100 mL with 0.01M *hydrochloric acid*. Dilute 20 mL of the resulting solution to 100 mL with 0.01M *hydrochloric acid*. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 420 nm exhibits two maxima, at 266 nm and 368 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the eye ointment containing 25 mg of Chlortetracycline Hydrochloride in 25 mL of *dichloromethane*, extract with two 10 mL quantities of 0.01M *hydrochloric acid*, filter the aqueous layer and dilute to 50 mL with *water*.

(2) 0.05% w/v of *chlortetracycline hydrochloride BPCRS* in *methanol*.

(3) 0.05% w/v of each of *chlortetracycline hydrochloride BPCRS*, *tetracycline hydrochloride BPCRS* and *metacycline hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel H* as the coating substance. Adjust the pH of a 10% w/v solution of *disodium edetate* to 8.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 mL for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. At the time of use, dry the plate in an oven at 110° for 1 hour.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To a quantity of the eye ointment containing 0.5 mg of Chlortetracycline Hydrochloride add 2 mL of *sulfuric acid*; a deep blue colour is produced, which becomes bluish green. Add 1 mL of *water*; a brown colour is produced.

TESTS

Tetracycline hydrochloride and 4-epichlortetracycline hydrochloride

Not more than 8.0% and 6.0% respectively, determined as described under Assay. Inject separately solutions (1) and (4).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, *prepared immediately before use*.

(1) Disperse a quantity of the eye ointment containing 25 mg of Chlortetracycline Hydrochloride in 20 mL of *chloroform* and 50 mL of 0.01M *hydrochloric acid* and shake for 15 minutes. Dilute to 100 mL with 0.01M *hydrochloric acid*, mix thoroughly, allow to separate and filter the aqueous layer.

(2) Dissolve 25 mg of *chlortetracycline hydrochloride BPCRS* in 20 mL of *chloroform* and 50 mL of 0.01M *hydrochloric acid* and shake for 15 minutes. Dilute to 100 mL with 0.01M *hydrochloric acid*, mix thoroughly, allow to separate and filter the aqueous layer.

(3) 0.025% w/v of each of *chlortetracycline hydrochloride BPCRS* and *4-epichlortetracycline hydrochloride* in 0.01M *hydrochloric acid*.

(4) 0.002% w/v of *tetracycline hydrochloride BPCRS* and 0.0015% w/v of *4-epichlortetracycline hydrochloride* in 0.01M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 355 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of *dimethylformamide* and 80 volumes of 0.1M *oxalic acid* the pH of which has been adjusted to 2.2 with *triethylamine*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{23}ClN_2O_8,HCl$ in the eye ointment using the declared content of $C_{22}H_{23}ClN_2O_8,HCl$ in *chlortetracycline hydrochloride BPCRS*.

STORAGE

Chlortetracycline Eye Ointment should be protected from light.

Chlortetracycline Ointment

Action and use

Tetracycline antibacterial.

DEFINITION

Chlortetracycline Ointment contains Chlortetracycline Hydrochloride in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of chlortetracycline hydrochloride, $C_{22}H_{23}ClN_2O_8,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the ointment containing 10 mg of Chlortetracycline Hydrochloride in 10 mL of *dichloromethane*, extract with two 10-mL quantities of 0.01M *hydrochloric acid*, combine the aqueous extracts, filter and extract the filtrate with two 10-mL quantities of *ether*. Discard the ether extracts and dilute the aqueous layer to 100 mL with 0.01M *hydrochloric acid*. Dilute 20 mL of the resulting solution to 100 mL with 0.01M *hydrochloric acid*. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 420 nm exhibits two maxima, at 266 nm and 368 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing 25 mg of Chlortetracycline Hydrochloride in 25 mL of *dichloromethane*, extract with two 10 mL quantities of 0.01M *hydrochloric acid*, filter the aqueous layer and dilute to 50 mL with *water*.

(2) 0.05% w/v of *chlortetracycline hydrochloride BPCRS* in *methanol*.

(3) 0.05% w/v of each of *chlortetracycline hydrochloride BPCRS*, *tetracycline hydrochloride BPCRS* and *metacycline hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel H* as the coating. Adjust the pH of a 10% w/v solution of *disodium edetate* to 8.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 mL for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. At the time of use, dry the plate in an oven at 110° for 1 hour.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To a quantity of the ointment containing 0.5 mg of Chlortetracycline Hydrochloride add 2 mL of *sulfuric acid*; a deep blue colour is produced, which becomes bluish green. Add 1 mL of *water*; a brown colour is produced.

TESTS

Tetracycline hydrochloride and 4-epichlortetracycline hydrochloride

Not more than 8.0% and 6.0% respectively, determined as described under Assay. Inject separately solutions (1) and (4).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, *prepared immediately before use*

(1) Disperse a quantity of the ointment containing 25 mg of Chlortetracycline Hydrochloride in 20 mL of *chloroform* and 50 mL of 0.01M *hydrochloric acid* and shake for 15 minutes. Dilute to 100 mL with 0.01M *hydrochloric acid*, mix thoroughly, allow to separate and filter the aqueous layer.

(2) Dissolve 25 mg of *chlortetracycline hydrochloride BPCRS* in 20 mL of *chloroform* and 50 mL of 0.01M *hydrochloric acid* and shake for 15 minutes. Dilute to 100 mL with 0.01M *hydrochloric acid*, mix thoroughly, allow to separate and filter the aqueous layer.

(3) 0.025% w/v of each of *chlortetracycline hydrochloride BPCRS* and *4-epichlortetracycline hydrochloride* in 0.01M *hydrochloric acid*.

(4) 0.002% w/v of *tetracycline hydrochloride BPCRS* and 0.0015% w/v of *4-epichlortetracycline hydrochloride* in 0.01M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 355 nm.

www.webofpharma.com

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of *dimethylformamide* and 80 volumes of 0.1M *oxalic acid* the pH of which has been adjusted to 2.2 with *triethylamine*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{23}ClN_2O_8,HCl$ in the ointment using the declared content of $C_{22}H_{23}ClN_2O_8,HCl$ in *chlortetracycline hydrochloride BPCRS*.

STORAGE

Chlortetracycline Ointment should be protected from light.

Choline Salicylate Ear Drops

Action and use

Salicylate; non-selective cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Choline Salicylate Ear Drops are a solution of choline salicylate in Propylene Glycol. They are prepared by diluting Choline Salicylate Solution.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of choline salicylate, $C_{12}H_{19}NO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Heat 2 mL with *sodium hydroxide* until fumes are evolved. Triethylamine vapour is evolved, which turns moist *red litmus paper* blue.

B. Dilute a quantity containing 2 g of choline salicylate to 20 mL with *water*. The resulting solution yields the reactions characteristic *of salicylates*, Appendix VI.

ASSAY

To a quantity containing 0.4 g of choline salicylate add 50 mL of *1,4-dioxan* and 5 mL of *acetic anhydride* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.25 mL of *methyl orange-xylene cyanol FF solution* as indicator. Each mL of *0.1M perchloric acid VS* is equivalent to 24.13 mg of $C_{12}H_{19}NO_4$.

LABELLING

The strength is stated as the percentage w/v of choline salicylate.

Choline Salicylate Oromucosal Gel

Choline Salicylate Dental Gel

Action and use

Salicylate; non-selective cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Choline Salicylate Oromucosal Gel is a solution of choline salicylate in a suitable water-miscible basis. It is prepared from Choline Salicylate Solution.

The oromucosal gel complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of choline salicylate, $C_{12}H_{19}NO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Mix a quantity containing 0.1 g of choline salicylate with 9 mL of *water* (solution A). To 1 mL of solution A add 1 mL of *ammonium reineckate solution*, filter and wash the precipitate produced. The precipitate is pink.

B. 1 mL of solution A yields reaction A characteristic *of salicylates*, Appendix VI.

C. Mix a quantity containing 0.2 g of choline salicylate with 15 mL of *water*, heat on a water bath for 15 minutes and filter. The filtrate yields reaction B characteristic *of salicylates*, Appendix VI.

ASSAY

To a quantity containing 0.5 g of choline salicylate in a conical flask add 25 mL of *1,4-dioxan* and 5 mL of *acetic anhydride*. Shake well until the gel has completely dispersed and wash the inside wall of the flask with 25 mL of *1,4-dioxan*. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.25 mL of *methyl orange-xylene cyanol FF solution* as indicator. Each mL of *0.1M perchloric acid VS* is equivalent to 24.13 mg of $C_{12}H_{19}NO_4$.

LABELLING

The quantity of active ingredient is stated as the amount of choline salicylate.

Choline Theophyllinate Tablets

Action and use

Non-selective phosphodiesterase inhibitor (xanthine); treatment of reversible airways obstruction.

DEFINITION

Choline Theophyllinate Tablets contain Choline Theophyllinate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of choline theophyllinate, $C_{12}H_{21}N_5O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Choline Theophyllinate with 20 mL of *absolute ethanol* for 10 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of choline theophyllinate *(RS 060)*.

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, exhibits a maximum at 275 nm.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Choline Theophyllinate with 10 mL of *ethanol (96%)* for 10 minutes and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with *ethanol (96%)*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* HF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *ethanol (96%)* and 95 volumes of *chloroform*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.1 g of Choline Theophyllinate add 500 mL of *water* shake vigorously for 2 minutes, dilute to 1000 mL with *water*, mix and filter. To 10 mL of the filtrate add 10 mL of 0.1M *sodium hydroxide* and dilute to 100 mL with *water*. Measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_{12}H_{21}N_5O_3$ taking 415 as the value of A(1%, 1 cm) at the maximum at 275 nm.

STORAGE

Choline Theophyllinate Tablets should be protected from light.

Chorionic Gonadotrophin Injection

Action and use

Gonadotrophic hormone.

DEFINITION

Chorionic Gonadotrophin Injection is a sterile solution of Chorionic Gonadotrophin in Water for Injections. It is prepared by dissolving Chorionic Gonadotrophin for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Chorionic Gonadotrophin Injection should be used immediately after preparation.

CHORIONIC GONADOTROPHIN FOR INJECTION

DEFINITION

Chorionic Gonadotrophin for Injection is a sterile material consisting of Chorionic Gonadotrophin with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Potency

The estimated potency is not less than 80% and not more than 125% of the stated potency.

CHARACTERISTICS

A white or almost white, amorphous powder.

IDENTIFICATION

Causes an increase in the weight of the seminal vesicles or the prostate glands of immature male rats when administered as directed under the Assay.

TESTS

Acidity or alkalinity

pH of a 1% w/v solution, 6.0 to 8.0, Appendix V L.

Clarity and colour of solution

A 1.0% w/v solution is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method I.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 500 IU of Chorionic Gonadotrophin per mL (solution A). The endotoxin limit concentration of solution A is 15 IU of endotoxin per mL.

ASSAY

The potency of chorionic gonadotrophin is estimated by comparing under given conditions its effect of increasing the mass of the seminal vesicles (or the prostate gland) of immature rats with the same effect of the International Standard of chorionic gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of chorionic gonadotrophin from the urine of pregnant women with lactose.
The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature male rats of the same strain, 19 to 28 days old, differing in age by not more than 3 days and having body masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 4 IU, 8 IU and 16 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2* such that the daily dose is administered in a volume of about 0.5 mL. Add a suitable antimicrobial preservative such as 0.4% w/v of phenol or 0.002% w/v of thiomersal. Store the solutions at 5 ± 3°.

Inject subcutaneously into each rat the daily dose allocated to its group, on 4 consecutive days at the same time each day. On the fifth day, about 24 hours after the last injection, euthanise the rats and remove the seminal vesicles. Remove any extraneous fluid and tissue and weigh the vesicles immediately. Calculate the results by the usual statistical methods, using the weight of the vesicles as the response. (A suitable correction of the organ weight with reference to the body mass of the animal from which it was taken may be applied; an analysis of covariance may be used).

The fiducial limits of error are not less than 64% and not more than 156% of the stated potency.

www.webofpharma.com

STORAGE
The sealed container should be protected from light and stored at a temperature not exceeding 20°.

LABELLING
The label of the sealed container states the number of IU (Units) contained in it.

Ciclosporin Capsules

Action and use
Calcineurin inhibitor; immunosuppressant.

DEFINITION
Ciclosporin Capsules contain Ciclosporin.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of ciclosporin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ciclosporin, $C_{62}H_{111}N_{11}O_{12}$
93.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of the capsules in sufficient *methanol* to produce a solution containing 0.05% w/v of Ciclosporin..

(2) 0.05% w/v of *ciclosporin EPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm with mobile phase A, dry in air and then develop the plate to 15 cm in the same direction with mobile phase B.

(e) After removal of the plate, dry in air, spray the plate with a freshly prepared mixture containing 5 volumes of a 1.7% w/v solution of *bismuth subnitrate*, 5 volumes of a 40% w/v solution of *potassium iodide*, 20 volumes of *glacial acetic acid* and 70 volumes of *water*. Immediately spray again with *dilute hydrogen peroxide solution* and examine in daylight.

MOBILE PHASE

Mobile phase A *ether.*

Mobile phase B 1 volume of *formic acid*, 2 volumes of *water*, 40 volumes of *butan-2-one* and 60 volumes of *ethyl acetate.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2)

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D using the following solutions. Prepare a mixture of 1 volume of *water* and 9 volumes of *tetrahydrofuran* (solvent A).

(1) Transfer a quantity of the capsule contents containing 0.5 g of Ciclosporin to a 250-mL volumetric flask. Add 25 mL of *water* and stir for a minimum of 16 hours. Add 150 mL of *tetrahydrofuran* whilst stirring, mix for a further 30 minutes before making up to volume with *tetrahydrofuran* and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dissolve approximately 10 mg of *ciclosporin EPCRS* in 5 mL of *absolute ethanol.* Add 2 mL of 1M sodium hydroxide and mix. Transfer the solution to an oven-proof vessel, cover and heat for 1 hour at 70°. Remove from the oven and evaporate to dryness. Reconstitute the residue in 5 mL of solvent A (generation of ciclosporin hydrolysis products).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 RP is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 75°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 41 volumes of *tetrahydrofuran* and 59 volumes of 0.05M *phosphoric acid.*

Mobile phase B *tetrahydrofuran.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-30	100	0	isocratic
30-31	100→0	0→100	linear gradient
31-34	0	100	isocratic
34-35	0→100	100→0	linear gradient
35-50	100	0	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciclosporin (retention time, about 9.3 minutes) are: impurity 1, about 0.61; ciclosporin B, about 0.88; ciclosporin G, about 1.17; ciclosporin H, about 1.33; iso-ciclosporin H, about 1.76; iso-ciclosporin A, about 2.02.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to ciclosporin and the hydrolysis product with a relative retention with reference to ciclosporin of about 1.14 is at least 1.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurity 1, iso-ciclosporin A and iso-ciclosporin H using the relative retention given under chromatographic conditions and multiply the areas of these peaks by the corresponding correction factors; impurity 1, 0.7; iso-ciclosporin A, 0.5; iso-ciclosporin H, 0.5.

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any *secondary peak* is not greater than 1.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Carry out the method for liquid chromatography, Appendix III D using the following solutions. Prepare a mixture of 1 volume of *water* and 9 volumes of *tetrahydrofuran* (solvent A).

(1) Transfer a quantity of the capsule contents containing 0.5 g of Ciclosporin to a 250-mL volumetric flask. Add 25 mL of *water* and stir for a minimum of 16 hours. Add 150 mL of *tetrahydrofuran* whilst stirring, mix for a further 30 minutes before making up to volume with *tetrahydrofuran* and filter through a 0.45-µm PTFE filter.

(2) 0.2% w/v of *ciclosporin EPCRS* in solvent A.

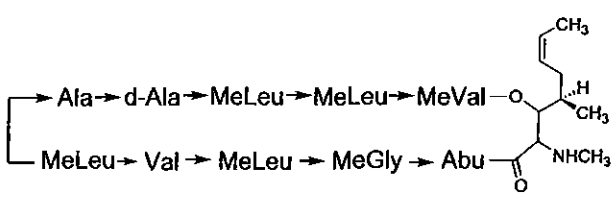
(3) Dissolve approximately 10 mg of *ciclosporin EPCRS* in 5 mL of *absolute ethanol*. Add 2 mL of 1M sodium hydroxide and mix. Transfer the solution to an oven-proof vessel, cover and heat for 1 hour at 70°. Remove from oven and evaporate to dryness. Reconstitute the residue in 5 mL of solvent A (generation of ciclosporin hydrolysis products).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3) the *resolution* between the peaks due to ciclosporin and the hydrolysis product with a relative retention with reference to ciclosporin of about 1.14 is at least 1.0.



DETERMINATION OF CONTENT

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the capsules using the declared content of $C_{62}H_{111}N_{11}O_{12}$ in *ciclosporin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include iso-ciclosporin A listed under Ciclosporin and:

1. Unknown structure

2. Iso-ciclosporin H

Ciclosporin Sterile Concentrate

Sterile Ciclosporin Concentrate

Action and use

Calcineurin inhibitor; immunosuppressant.

DEFINITION

Ciclosporin Sterile Concentrate is a sterile solution of Ciclosporin in a suitable solvent.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ciclosporin, $C_{62}H_{111}N_{11}O_{12}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the concentrate, if necessary, with sufficient *methanol* to produce a solution containing 0.05% w/v of Ciclosporin.

(2) 0.05% w/v of *ciclosporin EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm with mobile phase A, dry in air and then develop the plate to 15 cm in the same direction with mobile phase B.

(e) After removal of the plate, dry in air, spray the plate with a freshly prepared mixture containing 5 volumes of 1.7% w/v solution of *bismuth subnitrate*, 5 volumes of a 40% w/v solution of *potassium iodide*, 20 volumes of *glacial acetic acid* and 70 volumes of *water*. Immediately spray again with *dilute hydrogen peroxide solution* and examine in daylight.

MOBILE PHASE

Mobile phase A *ether*.

Mobile phase B 1 volume of *formic acid*, 2 volumes of *water*, 40 volumes of *butan-2-one* and 60 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2)

TESTS

Acidity or alkalinity

pH, 6.0 to 7.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the concentrate containing 30 mg of Ciclosporin to 25 mL with a mixture of equal volumes of *acetonitrile R1* and *water*.

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *acetonitrile R1* and *water*.

(3) Dissolve the contents of a vial of *ciclosporin for system suitability EPCRS* in 5 mL of the mobile phase.

www.webofpharma.com

(4) Dilute 1 volume of solution (2) to 20 volumes with a mixture of equal volumes of *acetonitrile R1* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (3-5 µm) (Supelco Superspher is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 80°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for at least 2.6 times the retention time of the principal peak.

MOBILE PHASE

0.1 volume of *orthophosphoric acid*, 5 volumes of *1,1-dimethylethyl methyl ether*, 46 volumes of *acetonitrile R1* and 49 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions the peak due to ciclosporin has a retention time of 25 to 30 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where H_p = height above the baseline of the peak due to ciclosporin U and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ciclosporin. If necessary, adjust the ratio of *1,1-dimethyethyl methyl ether* to *acetonitrile R1* in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 1.3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.3%);

the area of not more than one such peak is greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%);

the sum of the areas of any *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of equal volumes of *acetonitrile* and *water*.

(1) Dilute a quantity of the concentrate containing 30 mg of Ciclosporin to 25 mL with a mixture of equal volumes of *acetonitrile R1* and *water*.

(2) 0.12% w/v of *ciclosporin EPCRS* in a mixture of equal volumes of *acetonitrile R1* and *water*.

(3) Dissolve the contents of a vial of *ciclosporin for system suitability EPCRS* in 5 mL of the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.4, where H_p = height above the baseline of the peak due to ciclosporin U and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ciclosporin. If necessary, adjust the ratio of *1,1-dimethyethyl methyl ether* to *acetonitrile R1* in the mobile phase.

Inject solution (2) six times. The Assay is not valid unless the relative standard deviation of the area of the principal peak is not more than 1.0%.

DETERMINATION OF CONTENT

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the concentrate using the declared content of $C_{62}H_{111}N_{11}O_{12}$ in *ciclosporin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ciclosporin.

Ciclosporin Eye Drops

Action and use

Calcineurin inhibitor; immunosuppressant; treatment of allergic and autoimmune eye disease.

DEFINITION

Ciclosporin Eye Drops are a sterile solution of Ciclosporin in a suitable oily vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of ciclosporin, $C_{62}H_{111}N_{11}O_{12}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Add 10 mL of *absolute ethanol* to a quantity of the eye drops containing 0.1 g of Ciclosporin and mix. Allow to stand, remove the upper ethanolic layer and evaporate to dryness under a stream of nitrogen. Add 10 mL of *hexane* to the residue, mix (a precipitate is formed) and filter the resulting mixture. Wash the residue with 50 mL of *hexane* and allow to dry in air. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of ciclosporin (*RS 445*). Disregard any band occurring at about 1700 cm^{-1}.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 20 volumes of *chloroform* and 80 volumes of *methanol*.

(1) Dilute a volume of the eye drops containing 20 mg of Ciclosporin to produce 100 mL.

(2) 0.02% w/v of *ciclosporin EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *ethylsilyl silica gel for chromatography* (5 µm) (Phenomenex Maxsil RP2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

www.webofpharma.com

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.5 volumes of *orthophosphoric acid*, 50 volumes of *methanol*, 450 volumes of *water* and 550 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The Assay is not valid unless the *column efficiency*, determined on the peak due to ciclosporin in the chromatogram obtained with solution (2), is at least 700 *theoretical plates* per metre and the *symmetry factor* of the principal peak is 1.5 or less.

DETERMINATION OF CONTENT

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the eye drops using the declared content of $C_{62}H_{111}N_{11}O_{12}$ in *ciclosporin EPCRS*.

STORAGE

Ciclosporin Eye Drops should be protected from light.

Ciclosporin Oral Solution

Action and use

Calcineurin inhibitor; immunosuppressant.

DEFINITION

Ciclosporin Oral Solution is a solution containing Ciclosporin in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ciclosporin, $C_{62}H_{111}N_{11}O_{12}$

92.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral solution with sufficient *methanol* to produce a solution containing 0.05% w/v of Ciclosporin.

(2) 0.05% w/v of *ciclosporin EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm with mobile phase A, dry in air and then develop the plate to 15 cm in the same direction with mobile phase B.

(e) After removal of the plate, dry in air, spray the plate with a freshly prepared mixture containing 5 volumes of 1.7% w/v solution of *bismuth subnitrate*, 5 volumes of a 40% w/v solution of *potassium iodide*, 20 volumes of *glacial acetic acid* and 70 volumes of *water*. Immediately spray again with *dilute hydrogen peroxide solution* and examine in daylight.

MOBILE PHASE

Mobile phase A *ether*.

Mobile phase B 1 volume of *formic acid*, 2 volumes of *water*, 40 volumes of *butan-2-one* and 60 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2)

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D using the following solutions. Prepare a mixture of 1 volume of *water* and 9 volumes of *tetrahydrofuran* (solvent A).

(1) Dilute a quantity of the oral solution with sufficient solvent A to produce a solution containing 0.2% w/v of Ciclosporin and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with solvent A.

(3) Dissolve approximately 10 mg of *ciclosporin EPCRS* in 5 mL of *absolute ethanol*. Add 1 mL of 1M sodium hydroxide and mix. Transfer the solution to an oven-proof vessel, cover and heat for 1 hour at 70°. Remove from oven and evaporate to dryness. Reconstitute the residue in 5 mL of solvent A (generation of ciclosporin hydrolysis products).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (LiChrospher 100 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 75°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 41 volumes of *tetrahydrofuran* and 59 volumes of 0.05M *orthophosphoric acid*.

Mobile phase B *tetrahydrofuran*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-30	100	0	isocratic
30-31	100→0	0→100	linear gradient
31-34	0	100	isocratic
34-35	0→100	100→0	linear gradient
35-50	100	0	isocratic

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciclosporin (retention time, about 9.3 minutes) are: impurity 1, about 0.61; ciclosporin B, about 0.88; ciclosporin G, about 1.17; ciclosporin H, about 1.33; iso-ciclosporin H, about 1.76; iso-ciclosporin A, about 2.02.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3) the *resolution* between the peaks due to ciclosporin and the hydrolysis product with a relative retention with reference to ciclosporin of about 1.14 is at least 1.0.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurity 1, iso-ciclosporin A and iso-ciclosporin H using the relative retention given under chromatographic conditions and multiply the areas of these

www.webofpharma.com

peaks by the corresponding correction factors; impurity 1, 0.7; iso-ciclosporin A, 0.5; iso-ciclosporin H, 0.5.

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 1.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Carry out the method for liquid chromatography, Appendix III D using the following solutions. Prepare a mixture of 1 volume of *water* and 9 volumes of *tetrahydrofuran* (solvent A).

(1) Dilute a weighed quantity of the oral solution containing 0.1 g of Ciclosporin to 50 mL with solvent A and filter through a 0.45-µm PTFE filter.

(2) 0.2% w/v of *ciclosporin EPCRS* in solvent A.

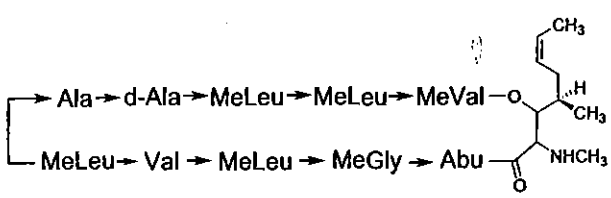
(3) Dissolve approximately 10 mg of *ciclosporin EPCRS* in 5 mL of *absolute ethanol*. Add 1 mL of 1M sodium hydroxide and mix. Transfer the solution to an oven-proof vessel, cover and heat for 1 hour at 70°. Remove from oven and evaporate to dryness. Reconstitute the residue in 5 mL of solvent A (generation of ciclosporin hydrolysis products).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3) the resolution factor between the peaks due to ciclosporin and the hydrolysis product with a relative retention with reference to ciclosporin of about 1.14 is at least 1.0.



DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{62}H_{111}N_{11}O_{12}$, weight in volume, using the declared content of $C_{62}H_{111}N_{11}O_{12}$ in *ciclosporin EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include iso-ciclosporin A listed under Ciclosporin and:

1. Unknown structure

2. Iso-ciclosporin H

Cilastatin and Imipenem for Infusion

Cilastatin and Imipenem for Injection

Action and use

Dehydropeptidase-I inhibitor; inhibition of the renal metabolism of imipenem + Carbapenem antibacterial

DEFINITION

Cilastatin and Imipenem for Infusion is a sterile mixture of Cilastatin Sodium and Imipenem Monohydrate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cilastatin, $C_{16}H_{25}N_2NaO_5S$

95.0 to 105.0% of the stated amount.

Content of imipenem, $C_{12}H_{17}N_3O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the contents of a sealed container containing 500 mg of Imipenem, add 4 mL of methanol and shake for 5 minutes. Add a further 3 mL of *methanol* and shake for a further 10 minutes. Filter the resulting suspension and reserve the filtrate for test B. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with that obtained with imipenem monohydrate EPCRS, prepared in the same manner.

B. Dry the filtrate reserved in test A at a temperature not exceeding 40°. The *infrared absorption spectrum* of the dried filtrate, Appendix II A, is concordant with that obtained with cilastatin sodium EPCRS, prepared in the same manner.

TESTS

ACIDITY OR ALKALINITY

pH of the injection, reconstituted as per the manufacturer's instructions, 6.5 to 8.5, Appendix V L.

Clarity and colour of solution

A solution containing the equivalent of 1% w/v of cilastatin in *water* is not more intensely coloured than *reference solution, Y_6*, Appendix IV B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.9% w/v solution of *sodium chloride* in *water*. *Prepare the solutions immediately before use.*

(1) Dissolve a quantity of the contents of a sealed container containing the equivalent of 32 mg of cilastatin in *water*, and dilute to 20 mL.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) 0.15% w/v of *cilastatin for system suitability 1 EPCRS*

(4) 0.15% w/v of *cilastatin for system suitability 2 EPCRS*

(5) Dissolve 5 mg of *imipenem EPCRS* in 8 mL of 0.006% w/v *sulphuric acid*. Allow to settle at room temperature for 5 minutes, add 10 mg *sodium carbonate* and dilute to 10 mL with *water*.

(6) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel colum (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (YMC Pack ODS-AQ is suitable).

(b) Use gradient elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

(g) Use an autosampler temperature of 5°.

MOBILE PHASE

Mobile phase A Dissolve 1.36 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 5.6 with a 10% w/v solution of *potassium hydroxide.*

Mobile phase B Equal volumes of *acetonitrile R1* and a solution prepared in the following manner:

Dissolve 1.36 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 3.0 with a 5% v/v solution or *orthophosphoric acid.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	100	0	isocratic
3-30	100→90	0→10	linear gradient
30-68	90→60	10→40	isocratic
68-78	60→30	40→70	linear gradient
78-88	30	70	isocratic
88-89	30→100	70→0	linear gradient
89-95	100	0	re-equillibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to cilastatin (retention time about 48 minutes) are: imipenem impurity B (epimer 1), about 0.08 ; imipenem impurity B (epimer 2), about 0.09; imipenem impurity A, about 0.18; imipenem, about 0.22; cilastatin impurity E, about 0.25; cilastatin impurity A (epimer 1), about 0.64; cilastatin impurity A (epimer 2), about 0.66; cilastatin impurity F, about 0.98; cilastatin impurity G (epimer 1), about 1.04; cilastatin impurity G (epimer 2), about 1.07; cilastatin impurity D, about 1.15; cilastatin impurity H, about 1.20; cilastatin impurity B, about 1.30; cilastatin impurity C, about 1.40.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 1.8 where *Hp* is the height above the baseline of the peak due to impurity G (epimer 1) and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to cilastatin;

in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 1.8 where *Hp* is the height above the baseline of the peak due to imipenem impurity B (epimer 1) and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to imipenem impurity B (epimer 2);

in the chromatogram obtained with solution (6), the *signal to noise ratio* for the peak due to imipenem is not less than 25 and the *signal to noise ratio* for the peak due to cilastatin is not less than 40.

LIMITS

For imipenem

Identify any peak corresponding to imipenem impurity A and impurity B in the chromatogram obtained with solution (1) using the chromatogram obtained with solution (5), and the relative retention times. Multiply the area of any peak corresponding to imipenem impurity A by a correction factor of 2.4.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to imipenem impurity A is not greater than twice the area of the peak due to imipenem in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to imipenem impurity B is not greater than 0.6 times the area of the peak due to imipenem in the chromatogram obtained with solution (2) (0.3% each);

the area of any other *secondary peak* is not greater than twice the area of the peak due to imipenem in the chromatogram obtained with solution (6) (0.2%);

the sum of the areas of any *secondary peaks* due to imipenem is not greater than 4 times the area of the peak due to imipenem in the chromatogram obtained with solution (2) (2.0%).

Disregard any peak with an area less than the area of the peak due to imipenem in the chromatogram obtained with solution (6) (0.1%) and any peak eluting after 20 minutes.

For cilastatin

Identify any peaks in the chromatogram obtained with solution (1) corresponding to cilastatin impurities A, B, C, D, E, F and G using the chromatograms obtained with solutions (3) and (4). Multiply the areas of the following peaks by the corresponding correction factors: impurity C, 1.3; impurity E, 3.3; impurity G, 1.6.

the sum of the areas of any peak corresponding to cilastatin impurity A is not greater than the area of the peak due to cilastatin in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to cilastatin impurity C is not greater than 0.8 times the area of the peak due to cilastatin in the chromatogram obtained with solution (2) (0.4%);

the area of any peak corresponding to cilastatin impurity E is not greater than 0.6 times the area of the peak due to cilastatin in the chromatogram obtained with solution (2) (0.3%);

the area of any peaks corresponding to cilastatin impurity B, F, G or H are not greater than 1.5 times the area of the peak due to cilastatin in the chromatogram obtained with solution (6) (0.15% each);

the area of any other *secondary peak* is not greater than the area of the peak due to cilastatin in the chromatogram obtained with solution (6) (0.1%);

the sum of the areas of any *secondary peaks* due to cilastatin is not greater than 3 times the area of the peak due to cilastatin in the chromatogram obtained with solution (2) (1.5%);

Disregard any peak with an area less than the area of the peak due to cilastatin in the chromatogram obtained with solution (6) (0.1%), any peak due to impurity D and any peak eluting before 20 minutes.

Loss on drying

When dried *in vacuo* at 60°, at a pressure not exceeding 0.67 kPa for 3 hours, does not lose more than 3.5% of its weight. Use 0.3 g.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for uniformity of weight, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in a solution containing, 0.002% w/v of *sodium bicarbonate*, 0.18% w/v of

www.webofpharma.com

sodium chloride and 0.0135% w/v of *potassium dihydrogen phosphate* previously adjusted to pH 6.8 with *sodium hydroxide* or *orthophosphoric acid*.

(1) Disperse a quantity of mixed contents of the 10 containers, containing the equivalent of 0.5 g of cilastatin and 0.5 g of imipenem in diluent and dilute to 100 mL. Dilute 1 volume of the resulting solution to 10 volumes.

(2) 0.05% w/v of *imipenem EPCRS*.

(3) 0.05% w/v of *cilastatin EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil-ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Dissolve 0.54 g of potassium dihydrogen orthophosphate and 2.0 g of sodium hexanesulphonate in 800 mL water. Adjust the pH to pH 6.8 with 0.5M sodium hydroxide or 0.5M orthophosphoric acid. Dilute to 1000 mL with water.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to imipenem is between 0.8 and 2.0.

The test is not valid unless, in the chromatogram obtained with solution (3), the *symmetry factor* of the peak due to cilastatin is between 0.8 and 2.0

DETERMINATION OF CONTENT

Calculate the content of imipenem, $C_{12}H_{17}N_3O_4S,H_2O$, in a container of average content weight from the chromatograms obtained and using the declared content of $C_{12}H_{17}N_3O_4S$, H_2O, in *imipenem EPCRS*.

Calculate the content of cilastatin, $C_{16}H_{25}N_2NaO_5S$, in a container of average content weight from the chromatograms obtained and using the declared content of $C_{16}H_{25}N_2NaO_5S$, in *cilastatin EPCRS*

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of cilastatin and imipenem.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Imipenem Monohydrate and Cilastatin Sodium

Cimetidine Injection

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulceration.

DEFINITION

Cimetidine Injection is a sterile solution in Water for Injections of cimetidine hydrochloride, prepared by the interaction of Cimetidine and Hydrochloric Acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of cimetidine, $C_{10}H_{16}N_6S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 310 nm of solution A used in the Assay exhibits a maximum at about 218 nm.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (8).

TESTS

Acidity or alkalinity

pH, 4.5 to 6.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and using the following solutions. For solution (1) dilute a quantity of the injection with sufficient *methanol* to give a solution containing the equivalent of 5.0% w/v of Cimetidine. For solution (2) dilute 1 volume of solution (1) to 10 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 20 volumes of the resulting solution to 100 volumes with *methanol*. For solution (4) dilute 5 volumes of solution (3) to 10 volumes with *methanol*. For solution (5) dilute 5 volumes of solution (4) to 10 volumes with *methanol*. For solution (6) dissolve 2.24 mg of *2-carbamoyl-1-methyl-3-[2-(5-methylimidazol-4-ylmethylthio)ethyl]guanidine dihydrochloride BPCRS* ('amide' impurity) in 5 mL of a 1.65% w/v solution of *sodium chloride* in *methanol (50%)*. For solution (7) dissolve 6.6 mg of *1-methyl-3-[2-(5-methylimidazol-4-yl-methylthio)ethyl]guanidine dihydrochloride BPCRS* ('guanidine' impurity) in 5 mL of a 1.65% w/v solution of *sodium chloride* in *methanol (50%)*. For solution (8) dissolve 5.0 mg of *cimetidine BPCRS* in 1 mL of *methanol*. Carry out the following tests.

A. Apply separately to the plate 4 µL of each solution. Allow the plate to stand for 15 minutes in the tank saturated with vapour from the mobile phase which consists of a mixture of 15 volumes of 13.5M *ammonia*, 20 volumes of *methanol* and 65 volumes of *ethyl acetate*. After development and removal of the plate, dry it in a current of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine under *ultraviolet light (254 nm)*.

B. Apply separately to the plate 4 µL of each solution. Develop using a mixture of 8 volumes of 13.5M *ammonia*, 8 volumes of *methanol* and 84 volumes of *ethyl acetate*. After removal of the plate, dry it in a current of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine under *ultraviolet light (254 nm)*.

The following limits apply to both methods. Any spot in the chromatogram obtained with solution (1) corresponding to the 'amide' impurity is not more intense than the principal spot in the chromatogram obtained with solution (6) (0.7%, calculated as the 'amide' base and with reference to cimetidine) and any spot corresponding to the 'guanidine' impurity is not more intense than the principal spot in the chromatogram obtained with solution (7) (2%, calculated as the 'guanidine' base and with reference to cimetidine). Any other *secondary spot* is not more intense than the principal spot in the chromatogram obtained with solution (3) (0.2%) and not more than two such spots are more intense than the principal spot in the chromatogram obtained with solution (4) (0.1% each). The tests are not valid unless

www.webofpharma.com

the chromatograms obtained with solution (5) show clearly visible spots.

ASSAY

Dilute a volume containing the equivalent of 0.5 g of Cimetidine with sufficient 0.05M *sulfuric acid* to produce a solution containing 0.001% w/v (solution A). Prepare a 0.001% w/v solution of *cimetidine BPCRS* in 0.05M *sulfuric acid* (solution B). Measure the *absorbance* of solutions A and B at the maximum at 218 nm and at 260 nm, Appendix II B. Calculate the content of $C_{10}H_{16}N_6S$ using the difference between the absorbances of solutions A and B at the two wavelengths and the declared content of $C_{10}H_{16}N_6S$ in *cimetidine BPCRS*.

LABELLING

The strength is stated in terms of the equivalent amount of Cimetidine in a suitable dose-volume.

Cimetidine Oral Solution

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulceration.

DEFINITION

Cimetidine Oral Solution is a solution containing Cimetidine in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cimetidine, $C_{10}H_{16}N_6S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Dilute a volume of the preparation to contain 0.04% w/v of Cimetidine.

(2) 0.04% w/v of *cimetidine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry and expose it to iodine vapour until maximum contrast between the spots is obtained.

MOBILE PHASE

15 volumes of 13.5M *ammonia*, 20 volumes of *methanol* and 65 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.0 to 6.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the preparation to contain 0.050% w/v of Cimetidine.

(2) 0.0020% w/v of *1-methyl-3-(2-(5-methylimidazol-4-ylmethylthio)ethyl)guanidine dihydrochloride BPCRS* ('guanidine' impurity).

(3) 0.0019% w/v of *2-carbamoyl-1-methyl-3-(2-(5-methylimidazol-4-ylmethylthio)ethyl)guanidine dihydrochloride BPCRS* ('amide' impurity).

(4) 0.0015% w/v of *2-cyano-1-methyl-3-(2-(5-methylimidazol-4-yl-methylsulfinyl)ethyl)guanidine BPCRS* ('sulfoxide' impurity).

(5) 0.00025% w/v each of the 'guanidine', 'amide' and 'sulfoxide' impurities and 0.0002% w/v of *saccharin*.

(6) Dilute 1 volume of solution (1) to 200 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with particles of silica (10 µm) *phenyl silica gel for chromatography* (µBondapak phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 228 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 3 times the retention time of the peak due to cimetidine.

MOBILE PHASE

4 volumes of *acetonitrile* and 96 volumes of a 0.25% v/v solution of *orthophosphoric acid*, the pH of the mixture being adjusted to 3.0 using 10M *potassium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows four clearly separated peaks.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 'guanidine' is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (3% calculated as the base and with reference to cimetidine);

the area of any peak corresponding to 'amide' is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3% calculated as the base and with reference to cimetidine);

the area of any other *secondary peak*, except that of any peak corresponding to saccharin, is not greater than the area of the principal peak in the chromatogram obtained with solution (6) (0.5%);

calculate the content of the individual named impurities using the respective reference solutions and the content of unnamed impurities using solution (6);

the total content of impurities is not greater than 4.0%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

www.webofpharma.com

(1) Dilute a weighed quantity of the preparation containing 0.2 g of Cimetidine to produce 200 mL. Dilute 5 mL of this solution to 100 mL.

(2) 0.005% w/v of *cimetidine BPCRS*.

(3) 0.004% w/v of *saccharin* and 0.005% w/v of *cimetidine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal peaks.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the preparation, Appendix V G, and calculate the content of $C_{10}H_{16}N_6S$ using the declared content of $C_{10}H_{16}N_6S$ in *cimetidine BPCRS*.

STORAGE

Cimetidine Oral Solution should be protected from light.

Cimetidine Oral Suspension

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulceration.

DEFINITION

Cimetidine Oral Suspension is a suspension containing Cimetidine in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cimetidine, $C_{10}H_{16}N_6S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a volume of the oral suspension containing 40 mg of Cimetidine with 50 mL of *methanol*, dilute to 100 mL with *methanol*, mix and filter.

(2) 0.04% w/v of *cimetidine BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry and expose it to iodine vapour until maximum contrast between the spots is obtained.

MOBILE PHASE

15 volumes of 13.5M *ammonia*, 20 volumes of *methanol* and 65 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH, 7.0 to 8.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) To a quantity of the oral suspension containing 0.1 g of Cimetidine add 100 mL of the mobile phase and shake for 10 minutes. Dilute to 200 mL with the mobile phase, mix and filter through a Whatman GF/F filter paper.

(2) 0.0020% w/v of *1-methyl-3-(2-(5-methylimidazol-4-ylmethylthio)ethyl)guanidine dihydrochloride BPCRS* ('guanidine' impurity).

(3) 0.0019% w/v of *2-carbamoyl-1-methyl-3-(2-(5-methylimidazol-4-ylmethylthio)ethyl)guanidine dihydrochloride BPCRS* ('amide' impurity).

(4) 0.0015% w/v of *2-cyano-1-methyl-3-(2-(5-methylimidazol-4-yl-methylsulfinyl)ethyl)guanidine BPCRS* ('sulfoxide' impurity).

(5) 0.00025% w/v each of 'guanidine', 'amide' and 'sulfoxide' reference substances and 0.0002% w/v of *saccharin*.

(6) Dilute 1 volume of solution (1) to 200 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with particles of silica (10 µm) *phenyl silica gel for chromatography* (µBondapak phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 228 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

4 volumes of *acetonitrile* and 96 volumes of a 0.25% v/v solution of *orthophosphoric acid*, the pH of the mixture being adjusted to 3.0 using 10M *potassium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows four clearly separated peaks.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to the sulfoxide impurity is not greater than the area of the principal peak in the chromatograms obtained with solution (4) (3%);

the areas of any other *secondary peaks*, except that of any peak corresponding to saccharin, are not greater than the area of the principal peak in the chromatogram obtained with solution (6) (0.5%).

The total content of impurities is not greater than 4.0%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) To a weighed quantity of the oral suspension containing 0.1 g of Cimetidine add 100 mL of the mobile phase and shake for 10 minutes. Dilute to 200 mL with the mobile phase, mix and filter through a Whatman GF/F filter paper. Dilute 5 mL of the filtrate to 50 mL with the mobile phase.

(2) 0.005% w/v of *cimetidine BPCRS*.

(3) 0.004% w/v of *saccharin* in solution (2).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between cimetidine and saccharin is at least 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the preparation, Appendix V G, and calculate the content of $C_{10}H_{16}N_6S$ using the declared content of $C_{10}H_{16}N_6S$ in *cimetidine BPCRS*.

STORAGE

Cimetidine Oral Suspension should be protected from light.

Cimetidine Tablets

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulceration.

DEFINITION

Cimetidine Tablets contain Cimetidine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cimetidine, $C_{10}H_{16}N_6S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.10 g of Cimetidine with 10 mL of *methanol* for 10 minutes, filter (Whatman GF/A is suitable) and evaporate to dryness on a rotary evaporator using gentle heat. Dissolve the residue in 5 mL of *chloroform* and evaporate to dryness with the aid of a current of air. Dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cimetidine *(RS 061)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (6).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 20 mL of *methanol* to a quantity of the powdered tablets containing 1 g of Cimetidine, mix with the aid of ultrasound for 2 minutes, shake for 3 minutes and filter using a suitable 0.2-µm filter.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol*.

(3) Dilute 1 volume of solution (2) to 20 volumes with *methanol*.

(4) Dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 20 volumes of this solution to 100 volumes with *methanol*.

(5) Dilute 5 volumes of solution (4) to 10 volumes with *methanol*.

(6) 0.50% w/v of *cimetidine BPCRS* in *methanol*.

Carry out the following tests.

A. CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel GF_{254} plate*.

(b) Use the mobile phase as described below.

(c) Apply 4 µL of each solution.

(d) Develop the plate for 15 minutes in the tank saturated with vapour from the mobile phase.

(e) After removal of the plate, dry in a current of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of 13.5M *ammonia*, 20 volumes of *methanol* and 65 volumes of *ethyl acetate*.

B. CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel GF_{254} plate*.

(b) Use the mobile phase as described below.

(c) Apply 4 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

8 volumes of 13.5M *ammonia*, 8 volumes of *methanol* and 84 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The tests are not valid unless the chromatograms obtained with solution (5) show clearly visible spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) in tests A and B:

is not more intense than the principal spot in the chromatogram obtained with solution (3) (0.5%);

not more than two such spots are more intense than the principal spot in the chromatogram obtained with solution (4) (0.2% of each).

ASSAY

Weigh and finely powder 20 tablets. Shake a quantity of the powdered tablets containing 0.1 g of Cimetidine with 300 mL of 0.05M *sulfuric acid* for 20 minutes, add sufficient 0.05M *sulfuric acid* to produce 500 mL and filter (Whatman GF/C is suitable). Dilute 5 mL of the filtrate to 100 mL with 0.05M *sulfuric acid* (solution A). Prepare a 0.001% w/v solution of *cimetidine BPCRS* in 0.05M *sulfuric acid* (solution B). Measure the *absorbance* of solutions A and B at the maximum at 218 nm and at 260 nm, Appendix II B. Calculate the content of $C_{10}H_{16}N_6S$ using the difference between the absorbances of solutions A and B at the two wavelengths and the declared content of $C_{10}H_{16}N_6S$ in *cimetidine BPCRS*.

Cinnarizine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cinnarizine Tablets contain Cinnarizine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cinnarizine, $C_{26}H_{28}N_2$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

Shake a quantity of the powdered tablets containing 45 mg of Cinnarizine with 20 mL of *acetone*, filter (Whatman GF/C paper is suitable), evaporate the filtrate and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cinnarizine *(RS 492)*.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.01M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium, filter and dilute the filtrate with sufficient of the dissolution medium, if necessary, to give a solution expected to contain about 0.0017% w/v of Cinnarizine.

(2) 0.0017% w/v of *cinnarizine BPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped solid core octadecylsilyl silica gel for chromatography* (5 µm) (X-Bridge Shield RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

48 volumes of a solution of 0.288% w/v of *ammonium dihydrogen orthophosphate*, adjusted to pH 4.9 with 10% v/v of *ammonia*, and 52 volumes of *acetonitrile R1*.

DETERMINATION OF CONTENT

Calculate the total content of cinnarizine, $C_{26}H_{28}N_2$, in the medium from the chromatograms obtained and using the declared content of $C_{26}H_{28}N_2$ in *cinnarizine BPCRS*.

LIMITS

The amount of cinnazirine released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 30 mg of Cinnarizine with 16 mL of *methanol*, dilute to 20 mL with *methanol*, filter through a 0.45-µm nylon filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 1 volume of the resulting solution to 5 volumes with *methanol*.

(3) 0.0003% w/v of *cinnarizine BPCRS* and 0.00035% w/v of *flunarizine dihydrochloride EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped base-deactivated octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil BDS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A 1.0% w/v of *ammonium acetate*.

Mobile phase B 0.2% *v/v* of *glacial acetic acid* in *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-3	75	25	isocratic
3-23	75→10	25→90	linear gradient
23-28	10	90	isocratic
28-33	10→75	90→25	linear gradient
33-38	75	25	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference to cinnarizine (retention time about 14 minutes) are: impurity A about 0.4; impurity B about 1.1; impurity C about 1.15; impurity D about 1.2; impurity E about 1.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cinnarizine and flunarizine is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the areas of any peaks corresponding to impurities A, B, C, D or E are not greater than 1.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.25% of each);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any secondary peak is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 30 mg of Cinnarizine with 16 mL of *methanol*, dilute to 20 mL with *methanol* and filter through a 0.45-µm nylon filter. Further dilute 1 volume of the filtrate to 100 volumes with *methanol*.

(2) 0.0015% w/v of *cinnarizine BPCRS* in *methanol*.

(3) 0.0003% w/v of *cinnarizine BPCRS* and 0.00035% w/v of *flunarizine dihydrochloride EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to cinnarizine and flunarizine is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{28}N_2$ in the tablets using the declared content of $C_{26}H_{28}N_2$ in *cinnarizine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Cinnarizine.

Ciprofloxacin Ear Drops

Action and use

Fluoroquinolone antibacterial.

DEFINITION

Ciprofloxacin Ear Drops are a solution of Ciprofloxacin Hydrochloride in a suitable vehicle.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, record the UV spectrum of the principal peak in the chromatograms obtained with solutions (1) and (2) with a diode array detector in the range of 210 to 400 nm.

The UV spectrum of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2);

the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 5.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the ear drops to produce a solution containing the equivalent of 0.01% w/v of ciprofloxacin.

(2) Dilute 1 volume of solution (1) to 20 volumes, then further dilute 1 volume to 10 volumes.

(3) 0.01% w/v of *ciprofloxacin impurity standard BPCRS*.

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 278 nm.

(f) Inject 25 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of ciprofloxacin.

MOBILE PHASE

13 volumes of *acetonitrile* and 87 volumes of a 0.245% w/v solution of *orthophosphoric acid* previously adjusted to pH 3.0 with *triethylamine*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciprofloxacin (retention time, about 9 minutes) are: impurity E, about 0.4; impurity F, about 0.5; impurity B, about 0.6; impurity C, about 0.7; and impurity D, about 1.2.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and impurity C is at least 1.3;

the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (4) is at least 70.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities B, C, D and E using solution (3) and multiply the area of these peaks by the following correction factors: 0.7, 0.6, 1.4 and 6.7 respectively.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of any peak corresponding to impurity E is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 1.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the ear drops to produce a solution containing the equivalent of 0.001% w/v of ciprofloxacin.

(2) 0.0011% w/v of *ciprofloxacin hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions stated under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the ear drops using the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin hydrochloride BPCRS*. Each mg of $C_{17}H_{18}FN_3O_3$,HCl is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

STORAGE

Ciprofloxacin Ear Drops should be kept in an airtight container and protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ciprofloxacin.

www.webofpharma.com

IMPURITIES
The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin.

Ciprofloxacin Eye Drops

NOTE: This monograph has been developed to cover unlicensed formulations.

Action and use
Fluoroquinolone antibacterial.

DEFINITION
Ciprofloxacin Eye Drops are a sterile solution of ciprofloxacin lactate, prepared by the interaction of Ciprofloxacin and Lactic Acid, in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements. Where appropriate, the eye drops also comply with the requirements stated under Unlicensed Medicines.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the eye drops with sufficient *water* to produce a solution containing the equivalent of 0.05% w/v of ciprofloxacin.

(2) 0.058% w/v of *ciprofloxacin hydrochloride BPCRS* in *water*.

(3) Mix equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution, as bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 15 minutes and examine under *ultraviolet light (254 nm* and *365 nm)*.

MOBILE PHASE

10 volumes of *acetonitrile*, 20 volumes of 13.5M *ammonia*, 40 volumes of *dichloromethane* and 40 volumes of *methanol*.

CONFIRMATION

The principal band in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal band in the chromatogram obtained with solution (3) appears as a single, compact band.

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the eye drops, if necessary, with *water* to produce a solution containing the equivalent of 0.2% w/v of ciprofloxacin.

(2) 0.07% w/v of *lithium lactate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 7.8 mm) packed with a strong cation-exchange resin of sulfonated, cross-linked *styrene-divinylbenzene copolymer* in the hydrogen form (7 to 11 µm) (Aminex HPX-87 H is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 208 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile* and 85 volumes of 0.0025M *sulfuric acid*.

After each analysis the column should be rinsed with a mixture of 0.005M *sulfuric acid* and *acetonitrile* and then regenerated with 0.025M *sulfuric acid*.

CONFIRMATION

The chromatogram obtained with solution (1) shows a peak due to lactate with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 3.9 to 4.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing the equivalent of 0.05% w/v of ciprofloxacin.

(2) 0.05% w/v of *ciprofloxacin impurity standard BPCRS* in the mobile phase.

(3) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume to 2 volumes with the mobile phase.

(4) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil 120-C18 and LiChrospher 100 RP 18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 278 nm.

(f) Inject 5 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of ciprofloxacin.

MOBILE PHASE

13 volumes of *acetonitrile* and 87 volumes of a 0.245% w/v solution of *orthophosphoric acid* previously adjusted to pH 3.0 with *triethylamine*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciprofloxacin (retention time about 9 minutes) are: impurity E, about 0.4; impurity F, about 0.5; impurity B, about 0.6; impurity C, about 0.7; and impurity D, about 1.2.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and impurity C is at least 1.3;

the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (4) is at least 70.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities B, C, D and E using solution (2) and multiply the area of these peaks by the following correction factors: 0.7, 0.6, 1.4 and 6.7 respectively.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks*, excluding the peak corresponding to ciprofloxacin impurity C, is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing the equivalent of 0.05% w/v of ciprofloxacin.

(2) 0.058% w/v of *ciprofloxacin hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the eye drops using the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin hydrochloride BPCRS*. Each mg of $C_{17}H_{18}FN_3O_3$,HCl is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

STORAGE

Ciprofloxacin Eye Drops should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ciprofloxacin.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin.

Ciprofloxacin Hydrochloride Eye Drops

Action and use
Fluoroquinolone antibacterial.

DEFINITION

Ciprofloxacin Hydrochloride Eye Drops are a solution of Ciprofloxacin Hydrochloride in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$
95.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, record the UV spectrum of the principal peak in the chromatograms obtained with solutions (1) and (2) with a diode array detector in the range of 210 to 400 nm.

The UV spectrum of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2);

the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

STORAGE

Ciprofloxacin Hydrochloride Eye Drops should not be refrigerated or frozen.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ciprofloxacin.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin.

Ciprofloxacin Infusion

Ciprofloxacin Intravenous Infusion

Action and use

Fluoroquinolone antibacterial.

DEFINITION

Ciprofloxacin Infusion is a sterile solution, in Glucose Infusion or in Sodium Chloride Infusion, of ciprofloxacin lactate prepared by the interaction of Ciprofloxacin and Lactic Acid. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the infusion with sufficient *water* to produce a solution containing the equivalent of 0.05% w/v of ciprofloxacin.

(2) 0.055% w/v of *ciprofloxacin hydrochloride BPCRS* in *water*.

(3) Mix 1 volume of solution (1) and 1 volume of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution, as bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 15 minutes and examine under *ultraviolet light (254 nm* and *365 nm)*.

MOBILE PHASE

10 volumes of *acetonitrile*, 20 volumes of 13.5M *ammonia*, 40 volumes of *dichloromethane* and 40 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the principal band in the chromatogram obtained with solution (3) appears as a single, compact band.

CONFIRMATION

The principal band in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the infusion, if necessary, with *water* to produce a solution containing the equivalent of 0.2% w/v of ciprofloxacin.

(2) 0.07% w/v of *lithium lactate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 7.8 mm) packed with a strong cation-exchange resin of sulfonated, cross-linked *styrene-divinylbenzene copolymer* in the hydrogen form (7 to 11 µm) (Aminex HPX-87 H is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 208 nm.

www.webofpharma.com

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile R1* and 85 volumes of 0.0025M *sulfuric acid.*

After each analysis the column should be rinsed with a mixture of 0.005M *sulfuric acid* and *acetonitrile R1* and then regenerated with 0.025M *sulfuric acid.*

CONFIRMATION

The chromatogram obtained with solution (1) shows a peak due to lactate with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

For infusions prepared in Glucose Infusion

pH, 3.5 to 4.6, Appendix V L.

For infusions prepared in Sodium Chloride Infusion

pH, 3.9 to 4.5, Appendix V L.

Colour of solution

The infusion is not more intensely coloured than *reference solution GY_6*, Appendix IV B, Method II.

5-Hydroxymethylfurfural

Infusions prepared in Glucose Infusion comply with the following test. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute 1 volume of the infusion to 4 volumes with the mobile phase to produce a solution containing 1.25% w/v of anhydrous glucose.

(2) 0.000625% w/v of *hydroxymethylfurfural* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to hydroxymethylfurfural is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.05%, calculated with reference to the glucose content).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a quantity of the infusion with sufficient mobile phase to produce a solution containing the equivalent of 0.01% w/v of ciprofloxacin.

(2) Dilute 1 volume of solution (1) to 20 volumes and further dilute 1 volume to 10 volumes.

(3) 0.01% w/v of *ciprofloxacin impurity standard BPCRS.*

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 278 nm.

(f) Inject 25 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of ciprofloxacin.

MOBILE PHASE

13 volumes of *acetonitrile* and 87 volumes of a 0.245% w/v solution of *orthophosphoric acid* previously adjusted to pH 3.0 with *triethylamine.*

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciprofloxacin (retention time, about 9 minutes) are: impurity E, about 0.4; impurity F, about 0.5; impurity B, about 0.6; impurity C, about 0.7; impurity D, about 1.2.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and impurity C is at least 1.3;

the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (4) is at least 70.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities B, C, D and E using solution (3) and multiply the area of these peaks by the following correction factors: 0.7, 0.6, 1.4 and 6.7 respectively.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity E is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Bacterial endotoxins

The endotoxin limit concentration is 0.5 IU per mL, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a quantity of the infusion with sufficient of the mobile phase to produce a solution containing the equivalent of 0.001% w/v of ciprofloxacin.

(2) 0.0011% w/v of *ciprofloxacin hydrochloride BPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions stated under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the infusion using the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin*

www.webofpharma.com

hydrochloride BPCRS. Each mg of $C_{17}H_{18}FN_3O_3,HCl$ is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

STORAGE
Ciprofloxacin Infusion should be protected from light. It should not be refrigerated or frozen.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of ciprofloxacin.

IMPURITIES
The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin.

Ciprofloxacin Oral Suspension

Action and use
Fluoroquinolone antibacterial.

DEFINITION
Ciprofloxacin Oral Suspension is a suspension of Ciprofloxacin in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of solvent just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the oral suspension as directed on the label. The suspension examined immediately after preparation, unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$
When freshly constituted, not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the oral suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION
In the Assay, record the UV spectrum of the principal peak in the chromatograms obtained with solutions (1) and (2) with a diode array detector in the range of 210 to 400 nm.

The UV spectrum of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2);

the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 3.5 to 5.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the oral suspension to produce a solution containing 0.01% w/v of Ciprofloxacin.

(2) Dilute 1 volume of solution (1) to 20 volumes and further dilute 1 volume to 10 volumes.

(3) 0.01% w/v of *ciprofloxacin impurity standard BPCRS*.

(4) Dilute 1 volume of solution (2) to 5 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 278 nm.

(f) Inject 25 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of ciprofloxacin.

MOBILE PHASE

13 volumes of *acetonitrile* and 87 volumes of a 0.245% w/v solution of *orthophosphoric acid* previously adjusted to pH 3.0 with *triethylamine*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciprofloxacin (retention time, about 9 minutes) are: impurity E, about 0.4; impurity F, about 0.5; impurity B, about 0.6; impurity C, about 0.7; impurity D, about 1.2.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and impurity C is at least 1.3;

the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (4) is at least 70.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities B, C, D and E using solution (3) and multiply the area of these peaks by the following correction factors: 0.7, 0.6, 1.4 and 6.7 respectively.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a weighed quantity of the oral suspension containing 1 g of Ciprofloxacin with sufficient mobile phase to produce a solution containing 0.01% w/v of Ciprofloxacin and filter (Whatman GF/C filter is suitable). Dilute 1 volume to 10 volumes.

(2) 0.0011% w/v of *ciprofloxacin hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions stated under Related substances may be used.

www.webofpharma.com

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, *Appendix V G*, and calculate the content of $C_{17}H_{18}FN_3O_3$ in the oral suspension using the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin hydrochloride BPCRS*. Each mg of $C_{17}H_{18}FN_3O_3$,HCl is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin.

Ciprofloxacin Tablets

Action and use

Fluoroquinolone antibacterial.

DEFINITION

Ciprofloxacin Tablets contain Ciprofloxacin Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add a quantity of the powdered tablets containing the equivalent of 0.5 g of ciprofloxacin to 150 mL of *water*, mix with the aid of ultrasound for 20 minutes, add sufficient *water* to produce 250 mL and filter (Whatman GF/C filter paper is suitable). Dilute the filtrate with sufficient *water* to produce a solution containing the equivalent of 0.05% w/v of ciprofloxacin.

(2) 0.055% w/v of *ciprofloxacin hydrochloride BPCRS* in *water*.

(3) Mix 1 volume of solution (1) and 1 volume of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution, as bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 15 minutes and examine under *ultraviolet light (254 nm* and *365 nm)*.

MOBILE PHASE

10 volumes of *acetonitrile*, 20 volumes of 13.5M *ammonia*, 40 volumes of *dichloromethane* and 40 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the principal band in the chromatogram obtained with solution (3) appears as a single, compact band.

CONFIRMATION

The principal band in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 30 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with *water*, if necessary, at the maximum at 276 nm, Appendix II B, using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *ciprofloxacin hydrochloride BPCRS* in *water* at the maximum at 276 nm using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$, in the medium from the absorbances obtained and from the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin hydrochloride BPCRS*. Each mg of $C_{17}H_{18}FN_3O_3$,HCl is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

LIMITS

The amount of ciprofloxacin released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add a quantity of the powdered tablets containing the equivalent of 0.2 g of ciprofloxacin to 75 mL of the mobile phase, mix with the aid of ultrasound for 20 minutes, add sufficient mobile phase to produce 100 mL and filter (Whatman GF/C filter is suitable). Dilute 1 volume of the filtrate to 20 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 20 volumes with the mobile phase and further dilute 1 volume to 10 volumes with the mobile phase.

(3) 0.01% w/v of *ciprofloxacin impurity standard BPCRS* in the mobile phase.

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 278 nm.

(f) Inject 25 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of ciprofloxacin.

www.webofpharma.com

MOBILE PHASE

13 volumes of *acetonitrile* and 87 volumes of a 0.245% w/v solution of *orthophosphoric acid* previously adjusted to pH 3.0 with *triethylamine*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ciprofloxacin (retention time about 9 minutes) are: impurity E, about 0.4; impurity F, about 0.5; impurity B, about 0.6; impurity C, about 0.7; and impurity D, about 1.2.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity B and impurity C is at least 1.3;

the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (4) is at least 70.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities B, C, D and E using solution (3) and multiply the area of these peaks by the following correction factors: 0.7, 0.6, 1.4 and 6.7 respectively.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity E is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Add a quantity of the powdered tablets containing the equivalent of 0.2 g of ciprofloxacin to 75 mL of the mobile phase, mix with the aid of ultrasound for 20 minutes, add sufficient mobile phase to produce 100 mL and filter (Whatman GF/C filter is suitable). Dilute 1 volume of the filtrate to 200 volumes.

(2) 0.0011% w/v of *ciprofloxacin hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions stated under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the tablets using the declared content of $C_{17}H_{18}FN_3O_3$,HCl in *ciprofloxacin hydrochloride BPCRS*. Each mg of $C_{17}H_{18}FN_3O_3$,HCl is equivalent to 0.9010 mg of $C_{17}H_{18}FN_3O_3$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ciprofloxacin.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B, C, D, E and F listed under Ciprofloxacin Hydrochloride.

Cisplatin Injection

Action and use

Platinum-containing cytotoxic.

DEFINITION

Cisplatin Injection is a sterile solution of Cisplatin. It is either supplied as a ready-to-use solution or it is prepared by dissolving Cisplatin for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

CHARACTERISTICS

A clear, colourless to pale yellow solution.

Content of cisplatin, $Cl_2H_6N_2Pt$

90.0 to 105.0% of the stated amount.

With the exception of identification test A, carry out the following procedures protected from light.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a solution diluted, if necessary, to contain 0.1% w/v of Cisplatin exhibits a maximum at 300 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L.

Related substances

Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a 0.9% w/v solution of *sodium chloride*. Prepare the solutions immediately before use.

(1) Use the injection diluted, if necessary, to produce a solution containing 0.05% w/v of Cisplatin.

(2) Dilute 1 volume of solution (1) to 100 volumes with a 0.9% w/v solution of *sodium chloride* and dilute 1 volume of the resulting solution to 5 volumes.

(3) Dissolve sufficient *potassium trichloroammineplatinate BPCRS* (cisplatin impurity B) in a 0.9% w/v solution of *sodium chloride* to produce a solution containing 0.0015% w/v of trichloroammineplatinate.

(4) 0.001% w/v of *transplatin BPCRS* (cisplatin impurity A) in a 0.9% w/v solution of *sodium chloride*.

(5) 0.001% w/v each of *transplatin BPCRS*, *potassium trichloroammineplatinate BPCRS* and *cisplatin BPCRS* in a 0.9% w/v solution of *sodium chloride*.

(6) 0.9% w/v solution of *sodium chloride* (blank solution).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *octylsilyl base-deactivated silica gel for chromatography* (4 µm) (Superspher RP B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 7 times the retention time of cisplatin.

MOBILE PHASE

Dissolve 1.08 g of *sodium octanesulfonate*, 1.70 g of *tetrabutylammonium hydrogen sulfate* and 2.72 g of *potassium dihydrogen orthophosphate* in *water* and dilute to 950 mL with the same solvent. Adjust to pH 5.9 with *1M sodium hydroxide* and dilute to 1000 mL with *water*.

When the chromatograms are recorded under the prescribed conditions, the *relative retentions* with reference to cisplatin (retention time about 4 minutes) are: impurity A, about 0.6; impurity B, about 0.7 and cisplatin aquo complex, about 1.2.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5):

the *resolution* between the peaks corresponding to transplatin (impurity A) and trichloroammineplatinate (impurity B) is at least 2.5;

the *resolution* between the peaks corresponding to the displacement peak and transplatin are well separated.

LIMITS

Use the chromatogram obtained with solution (6) to identify the displacement peak (the last eluting peak in the group of injection peaks) and use the chromatogram obtained with solution (1) to identify cisplatin aquo complex.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to trichloroammineplatinate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3.0%);

the area of any peak corresponding to transplatin is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (2.0%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard the displacement peak, any peak due to the cisplatin aquo complex and any peak less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Use the injection being examined diluted, if necessary, with a 0.9% w/v solution of *sodium chloride* to produce a solution containing 0.1% w/v of Cisplatin.

(2) 0.1% w/v of *cisplatin BPCRS* in a 0.9% w/v solution of *sodium chloride*.

(3) 0.05% w/v of *cisplatin BPCRS* and 0.005% w/v of *transplatin BPCRS* in a 0.9% w/v solution of *sodium chloride*; shake for 30 minutes to effect dissolution of the transplatin.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with particles of silica the surface of which has been modified by chemically bonded amine groups (10 µm) (Lichrosorb NH_2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

10 volumes of *water* and 90 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to transplatin and cisplatin is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $Cl_2H_6N_2Pt$ in the injection using the declared content of $Cl_2H_6N_2Pt$ in *cisplatin BPCRS*.

STORAGE

When supplied as a ready-to-use solution, Cisplatin Injection should be protected from light. It should not be refrigerated.

CISPLATIN FOR INJECTION

DEFINITION

Cisplatin for Injection is a sterile material consisting of Cisplatin with Mannitol and Sodium Chloride. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cisplatin, $Cl_2H_6N_2Pt$

95.0 to 105.0% of the stated amount.

With the exception of identification test A, carry out the procedures protected from light.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a solution containing 0.1% w/v of Cisplatin in *0.1M hydrochloric acid* exhibits a maximum only at 300 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a solution containing 0.1% w/v of Cisplatin, 3.5 to 6.5, Appendix V L.

Related substances

Complies with the test described for the ready-to-use solution above but preparing solution (1) in the following manner.

Dissolve the contents of a sealed container in sufficient of a 0.9% w/v solution of *sodium chloride* to produce a solution containing 0.05% w/v of Cisplatin.

www.webofpharma.com

Uniformity of content
Sealed containers containing the equivalent of 0.1 g or less of anhydrous cisplatin comply with the requirements stated under Parenteral Preparations, Powders for Injections.
Use the individual results obtained in the Assay.

ASSAY
Carry out the method described for the ready-to-use formulation above. For solution (1) dissolve the contents of a sealed container in sufficient of a 0.9% w/v solution of *sodium chloride* solution to produce a solution containing 0.1% w/v of Cisplatin.

Calculate the content of $Cl_2H_6N_2Pt$ in the sealed container using the declared content of $Cl_2H_6N_2Pt$ in *cisplatin BPCRS*. Repeat the procedure with a further nine sealed containers. Calculate the average content of $Cl_2H_6N_2Pt$ per container from the 10 individual results thus obtained.

STORAGE
The sealed container should be protected from light.
It should not be refrigerated.

IMPURITIES
The impurities limited by the requirements of this monograph include impurities A and B listed under Cisplatin.

Citalopram Oral Drops

Action and use
Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION
Citalopram Oral Drops contain Citalopram Hydrochloride in a suitable vehicle.

The oral drops comply with the requirements stated under Oral Liquids and with the following requirements.

Content of citalopram, $C_{20}H_{21}FN_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dilute the oral drops with sufficient *methanol* to produce a solution containing the equivalent of 0.001% w/v of citalopram. The *light absorption* of the resulting solution, Appendix II B, in the range 200 to 400 nm exhibits a maximum at about 239 nm and a minimum at about 223 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 4.0 to 6.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Dilute a suitable volume of the oral drops containing the equivalent of 100 mg of citalopram to 50 mL.

(2) Dilute 1volume of solution (1) to 100volumes. Dilute 1volume of the resulting solution to 10volumes.

(3) 0.0014% w/v of *citalopram impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 40 µL of each solution.

MOBILE PHASE

Mobile phase A 30 volumes of *acetonitrile* and 70 volumes of a solution containing 1 volume of *glacial acetic acid* and 250 volumes of *water* adjusted to pH 4.5 with 5M *sodium hydroxide*.

Mobile phase B 30 volumes of a solution containing 1 volume of *glacial acetic acid* and 250 volumes of *water* adjusted to pH 4.5 with 5M *sodium hydroxide*, and 70 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-15	95	5	isocratic
15-45	95→5	5→95	linear gradient
45-55	5	95	isocratic
55-60	5→95	95→5	linear gradient
60-65	95	5	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time of impurity D relative to citalopram (retention time, about 9.3 minutes) is about 0.9.

SYSTEM SUITABILITY
The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and citalopram is at least 2.0.

LIMITS
In the chromatogram obtained with solution (1):
the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);
the sum of the areas of any *secondary peaks* is not greater than 8 times the area of the principal peak in the chromatogram obtained with solution (2) (0.8%).
Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *0.1M hydrochloric acid*.

(1) Dilute a weighed quantity of the oral drops containing the equivalent of 20 mg of citalopram to 100 mL.

(2) 0.025% w/v *citalopram hydrobromide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

www.webofpharma.com

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of a solution containing 0.5 volumes of *triethylamine* and 100 volumes of 0.6% w/v of *anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 6.5 with 5M *hydrochloric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the retention time of the peak due to citalopram is between 7 and 11 minutes.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{20}H_{21}FN_2O$, weight in volume, using the declared content of $C_{20}H_{21}FN_2O$ in *citalopram hydrobromide BPCRS*

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of citalopram.

Citalopram Tablets

Action and use

Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION

Citalopram Tablets contain Citalopram Hydrobromide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of citalopram, $C_{20}H_{21}FN_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of powdered tablets containing the equivalent of 50 mg of citalopram, add 30 mL of *water* and filter. To the filtrate, add 1 mL of 0.1M *sodium hydroxide* and extract with two 25-mL quantities of *cyclohexane*. Filter the combined extract through silica treated filter paper (Whatman 1PS is suitable), evaporate the filtrate to dryness at 80° under nitrogen for approximately 1 hour. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of citalopram *(RS 471)*.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddles at 50 revolutions per minute.

(b) Use 900 mL of *0.1M hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and filter. Measure the *absorbance* of the filtered medium, diluted with 0.1M *hydrochloric acid*, if necessary, to produce a solution containing the equivalent of 0.00056% w/v of citalopram, at the maximum at 238 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell.

(2) 0.0007% w/v of *citalopram hydrobromide BPCRS* in *0.1M hydrochloric acid* using *0.1M hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of citalopram, $C_{20}H_{21}FN_2O$, in the medium from the absorbances obtained and using the declared content of $C_{20}H_{21}FN_2O$, in *citalopram hydrobromide BPCRS*.

LIMITS

The amount of citalopram released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Disperse a quantity of powdered tablets containing the equivalent of 100 mg of citalopram in 40 mL of mobile phase A, mix with the aid of ultrasound for 10 minutes, shake for a further 10 minutes and dilute to produce 50 mL. Centrifuge and use the supernatant liquid.

(2) Dilute 1volume of solution (1) to 100volumes. Dilute 1volume of the resulting solution to 10volumes.

(3) 0.0014% w/v of *citalopram impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 238 nm.

(f) Inject 40 µL of each solution.

MOBILE PHASE

Mobile phase A 30 volumes of *acetonitrile* and 70 volumes of a solution containing 1 volume of *glacial acetic acid* and 250 volumes of *water* adjusted to pH 4.5 with 5M *sodium hydroxide*.

Mobile phase B 30 volumes of a solution containing 1 volume of *glacial acetic acid* and 250 volumes of *water* adjusted to pH 4.5 with 5M *sodium hydroxide*, and 70 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-15	95	5	isocratic
15-45	95→5	5→95	linear gradient
45-55	5	95	isocratic
55-60	5→95	95→5	linear gradient
60-65	95	5	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times relative to citalopram (retention time, about 9.3 minutes) are: impurity A, about 0.4 and impurity D, about 0.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity D and citalopram is at least 2.0.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

the area of the peak due to impurity A is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 8 times the area of the principal peak in the chromatogram obtained with solution (2) (0.8%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *0.1M hydrochloric acid*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of citalopram with 50 mL of 0.1M *hydrochloric acid*, mix with the aid of ultrasound for 15 minutes, shake for a further 15 minutes and dilute to 100 mL with *0.1M hydrochloric acid*. Centrifuge and use the supernatant liquid.

(2) 0.025% w/v *citalopram hydrobromide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of a solution containing 100 volumes of 0.6% w/v of *anhydrous sodium dihydrogen orthophosphate* and 0.5 volumes of *triethylamine* adjusted to pH 6.5 with 5M *hydrochloric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the retention time of the peak due to citalopram is between 7 and 11 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{21}FN_2O$ in the tablets using the declared content of $C_{20}H_{21}FN_2O$ in *citalopram hydrobromide BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of citalopram.

Clarithromycin Granules for Oral Suspension

Action and use

Macrolide antibacterial.

DEFINITION

Clarithromycin Granules for Oral Suspension contain Clarithromycin.

Complies with the requirements for Powders and Granules for Oral Solutions and Suspensions stated under Oral Liquids and with the following requirements.

Content of clarithromycin, $C_{38}H_{69}NO_{13}$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the finely powdered granules containing 0.5 g of Clarithromycin with 20 mL of *dichloromethane*. Filter the liquid (Whatman GF/C paper followed by a 0.45-µm PTFE filter is suitable) and evaporate the filtrate to dryness under a stream of nitrogen.

The *infrared absorption spectrum* of the residue, Appendix II A, after drying under vacuum at room temperature for 2 hours, is concordant with the *reference spectrum* B of clarithromycin *(RS 480)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

Prepare the oral suspension as directed on the label.

pH, 4.5 to 5.4, Appendix V L.

Related substances

Prepare a solution containing 1 volume of *acetonitrile R1* and 2 volumes of water (solvent A).

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh a quantity of the finely powdered granules containing 250 mg of Clarithromycin into a 50-mL centrifuge tube. Add 10 mL 0.067M *dipotassium hydrogen orthophosphate* and 10 mL of *water* to the tube. Stopper and mix the sample before shaking for 10 minutes. Centrifuge the sample until phase separation is achieved.

Discard the supernatant liquid; add 20 mL of 0.067M *dipotassium hydrogen orthophosphate*, stopper and mix the sample before shaking for 10 minutes. Centrifuge the sample at 3000 revolutions per minute for 10 minutes. Discard the supernatant and repeat the extraction.

Discard the supernatant liquid; add 10 mL 0.067M *dipotassium hydrogen orthophosphate* and 10 mL of *water* to the tube. Stopper and mix the sample before shaking for 10 minutes. Centrifuge the sample at 3000 revolutions per minute for 10 minutes. Discard the supernatant and repeat the extraction.

Discard the supernatant liquid and transfer quantitatively the remaining solid into a 100 mL volumetric flask with approximately 70 mL of *acetonitrile R1*. Shake for 30 minutes, dilute to volume with *acetonitrile R1* and mix thoroughly.

Allow the excipients to settle for approximately 5 minutes and transfer 10 mL of the resulting solution to a 50-mL volumetric flask. Dilute to volume with solvent A and filter (Whatman GF/F is suitable).

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture of 4 volumes of *acetonitrile R1* and 6 volumes of water.

(3) Dilute 1 volume of solution (2) to 10 volumes with a mixture of 4 volumes of *acetonitrile R1* and 6 volumes of *water*.

(4) Produce a 0.25% w/v solution of *clarithromycin BPCRS* dissolved in 12 volumes of *acetonitrile R1* and mixed with 13 volumes of *water*. Mix 10 mL of the solution with 1 mL of *0.1M hydrochloric acid* into a 50 mL volumetric flask. Allow to stand for 15 minutes (generation of impurity I). Add 20 mL of 0.033M *potassium dihydrogen orthophosphate*, 4 mL of a 0.0008 % w/v solution of *potassium sorbate* in *water*, 5 mL of 0.0045% w/v of *clarithromycin impurity E BPCRS* in *methanol* and dilute to volume with *acetonitrile R1*.

(5) 0.05% w/v of *clarithromycin for peak identification EPCRS* in a mixture of 4 volumes of *acetonitrile R1* and 6 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (YMC C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use column temperature of 50°.

(e) Use a detection wavelength of 205 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 4 times the retention time of the principal peak.

MOBILE PHASE

45 volumes of *acetonitrile R1* and 55 volumes of 0.033M *potassium dihydrogen orthophosphate* adjusted to pH 5.4 with 2M *potassium hydroxide*.

When the chromatograms are recorded under the prescribed conditions the approximate retention time of clarithromycin is about 7 minutes. The retention times relative to clarithromycin are impurity A/impurity I, about 0.52; potassium sorbate about 0.57; impurity L, about 0.70; impurity B, about 0.78; impurity C, about 0.82; impurity D, about 0.97; impurity E, about 1.44; impurity F, about 1.53; impurity P, about 1.56; impurity G, about 2.80; impurity H, about 3.73.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity I and potassium sorbate is at least 1.5.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurity A/impurity I; impurity L; impurity B; impurity C; impurity D; impurity E; impurity F; impurity P; impurity G and impurity H using solution (5) and multiply the areas of these peaks by the corresponding correction factors; impurity A/impurity I, 0.68; impurity L, 0.38; impurity B, 0.76; impurity C, 0.31; impurity D, 0.44; impurity E, 0.76; impurity F, 0.76; impurity P, 0.86; impurity G, 0.28 and impurity H, 0.14.

In the chromatogram obtained with solution (1):

the area of any peak due to impurity I/impurity A is not greater than the area of the peak due to clarithromycin in the chromatogram obtained with solution (2) (1.0%);

the area of any peak due to impurity D is not greater than the area of the peak due to clarithromycin in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the peak due to clarithromycin in the chromatogram obtained with solution (2) (1.0%);

not more than four *secondary peaks* have an area greater than 0.4 times the area of the peak due to clarithromycin in the chromatogram obtained with solution (2) (0.4%);

the sum of the areas of all *secondary peaks* is not greater than four times the area of the peak due to clarithromycin in the chromatogram obtained with solution (2) (4.0%).

Disregard any peak with an area less than the area of the peak due to clarithromycin in the chromatogram obtained with solution (3) (0.1%); disregard the peaks eluting before impurity A/impurity I and after impurity H.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the granules containing 0.5 g of clarithromycin in 12 mL of *water* in a 100 mL volumetric flask. Add 34 mL of a 1.53 % w/v solution of *potassium hydrogen phosphate trihydrate* in *water* and shake for 45 minutes. Add 30 mL of *propan-2-ol*, shake for 60 minutes and dilute to 100 mL with *propan-2-ol*. Mix by inverting the container several times and allow the contents to settle. Mix the suspension with the aid of ultrasound for 30 minutes, shaking frequently to avoid coagulation. Allow to stand for at least 8 hours, adjust to volume with *propan-2-ol* if necessary and thoroughly mix and allow to stand for a further 30 minutes.

Dilute 1 volume of the supernatant solution to 100 volumes with mobile phase to give a test sample concentration of 0.005% w/v and filter (Whatman GF/C paper is suitable).

(2) Dissolve with the aid of ultrasound 25 mg of *clarithromycin BPCRS* in 10 mL of *propan-2-ol*, mix with the aid of ultrasound and dilute to 50 mL with mobile phase. Dilute 1 volume of this solution to 10 volumes with mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenomenex Luna C18 (2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

45 volumes of 0.067M *potassium dihydrogen orthophosphate* and 55 volumes of *methanol R1* adjusted to pH 3.5 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to clarithromycin is between 10 and 14 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{38}H_{69}NO_{13}$ in the granules from the chromatograms obtained and using the declared content of $C_{38}H_{69}NO_{13}$ in *clarithromycin BPCRS*.

www.webofpharma.com

IMPURITIES
The impurities limited by the requirements of this monograph include impurities A, B, C, D, E, F, G, H, I, L and P listed under Clarithromycin.

Clarithromycin for Infusion

Action and use
Macrolide antibacterial.

DEFINITION
Clarithromycin for Infusion is a sterile material consisting of Clarithromycin with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of clarithromycin, $C_{38}H_{69}NO_{13}$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of a sealed container containing 0.5 g of Clarithromycin with 10 mL of *water* and extract with 20 mL of *dichloromethane*. Separate the lower dichloromethane layer, wash with 5 mL of *water*, filter through *anhydrous sodium sulfate* and evaporate the filtrate to dryness under a stream of nitrogen. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum A* of clarithromycin (*RS 424*).

TESTS
Acidity
pH of a solution containing 5% w/v of Clarithromycin, 4.0 to 6.0, Appendix V L.

Clarity and colour of solution
A solution containing 5% w/v of Clarithromycin in *carbon dioxide-free water* is not more opalescent than *reference suspension II*, Appendix IV A, and not more intensely coloured than *reference solution* Y_7, Appendix IV B, Method II.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container containing 75 mg of Clarithromycin in 25 mL of *water*, mix with the aid of ultrasound and add sufficient *acetonitrile R1* to produce 50 mL.

(2) Dilute 5 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *acetonitrile R1* and *water*.

(3) Dilute 10 volumes of solution (2) to 100 volumes with a mixture of equal volumes of *acetonitrile R1* and *water*.

(4) 0.15% w/v of *clarithromycin for peak identification EPCRS* in a mixture of equal volumes of *acetonitrile R1* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenomenex Hypersil BDS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 205 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.476% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 4.4 with either 2M *orthophosphoric acid* or a 4.5% w/v solution of *potassium hydroxide*, filtered through a C18 filtration kit (3M Empore is suitable).

Mobile phase B *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-32	75→40	25→60	linear gradient
32-34	40	60	isocratic
34-36	40→75	60→25	linear gradient
36-42	75	25	re-equilibration

When the chromatograms are recorded using the prescribed conditions the retention times relative to clarithromycin (retention time = about 11 minutes) are: impurity I = about 0.38; impurity A = about 0.42; impurity J = about 0.63; impurity L = about 0.74; impurity B = about 0.79; impurity M = about 0.81; impurity C = about 0.89; impurity D = about 0.96; impurity N = about 1.15; impurity E = about 1.27; impurity F = about 1.33; impurity P = about 1.35; impurity O = about 1.41; impurity K = about 1.59; impurity G = about 1.72; impurity H = about 1.82.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to clarithromycin is less than 1.75;

in the chromatogram obtained with solution (4), the *peak-to-valley ratio* is at least 3.0 where H_p is the height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin;

the chromatogram obtained with solution (4), closely resembles the chromatogram supplied with *clarithromycin for peak identification EPCRS*.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities G and H using solution (4) and multiply the areas of these peaks by the corresponding correction factors; impurity G, 0.27; impurity H, 0.15.

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (1%);

not more than four such peaks have an area greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (3) (0.4%);

the sum of the areas of all the *secondary peaks* is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (3) (3.5%).

Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%). Disregard any peaks eluting before impurity I and after impurity H.

www.webofpharma.com

Water
Not more than 3.0% w/w, Appendix IX C. Use 0.5 g.

ASSAY
Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of the 10 containers containing 0.5 g of Clarithromycin in 10 mL of *water*, add 50 mL of *water* and 25 mL of *methanol* and mix with swirling; add sufficient *water* to produce 250 mL and mix well. Dilute 10 volumes of the resulting solution to 50 volumes with the mobile phase, mix well and filter.

(2) Dilute 10 volumes of a 0.2% w/v solution of *clarithromycin BPCRS* in *methanol* to 50 volumes with the mobile phase.

(3) 0.04% w/v of each of *clarithromycin BPCRS* and *clarithromycin impurity E BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

40 volumes of 0.067M *potassium dihydrogen orthophosphate* and 60 volumes of *methanol*, adjusted to pH 3.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The assay is not valid unless:

in the chromatogram obtained with solution (2), the *symmetry factor* of the peak corresponding to clarithromycin is between 0.8 and 2.0;

in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of clarithromycin, $C_{38}H_{69}NO_{13}$, in a container of average content weight from the chromatograms obtained and from the declared content of $C_{38}H_{69}NO_{13}$ in *clarithromycin BPCRS*.

Clarithromycin Tablets

Action and use
Macrolide antibacterial.

DEFINITION
Clarithromycin Tablets contain Clarithromycin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of clarithromycin, $C_{38}H_{69}NO_{13}$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.5 g of Clarithromycin with 10 mL of *water* and extract with 20 mL of *dichloromethane*. Separate the lower dichloromethane layer and centrifuge. Filter the supernatant (Whatman GF/C is suitable) and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, after drying under vacuum at room temperature for 2 hours, is concordant with the *reference spectrum A* of clarithromycin *(RS 424)*.

TESTS
Dissolution
Carry out the *dissolution test for tablets and capsules*, Appendix XII BI.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a solution containing 1000 volumes of a 1.361% w/v solution of *sodium acetate* and 350 volumes of 0.1M *acetic acid*, adjusted to pH 5.0 with 0.1M *acetic acid*, at a temperature of 37° ± 0.5°, as the medium.

PROCEDURE

After 45 minutes, withdraw a sample of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the filtered dissolution medium, diluted with mobile phase if necessary, to produce a solution expected to contain 0.011% w/v of Clarithromycin.

(2) 0.011% w/v of *clarithromycin BPCRS* in the mobile phase.

(3) 0.011% w/v of each of *clarithromycin BPCRS* and *clarithromycin impurity E BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Superspher ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

35 volumes of 0.067M *potassium dihydrogen orthophosphate* and 65 volumes of *methanol* adjusted to pH 4.0 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the approximate retention times for clarithromycin and clarithromycin impurity E are 4 and 6 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the total content of clarithromycin, $C_{38}H_{69}NO_{13}$, in the medium using the declared content of $C_{38}H_{69}NO_{13}$ in *clarithromycin BPCRS*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of powdered tablets containing 75 mg of Clarithromycin in 40 mL of a mixture of equal volumes of *acetonitrile R1* and *water* (solution A), mix with the aid of ultrasound, add sufficient solution A to produce 50 mL and

www.webofpharma.com

filter through a Whatman GF/C filter and then through a 0.45-µm PTFE filter.

(2) Dilute 5 volumes of solution (1) to 100 volumes with solution A.

(3) Dilute 10 volumes of solution (2) to 100 volumes with solution A.

(4) 0.15% w/v of *clarithromycin for peak identification EPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenomenex Hypersil BDS is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 205 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.476% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 4.4 with either 2M *orthophosphoric acid* or a 4.5% w/v solution of *potassium hydroxide*, filtered through a C18 filtration kit (3M Empore is suitable).

Mobile phase B *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-32	75→40	25→60	linear gradient
32-34	40	60	isocratic
34-36	40→75	60→25	linear gradient
36-42	75	25	re-equilibration

When the chromatograms are recorded using the prescribed conditions the retention times relative to clarithromycin (retention time = about 11 minutes) are: impurity I = about 0.38; impurity A = about 0.42; impurity J = about 0.63; impurity L = about 0.74; impurity B = about 0.79; impurity M = about 0.81; impurity C = about 0.89; impurity D = about 0.96; impurity N = about 1.15; impurity E = about 1.27; impurity F = about 1.33; impurity P = about 1.35; impurity O = about 1.41; impurity K = about 1.59; impurity G = about 1.72; impurity H = about 1.82.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2) the *symmetry factor* of the peak due to clarithromycin is less than 1.75;

in the chromatogram obtained with solution (4) the *peak-to-valley ratio* is at least 3.0 where H_p is the height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin;

the chromatogram obtained with solution (4) closely resembles the chromatogram supplied with *clarithromycin for peak identification EPCRS*.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities G and H using solution (4) and multiply the areas of these peaks by the corresponding correction factors; impurity G, 0.27; impurity H, 0.15.

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (1%) and not more than four such peaks have an area greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (3) (0.4%);

the sum of the areas of all the *secondary peaks* is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (3) (3.5%).

Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%). Disregard any peaks eluting before impurity I and after impurity H.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely powder a quantity of tablets containing 2 g of Clarithromycin and quantitatively transfer the powder to a volumetric flask using about 350 mL of *methanol*. Mix with the aid of ultrasound for 15 minutes, shake vigorously for 15 minutes, allow to cool, add sufficient *methanol* to produce 500 mL and mix. Filter the solution (Whatman GF/C paper is suitable), dilute 1 volume of the filtrate to 40 volumes with mobile phase and filter through a 0.45-µm filter.

(2) 0.01% w/v of *clarithromycin BPCRS* in the mobile phase.

(3) 0.01% w/v of each of *clarithromycin BPCRS* and *clarithromycin impurity E BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

When the chromatograms are recorded under the prescribed conditions the approximate retention times for clarithromycin and clarithromycin impurity E are 4 and 6 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{38}H_{69}NO_{13}$ in the tablets using the declared content of $C_{38}H_{69}NO_{13}$ in *clarithromycin BPCRS*.

Clarithromycin Prolonged-release Tablets

Prolonged-release Clarithromycin Tablets

Action and use

Macrolide antibacterial.

Clarithromycin Prolonged-release Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Clarithromycin Prolonged-release Tablets contain Clarithromycin. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Clarithromycin. The dissolution profile

www.webofpharma.com

reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of clarithromycin, $C_{38}H_{69}NO_{13}$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.5 g of Clarithromycin with 10 mL of *water* and extract with 20 mL of *dichloromethane*. Separate the lower dichloromethane layer and centrifuge. Filter the supernatant (Whatman GF/C is suitable) and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, after drying under vacuum at room temperature for 2 hours, is concordant with the *reference spectrum A* of clarithromycin *(RS 424)*.

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of powdered tablets containing 75 mg of Clarithromycin in 40 mL of a mixture of equal volumes of *acetonitrile R1* and *water* (solution A), mix with the aid of ultrasound, add sufficient solution A to produce 50 mL and filter through a Whatman GF/C filter and then through a 0.45-µm PTFE filter.

(2) Dilute 5 volumes of solution (1) to 100 volumes with solution A.

(3) Dilute 10 volumes of solution (2) to 100 volumes with solution A.

(4) 0.15% w/v of *clarithromycin for peak identification EPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenomenex Hypersil BDS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 205 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A A 0.476% w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 4.4 with either 2M *orthophosphoric acid* or a 4.5% w/v solution of *potassium hydroxide*, filtered through a C18 filtration kit (3M Empore is suitable).

Mobile phase B *acetonitrile* R1.

Use the following gradient.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-32	75→40	25→60	linear gradient
32-34	40	60	isocratic
34-36	40→75	60→25	linear gradient
36-42	75	25	re-equilibration

When the chromatograms are recorded using the prescribed conditions the retention times relative to clarithromycin (retention time = about 11 minutes) are: impurity I = about 0.38; impurity A = about 0.42; impurity J = about 0.63; impurity L = about 0.74; impurity B = about 0.79; impurity M = about 0.81; impurity C = about 0.89; impurity D = about 0.96; impurity N = about 1.15; impurity E = about 1.27; impurity F = about 1.33; impurity P = about 1.35; impurity O = about 1.41; impurity K = about 1.59; impurity G = about 1.72; impurity H = about 1.82.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2) the *symmetry factor* of the peak due to clarithromycin is less than 1.75;

in the chromatogram obtained with solution (4) the *peak-to-valley ratio* is at least 3.0 where H_p is the height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin;

the chromatogram obtained with solution (4) closely resembles the chromatogram supplied with *clarithromycin for peak identification EPCRS*.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities G and H using solution (4) and multiply the areas of these peaks by the corresponding correction factors; impurity G, 0.27; impurity H, 0.15.

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (1%) and not more than four such peaks have an area greater than 0.8 times the area of the principal peak in the chromatogram obtained with solution (3) (0.4%);

the sum of the areas of all the *secondary peaks* is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (3) (3.5%).

Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%). Disregard any peaks eluting before impurity I and after impurity H.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely powder a quantity of tablets containing 2 g of Clarithromycin and quantitatively transfer the powder to a volumetric flask using about 350 mL of *methanol*. Mix with the aid of ultrasound for 15 minutes, shake vigorously for 15 minutes, allow to cool, add sufficient *methanol* to produce 500 mL and mix. Filter the suspension (Whatman GF/C paper is suitable), dilute 1 volume of the filtrate to 40 volumes with mobile phase and filter through a 0.45-µm filter.

(2) 0.01% w/v of *clarithromycin BPCRS* in the mobile phase.

(3) 0.01% w/v of each of *clarithromycin BPCRS* and *clarithromycin impurity E BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Superspher ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 50°.

www.webofpharma.com

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

35 volumes of 0.067M *potassium dihydrogen orthophosphate* and 65 volumes of *methanol* adjusted to pH 4.0 with *orthophosphoric acid.*

When the chromatograms are recorded under the prescribed conditions the approximate retention times for clarithromycin and clarithromycin impurity E are 4 and 6 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{38}H_{69}NO_{13}$ in the tablets using the declared content of $C_{38}H_{69}NO_{13}$ in *clarithromycin BPCRS.*

Clemastine Tablets

Action and use
Histamine H_1 receptor antagonist; antihistamine.

DEFINITION
Clemastine Tablets contain Clemastine Fumarate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of clemastine, $C_{21}H_{26}ClNO$
93.0 to 105.0% of the stated amount.

IDENTIFICATION
A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

B. In the test for 1-(4-Chlorophenyl)-1-phenylethanol, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (3).

TESTS

1-(4-Chlorophenyl)-1-phenylethanol
Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Add to a quantity of the powdered tablets, containing the equivalent of 10 mg of clemastine, 200 mL of a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate,* shake vigorously for 45 minutes, centrifuge at a speed of at least 4000 revolutions per minute for 10 minutes and use the supernatant liquid.

(2) 0.0000335% w/v of *1-(4-chlorophenyl)-1-phenylethanol BPCRS* in a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate.*

(3) 0.0067% w/v of *clemastine fumarate BPCRS* in a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate.*

(4) 0.000335% w/v of *clemastine fumarate BPCRS* and 0.000064% w/v of *1-(4-chlorophenyl)-1-phenylethanol BPCRS* in a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used. Inject 100 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless the *resolution* between the peaks due to clemastine fumarate and 1-(4-chlorophenyl)-1-phenylethanol in the chromatogram obtained with solution (4) is at least 2.2.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 1-(4-chlorophenyl)-1-phenylethanol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%, calculated with reference to clemastine fumarate).

Related substances
Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 8 mg of clemastine with 4 mL of *methanol* for 15 minutes, centrifuge at 4000 revolutions per minute for 10 minutes and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol.*

(3) 0.027% w/v of *clemastine fumarate BPCRS* in *methanol.*

(4) 0.00135% w/v of *clemastine fumarate BPCRS* in *methanol.*

(5) 0.0135% w/v of each of *clemastine fumarate BPCRS* and *diphenhydramine hydrochloride BPCRS* in *methanol.*

(6) 0.00135% w/v of *2-(2-hydroxyethyl)-1-methylpyrrolidine BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel 60 F_{254} (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of cold air for 5 minutes, spray with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution* and 10 volumes of 2M *acetic acid* and then with *hydrogen peroxide solution (10 vol).* Cover the plate immediately with a glass plate of the same size and examine the chromatograms after 2 minutes.

MOBILE PHASE

1 volume of 13.5M *ammonia,* 20 volumes of *methanol* and 80 volumes of *stabiliser-free tetrahydrofuran.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 2-(2-hydroxyethyl)-1-methylpyrrolidine is not more intense than the spot in the chromatogram obtained with solution (6) (0.5%, with reference to clemastine fumarate);

any orange-brown *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (4) (0.5%, with reference to clemastine fumarate).

Disregard any spot remaining on the line of application and any spot with an Rf value greater than that of the principal spot.

www.webofpharma.com

Uniformity of content
Tablets containing the equivalent of less than 2 mg and/or less than 2% w/w of clemastine comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Vigorously shake one tablet with 40 mL of a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate* for 45 minutes and centrifuge until a clear supernatant liquid is obtained.

(2) 0.00335% w/v of *clemastine fumarate BPCRS* in a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.1 volume of *orthophosphoric acid*, 50 volumes of *acetonitrile* and 50 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{26}ClNO$ in each tablet using the declared content of $C_{21}H_{26}ClNO$ in *clemastine fumarate BPCRS*.

ASSAY

For tablets containing the equivalent of less than 2 mg and/or less than 2% w/w of clemastine

Use the average of the individual results determined in the test for Uniformity of content.

For tablets containing the equivalent of 2 mg or more and 2% w/w or more of clemastine

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add to a quantity of the powdered tablets containing the equivalent of 10 mg of clemastine 200 mL of a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate*, shake vigorously for 45 minutes, centrifuge at a speed of at least 4000 revolutions per minute for 10 minutes and use the supernatant liquid.

(2) 0.0067% w/v of *clemastine fumarate BPCRS* in a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable),

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.1 volume of *orthophosphoric acid*, 45 volumes of *acetonitrile* and 55 volumes of a 1% w/v solution of *ammonium dihydrogen orthophosphate*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{26}ClNO$ in the tablets using the declared content of $C_{21}H_{26}ClNO$ in *clemastine fumarate BPCRS*.

LABELLING
The quantity of the active ingredient is stated in terms of the equivalent amount of clemastine.

Clindamycin Capsules

Action and use
Lincosamide antibacterial.

DEFINITION
Clindamycin Capsules contain Clindamycin Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of clindamycin, $C_{18}H_{33}ClN_2O_5S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of the capsules containing the equivalent of 30 mg of clindamycin with 50 mL of *dichloromethane*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of clindamycin hydrochloride *(RS 064)*.

TESTS

Dissolution
Comply with the dissolution test for tablets and capsules, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of a buffer solution containing 0.68% w/v *potassium dihydrogen orthophosphate* and 0.063% w/v of *sodium hydroxide*.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Use the filtered sample, diluted with the dissolution medium if necessary, to produce a solution expected to contain the equivalent of 0.0028% w/v of clindamycin.

(2) 0.003% w/v of *clindamycin hydrochloride EPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS 5 µm is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile R1* and 55 volumes of a 0.68% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 7.5 with a 25% w/v solution of *potassium hydroxide*.

When the chromatograms are recorded under the prescribed conditions the retention time of clindamycin is about 10 minutes.

DETERMINATION OF CONTENT

Calculate the total content of $C_{18}H_{33}ClN_2O_5S$ in the medium from the chromatograms obtained and using the declared content of $C_{18}H_{33}ClN_2O_5S,HCl$ in *clindamycin hydrochloride EPCRS*. Each mg of $C_{18}H_{33}ClN_2O_5S,HCl$ is equivalent to 0.9209 mg of $C_{18}H_{33}ClN_2O_5S$.

LIMITS

The amount of $C_{18}H_{33}ClN_2O_5S$ released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 50 mg of clindamycin with 50 mL of the mobile phase for 15 minutes and filter (Whatman GF/C filter is suitable).

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase.

(3) 0.1% w/v of *clindamycin hydrochloride EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions under dissolution may be used.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to clindamycin (retention time about 10 minutes) are: impurity B, about 0.7 and impurity C, about 0.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity B and impurity C is at least 3.0 and;

the *resolution* between the peaks due to impurity C and clindamycin is at least 2.0

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peak corresponding to impurity C is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (4%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (6%).

Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 1 g.

ASSAY

Weigh the contents of 20 capsules. Mix and powder if necessary. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the mixed capsule contents containing the equivalent of 50 mg of clindamycin in 40 mL of the mobile phase for 15 minutes, dilute to 50 mL and filter (Whatman GF/C filter is suitable).

(2) 0.11% w/v of *clindamycin hydrochloride EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the capsules using the declared content of $C_{18}H_{33}ClN_2O_5S,HCl$ in *clindamycin hydrochloride EPCRS*. Each mg of $C_{18}H_{33}ClN_2O_5S,HCl$ is equivalent to 0.9209 mg of $C_{18}H_{33}ClN_2O_5S$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of clindamycin.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Clindamycin Hydrochloride.

Clindamycin Gel

Action and use

Lincosamide antibacterial.

DEFINITION

Clindamycin Gel contains Clindamycin Phosphate.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of clindamycin, $C_{18}H_{33}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of 45 volumes of *acetonitrile* and 155 volumes of 1M *potassium dihydrogen phosphate* previously adjusted to pH 2.5 with *orthophosphoric acid*.

(1) Disperse a quantity of the gel containing the equivalent of 5 mg of clindamycin in 1 mL and shake. Dilute to 5 mL and mix using a vortex mixer. Filter (a 0.45-µm nylon filter is suitable).

(2) 0.12% w/v of *clindamycin phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

www.webofpharma.com

(e) After removal of the plate, dry at 100° for 30 minutes, allow it to cool, spray with a 0.1% w/v solution of *potassium permanganate* and examine in daylight.

MOBILE PHASE

20 volumes of *water*, 20 volumes of *glacial acetic acid* and 60 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A. *Prepare the solutions immediately before use and protect from light.*

(1) Disperse a quantity of the gel containing the equivalent of 12.5 mg clindamycin in 5 mL, centrifuge and filter (a 0.45-µm nylon filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.3% w/v of *clindamycin phosphate for system suitability EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use an autosampler at 4°.

(f) Use a detection wavelength of 210 nm.

(g) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 21 volumes of *acetonitrile R1* and 79 volumes of 1M *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide*.

Mobile phase B 40 volumes of 1M *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide* and 60 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-13	100	0	isocratic
13-18	100→50	0→50	linear gradient
18-39	50	50	isocratic
39-40	50→100	50→0	linear gradient
40-50	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to clindamycin phosphate (retention time about 12 minutes) are: impurity F, about 0.15; impurity G, about 0.2; impurity I, about 0.35; impurity B, about 0.45; impurity L, about 0.65; impurity J, about 1.2; impurity E, about 1.75 and impurity K, about 1.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurities F and G is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peak due to impurity B is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of the peaks due to impurities F or L are not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1% of each);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any *secondary peak* is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Disregard all peaks with an area less than the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the gel containing the equivalent of 25 mg of clindamycin in 20 mL and shake for 1 hour, dilute to 100 mL, centrifuge and filter (a 0.45 µm nylon filter is suitable).

(2) 0.03% w/v of *clindamycin phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with an isocratic elution and mobile phase A.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the symmetry factor of the peak due to clindamycin phosphate is between 0.8 and 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{33}ClN_2O_5S$, in the gel from the chromatograms obtained and using the declared content of $C_{18}H_{33}ClN_2O_5S$, in *clindamycin phosphate BPCRS*. Each mg of $C_{18}H_{34}ClN_2O_8PS$ is equivalent to 0.8416 mg of $C_{18}H_{33}ClN_2O_5S$.

STORAGE

Clindamycin Gel should be stored at a temperature not exceeding 25°. It should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of clindamycin in a suitable weight-weight basis.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under *Clindamycin Phosphate*.

www.webofpharma.com

Clindamycin Injection

Clindamycin Infusion

Action and use
Lincosamide antibacterial.

DEFINITION
Clindamycin Injection is a sterile solution of Clindamycin Phosphate.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of clindamycin, $C_{18}H_{33}ClN_2O_5S$
90.0 to 105.0% of the stated amount.

CHARACTERISTICS
A colourless to almost colourless solution.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the injection containing the equivalent of 50 mg of clindamycin to 10 mL with *methanol*.

(2) 0.6% w/v of *clindamycin phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

1.5 volumes of 18M *ammonia*, 30 volumes of *toluene* and 70 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to clindamycin phosphate in the chromatogram obtained with solution (2).

TESTS

Acidity or Alkalinity
pH, 5.5 to 7.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A. Prepare the solutions immediately before use and protect from light.

(1) Dilute a volume of the injection with sufficient mobile phase to produce a solution containing the equivalent of 0.25% w/v of clindamycin.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.3% w/v of *clindamycin phosphate for system suitability EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm x 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 21 volumes of *acetonitrile R1* and 79 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide*.

Mobile phase B 40 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide*, and 60 volumes of acetonitrile R1.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-13	100	0	isocratic
13-18	100→50	0→50	linear gradient
18-39	50	50	isocratic
39-40	50→100	50→0	linear gradient
40-50	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to clindamycin phosphate (retention time about 12 minutes) are: impurity F, about 0.15; impurity G, about 0.2; impurity I, about 0.35; impurity B, about 0.45; impurity L, about 0.65; impurity J, about 1.2; impurity E, about 1.75 and impurity K, about 1.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurities F and G is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity F is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%);

the area of any peak due to impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peaks due to impurities B or L are not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1% of each);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peak* is not greater than 8 times the area of the principal peak in the chromatogram obtained with solution (2) (8%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection in *water BET* to give a solution containing the equivalent of 10 mg of clindamycin per mL (solution A). The endotoxin limit concentration of solution A is 6 IU of endotoxin per mL.

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase A.

(1) Dilute a volume of the injection with sufficient mobile phase to produce a solution containing the equivalent of 0.12% w/v of clindamycin.

(2) 0.14% w/v of *clindamycin phosphate EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with an isocratic elution and mobile phase A.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the symmetry factor of the peak due to clindamycin phosphate is between 0.8 and 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the injection using the declared content of $C_{18}H_{34}ClN_2O_8PS$ in *clindamycin phosphate BPCRS*. Each mg of $C_{18}H_{34}ClN_2O_8PS$ is equivalent to 0.8416 mg of $C_{18}H_{33}ClN_2O_5S$.

STORAGE

Clindamycin Injection should be stored at a temperature not exceeding 25°. It should not be refrigerated and it should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of clindamycin in a suitable dose-volume.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Clindamycin Phosphate.

Clindamycin Lotion

Clindamycin Cutaneous Emulsion

Action and use

Lincosamide antibacterial.

DEFINITION

Clindamycin Lotion contains Clindamycin Phosphate in a suitable vehicle.

The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of clindamycin, $C_{18}H_{33}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in solvent A.

Solvent A 45 volumes of *acetonitrile* and 155 volumes of 1M *potassium dihydrogen orthophosphate* previously adjusted to pH 2.5 with *orthophosphoric acid*.

(1) Shake a quantity of the solution containing the equivalent of 5 mg of clindamycin with solvent A, dilute to 5 mL and filter (a 0.45-µm nylon filter is suitable).

(2) 0.12% w/v of *clindamycin phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 100° for 30 minutes, allow it to cool, spray with a 0.1% w/v solution of *potassium permanganate* and examine in daylight.

MOBILE PHASE

20 volumes of *water*, 20 volumes of *glacial acetic acid* and 60 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solvent B. *Prepare the solutions immediately before use and protect from light.*

Solvent B 15 volumes of *acetonitrile R1* and 85 volumes of water previously adjusted to pH 2.0 with *orthophosphoric acid*.

(1) Disperse a quantity of the lotion containing the equivalent of 25 mg clindamycin in 10 mL and filter (a 0.45-µm nylon filter is suitable). Wash 5 mL of the filtrate and with three 5-mL quantities of *diethyl ether*, taking the aqueous layer.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.3% w/v of *clindamycin phosphate for system suitability EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use an autosampler at 4°.

(f) Use a detection wavelength of 210 nm.

(g) Inject 20 µL of each solution.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 15 volumes of *acetonitrile R1* and 85 volumes of *water* previously adjusted to pH 2.0 with *orthophosphoric acid*. *Prepare the solutions immediately before use and protect from light.*

(1) Disperse a quantity of the cream containing the equivalent of 25 mg of clindamycin in 10 mL and filter (a 0.45-µm nylon filter is suitable). Wash 5 mL of the filtrate and with three 5-mL quantities of *diethyl ether*, taking the aqueous layer.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.3% w/v of *clindamycin phosphate for system suitability EPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use an autosampler at 4°

(f) Use a detection wavelength of 210 nm.

(g) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 21 volumes of *acetonitrile R1* and 79 volumes of 1M *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide*.

Mobile phase B 40 volumes of 1M *potassium dihydrogen orthophosphate* previously adjusted to pH 6.0 with a 45% w/v solution of *potassium hydroxide* and 60 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-13	100	0	isocratic
13-18	100→50	0→50	linear gradient
18-39	50	50	isocratic
39-45	50→100	50→0	linear gradient
45-50	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to clindamycin phosphate (retention time about 12 minutes) are: impurity F, about 0.15; impurity G, about 0.2; impurity I, about 0.35; impurity B, about 0.45; impurity L, about 0.65; impurity J, about 1.2; impurity E, about 1.75 and impurity K, about 1.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurities F and G is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to impurity E is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peaks due to impurities B, F or L are not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1% of each);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the sum of the areas of any *secondary peak* is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Disregard all peaks with an area less than the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 15 volumes of *acetonitrile R1* and 85 volumes of *water* previously adjusted to pH 2.0 with *orthophosphoric acid*.

(1) Disperse a quantity of the cream containing the equivalent of 25 mg of clindamycin in 25 mL with the aid of ultrasound and shake for 30 minutes. Dilute to 100 mL and filter (a 0.45-µm nylon filter is suitable).

(2) 0.03% w/v of *clindamycin phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with an isocratic elution and mobile phase A.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to clindamycin phosphate is between 0.8 and 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{33}ClN_2O_5S$, in the cream from the chromatograms obtained and using the declared content of $C_{18}H_{33}ClN_2O_5S$, in *clindamycin phosphate BPCRS*. Each mg of $C_{18}H_{34}ClN_2O_8PS$ is equivalent to 0.8416 mg of $C_{18}H_{33}ClN_2O_5S$.

STORAGE

Clindamycin Vaginal Cream should be stored at a temperature not exceeding 25°. It should not be allowed to freeze.

LABELLING

The quantity of the active ingredient is stated in terms of the equivalent amount of clindamycin in a suitable weight-weight basis.

www.webofpharma.com

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under *Clindamycin Phosphate*.

Clobazam Oral Suspension

Clobazam Oral Suspensions from different manufacturers, whilst complying with the requirements of the monograph, may not be interchangeable.

Action and use
Benzodiazepine.

DEFINITION
Clobazam Oral Suspension is a suspension containing Clobazam in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of clobazam, $C_{16}H_{13}ClN_2O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral suspension containing 10 mg of Clobazam to 100 mL with *methanol*.

(2) 0.01% w/v of *clobazam BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

40 volumes of *acetone* and 60 volumes of *hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 4.5 to 5.5, Appendix V L.

Dissolution
Carry out the following procedure protected from light. Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the dissolution medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake the oral suspension for 30 seconds and place a volume equivalent to one dose into each dissolution vessel. After 20 minutes withdraw a sample of the medium and filter. Dilute 5 mL of the filtered medium with 5 mL of *acetonitrile* and further dilute this solution, if necessary, with equal volumes of *acetonitrile* and *water*, to produce a solution expected to contain 0.00028% w/v of Clobazam.

(2) 0.00028% w/v of *clobazam BPCRS* in equal volumes of *acetonitrile* and *water*.

(3) 0.005% w/v of *clobazam impurity A EPCRS* and 0.05% w/v of *propyl hydroxybenzoate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 2.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.35 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to propyl hydroxybenzoate and impurity A is at least 3.0.

DETERMINATION OF CONTENT

Calculate the total content of clobazam, $C_{16}H_{13}ClN_2O_2$, in the medium from the chromatograms obtained and using the declared content of $C_{16}H_{13}ClN_2O_2$ in *clonazepam BPCRS*.

LIMITS

The amount of clobazam, $C_{16}H_{13}ClN_2O_2$, released is not less than 80% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) To a quantity of the oral suspension containing 25 mg of Clobazam add 25 mL of the mobile phase and shake for 15 minutes. Mix with the aid of ultrasound for 15 minutes and shake for 15 minutes. Add sufficient mobile phase to produce 50 mL, centrifuge and use the supernatant liquid.

(2) Dilute 2.5 volumes of a 0.01% w/v solution of *clobazam impurity A EPCRS* in *methanol* to 100 volumes with the mobile phase.

(3) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Further dilute 1 volume of this solution to 5 volumes with the mobile phase.

(4) 0.005% w/v of *clobazam impurity A EPCRS* and 0.05% w/v of *propyl hydroxybenzoate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 2.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.25 mL per minute.

www.webofpharma.com

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 25 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of clobazam.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference to clobazam (retention time about 14 minutes) of propyl hydroxybenzoate is 0.7.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to propyl hydroxybenzoate and impurity A is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks*, excluding any peak due to impurity A, is not greater than five times the area of the principal peak in the chromatogram obtained with solution (3) (1%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a weighed quantity of the oral suspension containing 5 mg of Clobazam add 50 mL of the mobile phase and shake vigorously for 20 minutes. Mix with the aid of ultrasound for 40 minutes and further shake for 40 minutes. Add sufficient mobile phase to produce 100 mL, centrifuge and use the supernatant liquid.

(2) To 25 mg of *clobazam BPCRS* add 25 mL of the mobile phase and shake for 15 minutes. Add sufficient mobile phase to produce 50 mL and further dilute 1 volume of this solution to 10 volumes with the mobile phase.

(3) 0.005% w/v of *clobazam impurity A EPCRS* and 0.05% w/v of *propyl hydroxybenzoate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to propyl hydroxybenzoate and impurity A is at least 3.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{16}H_{13}ClN_2O_2$, weight in volume, using the declared content of $C_{16}H_{13}ClN_2O_2$ in *clobazam BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

A. 7-Chloro-1,5-dihydro-5-phenyl-1,5-benzodiazepine-2,4 (3*H*)-dione; 7-chloro-5-phenyl-1,5-dihydro-3*H*-1,5-benzodiazepine-2,4-dione (desmethylclobazam; European Pharmacopoeia impurity A).

STORAGE

Clobazam Oral Suspension should be protected from light.

Clobazam Tablets

Clobazam Tablets from different manufacturers, whilst complying with the requirements of the monograph, may not be interchangeable.

Action and use

Benzodiazepine.

DEFINITION

Clobazam Tablets contain Clobazam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of clobazam, $C_{16}H_{13}ClN_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 20 mg of Clobazam with 10 mL of *dichloromethane*, filter and evaporate the filtrate to dryness. Dissolve the residue in the minimum amount of *methanol*, evaporate to dryness and dry the residue at 105° for 10 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of clobazam *(RS 066)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 500 mL of *0.1M hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with *acetonitrile* if necessary, to produce a solution expected to contain 0.001% w/v of Clobazam.

(2) 0.001% w/v of *clobazam BPCRS* in a mixture of equal volumes of *acetonitrile* and *water*.

(3) Dilute 1 volume of a 0.005% w/v solution of *clobazam impurity A EPCRS* in *methanol* to 2 volumes with a 0.05% w/v solution of *clobazam BPCRS* in mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used. Inject 50 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and clobazam is at least 3.0.

DETERMINATION OF CONTENT

Calculate the total content of clobazam, $C_{16}H_{13}ClN_2O_2$, in the medium using the declared content of $C_{16}H_{13}ClN_2O_2$ in *clobazam BPCRS*.

LIMITS

The amount of clobazam, $C_{16}H_{13}ClN_2O_2$ released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 25 mg of Clobazam add 25 mL of the mobile phase and mix with the aid of ultrasound. Add sufficient mobile phase to produce 50 mL, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase. Further dilute 1 volume of this solution to 10 volumes with the mobile phase.

(3) Dilute 2.5 volumes of a 0.01% w/v solution of *clobazam impurity A EPCRS* in *methanol* to 100 volumes with the mobile phase.

(4) Dilute 1 volume of a 0.01% w/v solution of *clobazam impurity A EPCRS* in *methanol* to 2 volumes with a 0.1% w/v solution of *clobazam BPCRS* in mobile phase.

(5) Dilute 1 volume of solution (2) to 2 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 2.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.25 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 25 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of clobazam.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to impurity A and clobazam is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the impurities is not greater than 1.0%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 20 mg of Clobazam add 80 mL of the mobile phase, mix with the aid of ultrasound, add sufficient mobile phase to produce 100 mL and centrifuge. Dilute 1 volume of the supernatant liquid to 10 volumes with the mobile phase.

(2) 0.002% w/v of *clobazam BPCRS* in the mobile phase.

(3) Dilute 1 volume of a 0.01% w/v solution of *clobazam impurity A EPCRS* in *methanol* to 2 volumes with a 0.1% w/v solution of *clobazam BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to impurity A and clobazam is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{13}ClN_2O_2$ in the tablets using the declared content of $C_{16}H_{13}ClN_2O_2$ in *clobazam BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

A. 7-Chloro-1,5-dihydro-5-phenyl-1,5-benzodiazepine-2,4 (3*H*)-dione; 7-chloro-5-phenyl-1,5-dihydro-3*H*-1,5-benzodiazepine-2,4-dione (desmethylclobazam; European Pharmacopoeia impurity A).

Clobetasol Cream

Action and use

Glucocorticoid.

DEFINITION

Clobetasol Cream contains Clobetasol Propionate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of clobetasol propionate, $C_{25}H_{32}ClFO_5$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. Prepare solution (1) in the following manner. Transfer a quantity of the cream containing 0.75 mg of Clobetasol Propionate to a 25-mL centrifuge tube, add 10 mL of *methanol* and heat in a water-bath at 60° for 4 minutes. Remove from the water-bath and shake vigorously. Repeat the heating and shaking, cool to room temperature, add 3.5 mL of *water* and mix. Centrifuge for 10 minutes. Transfer 10 mL of the clear supernatant liquid to a 100-mL separating funnel, add 1 g of *sodium*

www.webofpharma.com

chloride and 10 mL of *water* and mix. Add 5 mL of *dichloromethane* and shake for 1 minute. Evaporate the dichloromethane layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 0.5 mL of *dichloromethane*. Solution (2) contains 0.05% w/v of *clobetasol propionate BPCRS* in *dichloromethane*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).
The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to clobetasol propionate in the chromatogram obtained with solution (1).

ASSAY

CAUTION Carry out the preparation of solutions (2) and (3) with full facial protection and wearing heat-resistant gloves.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.005% w/v of *clobetasol propionate BPCRS* and 0.01% w/v of *beclometasone dipropionate BPCRS* (internal standard) in *ethanol (50%)*. For solution (2) add 10 mL of *absolute ethanol* to a quantity of the cream containing 1 mg of Clobetasol Propionate, stopper firmly using a plastic stopper, heat on a water bath with intermittent shaking until the cream is completely dispersed. Cool the contents in ice for 30 minutes, centrifuge and dilute 5 mL of the supernatant liquid to 10 mL with water. Prepare solution (3) in the same manner as solution (2) but add 5 mL of a 0.04% w/v solution of *beclometasone dipropionate BPCRS* in *absolute ethanol* and 5 mL of *absolute ethanol*. Solutions (2) and (3) may assume a gel-like appearance.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *stationary phase C* (5 µm) (Spherisorb ODS 1 is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 45 volumes of *absolute ethanol* and 55 volumes of *water* and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{25}H_{32}ClFO_5$ using peak areas and the declared content of $C_{25}H_{32}ClFO_5$ in *clobetasol propionate BPCRS*.

STORAGE

Clobetasol Cream should be stored at a temperature not exceeding 30°.

Clobetasol Cutaneous Foam

Action and use
Glucocorticoid.

DEFINITION

Clobetasol Cutaneous Foam contains Clobetasol Propionate in a suitable basis in a suitable pressurised container.

The cutaneous foam complies with the requirements under Medicated Foams and with the following requirements.

Content of clobetasol propionate, $C_{25}H_{32}ClFO_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Transfer a quantity of the cutaneous foam containing 0.5 mg of Clobetasol Propionate to a 25-mL centrifuge tube, add 10 mL of *methanol* and heat in a water bath at 70° for 4 minutes. Remove from the water bath and shake vigorously. Repeat the heating and shaking, cool in ice for 5 minutes and centrifuge. Evaporate 10 mL of the clear supernatant liquid to dryness and dissolve the residue in 1 mL of *dichloromethane*.

(2) 0.05% w/v of *clobetasol propionate BPCRS* in *dichloromethane*.

(3) Equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) appears as a single compact spot.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to clobetasol propionate in the chromatogram obtained with solution (2).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.
