Buffer solution—To 55 g of sodium chloride in a 1000-mL volumetric flask add 500 mg of sodium citrate, 255 g of sodium acetate, and 300 mL of water. Shake to dissolve, and cautiously add 115 mL of glacial acetic acid with mixing. Cool to room temperature, add 300 mL of isopropyl alcohol, dilute with water to volume, and mix: the pH of this solution is between 5.0 and 5.5.

Standard stock solution—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS quantitatively in water to obtain a solution containing 1105 µg per mL. Each mL of this solution contains 500 µg of fluoride ion. Store in a tightly closed, plastic container.

Standard preparations—To four 100-mL volumetric flasks transfer, respectively, 2.0-, 4.0-, 10.0-, and 20.0-mL portions of the *Standard stock solution*, dilute each with *Buffer solution* to volume, and mix to obtain solutions having fluoride ion concentrations of 10, 20, 50, and 100 µg per mL, respectively.

Test preparation—Transfer about 1.8 g, accurately weighed, to a 100-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix. Transfer 20.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.

Procedure—Concomitantly measure the potential (see *pH* ⟨791⟩), in mV, of the *Standard preparations* and of the *Test preparation* with a pH meter capable of a minimum reproducibility of ±0.2 mV, equipped with a glass-sleeved calomel-fluoride specific-ion electrode system. [NOTE—When taking measurements, immerse the electrodes in the solution, which has been transferred to a 150-mL plastic beaker containing a plastic-coated stirring bar. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithm of the fluoride-ion concentrations, in µg per mL, of each *Standard preparation* versus potential, in mV. From the measured potential of the *Test preparation* and the standard curve, determine the concentration, in µg per mL, of fluoride ion in the *Test preparation:* not more than 1.2% is found.

Assay—

Monochloroacetate buffer—Dissolve 189 g of monochloroacetic acid and 55 g of sodium hydroxide in about 1500 mL of water. Cool, dilute with water to 2000 mL, and mix.

0.025 M Thorium nitrate—Dissolve 13.8 g of thorium nitrate in about 800 mL of water, and filter the solution into a 1000-mL volumetric flask. Dilute with water to volume, and mix. Standardize this solution as follows. Transfer 20.0 mL of *Standard stock solution,* prepared as directed in the test for *Limit of fluoride ion,* to a 150-mL beaker containing 50 mL of water. Add 3 drops of sodium alizarinsulfonate TS, mix, and adjust the acidity by the careful addition, successively, of sodium hydroxide solution (1 in 50) and dilute hydrochloric acid (1 in 160), until the pink color has just been discharged. Add 1 mL of *Monochloroacetate buffer,* and titrate with *0.025 M Thorium nitrate* to a permanent pink color. Calculate the molarity of the thorium nitrate titrant taken by the equation:

$$M = (S)/[(4)(41.99V)]$$

in which S is the weight, in mg, of USP Sodium Fluoride RS in the portion of *Standard stock solution* taken, 41.99 is the molecular weight of sodium fluoride, and V is the volume, in mL, of titrant consumed.

Procedure—Transfer about 1.8 g of Sodium Monofluorophosphate, accurately weighed, to a 100-mL volumetric flask. Add about 50 mL of water, mix to effect solution, dilute with water to volume, and mix. Transfer 20.0 mL of this solution to the reaction flask of a suitable fluoride steam distilling apparatus containing 10 lime-glass beads measuring 5 mm in diameter and 70 mL of dilute sulfuric acid (1 in 2). Distill, by passing steam through the solution in the reaction flask and applying heat to the flask, collecting the distillate in a 250-mL volumetric flask. Control the temperature of the solution in the reaction flask so that it does not exceed 140°. Change receivers when the flask is filled to volume with distillate, and continue distilling into a 400-mL beaker until an additional 150 mL to 200 mL of distillate tailing

www.webofpharma.com

has been collected. Mix the solution in the 250-mL volumetric flask, and transfer 50.0 mL to a 150-mL beaker. To the 150-mL beaker add 50 mL of water and 3 drops of sodium alizarinsulfonate TS, and mix. Adjust the acidity of this solution by the careful addition, successively, of sodium hydroxide solution (1 in 50) and dilute hydrochloric acid (1 in 160), until the pink color has just been discharged. Add 1 mL of *Monochloroacetate buffer*, titrate with *0.025 M Thorium nitrate* to a permanent pink color, and record the volume, in mL, of titrant consumed as V_A. Add 3 drops of sodium alizarinsulfonate TS to the distillation tail in the 400-mL beaker, proceed as directed previously with the adjustment of the acidity, the addition of *Monochloroacetate buffer*, and the titration with *0.025 M Thorium nitrate*, and record the volume, in mL, of titrant consumed as V_B. Calculate the percentage of Na_2PFO_3 in the Sodium Monofluorophosphate taken by the formula:

$$[(2)(143.95)(5V_A + V_B)(M)/(W)] - (143.95/18.9984)(F)$$

in which M is the molarity of *0.025 M Thorium nitrate*; W is the weight, in g, of the Sodium Monofluorophosphate taken; F is the percentage of fluoride ions determined as directed in the test for *Limit of fluoride ion*; 143.95 is the molecular weight of sodium monofluorophosphate; 18.9984 is the atomic weight of fluorine; and the other terms are as defined therein.

Sodium Nitrite

$NaNO_2$ 69.00
Nitrous acid, sodium salt;
Sodium nitrite [7632-00-0].

DEFINITION
Sodium Nitrite contains NLT 98.0% and NMT 102.0% of sodium nitrite ($NaNO_2$), calculated on the dried basis.

IDENTIFICATION
- **A. IDENTIFICATION TESTS—GENERAL,** *Chemical Identification Tests, Sodium* ⟨191⟩**:** A solution meets the requirements of the tests.
- **B. IDENTIFICATION TESTS—GENERAL,** *Chemical Identification Tests, Nitrite* ⟨191⟩**:** A solution meets the requirements of the tests.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Mobile phase: 2.7 mM sodium carbonate and 0.3 mM sodium bicarbonate in water
Standard solution: 0.12 mg/mL of USP Sodium Nitrite RS in water
Sample solution: 0.12 mg/mL of Sodium Nitrite in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Conductivity with suppression
Columns
Guard: 4-mm × 50-mm, packing L105
Analytical: 4-mm × 200-mm; 9-µm packing L105
Flow rate: 1.5 mL/min
Injection volume: 25 µL
Run time: NLT 4 times the retention time of nitrite
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for sodium and nitrite ions are 1.0 and 1.85, respectively.]
Suitability requirements
Tailing factor: NMT 2.0
Column efficiency: NLT 3000 theoretical plates
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sodium nitrite ($NaNO_2$) in the portion of Sodium Nitrite taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sodium Nitrite RS in the *Standard solution* (mg/mL)
C_U = concentration of Sodium Nitrite in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
- **LIMIT OF ALUMINUM, IRON, AND SELENIUM**

Internal standard stock solution: To 2 mL of each of commercially available 1000 ppm scandium (for aluminum) and yttrium (for iron) and 10^4 ppm germanium (for selenium) standards in a 100-mL volumetric flask, add 2 mL of nitric acid and dilute with water to volume.
Internal standard solution: To 0.5 mL of *Internal standard stock solution* in a 10-mL volumetric flask, add 0.5 mL of nitric acid and dilute with water to volume.
Blank solution: Dilute with water to volume, 0.125 mL of *Internal standard solution*, 0.5 mL of nitric acid, and 0.5 mL of 80 ppm gold solution in a 50-mL volumetric flask.
Standard solutions: 2, 5, 50, and 100 ppb solutions for aluminum and selenium; 0, 50, 100, 500, and 1000 ppb for iron as follows. To suitable amounts of commercially available aluminum, selenium, and iron standard solutions in a 50-mL volumetric flask, add 0.125 mL of *Internal standard solution*, 0.5 mL of nitric acid, and 0.5 mL of 80 ppm gold solution, and dilute with water to volume.
Sample solution: To 1 g of sodium nitrite in a 50-mL volumetric flask, add 0.125 mL of *Internal standard solution*, 2.5 mL of nitric acid, and 0.5 mL of 80 ppm gold solution, and dilute with water to volume.
Instrumental conditions
(See *Plasma Spectrochemistry* ⟨730⟩.)
Mode: Inductively coupled plasma–mass spectrometer (ICP–MS)
Spectrometer: Quadrupole mass spectrometer
Detector: Ion detector
System suitability
Sample: *Standard solutions*
Suitability requirements: Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the corresponding *Standard solutions* for each element under test. The linear regression coefficient is NLT 0.999.
Analysis
Sample: *Sample solution*
Determine the concentration of each element in the *Sample solution* using the calibration curve.
Acceptance criteria: See *Table 1*.

USP Monographs

www.webofpharma.com

Table 1

Element	Isotope (amu)	Acceptance Criteria, NMT (ppm)
Aluminum	27	2
Iron	57	10
Selenium	82	30

• **LIMIT OF SODIUM NITRATE**

Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

System suitability: Proceed as directed in the *Assay*.

[NOTE—The relative retention times for nitrite and nitrate are 1.0 and about 1.85, respectively.]

Analysis

Sample: *Sample solution*

Calculate the percentage of sodium nitrate ($NaNO_3$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

r_U = peak response of nitrate from the *Sample solution*
r_S = peak response of nitrite from the *Sample solution*
F = relative response factor for nitrate, 0.7

Acceptance criteria: NMT 0.4%

• **LIMIT OF CALCIUM AND POTASSIUM**

Internal standard solution: 40 ppm scandium solution prepared from a suitable commercially available 1000 ppm high purity scandium standard solution in water

Blank solution: To 0.5 mL of *Internal standard solution* in a 50-mL volumetric flask, add 0.5 mL of nitric acid and dilute with water to volume.

Standard solutions: 2.5, 5.0, 7.5, and 10.0 ppm of calcium and potassium prepared as follows. To suitable amounts of the respective commercially available calcium and potassium standard solutions in a suitable volumetric flask, add 0.5 mL of *Internal standard solution* and 0.5 mL of nitric acid, and dilute with water to 50 mL.

Sample solution: To 1 g of sodium nitrite in a 50-mL volumetric flask, add 0.5 mL of *Internal standard solution* and 2.5 mL of nitric acid, and dilute with water to volume.

Instrumental conditions

(See *Plasma Spectrochemistry* ⟨730⟩.)

Mode: Inductively coupled plasma–mass spectrometer (ICP–MS)

Spectrometer: Quadrupole mass spectrometer

Detector: Ion detector

System suitability

Sample: *Standard solutions*

Suitability requirements: Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the *Standard solutions* of the corresponding elements. The linear regression coefficient is NLT 0.999.

Analysis

Sample: *Sample solution*

Determine the concentration of each element in the *Sample solution* using the calibration curve.

Acceptance criteria: See *Table 2*.

Table 2

Element	Isotope (amu)	Acceptance Criteria, NMT (ppm)
Calcium	44	100
Potassium	39	50

• **LIMIT OF CARBONATE**

All carbonate solutions must be prepared fresh and stored in tightly sealed vials and stored in a cool area away from excessive heat.

Standard stock solution: 1 mg/mL of carbonate, prepared as follows. Dissolve 0.177 g of sodium carbonate in a 100-mL volumetric flask, and dilute with water to volume.

Standard solutions: Prepare solutions of 0.50, 1.0, 2.0, 4.0, and 5.0 µg/mL carbonate in water from *Standard stock solution*.

Sample solution: Transfer 1.0 g of Sodium Nitrite into a 100-mL volumetric flask, and dilute with water to volume.

System suitability: Before analyzing samples, the total organic carbon (TOC) analyzer must pass a suitable performance check. Generate the calibration curve using the *Standard solutions*. The linear regression coefficient is NLT 0.995; %RSD for each Standard is NMT 10%.

Analysis

Sample: *Sample solution*

Calculate the percentage of carbonate present in the sample taken:

$$\text{Result} = [(C_t \times D)/W] \times 100$$

C_t = concentration of carbonate (g/mL)
D = sample dilution, 100 mL
W = weight of sample taken (g)

Acceptance criteria: NMT 0.02%

• **TOTAL NON-PURGEABLE ORGANIC CONTENT**

Standard stock solution: Equivalent to 250 µg/mL of total organic carbon prepared as follows. Weigh 9 mg of USP Sucrose RS in a suitable flask, and add 15 mL of water.

Standard solutions: 0.5, 2.0, and 10 µg/mL of total organic carbon in water from *Standard stock solution*

Sample solution: Dissolve and dilute with water to volume, 5.0 g of Sodium Nitrite in a 100-mL volumetric flask.

System suitability: Before analyzing samples, the total organic carbon analyzer instrument must pass a suitable performance check. Generate the calibration curve using the *Standard solutions*. The linear regression coefficient is NLT 0.99; %RSD for the 2 µg/mL and 10 µg/mL calibration standards is NMT 15%.

Analysis

Sample: *Sample solution*

Calculate the amount, in ppm, of non-purgeable organic content present in the sample taken:

$$\text{Result} = [(C_t \times D)/W]$$

C_t = amount of non-purgeable organic content as determined by the analyzer (µg/g)
D = sample dilution, 100 mL
W = weight of sample taken (g)

Acceptance criteria: NMT 10 ppm

• **LIMIT OF SULFATE**

Standard solution: 0.0148 mg/mL of anhydrous sodium sulfate in water

Sample solution: 100 mg/mL of Sodium Nitrite in water

Analysis

Sample: *Sample solution*

Evaporate 5 mL of the *Sample solution* to dryness. Add 1 mL of dilute hydrochloric acid (prepared by adding 1 mL of hydrochloric acid to 19 mL water). Pass through a prewashed small filter paper, and wash with two 2-mL portions of water. Dilute to 10 mL, and add 1 mL of barium chloride TS. Compare turbidity in the *Standard solution* and *Sample solution*, 10 min after adding the barium chloride TS.

www.webofpharma.com

Acceptance criteria: Any turbidity in the *Sample solution* should not exceed the turbidity in the *Standard solution* (NMT 0.01%).

• **LIMIT OF CHLORIDE**

Standard solution: 0.0165 mg/mL of sodium chloride in water

Sample solution: 100 mg/mL of Sodium Nitrite in water

Analysis

Samples: *Standard solution* and *Sample solution*

To 2.0 mL of the *Sample solution* in a suitable test tube add 10 mL of water and 1 mL of glacial acetic acid and boil for 5 min. Pass through a chlorine-free filter paper, and dilute with water to 20 mL. Dilute 1 mL of the *Standard solution* with water to 20 mL in a separate test tube. Add 1 mL of nitric acid and 1 mL of 0.1 N silver nitrate. Allow to stand for 5 min protected from light and compare using a black background.

Acceptance criteria: Any turbidity in the *Sample solution* should not exceed the turbidity in the *Standard solution* (NMT 50 ppm).

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.1 USP Endotoxin Units/mg of sodium nitrite

• **MICROBIAL ENUMERATION TESTS** ⟨61⟩: NMT 100 cfu/g, total aerobic microbial count and NMT 20 cfu/g, total yeasts and molds

• **pH** ⟨791⟩: 7.0–9.0

• **INSOLUBLE MATTER**

Sample solution: 100 mg/mL of Sodium Nitrite in water

Analysis: Heat the *Sample solution* to boiling in a covered beaker at about 100° for 1 h. Pass the hot solution through a suitable crucible filter of 10–15 µm pore size. Wash the beaker and filter with hot water, dry at 105°, cool in a desiccator, and weigh the residue.

Acceptance criteria: NMT 50 ppm

• **LOSS ON DRYING** ⟨731⟩

Analysis: Dry over silica gel for 4 h.

Acceptance criteria: NMT 0.25%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers and store at 25°, excursions permitted between 15° and 30°.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Endotoxin RS

USP Sodium Nitrite RS

USP Sucrose RS

Sodium Nitrite Injection

DEFINITION

Sodium Nitrite Injection is a sterile solution of Sodium Nitrite in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium nitrite ($NaNO_2$).

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL,** *Chemical Identification Tests, Sodium* ⟨191⟩: Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL,** *Chemical Identification Tests, Nitrite* ⟨191⟩: Meets the requirements

• **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: 2.7 mM sodium carbonate and 0.3 mM sodium bicarbonate in water

Standard solution: 0.12 mg/mL of USP Sodium Nitrite RS in water

Sample solution: Nominally equivalent to 0.12 mg/mL of sodium nitrite in water from a suitable volume of Injection

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: Ion chromatography

Detector: Conductivity with suppression

Columns

Guard: 4-mm × 50-mm; packing L105

Analytical: 4-mm × 200-mm; 9-µm packing L105

Flow rate: 1.5 mL/min

Injection volume: 25 µL

Run time: NLT 4 times the retention time of nitrite

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for sodium and nitrite ions are 1.0 and 1.85, respectively.]

Suitability requirements

Tailing factor: NMT 2.0

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sodium nitrite ($NaNO_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sodium Nitrite RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of sodium nitrite in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

IMPURITIES

• **LIMIT OF SODIUM NITRATE**

Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

System suitability: Proceed as directed in the *Assay*.

[NOTE—The relative retention times for nitrite and nitrate are 1.0 and about 1.85, respectively.]

Analysis

Sample: *Sample solution*

Calculate the percentage of sodium nitrate ($NaNO_3$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

r_U = peak response of nitrate from the *Sample solution*

r_S = peak response of nitrite from the *Sample solution*

F = relative response factor of sodium nitrate, 0.7

Acceptance criteria: NMT 0.5%

• **LIMIT OF NITROGEN OXIDE (NO_x) RELATED IMPURITIES**

Blank solution 1: 0.1 N potassium chloride prepared as follows. Dissolve 7.46 g of potassium chloride in 1 L of water.

Blank solution 2: Acidified 0.1 N potassium chloride prepared as follows. In a 500-mL volumetric flask pipet 15-mL of 1 N hydrochloric acid and dilute with 0.1 N potassium chloride to volume.

Standard solution: 4.920 mg/mL of sodium nitrate in water equivalent to 1000 µg/mL of nitrogen

USP Monographs

www.webofpharma.com

Sample solution: Dilute 10.0 mL of Injection with water to 50.0 mL. Store between 2° and 8°. Use 40 mL for each measurement.

System suitability

[NOTE—Under acidic conditions of pH less than 1.8, the nitrite is converted to equivalent amounts of nitrogen oxides with different oxidation states.]

Samples: *Blank solution 2* and *Standard solution*

Suitability requirements: Generate a calibration curve of the mV readings for *Blank solution 2*, and a sequential addition of 100 µL, 100 µL, 800 µL, and 9 mL of the *Standard solution* to *Blank solution 2* versus the log of the concentrations of the nitrogen oxide (NO_x) in the solution. Use a pH meter equipped with a suitable nitrogen oxide (NO_x) electrode to obtain the mV readings. Perform a linear regression without the zero concentration point and determine the slope and correlation coefficient (R). The slope must be between 54 and 60 mV and the linear regression coefficient is NLT 0.995.

Analysis

Samples: *Blank solution 1*, *Blank solution 2*, *Standard solution*, and *Sample solution*

Analyze the samples in the following order and obtain the pH meter readings in mV for 40-mL portions each of *Blank solution 1* in duplicate, *Sample solution* in duplicate, and *Blank solution 1*; and 100 mL portions each of *Blank solution 2*, and *Blank solution 2* plus 100 µL of *Standard solution*. [NOTE—This solution contains 1 µg/mL of nitrogen oxide (NO_x).] Repeat the measurements.

Acceptance criteria: The mV reading obtained for the *Sample solution* is NMT the mV reading obtained for *Blank solution 2* with 100 µL of the *Standard solution* (NMT 1 ppm).

SPECIFIC TESTS

- **pH** ⟨791⟩: 7.0–9.0
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 4.0 USP Endotoxin Units/mL of sodium nitrite
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers of Type I glass. Protect from direct light. Do not freeze. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sodium Nitrite RS

Sodium Nitroprusside

$Na_2[Fe(CN)_5NO] \cdot 2H_2O$ 297.95

Ferrate(2-), pentakis(cyano-C)nitrosyl-, disodium, dihydrate, (*OC*-6-22)-.

Disodium pentacyanonitrosylferrate(2-) dihydrate [13755-38-9].

Sodium nitroferricyanide dihydrate.

Anhydrous 261.92

[14402-89-2].

» Sodium Nitroprusside contains not less than 99.0 percent of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards ⟨11⟩—
USP Sodium Nitroprusside RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
[NOTE—Use low-actinic glassware.]
Solution: 1 in 135.
Medium: water.
Wavelength range: 350 nm to 700 nm.

B: Dissolve 5 mg in 2 mL of water, and add 2 drops of acetone and 0.5 mL of 2 N sodium hydroxide: an orange color is produced. Add 2 mL of acetic acid: the color changes to purple.

C: A solution (1 in 4) imparts an intense yellow color to a nonluminous flame.

Water Determination, *Method I* ⟨921⟩ **:** between 9.0% and 15.0%.

Insoluble substances—Dissolve 10.0 g in 50 mL of water, heat the solution on a steam bath for 30 minutes, filter, wash the residue with water, and dry at 105° to constant weight: the weight of the residue is not greater than 1 mg (0.01%).

Chloride—

Standard chloride solution—Dissolve 42.4 mg of potassium chloride in water to make 100.0 mL of solution. Each mL of this solution contains 0.2 mg of chloride.

Procedure—Transfer 1.0 g of Sodium Nitroprusside to a 250-mL conical flask, transfer 1.0 mL of *Standard chloride solution* to a similar flask, and add to each flask 85 mL of water. To the flask containing the substance under test, add 15 mL of cupric sulfate solution (83 in 1000), mix, and allow any undissolved particles to settle. Carefully add cupric sulfate solution (83 in 1000) to the flask containing the diluted *Standard chloride solution*, with mixing, so that its color matches that of the test solution in the first flask. Filter the contents of each flask, and discard the first 25 mL of the filtrate. To 10 mL of the subsequent filtrate from each flask add 2 mL of nitric acid, and mix. Add 1 mL of 1 N silver nitrate to each, and again mix: the test solution so treated becomes no more turbid than the treated *Standard chloride solution* (0.02%).

Limit of ferricyanide—Dissolve 500 mg in 20 mL of ammonium acetate TS, previously adjusted with 1 N acetic acid to a pH of 4.62. Divide this solution into halves, and transfer each half to a separate 50-mL volumetric flask, identified as *A* and *B*, respectively. To flask *B* add 1.0 mL of a freshly prepared solution of potassium ferricyanide containing 78 µg per mL. To both flasks add 5 mL of ferrous ammonium sulfate solution (1 in 1000), dilute with water to volume, and mix. Allow the flasks to stand for 1 hour, and concomitantly determine the absorbance of the solutions at the wavelength of maximum absorbance at about 720 nm, using as a blank a solution prepared by dissolving 250 mg of the specimen in 10 mL of the pH 4.62 ammonium acetate TS and diluting with water to 50 mL. The absorbance of the solution in flask *A* is not greater than the absorbance of the solution in flask *B* minus the absorbance of the solution in flask *A* (0.02% of ferricyanide).

Limit of ferrocyanide—Dissolve 2.0 g in 40 mL of water, divide the solution into halves, and transfer each half to a separate 50-mL volumetric flask, identified as *A* and *B*, respectively. To flask *B* add 2 mL of a freshly prepared solution of potassium ferrocyanide containing 200 µg per mL. To both

www.webofpharma.com

flasks add 0.2 mL of ferric chloride TS, dilute with water to volume, and mix. Allow to stand for 20 minutes, accurately timed, and concomitantly measure the absorbance of the solutions at the wavelength of maximum absorbance at about 695 nm, using as a blank a solution prepared by dissolving 1.0 g of the specimen in water to make 50 mL: the absorbance of the solution in flask *A* is not greater than the absorbance of the solution in flask *B* minus the absorbance of the solution in flask *A* (0.02% of ferrocyanide).

Sulfate—

Standard sulfate solution—Dissolve 15 mg of anhydrous sodium sulfate in water to make 100.0 mL of solution. Each mL of this solution contains 0.1 mg of sulfate.

Procedure—Dissolve 5.0 g of Sodium Nitroprusside in water to make 250.0 mL of solution, and filter the solution into a flat-bottom, 250-mL graduated flask. Transfer 5.0 mL of *Standard sulfate solution* to a similar flask, and dilute to the same volume as the test solution. To each flask add 10 drops of glacial acetic acid and 5 mL of 1 N barium chloride, and allow to stand for 10 minutes. Place both flasks over a fluorescent light source, and observe: the turbidity in the treated test solution is not more intense than that of the treated *Standard sulfate solution* (0.01%).

Other requirements—Where the label states that Sodium Nitroprusside is sterile, it meets the requirements for *Sterility Tests* ⟨71⟩ and for *Bacterial endotoxins* under *Sodium Nitroprusside for Injection*. Where the label states that *Sodium Nitroprusside* must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Sodium Nitroprusside for Injection*.

Assay—Dissolve about 500 mg of Sodium Nitroprusside, accurately weighed, in 130 mL of chloride-free water. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-silver chloride electrode system. Each mL of 0.1 N silver nitrate is equivalent to 14.90 mg of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$.

Sodium Nitroprusside for Injection

» Sodium Nitroprusside for Injection is Sodium Nitroprusside suitable for parenteral use. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sodium nitroprusside ($Na_2[Fe(CN)_5NO] \cdot 2H_2O$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution*.

USP Reference standards ⟨11⟩—
USP Sodium Nitroprusside RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* ⟨1⟩, *Specific Tests, Completeness and clarity of solutions*.

Identification—To 50 mg contained in a small test tube add 10 mL of ascorbic acid solution (1 in 50), and mix. Add 1 mL of dilute hydrochloric acid (1 in 10), mix, and add dropwise, while mixing, 1 to 2 mL of 1 N sodium hydroxide: a transient blue color is produced.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.05 USP Endotoxin Unit per µg of sodium nitroprusside.

Water Determination, *Method I* ⟨921⟩: not more than 15.0%.

Other requirements—It responds to the *Identification* test *A* under *Sodium Nitroprusside*. It meets also the requirements for *Sterility Tests* ⟨71⟩, *Uniformity of Dosage Units* ⟨905⟩, and *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

Assay—

pH 7.1 buffer—Dissolve 1.36 g of monobasic potassium phosphate and 5.2 mL of a 1 in 4 solution of tetrabutylammonium hydroxide in methanol in water to make 1000 mL, and adjust with phosphoric acid or with the tetrabutylammonium hydroxide solution to a pH of 7.1.

Mobile phase—Prepare a suitable filtered mixture of *pH 7.1 buffer* and acetonitrile (about 70:30).

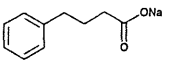
[NOTE—Use low-actinic glassware throughout the following sections.]

Standard preparation—Dissolve an accurately weighed quantity of USP Sodium Nitroprusside RS, in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Assay preparation 1 (where the label states only the total contents of the container)—Transfer the contents of 1 container of Sodium Nitroprusside for Injection to a 100-mL volumetric flask with the aid of *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively with *Mobile phase* to obtain a solution containing about 0.05 mg of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$ per mL.

Assay preparation 2 (where the label states the quantity of $Na_2[Fe(CN_5)NO] \cdot 2H_2O$ in a given volume of constituted solution)—Constitute Sodium Nitroprusside for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution thus obtained quantitatively and stepwise with *Mobile phase* to obtain a solution containing about 0.05 mg of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$ per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.



Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$ in the container or in the portion of constituted solution taken by the formula:

$$L(C/D)(r_U/r_S)$$

in which L is the labeled quantity, in mg of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$ in the container, or in the volume of constituted solution taken; C is the concentration, in mg per mL, of USP Sodium Nitroprusside RS in the *Standard preparation; D* is the concentration, in mg of $Na_2[Fe(CN)_5NO] \cdot 2H_2O$ per mL, of *Assay preparation 1* or of *Assay preparation 2*, on the basis of the labeled quantity in the container, or in the volume of constituted solution taken, respectively, and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

www.webofpharma.com

Sodium Phenylbutyrate

$C_{10}H_{11}NaO_2$ 186.18
Benzenebutanoic acid, sodium salt;
Sodium 4-phenylbutyrate;
Sodium 4-phenylbutanoate. [1716-12-7].

DEFINITION
Sodium Phenylbutyrate contains NLT 99.0% and NMT 101.0% of sodium phenylbutyrate ($C_{10}H_{11}NaO_2$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩, *Infrared Spectroscopy*: 197K▲** (CN 1-May-2020)
- **B. IDENTIFICATION TESTS—GENERAL ⟨191⟩, *Sodium***
  Sample solution: Dissolve 150 mg in 2 mL of water.
  Acceptance criteria: Meets the requirements of test *A*

ASSAY
- **PROCEDURE**
  Sample: 150 mg
  Analysis: Disperse the *Sample* in 50 mL of anhydrous acetic acid. [NOTE—The opalescence of the solution disappears during the titration.] Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 18.62 mg of sodium phenylbutyrate ($C_{10}H_{11}NaO_2$).
  Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES
- **LIMIT OF PHENYLBUTYRATE RELATED COMPOUND C**
  Silylation solution: To 2 mL of bis(trimethylsilyl) trifluoroacetamide add 0.04 mL of chlorotrimethylsilane, and mix.
  Sample solution: Dissolve 50.0 mg of Sodium Phenylbutyrate in 3 mL of water, and add 0.5 mL of hydrochloric acid. Extract with 2 quantities, each of 5 mL, of methylene chloride. Evaporate the combined methylene chloride extracts to dryness in a vial with a screw cap, and add 0.5 mL of the *Silylation solution*. Seal the vial, and heat at 70 ± 5° for 20 min.
  Standard stock solution: 0.5 mg/mL of USP Phenylbutyrate Related Compound C RS in methylene chloride
  Diluted standard stock solution: 0.05 mg/mL of USP Phenylbutyrate Related Compound C RS in methylene chloride from *Standard stock solution*
  Standard solution: Place an amount of the *Diluted standard stock solution*, equivalent to 0.05 mg, in a vial with a screw cap, evaporate to dryness, and add 0.5 mL of the *Silylation solution*. Seal the vial, and heat at 70 ± 5° for 20 min.
  System suitability solution: Prepare a solution containing 0.4 mg/mL of USP Sodium Phenylbutyrate RS in water. To 3 mL of this solution add 0.1 mL of hydrochloric acid. Extract with 2 quantities, each of 5 mL, of methylene chloride. Combine the methylene chloride extracts in a vial with a screw cap, and add 2 mL of *Standard stock solution*. Evaporate to dryness, and add 0.5 mL of the *Silylation solution*. Seal the vial, and heat at 70 ± 5° for 20 min.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: GC
  Detector: Flame ionization
  Column: 25-m × 0.25-mm fused silica capillary; coated with a 1.0-µm film of phase G27
  Temperatures
  Injector: 270°
  Detector: 270°
  Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	0	50	5
50	10	270	5

  Carrier gas: Helium
  Flow rate: 0.9 mL/min
  Injection volume: 1 µL
  Split ratio: 1:100
  System suitability
  Sample: *System suitability solution*
  [NOTE—The relative retention times for phenylbutyrate related compound C and phenylbutyrate are about 0.98 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 3.0 between the phenylbutyrate related compound C and phenylbutyrate peaks
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of phenylbutyrate related compound C in the portion of Sodium Phenylbutyrate taken:

$$\text{Result} = (r_U/r_S) \times (W_S/W_U) \times 100$$

r_U = peak response of phenylbutyrate related compound C from the *Sample solution*
r_S = peak response of phenylbutyrate related compound C from the *Standard solution*
W_S = amount of USP Phenylbutyrate Related Compound C RS taken to prepare the *Standard solution* (mg)
W_U = amount of Sodium Phenylbutyrate taken to prepare the *Sample solution* (mg)

  Acceptance criteria: NMT 0.1%
- **ORGANIC IMPURITIES**
  Mobile phase: Methanol, glacial acetic acid, and water (49:1:50)
  Impurity stock solution A: 0.1 mg/mL of USP Phenylbutyrate Related Compound A RS in methanol
  Impurity standard solution A: Dilute 1.0 mL of *Impurity stock solution A* with water to 50.0 mL. This solution contains 2 µg/mL of USP Phenylbutyrate Related Compound A RS.
  Impurity stock solution B: 0.02 mg/mL of USP Phenylbutyrate Related Compound B RS in methanol
  Impurity standard solution B: Dilute 1.0 mL of *Impurity stock solution B* with water to 50.0 mL. This solution contains 0.4 µg/mL of USP Phenylbutyrate Related Compound B RS.
  System suitability solution: Prepare a solution containing 20 mg/mL of USP Sodium Phenylbutyrate RS in methanol. Transfer 10 mL of this solution to a 50-mL volumetric flask, add 1.0 mL of *Impurity stock solution B*, and dilute with water to volume.
  Sensitivity solution: Dilute 6.0 mL of *Impurity standard solution A* with water to 10.0 mL. This solution contains 1.2 µg/mL of USP Phenylbutyrate Related Compound A RS.

www.webofpharma.com

Sample solution: 4.0 mg/mL of Sodium Phenylbutyrate, prepared as follows. Dissolve it first in methanol, using 20% of the final volume, and dilute with water to volume.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 245 nm
Column: 4.6-mm × 25-cm; 5-µm base-deactivated end-capped packing L1
Flow rate: 1.3 mL/min
Injection volume: 20 µL

System suitability
Samples: *System suitability solution* and *Sensitivity solution*
Suitability requirements
Resolution: NLT 6 between phenylbutyrate and phenylbutyrate related compound B, *System suitability solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis
Samples: *Impurity standard solution A*, *Impurity standard solution B*, and *Sample solution*
Calculate the percentage of phenylbutyrate related compound A or phenylbutyrate related compound B in the portion of Sodium Phenylbutyrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of respective impurity in the *Sample solution*
r_S = peak response of phenylbutyrate related compound A or phenylbutyrate related compound B in the respective *Impurity standard solution*
C_S = concentration of USP Phenylbutyrate Related Compound A RS or USP Phenylbutyrate Related Compound B RS in the respective *Impurity standard solution* (mg/mL)
C_U = concentration of Sodium Phenylbutyrate in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Sodium Phenylbutyrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified impurity in the *Sample solution*
r_S = peak response of phenylbutyrate related compound A in *Impurity standard solution A*
C_S = concentration of USP Phenylbutyrate Related Compound A RS in *Impurity standard solution A* (mg/mL)
C_U = concentration of Sodium Phenylbutyrate in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard any peak below 0.03%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Phenylbutyrate related compound A	0.3	0.1
Phenylbutyrate related compound B	0.7	0.01
Sodium phenylbutyrate	1.0	—
Any individual unspecified impurity	—	0.05
Total impurities	—	0.1

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method Ia* ⟨921⟩**:** NMT 0.5%
• **pH** ⟨791⟩
Sample solution: 20 mg/mL in carbon dioxide-free water
Acceptance criteria: 6.5–7.5

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve under argon in tight containers. Store at room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sodium Phenylbutyrate RS
USP Phenylbutyrate Related Compound A RS
3-Benzoylpropionic acid;
4-Oxo-4-phenylbutanoic acid.
$C_{10}H_{10}O_3$ 178.18
USP Phenylbutyrate Related Compound B RS
α-Tetralone;
3,4-Dihydronaphthalen-1(2*H*)-one.
$C_{10}H_{10}O$ 146.19

Sodium Phenylbutyrate Compounded Oral Suspension

DEFINITION
Sodium Phenylbutyrate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium phenylbutyrate ($C_{10}H_{11}O_2Na$).
Prepare Sodium Phenylbutyrate Compounded Oral Suspension 200 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sodium Phenylbutyrate powder[a]	20 g
Vehicle: a 1:1 mixture of Ora-Sweet[b] (regular or sugar-free) and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Ucyclyd Pharma, Inc., Scottsdale, AZ.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the *Sodium Phenylbutyrate powder* in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a sodium phenylbutyrate liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY
• **PROCEDURE**
Mobile phase: Acetonitrile and 5 mM phosphoric acid (40:60). Filter and degas.

USP Monographs

www.webofpharma.com

Standard solution: 0.1 mg/mL of sodium phenylbutyrate in *Mobile phase*. [NOTE—The *Standard solution* should be prepared from the appropriate reference material.]
Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.1 mg/mL of sodium phenylbutyrate from Oral Suspension and *Mobile phase*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 218 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 60°
Flow rate: 1.0 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for sodium phenylbutyrate is about 3.0 min.]
Suitability requirements
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sodium phenylbutyrate ($C_{10}H_{11}O_2Na$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of sodium phenylbutyrate in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium phenylbutyrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **pH** ⟨791⟩**:** 7.0–8.0

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.
• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature
• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

Dibasic Sodium Phosphate

$Na_2HPO_4 \cdot 12H_2O$ 358.14
$Na_2HPO_4 \cdot 7H_2O$ 268.07
$Na_2HPO_4 \cdot 2H_2O$ 177.99
$Na_2HPO_4 \cdot H_2O$ 159.94
Na_2HPO_4 141.96
Phosphoric acid, disodium salt, dodecahydrate; Disodium hydrogen phosphate, dodecahydrate [10039-32-4].
Phosphoric acid, disodium salt, heptahydrate; Disodium hydrogen phosphate heptahydrate [7782-85-6].
Phosphoric acid, disodium salt, dihydrate; Disodium hydrogen phosphate, dihydrate [10028-24-7].
Phosphoric acid, sodium salt, monohydrate; Disodium hydrogen phosphate, monohydrate [118830-14-1].
Phosphoric acid, disodium salt, hydrate; Disodium hydrogen phosphate hydrate [10140-65-5].
Anhydrous [7558-79-4].

DEFINITION
Dibasic Sodium Phosphate is dried or contains one, two, seven, or twelve molecules of water of hydration. It contains NLT 98.0% and NMT 100.5% of Na_2HPO_4, calculated on the dried basis.

IDENTIFICATION
• **A. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩
Sample solution: Equivalent to 1 part of Na_2HPO_4 in 30
Acceptance criteria: The solution meets the requirements.
• **B. IDENTIFICATION TESTS—GENERAL,** *Phosphate* ⟨191⟩
Sample solution: Equivalent to 1 part of Na_2HPO_4 in 30
Acceptance criteria: The solution meets the requirements.

ASSAY
• **PROCEDURE**
Sample: Equivalent to 2.5 g of Na_2HPO_4
Sample solution: Transfer the *Sample* to a 250-mL beaker. Add 50 mL of water and 40.0 mL of 1 N hydrochloric acid, and stir until dissolved.
Blank: Transfer 40.0 mL of 1 N hydrochloric acid to a 250-mL beaker. Add 50 mL of water.
Analysis: Titrate the *Blank* with 1 N sodium hydroxide VS, and record the volume of 1 N sodium hydroxide VS consumed. Titrate the excess acid in the *Sample solution* potentiometrically with 1 N sodium hydroxide VS to the inflection point at about pH 4, and record the buret reading. Subtract this buret reading from that of the *Blank*, and designate the volume of 1 N sodium hydroxide VS resulting from this subtraction as *A*. Continue the titration with 1 N sodium hydroxide VS to the inflection point at about pH 8.8, record the buret reading, and calculate the volume (*B*) of 1 N sodium hydroxide required in the titration between the two inflection points (pH 4–8.8). Where *A* is equal to or less than *B*, each mL of the volume *A* of 1 N sodium hydroxide is equivalent to 142.0 mg of Na_2HPO_4. Where *A* is greater than *B*, each mL of the volume $(2B - A)$ of 1 N sodium hydroxide is equivalent to 142.0 mg of Na_2HPO_4.
Acceptance criteria: 98.0%–100.5% on the dried basis

IMPURITIES
• **INSOLUBLE SUBSTANCES**
Sample solution: Equivalent to 5.0 g of Na_2HPO_4 in 100 mL of hot water
Analysis: Filter through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.
Acceptance criteria: NMT 20 mg (NMT 0.4%)
• **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
Sample: Equivalent to 0.5 g of Na_2HPO_4
Acceptance criteria: Shows no more chloride than corresponds to 0.42 mL of 0.020 N hydrochloric acid (NMT 0.06%)
• **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩
Sample: Equivalent to 0.1 g of Na_2HPO_4
Acceptance criteria: Shows no more sulfate than corresponds to 0.2 mL of 0.020 N sulfuric acid (NMT 0.2%)
• **ARSENIC,** *Method I* ⟨211⟩
Test preparation: Equivalent to 187.5 mg of Na_2HPO_4 in 35 mL of water
Acceptance criteria: NMT 16 ppm

www.webofpharma.com

SPECIFIC TESTS
- **Loss on Drying** ⟨731⟩: Dry a sample at 130° to constant weight.
  Acceptance criteria: See *Table 1*.

Table 1

Hydrate Form	Acceptance Criteria
Dried	NMT 5.0%
Monohydrate	10.3%–12.0%
Dihydrate	18.5%–21.5%
Heptahydrate	43.0%–50.0%
Dodecahydrate	55.0%–64.0%

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight containers.
- **Labeling:** Label it to indicate whether it is dried or is the monohydrate, the dihydrate, the heptahydrate, or the dodecahydrate.

Monobasic Sodium Phosphate

NaH_2PO_4 119.98

$NaH_2PO_4 \cdot H_2O$ 137.99

$NaH_2PO_4 \cdot 2H_2O$ 156.01

Phosphoric acid, monosodium salt, monohydrate; Monosodium phosphate monohydrate [10049-21-5].
Phosphoric acid, monosodium salt, dihydrate; Monosodium phosphate dihydrate [13472-35-0].
Anhydrous [7558-80-7].

DEFINITION
Monobasic Sodium Phosphate contains one or two molecules of water of hydration, or is anhydrous. It contains NLT 98.0% and NMT 103.0% of monobasic sodium phosphate (NaH_2PO_4), calculated on the anhydrous basis.

IDENTIFICATION
- **A. Identification Tests—General,** *Sodium* ⟨191⟩
  Sample solution: 50 mg/mL
  Acceptance criteria: Meets the requirements
- **B. Identification Tests—General,** *Phosphate* ⟨191⟩
  Sample solution: 50 mg/mL
  Acceptance criteria: Meets the requirements

ASSAY
- **Procedure**
  Sample: 2.5 g
  Titrimetric system
  (See *Titrimetry* ⟨541⟩.)
  Mode: Direct titration
  Titrant: 1 N sodium hydroxide VS
  Endpoint detection: Visual
  Analysis: Dissolve the *Sample* in 10 mL of cold water. Add 20 mL of a cold, saturated solution of sodium chloride, add phenolphthalein TS, and then titrate with *Titrant*, keeping the temperature of the solution between 10° and 15° during the entire titration. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 120.0 mg of monobasic sodium phosphate (NaH_2PO_4).
  Acceptance criteria: 98.0%–103.0% on the anhydrous basis

IMPURITIES
- **Insoluble Substances**
  Sample solution: Equivalent to 10.0 g of $NaH_2PO_4 \cdot H_2O$ in 100 mL of hot water
  Analysis: Pass through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.
  Acceptance criteria: NMT 20 mg (0.2%)
- **Chloride and Sulfate,** *Chloride* ⟨221⟩
  Sample: Equivalent to 1.0 g of $NaH_2PO_4 \cdot H_2O$
  Control: 0.20 mL of 0.020 N hydrochloric acid
  Acceptance criteria: NMT 0.014%; the *Sample* shows no more chloride than the *Control*.
- **Chloride and Sulfate,** *Sulfate* ⟨221⟩
  Sample: Equivalent to 0.20 g of $NaH_2PO_4 \cdot H_2O$
  Control: 0.30 mL of 0.020 N sulfuric acid
  Acceptance criteria: NMT 0.15%; the *Sample* shows no more sulfate than the *Control*.
- **Aluminum, Calcium, and Related Elements**
  Sample solution: Equivalent of 1.0 g of $NaH_2PO_4 \cdot H_2O$ in 10 mL of water
  Acceptance criteria: The *Sample solution* does not become turbid when rendered slightly alkaline to litmus paper with 6 N ammonium hydroxide.
- **Arsenic,** *Method I* ⟨211⟩
  Test preparation: Equivalent of 0.375 g of $NaH_2PO_4 \cdot H_2O$ in 35 mL of water
  Acceptance criteria: NMT 8 ppm

SPECIFIC TESTS
- **pH** ⟨791⟩
  Sample solution: Equivalent to 1.0 g of $NaH_2PO_4 \cdot H_2O$ in 20 mL of water
  Acceptance criteria: 4.1–4.5
- **Water Determination,** *Method I* ⟨921⟩
  Test preparation: For the monohydrate, before performing the test, the sample may be ground to a fine powder in an atmosphere of temperature and relative humidity known not to influence the results.
  Acceptance criteria: See *Table 1*.

Table 1

Hydrate Form	Acceptance Criteria (%)
Anhydrous	<2.0
Monohydrate	10.0–15.0
Dihydrate	18.0–26.5

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in well-closed containers.
- **Labeling:** Label it to indicate whether it is anhydrous, monohydrate, or dihydrate.

Sodium Phosphates Injection

» Sodium Phosphates Injection is a sterile solution of Monobasic Sodium Phosphate and Dibasic Sodium Phosphate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$)

USP Monographs

www.webofpharma.com

and dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$). It contains no bacteriostat or other preservative.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.
Labeling—The label states the sodium content in terms of milliequivalents in a given volume, and states also the phosphorus content in terms of millimoles in a given volume. Label the Injection to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration and that once opened any unused portion is to be discarded. The label states also the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Phosphate* ⟨191⟩.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 1.10 USP Endotoxin Units per mg of sodium phosphates.
Particulate Matter in Injections ⟨788⟩: meets the requirements under small-volume injections.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay for monobasic sodium phosphate—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of anhydrous monobasic sodium phosphate, to a 100-mL beaker, and dilute with water to about 50 mL. Place the electrodes of a suitable pH meter in the solution, and titrate with 0.1 N sodium hydroxide VS to the inflection point to a pH of about 8.8. Each mL of 0.1 N sodium hydroxide is equivalent to 13.80 mg of $NaH_2PO_4 \cdot H_2O$.
Assay for dibasic sodium phosphate—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of anhydrous dibasic sodium phosphate, to a 100-mL beaker, and dilute with water to about 50 mL. Place the electrodes of a suitable pH meter in the solution, and titrate with 0.1 N hydrochloric acid VS to the inflection point to a pH of about 4.0. Each mL of 0.1 N hydrochloric acid is equivalent to 26.81 mg of $Na_2HPO_4 \cdot 7H_2O$.

Sodium Phosphates Compounded Injection

DEFINITION

Sodium Phosphates Compounded Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$) and dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$). It contains no bacteriostat or other preservative.

Prepare Sodium Phosphates Compounded Injection containing 3 mM/mL of phosphorus and 4.0 mEq/mL of sodium as follows (see *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

Monobasic Sodium Phosphate (anhydrous)[a]	24 g
Dibasic Sodium Phosphate (anhydrous)	14.2 g
Sterile Water for Injection, a sufficient quantity to make	100 mL

[a] If anhydrous is not used, waters of hydration should be included in calculating the appropriate amount of sodium phosphates.

Dissolve the *Dibasic Sodium Phosphate (anhydrous)* in 50 mL of *Sterile Water for Injection*. Dissolve the *Monobasic Sodium Phosphate (anhydrous)* in the solution, and bring to final volume with *Sterile Water for Injection*. [NOTE—May need to heat to 77° to fully dissolve. If heating is required, allow to reach room temperature prior to passing through a filter.] Pass through a filter of 1.2-µm pore size to remove particulate matter, and sterilize by autoclave.

ASSAY

• **PROCEDURE FOR SODIUM**
Mobile phase: 8 mM methanesulfonic acid
Standard solution: 0.025 mg/mL of sodium prepared with USP Sodium Chloride RS and water
Sample solution: Transfer 1 mL of Injection into a 100-mL volumetric flask, and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Conductivity
Column: 4.6-mm × 25-cm; packing L97
Column temperature: 30°
Flow rate: 1.0 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for sodium is about 3.6 min.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sodium from the *Sample solution*
r_S = peak response of sodium from the *Standard solution*
C_S = concentration of sodium in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

• **PROCEDURE FOR PHOSPHATE**
Mobile phase: 40 mM sodium hydroxide
Standard solution: 0.230 mg/mL of phosphate prepared from USP Dibasic Potassium Phosphate RS in water
Sample solution: Transfer 0.2 mL of Injection into a 250-mL volumetric flask and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Conductivity
Column: 4.6-mm × 25-cm; packing L103
Column temperature: 30°
Flow rate: 1.0 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for phosphorus is about 5.4 min.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections

www.webofpharma.com

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of phosphate (PO_4) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phosphate from the *Sample solution*
r_S = peak response of phosphate from the *Standard solution*
C_S = concentration of phosphate in the *Standard solution* (mg/mL)
C_U = nominal concentration of phosphate in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS
- **pH** ⟨791⟩: 5.3–6.3
- **Sterility Tests** ⟨71⟩: Meets the requirements
- **Bacterial Endotoxins Test** ⟨85⟩: NMT 1.10 USP Endotoxin Units/mg of sodium phosphates
- **Particulate Matter in Injections** ⟨788⟩: Meets the requirements

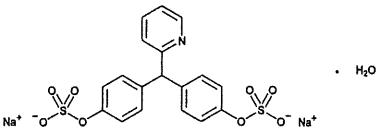
ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Package in single-dose glass containers. Store at controlled room temperature.

Change to read:

- **Beyond-Use Date:** ▲In the absence of passing a sterility test and endotoxins test, the BUDs in ⟨797⟩ apply. If prepared as a Category 2 CSP and a sterility and endotoxins test is passed, NMT 120 days after the date on which it was compounded when stored at controlled room temperature.▲ (CN 1-May-2020)
- **Labeling:** Label it to state the *Beyond-Use Date*. The label states the sodium content in terms of milliequivalents in a given volume, and states also the phosphorus content in terms of millimoles in a given volume.
- **USP Reference Standards** ⟨11⟩
  USP Dibasic Potassium Phosphate RS
  USP Sodium Chloride RS

Sodium Phosphates Oral Solution

» Sodium Phosphates Oral Solution is a solution of Dibasic Sodium Phosphate and Monobasic Sodium Phosphate, or Dibasic Sodium Phosphate and Phosphoric Acid, in Purified Water. It contains, in each 100 mL, not less than 16.2 g and not more than 19.8 g of dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$), and not less than 43.2 g and not more than 52.8 g of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$).



Packaging and storage—Preserve in tight containers.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Phosphate* ⟨191⟩.
Specific gravity ⟨841⟩: between 1.333 and 1.366.
pH ⟨791⟩: between 4.4 and 5.2.
Assay—Pipet 25.0 mL of Oral Solution into a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 25.0 mL of this stock solution to a 250-mL beaker, and add 15.0 mL of 0.5 N sodium hydroxide and 75 mL of water. Proceed as directed in the *Assay* under *Sodium Phosphates Rectal Solution*, beginning with "Titrate the excess base."

Sodium Phosphates Rectal Solution

» Sodium Phosphates Rectal Solution is a solution of Dibasic Sodium Phosphate and Monobasic Sodium Phosphate, or Dibasic Sodium Phosphate and Phosphoric Acid, in Purified Water. It contains, in each 100 mL, not less than 5.4 g and not more than 6.6 g of dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$), and not less than 14.4 g and not more than 17.6 g of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$).

Packaging and storage—Preserve in tight, single-unit containers, at controlled room temperature.
Identification—It meets the requirements of the tests for *Sodium* ⟨191⟩ and for *Phosphate* ⟨191⟩.
Specific gravity ⟨841⟩: between 1.112 and 1.136.
pH ⟨791⟩: between 5.0 and 5.8.
Assay—Pipet 5.0 mL of Rectal Solution into a 250-mL beaker, and add 15.0 mL of 0.5 N sodium hydroxide VS and 95 mL of water. Titrate the excess base potentiometrically with 0.5 N hydrochloric acid VS to the first inflection point, at a pH of about 9.2. Record the volume, *A*, in mL, of 0.5 N hydrochloric acid consumed. Continue the titration to the second inflection point, at a pH of about 4.4, and record the total volume, *B*, in mL, of 0.5 N hydrochloric acid required in the titration. For a blank determination, transfer 15.0 mL of 0.5 N sodium hydroxide into a 250-mL beaker, add 100 mL of water, and immediately titrate potentiometrically with 0.5 N hydrochloric acid VS. Record the volume, *C*, in mL, of 0.5 N hydrochloric acid consumed. Each mL of the volume ($C - A$) of 0.5 N hydrochloric acid is equivalent to 69.0 mg of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$). Each mL of the volume ($B - C$) of 0.5 N hydrochloric acid is equivalent to 134.0 mg of dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$).

Sodium Picosulfate

$C_{18}H_{13}NNa_2O_8S_2 \cdot H_2O$ 499.42
$C_{18}H_{13}NNa_2O_8S_2$ 481.41
4,4′-(2-Pyridylmethylene)diphenyl bis(hydrogen sulfate) disodium salt, monohydrate;
Disodium 4,4′-(pyridin-2-ylmethanediyl)dibenzenesulfate 4,4′-(Pyridin-2-ylmethylene)bisphenyl bis(sodium sulfate), monohydrate [10040-45-6].

www.webofpharma.com

DEFINITION

Sodium Picosulfate contains NLT 98.5% and NMT 100.5% of sodium picosulfate ($C_{18}H_{13}NNa_2O_8S_2$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A, 197K, or 197M▲ (CN 1-May-2020)
- **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Sodium*: Meets the requirements for test *A*

ASSAY

- **PROCEDURE**

Sample solution: Dissolve 400 mg of Sodium Picosulfate in 80 mL of methanol.

Analysis: Titrate with 0.1 N perchloric acid VS (see *Titrimetry* ⟨541⟩), determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 48.14 mg of sodium picosulfate ($C_{18}H_{13}NNa_2O_8S_2$).

Acceptance criteria: 98.5%–100.5% on the anhydrous basis

IMPURITIES

- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩: A 1.0-g portion shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid: NMT 0.02%.
- **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩: A 500-mg portion shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid: NMT 0.04%.
- **ORGANIC IMPURITIES**

Buffer: 2.3 g/L of dibasic sodium phosphate dihydrate in water. For each liter of solution, add 200 mg of cetylrimethylammonium bromide, and adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (45:55). [NOTE—If necessary, vary the buffer/acetonitrile proportion in 10-mL increments per L of *Mobile phase* in order to fulfill the resolution requirement.]

Impurity solution: 0.025 mg/mL of USP Sodium Picosulfate Related Compound A RS in *Mobile phase*

System suitability solution: 0.5 mg/mL of sodium picosulfate and 0.5 µg/mL of USP Sodium Picosulfate Related Compound A RS (from *Impurity solution*), in *Mobile phase*

Sample solution: 0.5 mg/mL of Sodium Picosulfate in *Mobile phase*

Diluted sample solution: 0.5 µg/mL of Sodium Picosulfate in *Mobile phase*, from *Sample solution*

Sensitivity solution: 0.25 µg/mL of Sodium Picosulfate in *Mobile phase*, from *Diluted sample solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 263 nm

Column: 4.6-mm or 4.0-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 40 µL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 4 between sodium picosulfate related compound A and sodium picosulfate, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Sample solution* and *Diluted sample solution*

Calculate the percentage of each impurity in the portion of Sodium Picosulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response for sodium picosulfate from the *Diluted sample solution*

C_S = concentration of Sodium Picosulfate in the *Diluted sample solution* (mg/mL)

C_U = concentration of Sodium Picosulfate in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Disregard any peak below 0.05%.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria (%)
4,4′-[(Pyridin-2-yl) methylene]bisphenol	0.5	2.0	0.2
4-[(Pyridin-2-yl)(4-hydroxyphenyl)methyl]-phenyl sodium sulfate (sodium picosulfate related compound A)	0.7	1.4	0.2
Sodium picosulfate	1.0	—	—
Any other individual impurity	—	1.0	0.10
Total impurities	—	—	0.5

SPECIFIC TESTS

- **COLOR OF SOLUTION**

Standard solution: Mix 0.75 mL of *Matching Fluid O* (see *Color and Achromicity* ⟨631⟩) with 99.25 mL of dilute hydrochloric acid (10 g/L).

Sample solution: Dissolve 2.5 g of Sodium Picosulfate in 50 mL of carbon dioxide-free water. [NOTE—Retain the remaining portion of the *Sample solution* for the test for *Acidity and Alkalinity*.]

Analysis: Proceed as directed in *Color and Achromicity* ⟨631⟩.

Acceptance criteria: The *Sample solution* is not more intensely colored than the *Standard solution*.

- **ACIDITY AND ALKALINITY**

Analysis: To 10 mL of the portion of *Sample solution* retained from the test for *Color of Solution* add a drop of phenolphthalein TS.

Acceptance criteria: The solution is colorless. NMT 0.25 mL of 0.01 N sodium hydroxide is required to change the color of the indicator to pink.

- **WATER DETERMINATION,** *Method Ia* ⟨921⟩: 3.0%–5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Picosulfate RS

USP Sodium Picosulfate Related Compound A RS

4-[(Pyridin-2-yl)(4-hydroxyphenyl)methyl]phenyl sodium sulfate.

Sodium Polystyrene Sulfonate

Benzene, diethenyl-, polymer with ethenylbenzene, sulfonated, sodium salt.
Divinylbenzene copolymer with styrene, sulfonated, sodium salt.

» Sodium Polystyrene Sulfonate is a cation-exchange resin prepared in the sodium form. Each g exchanges not less than 110 mg and not more than 135 mg of potassium, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers.
Labeling—Sodium Polystyrene Sulfonate that is intended for preparing suspensions for oral or rectal administration may be labeled Sodium Polystyrene Sulfonate for Suspension.
Water Determination, *Method I* ⟨921⟩: not more than 10.0%.
Limit of ammonium salts—Place 1 g in a 50-mL beaker, add 5 mL of 1 N sodium hydroxide, cover the beaker with a watch glass having a moistened strip of red litmus paper on the underside, and allow to stand for 15 minutes: the litmus paper shows no blue color.

Sodium content—
Sodium solution—Dissolve in water an accurately weighed quantity of sodium chloride to make a solution containing 5.00 mg of sodium per mL.
Standard graph—Into four 1-liter flasks pipet, respectively, 0, 1, 2, and 3 mL of *Sodium solution*. To each flask add 0.1 mL of nitric acid, 0.1 mL of sulfuric acid, and 10 mL of low-sodium, low-potassium, nonionic surfactant solution (1 in 50), dilute with water to volume, and mix. Adjust the scale of a suitable flame spectrophotometer to a reading of 100 at a wavelength of 588 nm with the solution containing 15 mg of sodium per L. Determine the instrument readings on the other three solutions, and plot the observed readings, on ruled coordinate paper, as the ordinate, and the concentration of sodium, in mg per liter, as the abscissa. The line intersects the ordinate at, or below, a scale reading of 25 ("blank reading").
Procedure—Ash the equivalent of 1 g of Sodium Polystyrene Sulfonate, accurately weighed, with a slight excess of sulfuric acid. Add 1 mL of nitric acid and a few mL of water to the residue. Warm to dissolve, and transfer with water to a 1-liter volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, add 1 mL of low-sodium, low-potassium, non-ionic surfactant solution (1 in 50), dilute with water to volume, and mix. Determine the instrument reading concomitantly with the readings obtained for plotting the *Standard graph*, and determine the sodium concentration, in mg per liter, by interpolation from the *Standard graph*. Calculate the percentage of sodium taken by the formula:

$$A/W$$

in which A is the weight, in mg, of sodium found per L and W is the weight, in g, of Sodium Polystyrene Sulfonate taken. The sodium content is not less than 9.4% and not more than 11.5%, calculated on the anhydrous basis.

Potassium exchange capacity—
Potassium solution—Dissolve an accurately weighed quantity of potassium chloride in water to make a solution containing 5.00 mg of potassium per mL.
Sodium solution—Dissolve an accurately weighed quantity of sodium chloride in water to make a solution containing 4.00 mg of sodium per mL.
Standard graph—Identify five 1-liter volumetric flasks by the numbers *1*, *2*, *3*, *4*, and *5*. In that order pipet into the flasks 4, 3, 2, 1, and 0 mL, respectively, of *Sodium solution*, and in the same order 0, 1, 2, 3, and 4 mL, respectively, of *Potassium solution*. To each flask add 10 mL of low-sodium, low-potassium, nonionic surfactant solution (1 in 50), dilute with water to volume, and mix. Adjust the scale of a suitable flame spectrophotometer to 100 with solution from flask *5* at 766 nm. Determine the instrument readings with solutions from flasks *4*, *3*, *2*, and *1*. On ruled coordinate paper, plot the observed instrument readings as the ordinate, and the concentrations, in mg per liter, of potassium as the abscissa.
Procedure—Pipet 100 mL of *Potassium solution* into a glass-stoppered flask containing about 1.6 g of Sodium Polystyrene Sulfonate, accurately weighed, shake by mechanical means for 15 minutes, filter, and discard the first 20 mL of the filtrate. Pipet 5 mL of the filtrate into a 1-liter volumetric flask, add 10 mL of low-sodium, low-potassium, nonionic surfactant solution (1 in 50), dilute with water to volume, and mix. Observe the flame spectrophotometer readings of the exchanged solution concomitantly with those obtained for plotting the *Standard graph*, and determine the potassium concentration, in mg per liter, by interpolation from the *Standard graph*. Calculate the quantity, in mg per g, of potassium adsorbed on the resin taken by the formula:

$$(X - 20Y)/W$$

in which X is the weight, in mg, of potassium in 100 mL of *Potassium solution* before exchange; Y is the weight, in mg, of potassium per L as interpolated from the *Standard graph;* and W is the weight, in g, of Sodium Polystyrene Sulfonate taken, expressed on the anhydrous basis.

Sodium Polystyrene Sulfonate Suspension

» Sodium Polystyrene Sulfonate Suspension is a suspension of Sodium Polystyrene Sulfonate in an aqueous vehicle that may contain suitable suspending or stabilizing agents. It exchanges not less than 110 mg and not more than 135 mg of potassium for each g of the labeled amount of sodium polystyrene sulfonate.

Packaging and storage—Preserve in well-closed containers, protected from freezing and from excessive heat.
Microbial enumeration tests ⟨61⟩ **and *Tests for specified microorganisms*** ⟨62⟩—Its total aerobic microbial count does not exceed 100 cfu per mL, its total combined molds and yeasts count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Pseudomonas aeruginosa*.

Sodium content—
Sodium solution and *Standard graph*—Prepare as directed in the test for *Sodium content* under *Sodium Polystyrene Sulfonate*.
Procedure—Transfer an accurately measured quantity of Suspension, freshly mixed and free from air bubbles, equivalent to about 1 g of sodium polystyrene sulfonate, to a suitable crucible, heat at 80° until dry, and ash the residue with a slight excess of sulfuric acid. Proceed as directed for

USP Monographs

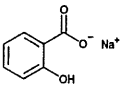
www.webofpharma.com

Procedure in the test for *Sodium content* under *Sodium Polystyrene Sulfonate*, beginning with "Add 1 mL of nitric acid." Calculate the percentage of sodium taken by the formula:

$$A/L$$

in which A is the quantity, in mg, of sodium found per liter, and L is the quantity, in g, of sodium polystyrene sulfonate in the portion of Suspension taken, based on the labeled amount: the sodium content is not less than 9.4% and not more than 11.5%.

Potassium exchange capacity—



Potassium solution, *Sodium solution*, and *Standard graph*—Prepare as directed in the test for *Potassium exchange capacity* under *Sodium Polystyrene Sulfonate*.

Procedure—Transfer an accurately measured quantity of Suspension, freshly mixed and free from air bubbles, equivalent to about 1.6 g of sodium polystyrene sulfonate, to a suitable glass-stoppered flask, add 100.0 mL of *Potassium solution*, shake by mechanical means for 15 minutes, filter, and discard the first 20 mL of the filtrate. Proceed as directed for *Procedure* in the test for *Potassium exchange capacity* under *Sodium Polystyrene Sulfonate*, beginning with "Pipet 5 mL of the filtrate." Calculate the quantity, in mg, of potassium adsorbed on each g of the sodium polystyrene sulfonate taken by the formula:

$$(X - 20Y)/L$$

in which X is the quantity, in mg, of potassium in 100 mL of *Potassium solution* before exchange; Y is the quantity, in mg, of potassium per L as interpolated from the *Standard graph;* and L is the labeled quantity, in g, of sodium polystyrene sulfonate in the portion of Suspension taken.

Sodium Salicylate

$C_7H_5NaO_3$ 160.10

Benzoic acid, 2-hydroxy-, monosodium salt; Monosodium salicylate [54-21-7].

DEFINITION

Sodium Salicylate contains NLT 98.0% and NMT 102.0% of sodium salicylate ($C_7H_5NaO_3$), calculated on the anhydrous basis.

IDENTIFICATION

Sodium Salicylate Tablets

DEFINITION
Sodium Salicylate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of sodium salicylate ($C_7H_5NaO_3$).

IDENTIFICATION
• **A.**
Sample: 50 mg/mL of sodium salicylate in water from powdered Tablets. Filter and use the filtrate.
Acceptance criteria: The sample imparts an intense yellow color to a nonluminous flame.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Mobile phase: Methanol, trifluoroacetic acid, and water (40: 0.1: 60). Prepare by adding 1 mL of trifluoroacetic acid to a solution containing 400 mL of methanol and 600 mL of water.
Standard solution: 0.04 mg/mL of USP Sodium Salicylate RS in *Mobile phase*
Sample stock solution: Nominally 0.4 mg/mL of sodium salicylate from NLT 20 finely powdered Tablets in *Mobile phase* prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 60% of the flask volume of *Mobile phase*, and sonicate for 10 min. Allow the solution to cool to room temperature and then dilute with *Mobile phase* to volume.
Sample solution: Nominally 0.04 mg/mL of sodium salicylate in *Mobile phase* from *Sample stock solution*. Pass through a suitable filter of 0.20-µm pore size, discarding the first 2–3 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 212 nm
Column: 2.1-mm × 5-cm; 1.7-µm packing L1
Column temperature: 30°
Flow rate: 0.2 mL/min
Injection volume: 2 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.8–1.8
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sodium salicylate ($C_7H_5NaO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of USP Sodium Salicylate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium salicylate in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩
Medium: Water; 900 mL
Apparatus 1: 100 rpm
Time: 45 min
Standard solution: A known concentration of USP Sodium Salicylate RS in *Medium*
Sample solution: Filter portions of the solution under test, and dilute with water, if necessary.
Instrumental conditions
Mode: UV
Analytical wavelength: Maximum absorbance at about 230 nm
Analysis: Determine the amount of sodium salicylate ($C_7H_5NaO_3$) dissolved from UV absorbance of the *Sample solution*, in comparison with that of the *Standard solution*.
Tolerances: NLT 75% (*Q*) of the labeled amount of sodium salicylate ($C_7H_5NaO_3$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

• **Organic Impurities**
Mobile phase: Methanol, trifluoroacetic acid, and water (40: 0.1: 60). Prepare by adding 1 mL of trifluoroacetic acid to a solution containing 400 mL of methanol and 600 mL of water.
System suitability solution: 0.5 mg/mL of USP Sodium Salicylate RS, 0.5 µg/mL of USP Salicylic Acid Related Compound A RS, 0.5 µg/mL of USP Salicylic Acid Related Compound B RS, and 0.5 µg/mL of USP Phenol RS in *Mobile phase*
Standard solution: 2.5 µg/mL of USP Sodium Salicylate RS in *Mobile phase*
Sample solution: Nominally 2.5 mg/mL of sodium salicylate from NLT 20 finely powdered Tablets in *Mobile phase* prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 60% of the flask volume of *Mobile phase*, and sonicate for 15 min. Allow the solution to cool to room temperature and then dilute with *Mobile phase* to volume. Centrifuge the solution, and use the supernatant.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 212 nm
Column: 2.1-mm × 5-cm; 1.7-µm packing L1
Column temperature: 30°
Flow rate: 0.2 mL/min
Injection volume: 2 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 3.0 between salicylic acid related compound A and phenol; NLT 3.0 between phenol and salicylic acid related compound B, *System suitability solution*
Relative standard deviation: NMT 2%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any individual unspecified impurity from the *Sample solution*
r_S = peak response of sodium salicylate from the *Standard solution*
C_S = concentration of USP Sodium Salicylate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium salicylate in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Salicylic acid related compound A[a]	0.3	—
Phenol[a]	0.4	—
Salicylic acid related compound B[a]	0.6	—
Salicylic acid	1.0	—
Any individual unspecified impurity	—	0.10
Total impurities	—	1.0

[a] These are process impurities, which are included in the table for identification only. These impurities are controlled in the drug substance. They are not to be reported for the drug product and should not be included in the total impurities.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in well-closed containers.

• **USP Reference Standards** ⟨11⟩
USP Phenol RS
USP Salicylic Acid Related Compound A RS
4-Hydroxybenzoic acid.
$C_7H_6O_3$ 138.12
USP Salicylic Acid Related Compound B RS
4-Hydroxyisophthalic acid.
$C_8H_6O_5$ 182.13
USP Sodium Salicylate RS

Sodium Sulfate

$Na_2SO_4 \cdot 10H_2O$ 322.19
Sulfuric acid disodium salt, decahydrate.
Disodium sulfate decahydrate [7727-73-3].
Anhydrous 142.04
[7757-82-6].

» Sodium Sulfate contains ten molecules of water of hydration, or is anhydrous. It contains not less than 99.0 percent of Na_2SO_4, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, preferably at a temperature not exceeding 30°.
Labeling—Label it to indicate whether it is the decahydrate or is anhydrous.
Identification—A solution (1 in 20) responds to the tests for *Sodium* ⟨191⟩ and for *Sulfate* ⟨191⟩.

www.webofpharma.com

Acidity or alkalinity—To 10 mL of a solution, containing the equivalent of 1.0 g of $Na_2SO_4 \cdot 10H_2O$ in 20 mL of water, add 1 drop of bromothymol blue TS: not more than 0.50 mL of either 0.010 N hydrochloric acid or 0.010 N sodium hydroxide is required to change the color of the solution.
Loss on drying ⟨731⟩—Dry at 105° for 4 hours: the decahydrate loses between 51.0% and 57.0% of its weight, and the anhydrous form loses not more than 0.5% of its weight.
Chloride ⟨221⟩—A portion equivalent to 1.0 g of $Na_2SO_4 \cdot 10H_2O$ shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (0.02%).
Assay—Weigh accurately a portion of Sodium Sulfate, equivalent to about 400 mg of anhydrous sodium sulfate, dissolve in 200 mL of water, and add 1 mL of hydrochloric acid. Heat to boiling, and gradually add, in small portions and while constantly stirring, an excess of hot barium chloride TS (about 8 mL). Heat the mixture on a steam bath for 1 hour, collect the precipitate of barium sulfate on a retentive, ashless filter paper, wash until free from chloride when tested with silver nitrate TS, and place the filter into a suitable tared crucible. Carefully burn away the paper, and ignite at 800 ± 25° to constant weight. The weight of the barium sulfate so obtained, multiplied by 0.6086, represents its equivalent of Na_2SO_4.

Sodium Sulfate Injection

» Sodium Sulfate Injection is a sterile, concentrated solution of Sodium Sulfate in Water for Injection, which upon dilution is suitable for parenteral use. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $Na_2SO_4 \cdot 10H_2O$.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.
Labeling—Label it to indicate that it is to be diluted before injection to render it isotonic (3.89% of $Na_2SO_4 \cdot 10H_2O$).
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Sulfate* ⟨191⟩.
Pyrogen—When diluted with water for injection to contain 3.89% of $Na_2SO_4 \cdot 10H_2O$, it meets the requirements of the *Pyrogen Test* ⟨151⟩.
pH ⟨791⟩: between 5.0 and 6.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Transfer an accurately measured volume of Injection, equivalent to about 400 mg of sodium sulfate ($Na_2SO_4 \cdot 10H_2O$), to a suitable vessel. Dilute if necessary, to 200 mL, and proceed as directed in the *Assay* under *Sodium Sulfate*, beginning with "add 1 mL of hydrochloric acid." The weight of the barium sulfate so obtained, multiplied by 1.3804, represents its equivalent of $Na_2SO_4 \cdot 10H_2O$.

Sodium Sulfide

$Na_2S \cdot 9H_2O$ 240.18
Sodium sulfide nonahydrate;
Disodium sulfide nonahydrate [1313-84-4].

DEFINITION
Sodium Sulfide contains NLT 98.0% and NMT 103.0% of sodium sulfide ($Na_2S \cdot 9H_2O$).

IDENTIFICATION
• **A.**
Conduct this test in a fume hood.
Sample: 100 mg
Analysis: To the *Sample* add 10 mL of 3 N hydrochloric acid, and cover the top of the container with filter paper saturated with a 0.2 M lead acetate solution.
Acceptance criteria: A brownish or silvery-black color forms on the paper.

ASSAY
• **PROCEDURE**
Sample solution: Dissolve 275 mg of Sodium Sulfide in 30 mL of filtered and degassed water. Add 50.0 mL of 0.1 N iodine while mixing, add 2 mL of hydrochloric acid, and allow to stand for 15 min in a dark place.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N sodium thiosulfate VS
Endpoint detection: Visual
Analysis: Titrate the *Sample solution* with *Titrant* to a pale yellow color. Add 5 mL of starch TS, and titrate with *Titrant* to a clear endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 12.01 mg of sodium sulfide ($Na_2S \cdot 9H_2O$).
Acceptance criteria: 98.0%–103.0%

IMPURITIES
• **LIMIT OF IRON**
Sample solution: 50 mg/mL in water
Acceptance criteria: The solution is clear and colorless.
• **LIMIT OF SULFITE AND THIOSULFATE**
Sample solution: Dissolve 3.0 g of Sodium Sulfide in 200.0 mL of filtered and degassed water. Add 100.0 mL of 0.2 N zinc sulfate, and allow to stand for 30 min. Filter, and add 1 mL of starch TS.
Titrimetric system
Mode: Direct titration
Titrant: 0.01 N iodine VS
Endpoint detection: Visual
Analysis: Titrate 100.0 mL of the filtrate from the *Sample solution* with *Titrant*.
Acceptance criteria: NMT 3.0 mL of *Titrant* is required.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cool place.

Sodium Sulfide Topical Gel

DEFINITION
Sodium Sulfide Topical Gel contains NLT 90.0% and NMT 120.0% of the labeled amount of sodium sulfide ($Na_2S \cdot 9H_2O$) in a suitable gel base.

IDENTIFICATION
• **A.**
Conduct this test in a fume hood.
Sample: 100 mg
Analysis: Add 10 mL of 3 N hydrochloric acid to the *Sample*, and cover the top of the container with filter paper saturated with 0.2 M lead acetate solution.

USP Monographs

www.webofpharma.com

Acceptance criteria: A brownish or silvery-black color forms on the paper.

ASSAY

• **PROCEDURE**

Solution A: 67.0 g/L of edetate disodium and 36.0 g/L of ascorbic acid in 2.0 M sodium hydroxide solution

Sample solution: Transfer a portion of the Topical Gel, equivalent to 30 mg of sodium sulfide, to a 100-mL volumetric flask. Add 50 mL of *Solution A*, and shake by mechanical means until the Topical Gel is dispersed. Dilute with *Solution A* to volume.

Titrimetric system

Mode: Direct titration

Titrant: 0.01 M lead perchlorate VS

Endpoint detection: Potentiometric

Analysis: Transfer 30.0 mL of the *Sample solution* to a suitable beaker, and titrate with *Titrant*, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.01 M lead perchlorate is equivalent to 2.4018 mg of sodium sulfide ($Na_2S \cdot 9H_2O$).

Acceptance criteria: 90.0%–120.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 11.5–13.5

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers at controlled room temperature or in a cool place.

Sodium Thiosulfate

$Na_2S_2O_3 \cdot 5H_2O$ 248.18

$Na_2S_2O_3$ 158.11

Thiosulfuric acid, disodium salt, pentahydrate; Disodium thiosulfate pentahydrate [10102-17-7]. Anhydrous [7772-98-7].

DEFINITION

Sodium Thiosulfate contains NLT 99.0% and NMT 100.5% of sodium thiosulfate ($Na_2S_2O_3$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197A▲** (CN 1-May-2020)

• **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩

Sample solution: 0.1 g/mL in water

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Sample: 800 mg

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 30 mL of water. Adjust with a suitable solution of dilute hydrochloric acid or dilute sodium hydroxide to a pH of 6.2–6.7, if necessary. Titrate with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *Titrant* is equivalent to 15.81 mg of sodium thiosulfate ($Na_2S_2O_3$).

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES

• **CALCIUM**

Sample solution: Dissolve 1 g in 20 mL of water.

Analysis: To the *Sample solution* add a few mL of ammonium oxalate TS.

Acceptance criteria: No turbidity is produced.

SPECIFIC TESTS

• **WATER DETERMINATION,** *Method III* ⟨921⟩

Sample: 1.0 g

Analysis: Dry the *Sample* under vacuum at 40°–45° for 16 h.

Acceptance criteria: 32.0%–37.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Thiosulfate RS

Sodium Thiosulfate Injection

DEFINITION

Sodium Thiosulfate Injection is a sterile solution of Sodium Thiosulfate in freshly boiled Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium thiosulfate ($Na_2S_2O_3 \cdot 5H_2O$).

IDENTIFICATION

• **A. PROCEDURE**

Sample solution: Equivalent to 0.1 g/mL of sodium thiosulfate in water

Analysis: Add a few drops of iodine TS.

Acceptance criteria: The color is discharged.

• **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩

Sample solution: Equivalent to 0.1 g/mL of sodium thiosulfate in water

Acceptance criteria: Meets the requirements

• **C. IDENTIFICATION TESTS—GENERAL,** *Thiosulfate* ⟨191⟩

Sample solution: Equivalent to 0.1 g/mL of sodium thiosulfate in water

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Sample solution: Equivalent to 1 g of sodium thiosulfate from Injection. Adjust with a suitable solution of dilute hydrochloric acid or dilute sodium hydroxide to a pH of 6.2–6.7, and dilute with water to about 20 mL.

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

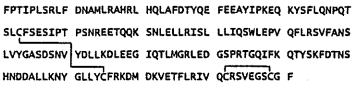
Analysis: Titrate the *Sample solution* with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *Titrant* is equivalent to 24.82 mg of sodium thiosulfate ($Na_2S_2O_3 \cdot 5H_2O$).

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.03 USP Endotoxin Units/mg of sodium thiosulfate

• **pH** ⟨791⟩: 6.0–9.5



• **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩

www.webofpharma.com

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers of Type I glass.

Somatropin

$C_{990}H_{1528}N_{262}O_{300}S_7$ 22,124.77
[12629-01-5].

DEFINITION

Somatropin is a protein hormone consisting of 191 amino acid residues, and its structure corresponds to the major component of the growth hormone extracted from human pituitary glands. It is produced as a lyophilized powder or bulk solution by methods based on recombinant DNA technology. The presence of host-cell DNA and host-cell protein impurities in Somatropin is process specific—the limits of these impurities are determined by validated methods. Manufacturers must demonstrate a correlation between the *Assay* and a validated and approved growth-promotion-based bioassay. It may contain excipients.

[NOTE—One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

IDENTIFICATION

- **A.** The retention time of the somatropin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Chromatographic Purity*, except that a *Standard solution* is also chromatographed and prepared by reconstituting a vial of USP Somatropin RS with *Diluent* to obtain a known concentration of about 2 mg/mL.
- **B. PEPTIDE MAPPING**

Solution A: Trifluoroacetic acid and water (1:999). Filter, and degas.

Solution B: Water, trifluoroacetic acid, and acetonitrile (100:1:899)

Solution C: 0.05 M solution of tris(hydroxymethyl) aminomethane (Tris). Adjust with hydrochloric acid to a pH of 7.5.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	80	20
40	75	25
65	50	50
70	20	80
71	100	0
86	100	0

Trypsin solution: 1 mg/mL of trypsin in *Solution C*. Store in a freezer, if necessary.

Standard stock solution: 2.0 mg/mL of USP Somatropin RS in *Solution C*

Standard solution: To 1 mL of the *Standard stock solution* add 30 µL of *Trypsin solution*. Cap the tube, and place it in a water bath at 37° for 4 h. [NOTE—If this solution is not injected immediately, store it in a freezer.]

Sample stock solution: 2.0 mg/mL of Somatropin in *Solution C*

Sample solution: To 1 mL of the *Sample stock solution* add 30 µL of *Trypsin solution*. Cap the tube, and place it in a water bath at 37° for 4 h. [NOTE—If this solution is not injected immediately, store it in a freezer.]

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 25-cm; packing L7
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 100 µL

Analysis
Samples: *Standard solution* and *Sample solution*, separately injected
[NOTE—Condition the chromatographic system by running a blank gradient program before injecting the digests.]

Acceptance criteria: The chromatographic profile of the *Sample solution* is similar to that of the *Standard solution*.

- **C. SOMATROPIN BIOIDENTITY TESTS** ⟨126⟩**:** Meets the requirements

[NOTE—The bioidentity test may be performed either on the Somatropin bulk drug substance or on the finished pharmaceutical product.]

ASSAY

- **SOMATROPIN CONTENT**

Buffer solution: Dissolve 5.18 g of dibasic sodium phosphate and 3.65 g of monobasic sodium phosphate in 950 mL of water. Adjust with phosphoric acid or sodium hydroxide solution to a pH of 7.0. Dilute with water to 1000 mL.

Mobile phase: Isopropyl alcohol and *Buffer solution* (3:97). Filter, and degas.

Diluent: *Buffer solution* and water (1:1.5)

System suitability solution: Place 1 vial of USP Somatropin RS in an oven at 50° for 12–24 h. Remove from the oven, and dissolve the contents of the vial in *Diluent* to obtain a solution with a known concentration of about 1 mg/mL and a dimer content of 1%–2%.

Standard solution: Known concentration of about 1 mg/mL of USP Somatropin RS in *Diluent*

Sample solution: About 1 mg/mL of accurately weighed Somatropin in *Diluent*, or by diluting a bulk solution of Somatropin with *Diluent*. [NOTE—If necessary, the amount of protein in the solution can be determined with the test for *Total Protein Content*.]

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 7.8-mm × 30-cm; packing L33
Column temperature: Ambient
Flow rate: 0.6 mL/min
Injection volume: 20 µL

System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NMT 0.4 for the ratio of the valley height, between the dimer and the monomer, and the dimer peak height
Tailing factor: NMT 1.7 for the monomer (major) peak

USP Monographs

www.webofpharma.com

Analysis
Samples: *Standard solution* and *Sample solution*, separately injected
Record the chromatograms for NLT twice the retention time of the somatropin monomer (major) peak, and measure the peak responses for the monomer.
Calculate the concentration, in mg/mL, of somatropin in the *Sample solution* taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of the monomer from the *Sample solution*
r_S = peak response of the monomer from the *Standard solution*
C_S = concentration of USP Somatropin RS in the *Standard solution* (mg/mL)

Acceptance criteria: NLT 910 µg of somatropin/mg on the anhydrous basis. When prepared as a bulk solution, it contains NLT 910 µg of somatropin/mg of total protein.

IMPURITIES

• **CHROMATOGRAPHIC PURITY**
Diluent: 0.05 M Tris in water. Adjust with hydrochloric acid to a pH of 7.5.
Mobile phase: *n*-Propyl alcohol and degassed *Diluent* (29:71). Filter.
System suitability solution: 2.0 mg/mL of Somatropin in *Diluent*. Pass through a filter to sterilize or add sodium azide to a final concentration of 0.01%, and allow to stand at room temperature for 24 h. [NOTE—Use within 48 h of preparation, or store the solution in a refrigerator until ready to use.]
Sample solution: 2.0 mg/mL of Somatropin in *Diluent*. [NOTE—Maintain the solutions between 2° and 8°, and use within 24 h. If an automatic injector is used, maintain the temperature between 2° and 8°.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; packing L26
Column temperature: 45°
Flow rate: 0.5 mL/min
Injection volume: 20 µL
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.0 between somatropin and its adjacent peak
Tailing factor: 0.9–1.8 for the somatropin (major) peak
Analysis
Sample: *Sample solution*
Calculate the percentage of impurities in the portion of Somatropin taken:

$$\text{Result} = [A_U/(A_U + A_S)] \times 100$$

A_U = sum of all the peak responses other than the somatropin (major) peak and disregarding any peak due to the solvent from the *Sample solution*
A_S = peak response of somatropin from the *Sample solution*

Acceptance criteria: NMT 6.0% of total impurities

• **LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS**
Buffer solution, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis
Sample: *Sample solution*
Measure the areas of the main peak and of the peaks eluting before the main peak, excluding the solvent peaks.
Calculate the percentage of high molecular weight proteins in the portion of Somatropin taken:

$$\text{Result} = [A_H/(A_H + A_M)] \times 100$$

A_H = sum of the areas of the high molecular weight peaks
A_M = peak area of the monomer from the *Sample solution*

Acceptance criteria: NMT 4% of high molecular weight proteins

SPECIFIC TESTS

• **TOTAL PROTEIN CONTENT**
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
The method is used in the calculation of total protein in the assay of bulk solution.
Buffer solution: 0.025 M solution of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 7.0.
Sample solution: Mix a weighed quantity of Somatropin bulk solution with a weighed quantity of *Buffer solution* to obtain a solution with an absorbance value between 0.5 and 1.0 at the wavelength of maximum absorbance at 280 nm.
Analysis: Determine the absorbance of the *Sample solution* using a spectrophotometric cell of path length 1 cm, at the wavelength of maximum absorbance around 280 nm and at 320 nm, using *Buffer solution* as the blank.
Calculate the protein content, in mg, in the portion of Somatropin taken:

$$\text{Result} = (A_{max} - A_{320}) \times (V/0.82)$$

A_{max} = absorbance value of the *Sample solution* at the wavelength of maximum absorbance
A_{320} = absorbance value of the *Sample solution* at 320 nm
V = volume of the *Sample solution*

• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count is NMT 3×10^2 cfu/g, the test being performed on 0.2–0.3 g of powder, accurately weighed.
• **WATER DETERMINATION** ⟨921⟩, *Method I, Method Ic*: NMT 10%, when prepared as a lyophilized powder
• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 10 USP Endotoxin Units/mg of Somatropin

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store between –10° and –25°.
• **LABELING:** The labeling states that the material is of recombinant DNA origin.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Somatropin RS

Somatropin for Injection

DEFINITION

Somatropin for Injection is a sterile, lyophilized mixture of Somatropin with one or more suitable buffering and stabilizing agents. Manufacturers must demonstrate a

www.webofpharma.com

correlation between the *Assay* and a validated and approved growth-promotion-based bioassay.
[NOTE—One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

IDENTIFICATION

- **A.** The retention time of the somatropin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Chromatographic Purity*, except that a *Standard solution* is also chromatographed and prepared by reconstituting a vial of USP Somatropin RS with *Diluent* to obtain a known concentration of about 2 mg/mL.

Suitability requirements
Resolution: NMT 0.4 for the ratio of the valley height, between the dimer and the monomer, and the dimer peak height
Tailing factor: NMT 1.7 for the monomer (major) peak
Analysis
Samples: *Standard solution* and *Sample solution*, separately injected
Record the chromatograms for NLT twice the retention time of the somatropin monomer (major) peak, and measure the peak responses for the monomer.
Calculate the percentage of somatropin per container:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/N) \times 100$$

r_U = peak response of the monomer from the *Sample solution*
r_S = peak response of the monomer from the *Standard solution*
C_S = concentration of USP Somatropin RS in the *Standard solution* (mg/mL)
V = total volume of the *Sample solution* (mL)
N = number of containers used to obtain the *Sample solution*

Acceptance criteria: 89.0%–110.0%

IMPURITIES

- **CHROMATOGRAPHIC PURITY**

Diluent: 0.05 M tris(hydroxymethyl)aminomethane in water. Adjust with hydrochloric acid to a pH of 7.5.
Mobile phase: *n*-Propyl alcohol and degassed *Diluent* (29:71). Filter.
System suitability solution: 2.0 mg/mL of somatropin in *Diluent*. Pass through a filter to sterilize or add sodium azide to a final concentration of 0.01%, and allow to stand at room temperature for 24 h. [NOTE—Use within 48 h of preparation, or store the solution in a refrigerator until ready to use.]
Sample solution: 2.0 mg/mL of somatropin in *Diluent*. [NOTE—Maintain the solutions between 2° and 8°, and use within 24 h. If an automatic injector is used, maintain the temperature between 2° and 8°.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; packing L26
Column temperature: 45°
Flow rate: 0.5 mL/min
Injection volume: 20 µL
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.0 between somatropin and its adjacent peak
Tailing factor: 0.9–1.8 for the somatropin (major) peak
Analysis
Sample: *Sample solution*
Calculate the percentage of impurities in the portion of Injection taken:

$$\text{Result} = [A_U/(A_U + A_S)] \times 100$$

A_U = sum of all the peak responses other than the somatropin (major) peak, disregarding any peak due to the solvent
A_S = peak response of somatropin

Acceptance criteria: NMT 12% of total impurities

- **LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS**

Buffer solution, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Analysis
Samples: *System suitability solution* and *Sample solution*
Measure the areas of the main peak and of the peaks eluting before the main peak, excluding the solvent peaks.
Calculate the percentage of high molecular weight proteins in the portion of Injection taken:

$$\text{Result} = [A_H/(A_H + A_M)] \times 100$$

A_H = sum of the areas of the high molecular weight peaks
A_M = peak area of the monomer from the *Sample solution*

Acceptance criteria: NMT 6% of high molecular weight proteins

- **STERILITY TESTS** ⟨71⟩, *Test for Sterility of the Product to Be Examined, Membrane Filtration*: Meets the requirements

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, and store between 2° and 8°.
- **LABELING:** The labeling states that the material is of recombinant DNA origin.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Somatropin RS

Sorbitol Solution

DEFINITION
Sorbitol Solution is an aqueous solution containing NLT 64.0% of D-sorbitol ($C_6H_{14}O_6$). The amounts of total sugars, other polyhydric alcohols, and any hexitol anhydrides, if detected, are not included in the requirements or in the calculated amount under *General Notices, 5.60.10. Other Impurities in USP and NF Articles.*

IDENTIFICATION
- **A. PROCEDURE**
  Sample solution: Dissolve 1.4 g of Sorbitol Solution in 75 mL of water.
  Analysis: Transfer 3 mL of the *Sample solution* to a 15-cm test tube. Add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix again, and gently heat the tube in a flame for 30 s.
  Acceptance criteria: A deep pink or wine-red color appears.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL**
  Diluent: Acetone and water (96:4)
  Standard solution: 0.08 mg/mL of USP Diethylene Glycol RS and 0.08 mg/mL of USP Ethylene Glycol RS in *Diluent*
  Sample solution: Transfer 2.0 g of Sorbitol Solution to a 25-mL volumetric flask. Add 1.0 mL of *Diluent* to the flask, and mix on a vortex mixer for 3 min. Add the remaining *Diluent* to the flask to volume in three equal portions. Mix on a vortex mixer for about 3 min after each addition of *Diluent*. Pass a portion of the supernatant layer obtained through a 0.45-µm nylon filter. Discard the first 2 mL of the filtrate, and collect the rest of the filtrate for analysis. [NOTE—Acetone is used to precipitate sorbitol.]
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: GC
  Detector: Flame ionization
  Column: 0.32-mm × 15-m fused-silica capillary column; 0.25-µm layer of phase G46
  Temperature
  Detector: 300°
  Injector port: 240°
  Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	50	300	5

  Carrier gas: Helium
  Flow rate: 3.0 mL/min
  Injection size: 1.0 µL
  Injection type: Split injection. The split ratio is about 10:1. [NOTE—A split liner, deactivated with glass wool, is used.]
  System suitability
  Sample: *Standard solution*
  [NOTE—Diethylene glycol elutes after ethylene glycol in the chromatogram.]
  Suitability requirements
  Resolution: NLT 30 between ethylene glycol and diethylene glycol
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Based on the *Standard solution*, identify the peaks of ethylene glycol and diethylene glycol. Compare peak areas of ethylene glycol and diethylene glycol in the *Standard solution* and the *Sample solution*.
  Acceptance criteria
  Diethylene glycol: The peak area of diethylene glycol in the *Sample solution* is NMT the peak area of diethylene glycol in the *Standard solution*, corresponding to NMT 0.10% of diethylene glycol in Sorbitol Solution.
  Ethylene glycol: The peak area of ethylene glycol in the *Sample solution* is NMT the peak area of ethylene glycol in the *Standard solution*, corresponding to NMT 0.10% of ethylene glycol in Sorbitol Solution.

ASSAY
- **PROCEDURE**
  Mobile phase: Water
  System suitability solution: 4.8 mg/g of mannitol and 4.8 mg/g of USP Sorbitol RS in water
  Standard solution: 4.8 mg/g of USP Sorbitol RS in water
  Sample solution: 6.0 mg/g of Sorbitol Solution in water
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: Refractive index
  Column: 7.8-mm × 10-cm; packing L34
  Temperature
  Detector: 35°
  Column: 50 ± 2°
  Flow rate: 0.7 mL/min
  Injection size: 10 µL
  System suitability
  Samples: *System suitability solution* and *Standard solution*
  [NOTE—The relative retention times for mannitol and sorbitol are 0.6 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 2.0 between sorbitol and mannitol, *System suitability solution*
  Relative standard deviation: NMT 2.0% for sorbitol, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_6H_{14}O_6$ in the Sorbitol Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

www.webofpharma.com

C_S = concentration of USP Sorbitol RS in the *Standard solution* (mg/g)
C_U = concentration of Sorbitol Solution in the *Sample solution* (mg/g)

Acceptance criteria: NLT 64.0%

IMPURITIES

INORGANIC IMPURITIES

- **Residue on Ignition** ⟨281⟩: NMT 0.1%, calculated on the anhydrous basis, determined on a 2-g portion
- **Limit of Nickel**

Solution A: A saturated ammonium pyrrolidine dithiocarbamate solution (containing 10 mg/mL of ammonium pyrrolidine dithiocarbamate)

Sample solution: Dissolve and dilute 20.0 g of Sorbitol Solution to 100 mL with diluted acetic acid. Add 2.0 mL of *Solution A* and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Standard solutions: Prepared as directed for *Sample solution*, except to prepare three solutions by adding 0.5, 1.0, and 1.5 mL of nickel standard solution TS.

Blank solution: Prepare as directed for *Sample solution*, except to omit the use of the Sorbitol Solution.

Spectrometric conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm (maximum absorbance)

Lamp: Nickel hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions, Sample solution,* and *Blank solution*

Set the instrument to zero using the *Blank solution.* Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at least three times each. Record the average of the steady readings for each of these solutions. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution.*

Acceptance criteria: NMT 1 ppm, calculated on the anhydrous basis

ORGANIC IMPURITIES

- **Procedure: Reducing Sugars**

Sample: Equivalent to 3.3 g of sorbitol on the anhydrous basis from Sorbitol Solution

Analysis: To the *Sample*, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added toward the end of the titration, as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to NMT 0.3% of reducing sugars, on the anhydrous basis, as glucose.

[NOTE—The amount determined in this test is not included in the calculated amount under *General Notices, 5.60.10. Other Impurities in USP and NF Articles.*]

SPECIFIC TESTS

Sotalol Hydrochloride Compounded Oral Suspension

DEFINITION

Sotalol Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sotalol hydrochloride ($C_{12}H_{20}N_2O_3S \cdot HCl$).

Prepare Sotalol Hydrochloride Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sotalol Hydrochloride tablets[a] equivalent to	600 mg of sotalol hydrochloride
Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus,[b] a sufficient quantity to make	120 mL

[a] Betapace 120-mg tablets, Berlex Laboratories, Wayne, NJ.

[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Sotalol Hydrochloride tablets* in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a sotalol hydrochloride liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and 5 mM octanesulfonic acid (25:75), adjusted to a pH of 3.2. Pass through a nylon 66 filter of 0.45-µm pore size, and degas.

Standard solution: 20 µg/mL of USP Sotalol Hydrochloride RS in *Mobile phase*

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 20 µg/mL of sotalol hydrochloride from Oral Suspension and *Mobile phase*. Centrifuge.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 3.0-mm × 15-cm; 5-µm packing L1

Flow rate: 0.4 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

www.webofpharma.com

[NOTE—The retention time for sotalol hydrochloride is about 5.1 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sotalol hydrochloride ($C_{12}H_{20}N_2O_3S \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sotalol Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of sotalol hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩**:** 3.8–4.8

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored in a refrigerator or at controlled room temperature
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date.*
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sotalol Hydrochloride RS

Sotalol Hydrochloride Tablets

» Sotalol Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of sotalol hydrochloride ($C_{12}H_{20}N_2O_3S \cdot HCl$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—
USP Sotalol Hydrochloride RS

Identification—Weigh and powder a quantity of the Tablets, equivalent to about 250 mg of sotalol hydrochloride, and transfer to a 50-mL volumetric flask. Add 25 mL of methanol, and shake for 10 minutes. Dilute with methanol to volume, mix, and filter: the filtrate so obtained meets the requirements for *Identification* test *B* under *Sotalol Hydrochloride.*

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{12}H_{20}N_2O_3S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, in comparison with a Standard solution having a known concentration of USP Sotalol Hydrochloride RS in the same *Medium.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{12}H_{20}N_2O_3S \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Assay—

Phosphate buffer—Dissolve 6.8 g of monobasic potassium phosphate in about 800 mL of water. Dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (9:1).

Internal standard solution—Transfer about 1.8 g of caffeine, accurately weighed, to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Standard preparation—Transfer about 80 mg of USP Sotalol Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask. Add 2.5 mL of 1 N hydrochloric acid, dissolve in and dilute with water to volume, mix, and filter. Transfer 10.0 mL of the filtrate and 25.0 mL of the *Internal standard solution* to a 200-mL volumetric flask. Dilute with water to volume, and mix.

Assay preparation—Transfer an appropriate number of Tablets, equivalent to about 800 mg of sotalol hydrochloride, to a 250-mL volumetric flask. Add 25 mL of 1 N hydrochloric acid, and swirl. Dilute with water to about three-fourths of the volume of the flask, and shake for 15 minutes. Dilute with water to volume, mix, and filter. Transfer 10.0 mL of this solution and 25.0 mL of the *Internal standard solution* to a 200-mL volumetric flask. Dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the relative retention times for sotalol and caffeine are about 1.0 and 2.0, respectively; the resolution, *R,* between caffeine and sotalol is not less than 6.0; and the relative standard deviation for replicate injections, determined from peak area ratios, is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of sotalol hydrochloride ($C_{12}H_{20}N_2O_3S \cdot HCl$) in the portion of Tablets taken by the formula:

$$5000C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Sotalol Hydrochloride RS in the *Standard preparation;* and R_U and R_S are the peak area ratios of sotalol to caffeine obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Soybean Oil

[8001-22-7].

DEFINITION

Soybean Oil is the refined fixed oil obtained from the seeds of the soya plant *Glycine max* Merr. (Fam. Fabaceae). It may contain suitable antioxidants.

IDENTIFICATION

- **A. IDENTITY BY FATTY ACID COMPOSITION**
  Analysis: Proceed as directed in the test for *Fats and Fixed Oils, Fatty Acid Composition.*
  Acceptance criteria: Meets the composition profile of fatty acids in *Table 1*

USP Monographs

www.webofpharma.com

• **B. Identity by Triglyceride Profile**
Analysis: Proceed as directed in *Identification of Fixed Oils by Thin-Layer Chromatography* ⟨202⟩.
Acceptance criteria: Meets the requirements in the chapter

IMPURITIES

• **Alkaline Impurities**
Sample: 10 mL
Analysis: Mix 10 mL of acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. If necessary, neutralize the solution to a green color with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.
Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

• **Fats and Fixed Oils,** *Acid Value* ⟨401⟩**:** NMT 0.3
• **Fats and Fixed Oils,** *Peroxide Value* ⟨401⟩
Solution A: Glacial acetic acid and chloroform (60:40)
Solution B: Prepare a saturated solution of potassium iodide in freshly boiled and cooled water, and store it protected from light. Discard it if it gives a color on addition of *Solution A* and starch TS.
Sample: 10 g
Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Direct titration
Titrant: 0.01 N sodium thiosulfate VS
Endpoint detection: Visual
Analysis: Transfer the *Sample* to a conical flask. Add 30 mL of *Solution A*, and swirl to dissolve. Add 0.5 mL of *Solution B*, swirl the flask for 1 min, accurately timed, and add 30 mL of water. Titrate with *Titrant*, with vigorous agitation, to a light yellow color. Add 0.5 mL of starch TS, and continue the titration until the blue color has disappeared. Perform a blank test, and make any necessary correction.
Calculate the peroxide value:

$$\text{Result} = [(V \times N)/W] \times F$$

V = volume of sodium thiosulfate (mL)
N = normality of the sodium thiosulfate solution (mEq/mL)
W = weight of Soybean Oil taken (g)
F = conversion factor, 1000 g/kg

Acceptance criteria: NMT 10.0
• **Fats and Fixed Oils,** *Fatty Acid Composition* ⟨401⟩**:**
Soybean Oil exhibits the composition profile of fatty acids shown in *Table 1*, as determined in the chapter.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	0	≤0.1
14	0	≤0.2
16	0	9.0–13.0
16	1	≤0.3
18	0	2.5–5.0
18	1	17.0–30.0
18	2	48.0–58.0
18	3	5.0–11.0
20	0	≤1.0
20	1	≤1.0
22	0	≤1.0
22	1	≤0.3
24	0	≤0.5

• **Fats and Fixed Oils,** *Unsaponifiable Matter* ⟨401⟩**:** NMT 1.5%
• **Sterol Composition**
Sample A: Transfer 5 g of Soybean Oil to a 250-mL conical flask, add 50 mL of an alcoholic potassium hydroxide solution prepared by dissolving 12 g of potassium hydroxide in 10 mL of water and diluting with alcohol to 100 mL, and heat the flask on a steam bath under a suitable condenser to maintain reflux for 1 h, swirling frequently. Cool to a temperature below 25°, and transfer the contents of the flask to a separator with a polytetrafluoroethylene stopcock, rinsing the flask with two 50-mL portions of water that are added to the separator (do not use grease on the stopcock). Extract with three 100-mL portions of ether, combining the ether extracts in another separator containing 40 mL of water. Gently rotate or shake the separator for a few minutes. [Note—Violent agitation may result in the formation of a difficult-to-separate emulsion.] Allow the mixture to separate, and discard the lower aqueous phase. Wash the ether extract with two additional 40-mL portions of water, and discard the lower aqueous phase. Wash the ether extract successively with a 40-mL portion of potassium hydroxide solution (3 in 100) and a 40-mL portion of water. Repeat this potassium hydroxide solution–water wash sequence three times. Wash the ether extract with 40-mL portions of water until the last washing is not reddened by the addition of 2 drops of phenolphthalein TS. Transfer the ether extract to a tared flask, and rinse the separator with 10 mL of ether, adding the rinsings to the flask. Evaporate the ether on a steam bath, and add 6 mL of acetone to the residue. Remove the acetone in a current of air, and dry the residue at 105°.
Reference A: Transfer 5 g of sunflower oil to a 250-mL conical flask, and proceed as directed in *Sample A*, beginning with "add 50 mL of an alcoholic potassium hydroxide solution prepared by dissolving 12 g of potassium hydroxide in 10 mL of water and diluting with alcohol to 100 mL".
Separation of the sterol fraction by LC
Mobile phase: Isopropyl alcohol and *n*-hexane (1:99)
Sample solution A: Transfer *Sample A* with three 4-mL quantities of ether to a 15-mL test tube. Evaporate to dryness under a stream of nitrogen. Dissolve *Sample A* in *Mobile phase* to obtain a solution with an approximate concentration of 40 mg/mL. Add a few drops of isopropyl alcohol to improve the solubility. [Note—3 drops are normally sufficient to ensure complete solubilization.] Pass through a membrane filter (nominal 0.45-µm pore size).
Reference solution A: Prepare as directed for *Sample solution A* except use *Reference A* instead of *Sample A*.
Chromatographic system
(See *Chromatography* ⟨621⟩.)
Mode: LC
Detector: UV 210 nm
Columns
Guard: 4.6-mm × 0.5-cm (or 4.6-mm × 1.0-cm); 5-µm packing L3 with a 6-nm pore size
Analytical: 4.6-mm × 25-cm; 5-µm packing L3 with a 6-nm pore size

www.webofpharma.com

Flow rate: 1.0 mL/min
Injection volume: 50 µL

Identification of peaks due to sterols
Samples: *Sample solution A* and *Reference solution A*
Sterol identification: The sterol fraction elutes at the end of the chromatogram. Locate the fraction to be collected by using the chromatogram from *Reference solution A*. The chromatogram from *Reference solution A* shows two or three principal peaks, which elute at approximately 21–35 min depending on the column used.
Sterol collection: Collect the fraction at the detector outlet in a 15-mL tube with a screw cap. Evaporate the solvent under a stream of nitrogen. [NOTE—If necessary, to increase the sample amount for later analysis, make the second injection of 50 µL on the HPLC column and collect the fraction at the detector outlet in the same 15-mL test tube with a screw cap. Evaporate the solvent under a stream of nitrogen.]

Determination of sterols by GC
Sample solution B: Dissolve the residue of the sterol fraction obtained from *Sample solution A* in the previous LC step in 0.2 mL of anhydrous pyridine and 0.2 mL of a mixture of 1 volume of chlorotrimethylsilane and 99 volumes of bis(trimethylsilyl)trifluoroacetamide. Insert the stopper into the test tube tightly and heat at 80° for 20 min. Allow to cool and use the liquid phase.
Reference solution B: Dissolve 9 parts of the residue of the sterol fraction obtained from *Reference solution A* in the previous LC step, 1 part of cholesterol in 0.2 mL of anhydrous pyridine, and 0.2 mL of a mixture of 1 volume of chlorotrimethylsilane and 99 volumes of bis(trimethylsilyl)trifluoroacetamide. Insert the stopper into the test tube tightly, and heat at 80° for 20 min. Allow to cool and use the liquid phase.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.25-mm × 30-m fused-silica capillary; 0.25-µm layer of phase G27
Temperatures
Injection port: 290°
Detector: 290°
Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
260	—	260	38
260	5	290	5

Carrier gas: Helium
Flow rate: 2.6 mL/min
Injection volume: 1–3 µL (depending on the expected amount of sterols in the test sample).
Injection type: Split injection; split ratio is 25:1

System suitability
Sample: *Reference solution B*
The chromatogram from *Reference solution B* shows five principal peaks corresponding to cholesterol, campesterol, stigmasterol, β-sitosterol, and Δ7-stigmastenol.
[NOTE—The retention times of the sterols with reference to β-sitosterol are given in *Table 3*.]

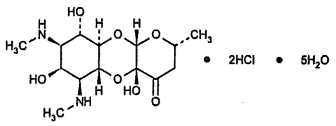
Table 3

Identification	Relative Retention Time
Cholesterol	0.65
Brassicasterol	0.71
24-Methylene-cholesterol	0.81
Campesterol	0.82
Campestanol	0.84
Stigmasterol	0.88
Δ7-Campesterol	0.93
Δ5,23-Stigmastadienol	0.95
Clerosterol	0.96
β-Sitosterol	1.00
Sitostanol	1.02
Δ5-Avenasterol	1.03
Δ5,24-Stigmastadienol	1.09
Δ7-Stigmastenol	1.13
Δ7-Avenasterol	1.17

Suitability requirements
Resolution: NLT 3.0 between the campesterol and stigmasterol peaks

Analysis
Samples: *Sample solution B* and *Reference solution B*
Use the chromatogram from *Reference solution B* to identify the peaks due to cholesterol, campesterol, stigmasterol, β-sitosterol and Δ7-stigmastenol. Identify the peaks due to the sterols in the chromatogram from *Sample solution B* using the chromatograms from *Reference solution B* and the relative retention times with reference to β-sitosterol (main peak) given in *Table 3*.
Calculate the percentage of the content of each sterol in the sterol fraction of Soybean Oil taken:

$$\text{Result} = (r_U/r_T) \times 100$$



r_U = area of the peak due to the sterol component to be determined
r_T = sum of the areas of the peaks due to the components indicated in *Table 3*

Acceptance criteria: NMT 0.3% of brassicasterol
- **WATER DETERMINATION,** *Method Ic* ⟨921⟩**:** NMT 0.1%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidant. Where Soybean Oil is intended for use in the manufacture of injectable dosage forms, it is so labeled.
- **OTHER REQUIREMENTS:** For Soybean Oil intended for use in injectable dosage forms, which is specified in the labeling, the requirements for *Unsaponifiable Matter, Acid Value, Peroxide Value,* and *Water, Method Ic* in *Injections and Implanted Drug Products* ⟨1⟩, *Specific Tests, Vehicles and added substances, Nonaqueous vehicles* must be met.

www.webofpharma.com

Spectinomycin Hydrochloride

$C_{14}H_{24}N_2O_7 \cdot 2HCl \cdot 5H_2O$ 495.35
4*H*-Pyrano[2,3-*b*][1,4]benzodioxin-4-one, decahydro-4a,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)-, dihydrochloride, pentahydrate, [2*R*-(2α,4aβ,5aβ,6β,7β,8β,9α,9aα,10aβ)]-.
(2*R*,4a*R*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-Decahydro-4a,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)-4*H*-pyrano[2,3-*b*]1,4]benzodioxin-4-one dihydrochloride pentahydrate [22189-32-8].
Anhydrous 405.28
[21736-83-4].

» Spectinomycin Hydrochloride has a potency equivalent to not less than 603 µg of spectinomycin ($C_{14}H_{24}N_2O_7$) per mg.

Packaging and storage—Preserve in tight containers.
Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
USP Reference standards ⟨11⟩—
USP Spectinomycin Hydrochloride RS

Change to read:

Identification, ▲***Spectroscopic Identification Tests*** ⟨197⟩, *Infrared Spectroscopy* **: *197M*** ▲ (CN 1-May-2020)—Do not dry specimen.
Crystallinity ⟨695⟩: meets the requirements.
Bacterial Endotoxins Test ⟨85⟩ —Where the label states that Spectinomycin Hydrochloride is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains not more than 0.09 USP Endotoxin Unit per mg of spectinomycin.
Sterility Tests ⟨71⟩ —Where the label states that Spectinomycin Hydrochloride is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*
pH ⟨791⟩: between 3.8 and 5.6, in a solution containing 10 mg per mL.
Water Determination, *Method I* ⟨921⟩: between 16.0% and 20.0%.
Residue on ignition ⟨281⟩: not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Assay—
Internal standard solution—Dissolve triphenylantimony in dimethylformamide to obtain a solution containing about 2 mg per mL.
Standard preparation—Transfer about 30 mg of USP Spectinomycin Hydrochloride RS, accurately weighed, to a glass-stoppered, 25-mL conical flask. Add 10.0 mL of *Internal standard solution* and 1.0 mL of hexamethyldisilazane, and shake intermittently for 1 hour.
Assay preparation—Proceed as directed under *Standard preparation* using Spectinomycin Hydrochloride.
Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 3-mm × 60-cm glass column packed with 5 percent phase G27 on 80- to 100-mesh support S1AB. The column and detector are maintained at about 190° and 220°, respectively, and the injection port at about 215°, and dry helium is used as the carrier gas at a flow rate of about 45 mL per minute. Chromatograph the *Standard preparation,* and record the chromatogram as directed for *Procedure:* the resolution, *R,* between the major peaks is not less than 2.0; and the relative standard deviation of the peak response ratios, R_S, from replicate injections of the *Standard preparation* is not more than 3.5%.
Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the ratio, R_U, of the response of the spectinomycin peak to the response of the internal standard peak in the chromatogram from the *Assay preparation,* and similarly calculate the ratio, R_S, in the chromatogram from the *Standard preparation.* Calculate the quantity, in µg, of $C_{14}H_{24}N_2O_7$ in the portion of Spectinomycin Hydrochloride taken to prepare the *Assay preparation* by the formula:

$$P(W_S)(R_U/R_S)$$

in which *P* is the potency of USP Spectinomycin Hydrochloride RS, in µg of spectinomycin per mg; and W_S is the weight, in mg, of USP Spectinomycin Hydrochloride RS taken from the *Standard preparation;* and the other terms are as defined above.

Spectinomycin for Injectable Suspension

» Spectinomycin for Injectable Suspension contains an amount of Spectinomycin Hydrochloride equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of spectinomycin ($C_{14}H_{24}N_2O_7$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution.*
USP Reference standards ⟨11⟩—
USP Spectinomycin Hydrochloride RS

Change to read:

Identification—▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020). Do not dry specimen.
pH ⟨791⟩: between 4.0 and 7.0, in the suspension constituted as directed in the labeling.
Other requirements—It conforms to the Definition, and meets the requirements for *Crystallinity, Bacterial endotoxins, Sterility, Water,* and *Residue on ignition* under *Spectinomycin Hydrochloride.* It meets also the requirements for *Uniformity of Dosage Units* ⟨905⟩ and *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products.*

Assay—
Internal standard solution , *Standard preparation,* and *Chromatographic system*—Prepare as directed in the *Assay* under *Spectinomycin Hydrochloride.*

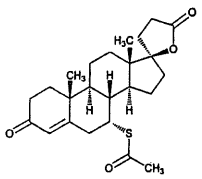
USP Monographs

www.webofpharma.com

Assay preparation 1—Suspend the contents of 1 container of Spectinomycin for Injectable Suspension in water, and dilute quantitatively with water to obtain a stock solution containing about 20 mg of spectinomycin per mL. Transfer 1.0 mL of this solution to a glass-stoppered, 25-mL conical flask, and freeze-dry. Add 10.0 mL of *Internal standard solution* and 1.0 mL of hexamethyldisilazane, and shake intermittently for 1 hour.

Assay preparation 2 (where the label states the quantity of spectinomycin in a given volume of constituted suspension)—Constitute 1 container of Spectinomycin for Injectable Suspension in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. Dilute an accurately measured portion of the constituted suspension quantitatively with water to obtain a stock solution containing about 20 mg of spectinomycin per mL. Transfer 1.0 mL of this solution to a glass-stoppered, 25-mL conical flask, and freeze-dry. Add 10.0 mL of *Internal standard solution* and 1.0 mL of hexamethyldisilazane, and shake intermittently for 1 hour.

Procedure—Proceed as directed in the *Assay* under *Spectinomycin Hydrochloride*. Calculate the quantity, in g, of $C_{14}H_{24}N_2O_7$ in the container of Spectinomycin for Injectable Suspension taken to prepare *Assay preparation 1* taken by the formula:



$$(L_1/D_1)(P/1000)(W_S)(R_U/R_S)$$

in which L_1 is the labeled quantity, in g, of $C_{14}H_{24}N_2O_7$ in the container, and D_1 is the concentration, in mg per mL, of spectinomycin in the stock solution used to prepare *Assay preparation 1*, on the basis of the labeled quantity in the container and the extent of dilution, and the other terms are as defined therein. Calculate the quantity, in mg, of $C_{14}H_{24}N_2O_7$ in each mL of constituted Injectable Suspension taken to prepare *Assay preparation 2* taken by the formula:

$$(L_2/D_2)(P/1000)(W_S)(R_U/R_S)$$

in which L_2 is the labeled quantity, in mg, of $C_{14}H_{24}N_2O_7$ in each mL of constituted suspension of Spectinomycin for Injectable Suspension, and D_2 is the concentration, in mg per mL, of spectinomycin in the stock solution used to prepare *Assay preparation 2*, on the basis of the labeled quantity in each mL of constituted suspension and the extent of dilution.

Spironolactone

$C_{24}H_{32}O_4S$ 416.57

Pregn-4-ene-21-carboxylic acid, 7-(acetylthio)-17-hydroxy-3-oxo-, γ-lactone, (7α,17α)-;
17-Hydroxy-7α-mercapto-3-oxo-17α-pregn-4-ene-21-carboxylic acid γ-lactone acetate;
(2′*R*)-7α-(Acetylthio)-3′,4′-dihydro-5′*H*-spiro[androst-4-ene-17,2′-furan]-3,5′-dione [52-01-7].

DEFINITION

Spironolactone contains NLT 97.0% and NMT 103.0% of spironolactone ($C_{24}H_{32}O_4S$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A.** **SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A or 197K (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Methanol and water (60:40)
Standard solution: 0.5 mg/mL of USP Spironolactone RS in a mixture of acetonitrile and water (1:1)
Sample solution: 0.5 mg/mL of Spironolactone in a mixture of acetonitrile and water (1:1)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 2 times the retention time of spironolactone
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.10%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of spironolactone ($C_{24}H_{32}O_4S$) in the portion of Spironolactone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of spironolactone from the *Sample solution*
r_S = peak response of spironolactone from the *Standard solution*
C_S = concentration of USP Spironolactone RS in the *Standard solution* (mg/mL)
C_U = concentration of Spironolactone in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

- **LIMIT OF MERCAPTO COMPOUNDS**

Sample solution: Shake 2.0 g with 30 mL of water, and filter.
Analysis: To 15 mL of the *Sample solution* add 3 mL of starch TS, and titrate with 0.010 N iodine. Perform a blank determination, and make any necessary correction.
Acceptance criteria: NMT 0.10 mL of 0.010 N iodine is consumed.

- **ORGANIC IMPURITIES**

Diluent: Acetonitrile and water (50:50)
Mobile phase: Acetonitrile, tetrahydrofuran, methanol, and water (15:20:425:540)
Standard stock solutions: 2 mg/mL of USP Spironolactone RS and 0.2 mg/mL each of USP Spironolactone Related Compound A RS, USP Spironolactone Related Compound B RS, USP Spironolactone Related Compound C RS, USP Spironolactone Related Compound D RS, USP Spironolactone Epimer Mixture RS, and USP Spironolactone Related Compound I RS prepared

USP Monographs

www.webofpharma.com

separately as follows. Dissolve each suitable amount of the corresponding USP Reference Standard in a suitable volumetric flask in about 10% of the total volume of tetrahydrofuran. Dilute with *Diluent* to volume.

Standard solution: 0.002 mg/mL of USP Spironolactone RS and 0.006 mg/mL of USP Spironolactone Related Compound A RS in *Diluent* from the corresponding *Standard stock solutions*

System suitability solution: 0.02 mg/mL of USP Spironolactone RS and 0.006 mg/mL each of USP Spironolactone Related Compound A RS, USP Spironolactone Related Compound B RS, USP Spironolactone Related Compound C RS, USP Spironolactone Related Compound D RS, USP Spironolactone Epimer Mixture RS, and USP Spironolactone Related Compound I RS in *Diluent* from the corresponding *Standard stock solutions*

Sensitivity solution: 0.001 mg/mL of USP Spironolactone RS in *Diluent* from the corresponding *Standard stock solution*

Sample solution: 2 mg/mL of Spironolactone prepared as follows. Dissolve a suitable amount of Spironolactone in about 10% of the total volume of tetrahydrofuran and dilute with *Diluent* to volume.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L1
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 2.8 times the retention time of the spironolactone peak

System suitability
Samples: *Standard solution*, *System suitability solution*, and *Sensitivity solution*
Suitability requirements
Resolution: NLT 1.2 between spironolactone and spironolactone related compound B, *System suitability solution*
Relative standard deviation: NMT 5.0% for the spironolactone peak, *Standard solution*
Signal-to-noise ratio: NLT 20, *Sensitivity solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of spironolactone related compound A in the portion of Spironolactone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of spironolactone related compound A from the *Sample solution*
r_S = peak response of spironolactone related compound A from the *Standard solution*
C_S = concentration of USP Spironolactone Related Compound A RS in the *Standard solution* (mg/mL)
C_U = concentration of Spironolactone in the *Sample solution* (mg/mL)

Calculate the percentage of each impurity, other than spironolactone related compound A, in the portion of Spironolactone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity, other than spironolactone related compound A, from the *Sample solution*
r_S = peak response of spironolactone from the *Standard solution*
C_S = concentration of USP Spironolactone RS in the *Standard solution* (mg/mL)
C_U = concentration of Spironolactone in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. The reporting threshold is 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Spironolactone related compound B	0.95	0.2
Spironolactone	1.0	—
Spironolactone related compound A	1.2	0.2
Spironolactone related compound C	1.5	0.2
Spironolactone related compound D	1.6	0.3
Spironolactone epimer	1.7	0.3
Spironolactone related compound I	1.9	0.1
Any unspecified impurity	—	0.10
Total impurities	—	1.0

SPECIFIC TESTS

- **Optical Rotation** ⟨781S⟩, *Procedures*, *Specific Rotation*
  Sample solution: 10 mg/mL in alcohol
  Acceptance criteria: –41° to –45°
- **Loss on Drying** ⟨731⟩
  Analysis: Dry at 105° for 2 h.
  Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.

Spironolactone Compounded Oral Suspension

DEFINITION

Spironolactone Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$). Prepare Spironolactone Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Spironolactone tablet(s)[a] equivalent to	500 mg
Ora-Blend[b], a sufficient quantity to make	100 mL

[a] Spironolactone 25-mg tablet, Qualitest Pharmaceuticals, Huntsville, AL.
[b] Perrigo Pharmaceuticals, Allegan, MI.

Crush the *Spironolactone tablet(s)* to a fine powder, and pass through a 40-mesh sieve. Wet the powder with a small amount of *Ora-Blend*, and triturate to make a smooth paste. Add the *Ora-Blend* to make the mortar contents pourable. Transfer the contents stepwise and quantitatively to a calibrated container using the remainder of the *Ora-Blend*. Add sufficient *Ora-Blend* to bring to final volume. Shake to mix well.

ASSAY

- **PROCEDURE**

Mobile phase: Mix 435 mL of water with 2.7 mL of phosphoric acid and 50 mL of methanol. Combine the solution with 515 mL of acetonitrile and mix well. Filter and degas.

Standard solution: 0.2 mg/mL of USP Spironolactone RS in *Mobile phase*

Sample solution: Shake each bottle of Oral Suspension thoroughly. Transfer 1.0 mL of Oral Suspension into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix well to dissolve.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 238 nm
Column: 4.6-mm × 25-cm; 5-µm packing L11
Flow rate: 1.0 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution*
[NOTE—The retention time for spironolactone is about 10.7 min.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of spironolactone from the *Sample solution*
r_S = peak response of spironolactone from the *Standard solution*
C_S = concentration of spironolactone in the *Standard solution* (mg/mL)
C_U = nominal concentration of spironolactone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩: 3.6–4.6

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or at controlled room temperature
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Spironolactone RS

Spironolactone Compounded Oral Suspension, Veterinary

DEFINITION

Spironolactone Compounded Oral Suspension, Veterinary contains NLT 90.0% and NMT 110.0% of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$).

Prepare Spironolactone Compounded Oral Suspension, Veterinary 25 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Spironolactone tablets[a] equivalent to	2.5 g
Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus[b], a sufficient quantity to make	100 mL

[a] Spironolactone 25-mg tablets, Mylan, Morgantown, WV.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a spironolactone liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and 20 mM dibasic ammonium phosphate (55:45). Filter and degas.

Diluent: Acetonitrile and water (50:50)

Standard stock solution: 1.0 mg/mL of USP Spironolactone RS in *Diluent*

Standard solution: Pipet 2.5 mL of the *Standard stock solution* to a 10-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution with a nominal concentration of 0.25 mg/mL.

Sample solution: Shake each bottle of Oral Suspension, Veterinary thoroughly by hand. Pipet 1.0 mL of the Oral Suspension, Veterinary into a 100-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution with a nominal concentration of 0.25 mg/mL.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC

www.webofpharma.com

Detector: UV 254 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1.0 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for spironolactone is about 10.4 min.]
Suitability requirements
Column efficiency: NLT 9000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) in the portion of Oral Suspension, Veterinary taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of spironolactone in the *Standard solution* (mg/mL)
C_U = nominal concentration of spironolactone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **PH** ⟨791⟩**:** 3.7–4.9

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.
• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*. Label to indicate that it is for veterinary use only.
• **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded, when stored at 2°–8° or controlled room temperature
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Spironolactone RS

Spironolactone Tablets

DEFINITION
Spironolactone Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$).

IDENTIFICATION
• **A.**
Standard solution: 4 mg/mL of USP Spironolactone RS in methanol
Sample solution: Equivalent to 4 mg/mL of spironolactone from finely powdered Tablets in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Developing solvent system: Chloroform, ethyl acetate, and methanol (20:20:10)
Application volume: 10 µL
Analysis: Develop the plate until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light.
Acceptance criteria: The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.

ASSAY
• **PROCEDURE**
Mobile phase: Methanol and water (600:400)
Diluent: Acetonitrile and water (50:50)
Standard solution: 0.5 mg/mL of USP Spironolactone RS in *Diluent*
Sample stock solution: Weigh NLT 10 Tablets, and transfer to a suitable volumetric flask. [NOTE—The target concentration is about 1 mg/mL.] Add a sufficient quantity of *Diluent*, shake for about 30 min, and sonicate for 30 min or until the Tablets are disintegrated. Cool the solution to room temperature, dilute with *Diluent* to volume, and centrifuge a suitable portion of the mixture.
Sample solution: Nominally 0.5 mg/mL in *Diluent* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.6-mm × 15-cm; packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Spironolactone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of spironolactone in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Medium: 0.1 N hydrochloric acid containing 0.1% of sodium lauryl sulfate; 1000 mL
Apparatus 2: 75 rpm
Time: 60 min
Standard solution: A known concentration of USP Spironolactone RS in *Medium*. [NOTE—A volume of alcohol not exceeding 1% of the final volume of the solution may be used to prepare the *Standard solution*.]
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, as necessary in comparison with the *Standard solution*.
Instrumental conditions
Mode: UV
Analytical wavelength: 242 nm
Analysis
Samples: *Standard solution* and *Sample solution*

USP Monographs

www.webofpharma.com

Determine the amount of spironolactone ($C_{24}H_{32}O_4S$) dissolved using UV absorption of the samples used.

Tolerances: NLT 75% (Q) of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS

Spironolactone and Hydrochlorothiazide Compounded Oral Suspension

DEFINITION

Spironolactone and Hydrochlorothiazide Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Prepare an oral suspension containing 5 mg/mL of spironolactone and 5 mg/mL of hydrochlorothiazide as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Spironolactone and Hydrochlorothiazide tablets[a] equivalent to	500 mg of spironolactone and 500 mg of hydrochlorothiazide
Vehicle: a 1:1 mixture of Ora-Sweet[b] (regular or sugar-free) and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Spironolactone and hydrochlorothiazide 25-mg/25-mg tablets, Mylan Pharmaceutical Inc., Morgantown, WV.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Spironolactone and Hydrochlorothiazide tablets* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a spironolactone and hydrochlorothiazide liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Mobile phase: Methanol and water (70:30). Filter and degas.

Standard solution: 0.1 mg/mL of USP Spironolactone RS and 0.1 mg/mL of USP Hydrochlorothiazide RS in methanol

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.1 mg/mL of spironolactone and 0.1 mg/mL of hydrochlorothiazide from Oral Suspension and methanol. Centrifuge.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1.0 mL/min
Injection volume: 20 µL

System suitability
Sample: *Standard solution*
[NOTE—The retention times for hydrochlorothiazide and spironolactone are about 3.5 and 7.4 min, respectively.]
Suitability requirements
Relative standard deviation: NMT 2.0% for spironolactone and NMT 2.0% for hydrochlorothiazide for replicate injections

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of spironolactone ($C_{24}H_{32}O_4S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Spironolactone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of spironolactone in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Oral Suspension taken by the same formula, changing the terms to refer to hydrochlorothiazide.

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩: 3.8–4.8

ADDITIONAL REQUIREMENTS

Stannous Fluoride

SnF_2 156.71
Tin fluoride (SnF_2).
Tin fluoride (SnF_2) [7783-47-3].

» Stannous Fluoride contains not less than 71.2 percent of stannous tin (Sn^{++}), and not less than 22.3 percent and not more than 25.5 percent of fluoride (F), calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Sodium Fluoride RS

Identification—
A: To 5 mL of a solution (1 in 100) in a test tube add 2 mL of calcium chloride TS: a fine, white precipitate of calcium fluoride is formed.
B: Mix on a spot plate 2 drops of a solution (1 in 100) with 2 drops of silver nitrate TS: a brown-black precipitate is formed.
C: Add 1 drop of a solution (1 in 100) to 2 drops of mercuric chloride TS: a white, silky precipitate is formed. On further

www.webofpharma.com

addition of the solution (1 in 100), a brown-black precipitate is formed.

pH ⟨791⟩: between 2.8 and 3.5, in a freshly prepared 0.4% solution.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Water-insoluble substances—Transfer about 10 g, accurately weighed, to a 400-mL plastic beaker, add 200 mL of water, and stir with a plastic rod for 3 minutes, or until no more solid dissolves. Filter through a tared filtering crucible, and wash thoroughly, first with ammonium fluoride solution (1 in 100), then with water. [NOTE—Prepare and use the filtering crucible in a well-ventilated hood.] Dry the residue at 105° for 4 hours, cool, and weigh: the weight of the residue does not exceed 0.2%.

Antimony—

Rhodamine B solution—Dissolve 20 mg of rhodamine B in 200 mL of 0.5 N hydrochloric acid.

Standard preparation—Transfer 55.0 mg of antimony potassium tartrate, accurately weighed, to a 200-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, add 6 N hydrochloric acid to volume, and mix.

Test preparation—Transfer 1.0 g of Stannous Fluoride, accurately weighed, to a 50-mL volumetric flask, add 6 N hydrochloric acid to volume, and mix.

Procedure—Pipet 5 mL each of the *Standard preparation* and the *Test preparation* into separate 125-mL separators, add 15 mL of hydrochloric acid and 1 g of ceric sulfate, and allow to stand for 5 minutes, with occasional shaking. Add 500 mg of hydroxylamine hydrochloride, and shake for 1 minute. Pipet 15 mL of isopropyl ether into the mixture, shake for 30 seconds, add 7 mL of water, and mix. Cool in a water bath at room temperature for 10 minutes, shake for 30 seconds, allow the layers to separate, and discard the aqueous phase. Add 20 mL of *Rhodamine B solution*, shake for 30 seconds, and discard the aqueous layer. Decant the ether layer from the top of the separator, and centrifuge, if necessary, to obtain a clear solution. Concomitantly determine the absorbances of the ether solutions from the *Test preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 550 nm, with a suitable spectrophotometer, using water as the blank: the absorbance of the *Test preparation* does not exceed that of the *Standard preparation* (0.005%).

Assay for stannous ion—

0.1 N Potassium iodide-iodate—In a 1000-mL volumetric flask, dissolve 3.567 g of potassium iodate, previously dried at 110° to constant weight, in 200 mL of oxygen-free water containing 1 g of sodium hydroxide and 10 g of potassium iodide, dilute with oxygen-free water to volume, and mix. Standardize this solution by titrating a solution prepared from an accurately weighed quantity of reagent tin (Sn) and hydrochloric acid. Each mL of *0.1 N Potassium iodide-iodate* is equivalent to 5.935 mg of Sn.

Procedure—Transfer about 250 mg of Stannous Fluoride, accurately weighed, to a 500-mL conical flask, and add 300 mL of hot, recently boiled 3 N hydrochloric acid. While passing a stream of an oxygen-free inert gas over the surface of the liquid, swirl the flask to dissolve the Stannous Fluoride, and cool to room temperature. Add 5 mL of potassium iodide TS, and titrate in an inert atmosphere with *0.1 N Potassium iodide-iodate*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *0.1 N Potassium iodide-iodate* is equivalent to 5.935 mg of Sn^{++}.

Assay for fluoride— [NOTE—Store all solutions, except *Buffer solution*, in plastic containers.]

Buffer solution—Dissolve 57 mL of glacial acetic acid, 58 g of sodium chloride, and 4 g of (1,2-cyclohexylenedinitrilo) tetraacetic acid in 500 mL of water. Adjust with 5 N sodium hydroxide to a pH of 5.25 ± 0.25, dilute with water to 1000 mL, and mix.

Standard preparations—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS quantitatively in water to obtain a solution containing 420 µg per mL. Each mL of this solution *(Standard preparation A)* contains 190 µg of fluoride ion (10^{-2} M). Transfer 25.0 mL of *Standard preparation A* to a 250-mL volumetric flask, dilute with water to volume, and mix. This solution *(Standard preparation B)* contains 19 µg of fluoride ion per mL (10^{-3} M). Transfer 25.0 mL of *Standard preparation B* to a 250-mL volumetric flask, dilute with water to volume, and mix. This solution *(Standard preparation C)* contains 1.9 µg of fluoride ion per mL (10^{-4} M).

Assay preparation—Transfer to a 250-mL volumetric flask about 100 mg of Stannous Fluoride, accurately weighed. Add 50 mL of water, mix vigorously for 5 minutes, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Pipet 20 mL of each *Standard preparation* and of the *Assay preparation* into separate plastic beakers each containing a plastic-coated stirring bar. Pipet 20 mL of *Buffer solution* into each beaker. Concomitantly measure the potentials (see *pH* ⟨791⟩), in mV, of the solutions from the *Standard preparations* and of the solution from the *Assay preparation*, with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithms of the fluoride-ion concentrations, in µg per mL, of the *Standard preparations* versus potential, in mV. From the measured potential of the *Assay preparation* and the standard reponse line, determine the concentration, *C*, in µg per mL, of fluoride ion in the *Assay preparation*. Calculate the percentage of fluoride (F) in the portion of Stannous Fluoride taken by the formula:

$$125C/W$$

in which *C* is the determined concentration of fluoride, in µg per mL, in the *Assay preparation*, and *W* is the weight, in mg, of Stannous Fluoride taken.

Stannous Fluoride Gel

DEFINITION

Stannous Fluoride Gel contains NLT 95.0% and NMT 115.0% of the labeled amount of stannous fluoride (SnF_2) in a suitable medium containing a suitable viscosity-inducing agent.

[NOTE—If Glycerin is used as the medium in the preparation of this Gel, use Glycerin that has a low water content; that is, Glycerin having a specific gravity of NLT 1.2607, corresponding to a concentration of 99.5%.]

IDENTIFICATION

• **A.**

Sample solution: Nominally 1 mg/mL of stannous fluoride from Gel in water

www.webofpharma.com

Analysis: Add 2 mL of calcium chloride TS to 5 mL of the *Sample solution*.
Acceptance criteria: A fine, white precipitate of calcium fluoride is formed.

• **B.**
Sample solution: Nominally 1 mg/mL of stannous fluoride from Gel in water
Analysis: On a spot plate, mix 2 drops of *Sample solution* with 2 drops of silver nitrate TS.
Acceptance criteria: A brown-black precipitate is formed.

• **C.**
Sample solution: Nominally 1 mg/mL of stannous fluoride from Gel in water
Analysis: Add 1 drop of *Sample solution* to 2 drops of mercuric chloride TS.
Acceptance criteria: A white, silky precipitate is formed. On further addition of the *Sample solution*, a brown-black precipitate is formed.

ASSAY

• **PROCEDURE**

[NOTE—Store all solutions except the *Buffer solution* in plastic containers.]

Buffer solution: Dissolve 57 mL of glacial acetic acid, 58 g of sodium chloride, and 4 g of (1,2-cyclohexylenedinitrilo) tetraacetic acid in 500 mL of water. Adjust with 5 N sodium hydroxide to a pH of 5.25 ± 0.25, and dilute with water to 1000 mL.
Standard solution A: 420 µg/mL of USP Sodium Fluoride RS in water, equivalent to 190 µg/mL (10^{-2} M) of fluoride ion
Standard solution B: 19 µg/mL (10^{-3} M) of fluoride ion in water from *Standard solution A*
Standard solution C: 1.9 µg/mL (10^{-4} M) of fluoride ion in water from *Standard solution B*
Sample solution: Nominally 0.08 mg/mL of stannous fluoride from Gel in water
Analysis
Samples: *Standard solutions A–C* and *Sample solution*
Transfer accurately 20 mL each of *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution* into separate plastic beakers, each containing a plastic-coated stirring bar. Transfer accurately 20 mL of *Buffer solution* into each beaker. Concomitantly measure the potentials (see *pH* ⟨791⟩), in millivolts, of each solution with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a suitable reference electrode.
[NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]
Plot the logarithms of the fluoride-ion concentrations, in µg/mL, of *Standard solution A*, *Standard solution B*, and *Standard solution C* versus potential, in millivolts. From the measured potential of the *Sample solution* and the standard response line, determine the concentration (C), in µg/mL, of fluoride ion in the *Sample solution*.
Calculate the concentration of the labeled amount of stannous fluoride (SnF_2), in mg/g, in the portion of Gel taken:

$$\text{Result} = (C/C_U) \times (M_{r1}/M_{r2})$$

C = concentration of fluoride ion in the *Sample solution* (µg/mL)
C_U = nominal concentration of stannous fluoride in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of stannous fluoride, 156.71
M_{r2} = twice the atomic weight of fluorine, 38.0

Acceptance criteria: 95.0%–115.0%

SPECIFIC TESTS

• **CONTENT OF TOTAL TIN**
Potassium chloride solution: 19.1 mg/mL potassium chloride in water
Standard stock solution: 1 mg/mL of tin prepared as follows. Transfer an appropriate amount of tin (Sn) to a suitable volumetric flask. Add hydrochloric acid to about 20% of the final volume of the flask, and swirl to dissolve. Add 20% of the flask volume of water into the flask, and allow to cool. Dilute with water to volume, and mix.
Standard solution A: 50.0 µg/mL of tin and 191 µg/mL of potassium chloride from the *Standard stock solution* and the *Potassium chloride solution* in water
Standard solution B: 100.0 µg/mL of tin and 191 µg/mL of potassium chloride from the *Standard stock solution* and the *Potassium chloride solution* in water
Standard solution C: 150.0 µg/mL of tin and 191 µg/mL of potassium chloride from the *Standard stock solution* and the *Potassium chloride solution* in water
Sample solution: Nominally 0.132 mg/mL of stannous fluoride from a portion of Gel prepared as follows. Transfer an accurately weighed quantity of Gel, equivalent to about 132 mg of stannous fluoride, to a plastic beaker. Add 80 mL of water and 20 mL of hydrochloric acid, and mix. Transfer this mixture to a 1000-mL volumetric flask, add 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.
Blank: *Potassium chloride solution*, hydrochloric acid, and water (1:2:97)
Instrumental conditions
(See *Atomic Absorption Spectroscopy* ⟨852⟩.)
Mode: Atomic absorption spectrophotometer
Analytical wavelength: 235.5 nm
Lamp: Tin hollow-cathode
Flame: Nitrous oxide-acetylene oxidizing flame
Analysis
Samples: *Blank*, *Standard solutions A–C*, and *Sample solution*
Use water to adjust the instrument to zero. Concomitantly determine the absorbance of *Blank*, each *Standard solution*, and the *Sample solution*. Aspirate water before and after each determination. Correct the absorbances of each *Standard solution* and the *Sample solution* by subtracting the absorbance of the *Blank*. Plot the corrected absorbances of each *Standard solution* versus concentration, in µg/mL, of tin, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration (C), in µg/mL, of tin in the *Sample solution*.
Calculate the concentration of tin, in mg/g, in the portion of Gel taken:

$$\text{Result} = C/C_U$$

C = concentration of tin in the *Sample solution* (µg/mL)
C_U = nominal concentration of stannous fluoride in the *Sample solution* (mg/mL)

[NOTE—Use this value to calculate the percentage of stannous ion for the test for the *Content of Stannous Ion*.]

USP Monographs

www.webofpharma.com

• **CONTENT OF STANNOUS ION**

Solution A: 5 mg/mL of sodium hydroxide and 50 mg/mL of potassium iodide in oxygen-free water

Potassium iodide-iodate titrant: 0.1 N potassium iodide-iodate solution prepared as follows. In a 1000-mL volumetric flask, dissolve 3.567 g of potassium iodate, previously dried at 110° to constant weight, in 200 mL of *Solution A*. Dilute with oxygen-free water to volume, and mix. Standardize this solution by titrating a solution prepared from an accurately weighed quantity of reagent tin (Sn) and hydrochloric acid. Each milliliter of 0.1 N *Potassium iodide-iodate titrant* is equivalent to 5.935 mg of tin (Sn).

Sample: A suitable amount of Gel, equivalent to 80 mg of stannous fluoride

Titrimetric system

Mode: Direct titration

Titrant: *Potassium iodide-iodate titrant*

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a capped plastic vessel equipped for titration in an inert atmosphere. Add a plastic coated stirring bar, 20 mL of recently boiled 3 N hydrochloric acid, and 5 mL of potassium iodide TS. Close the vessel, purge the system with an oxygen-free inert gas, and titrate immediately with *Potassium iodide-iodate titrant*, adding 2 mL of starch TS as the endpoint is approached.

Calculate the concentration of stannous ion (Sn^{++}), in mg/g, in the portion of Gel taken:

$$\text{Result} = (V \times F)/W$$

V = volume of the *Potassium iodide-iodate titrant* consumed (mL)

F = equivalency factor, 5.935 mg/mL of 0.1 N potassium iodide-iodate

W = weight of the portion of Gel taken (g)

Acceptance criteria: NLT 68.2% of the concentration of stannous fluoride as determined in the *Assay* and NLT 90.0% of the concentration of total tin as determined in the test for *Content of Total Tin*

• **VISCOSITY—ROTATIONAL METHODS** ⟨912⟩

Sample: A portion of Gel

Analysis: Transfer the *Sample* to a suitable plastic container, insert the stopper securely, and allow to stand until the *Sample* is free from air bubbles. Place it in a water bath maintained at a temperature of 25 ± 0.5° until it adjusts to the temperature of the water bath (4 h or longer). Do not stir the *Sample* while it is in the bath. Remove the *Sample* from the bath, stir the *Sample* gently for 2 min, and without delay, using a rotational viscometer, determine the viscosity by using a spindle having a cylinder 1.27 cm in diameter and 0.16 cm high that is attached to a shaft 0.32 cm in diameter, with the distance from the top of the cylinder to the lower tip of the shaft being 2.54 cm and the immersion depth being 5.00 cm (No. 3 spindle). Operate the viscometer at 12 rpm, and record the scale reading at 1-min intervals for 4 min.

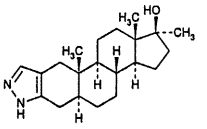
Calculate the viscosity, in centipoises, by multiplying the scale reading by 100.

Acceptance criteria: 600–170,000 centipoises

• **pH** ⟨791⟩

Sample solution: A freshly prepared mixture with water (50:50)

Acceptance criteria: 2.8–4.0



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Fluoride RS

Stanozolol

$C_{21}H_{32}N_2O$ 328.49

2′*H*-Androst-2-eno[3,2-*c*]pyrazol-17-ol, 17-methyl-, (5α, 17β)-.

17-Methyl-2′*H*-5α-androst-2-eno[3,2-*c*]pyrazol-17β-ol [10418-03-8].

» Stanozolol contains not less than 98.0 percent and not more than 100.5 percent of $C_{21}H_{32}N_2O$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Stanozolol RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—

Solution: 50 µg per mL.

Medium: alcohol.

Absorptivities at 224 nm, calculated on the dried basis, do not differ by more than 3.0%.

Specific rotation ⟨781S⟩: between +34° and +40°.

Test solution: 10 mg per mL, in chloroform.

Loss on drying ⟨731⟩—Dry it at a pressure not exceeding 5 mm of mercury at 100° to constant weight: it loses not more than 1.0% of its weight.

Chromatographic purity—

Standard dilutions—Dissolve an accurately weighed quantity of USP Stanozolol RS in a mixture of chloroform and methanol (9:1) to obtain a solution having a known concentration of about 20 mg per mL. Dilute this solution with the same medium to obtain *Standard dilutions* having known concentrations of about 50, 100, 200, and 400 µg per mL, respectively.

Procedure—Score a 20- × 20-cm thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (binder-free) into channels 10 mm wide. Apply 10-µL portions, in two 5-µL increments, of a test solution prepared by dissolving Stanozolol in a mixture of chloroform and methanol (9:1) to obtain a solution containing about 20 mg per mL, and of each of the four *Standard dilutions* in the center of the channels at points about 2.5 cm from one edge of the plate. Develop the plate in a suitable chamber, lined with filter paper and previously equilibrated with 200 mL of a mixture of chloroform and

USP Monographs

www.webofpharma.com

methanol (188:12), for 15 minutes, taking care to ensure that the filter paper has been wetted completely with the solvent mixture. Allow the plate to develop until the solvent front has moved about 15 cm above the line of application. Remove the plate, and allow the solvent to evaporate completely. Spray it with 20% sulfuric acid, and heat in an oven at 100° for 15 minutes. Examine the plate under long-wavelength UV light: the channel for the test solution exhibits its principal spot at the same R_F value as the spots for the *Standard dilutions*. Estimate the concentration of any spots in the channel for the test solution, other than the principal spot, by comparison with the spots from the *Standard dilutions*. The spots from the 50-, 100-, 200-, and 400-µg-per-mL dilutions correspond to 0.25%, 0.5%, 1.0%, and 2.0% of chromatographic impurities, respectively, and the sum of the chromatographic impurities in the test solution is not greater than 2.0%.

Assay—Dissolve about 700 mg of Stanozolol, accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 32.85 mg of $C_{21}H_{32}N_2O$.

Stanozolol Tablets

» Stanozolol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of stanozolol ($C_{21}H_{32}N_2O$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Stanozolol RS

Identification—Boil an amount of powdered Tablets, equivalent to about 2 mg of stanozolol, with 5 mL of benzene, filter, and evaporate on a steam bath to dryness. Add 3 mL of *p*-dimethylaminobenzaldehyde TS to the residue: a yellow color develops, which exhibits a green fluorescence under long-wavelength UV light.

Dissolution ⟨711⟩—
Medium: 0.1 N hydrochloric acid; 500 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.

Determine the amount of $C_{21}H_{32}N_2O$ dissolved by employing the following method.

Bromocresol purple solution—Mix 1.0 g of bromocresol purple with 1000 mL of dilute glacial acetic acid (1 in 50), and filter if necessary to obtain a clear solution.

Standard preparations— [NOTE—Prepare *Standard preparations* on the day of use.] Transfer about 50 mg of USP Stanozolol RS, accurately weighed, to a 50-mL volumetric flask, add 15.0 mL of methanol, and mix to dissolve. Add 5.0 mL of 1.0 N hydrochloric acid, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 200-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix. Separately pipet 2-mL, 4-mL, and 6-mL portions of the solution into three 60-mL separators, add accurately measured volumes of *Dissolution Medium* to adjust the volumes in each to 25.0 mL, and pipet 25 mL of *Dissolution Medium* into a fourth 60-mL separator.

Procedure—Pipet 25 mL of a filtered portion of the solution under test into a 60-mL separator. To this separator and to each of the four separators containing *Standard preparations* add 1.0 mL of *Bromocresol purple solution* and 10.0 mL of chloroform. Insert the stopper in each, shake gently for 1 minute, allow the phases to separate, and swirl if necessary to break up emulsions. Transfer the lower chloroform layers to separate 50-mL centrifuge tubes, insert the glass stoppers, and centrifuge for 5 minutes to clarify the solutions. Concomitantly determine the absorbances of the solutions obtained from the solution under test and from the *Standard preparation* in 1-cm cells, at the wavelength of maximum absorbance at about 420 nm, with a suitable spectrophotometer, using chloroform as the blank. Construct a standard plot of absorbances versus the concentrations of the solutions from the *Standard preparations*. From the plot so obtained, determine the amount of $C_{21}H_{32}N_2O$ dissolved in the solution from the solution under test.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{21}H_{32}N_2O$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩— [NOTE—Maintain the acid concentration at a uniform level in the solutions being compared spectrophotometrically; the same acidic alcohol solution is to be used throughout this procedure. Also, take precautions throughout this procedure to minimize evaporation.] Transfer 1 Tablet to a 25-mL volumetric flask, add 0.5 mL of water, and shake to disintegrate. Add about 20 mL of alcohol, heat on a steam bath, with occasional swirling, for 10 to 15 minutes, then cool, dilute with alcohol to volume, and mix. Filter through medium-porosity filter paper, taking precautions to minimize evaporation, discard the first 5 mL of the filtrate, and proceed as directed for *Assay preparations* in the *Assay*, beginning with "Transfer 5.0 mL of the filtrate."

Assay— [NOTE—Maintain the acid concentration at a uniform level in the solutions being compared spectrophotometrically; the same acidic alcohol solution is to be used throughout this procedure.]

Standard preparations—Dissolve a suitable quantity of USP Stanozolol RS, accurately weighed, in alcohol, and dilute quantitatively and stepwise with alcohol, if necessary, to obtain a stock solution having a known concentration of about 80 µg per mL. Transfer 5.0 mL of this stock solution to a 10-mL volumetric flask, dilute with alcohol to volume, and mix to prepare the *Neutral standard preparation*. Transfer another 5.0-mL portion of the stock solution to a second 10-mL volumetric flask, dilute with acidic alcohol (1.5 mL of hydrochloric acid in 100 mL of alcohol) to volume, and mix to prepare the *Acidic standard preparation*. The concentration of USP Stanozolol RS in the *Standard preparations* is about 40 µg per mL.

Assay preparations—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 4 mg of stanozolol, to a 50-mL volumetric flask, add about 25 mL of alcohol, and heat on a steam bath, with frequent swirling, for 15 minutes. Cool, dilute with alcohol to volume, mix, filter through medium-porosity filter paper, taking precautions to minimize evaporation, and discard the first 10 mL of the filtrate. Transfer 5.0 mL of the filtrate to a 10-mL volumetric flask, dilute with alcohol to volume, and mix to prepare the *Neutral assay preparation*. Transfer another 5.0-mL portion of the filtrate to a second 10-mL volumetric flask, dilute with acidic alcohol (1.5 mL of hydrochloric acid in 100 mL of alcohol) to volume, and mix to prepare the *Acidic assay preparation*.

Procedure—Concomitantly determine the absorbances of the acidic alcohol solution, the *Acidic standard preparation*, and the *Acidic assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 235 nm, with a suitable spectrophotometer, using alcohol, the *Neutral standard preparation*, and the *Neutral assay preparation*, respectively, as the blanks. Calculate the quantity, in mg, of $C_{21}H_{32}N_2O$ in the portion of Tablets taken by the formula:

USP Monographs

www.webofpharma.com

$$0.1C(A_U - A_O)/(A_S - A_O)$$

in which C is the concentration, in µg per mL, of USP Stanozolol RS in the *Standard preparations;* and A_U, A_S, and A_O are the absorbances of the *Acidic assay preparation*, the *Acidic standard preparation*, and the acidic alcohol solution, respectively.

Topical Starch

DEFINITION

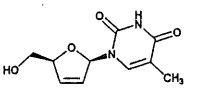
Topical Starch consists of the granules separated from the mature grain of corn [*Zea mays* L. (Fam. Gramineae)].

IDENTIFICATION

- **A.**
  Sample: 1 g
  Analysis: Prepare a smooth mixture of the *Sample* with 2 mL of cold water, stir it into 15 mL of boiling water, boil gently for 2 min, and cool.
  Acceptance criteria: A translucent, whitish jelly is produced.
- **B.** A water slurry of it is colored reddish violet to deep blue by iodine TS.

IMPURITIES

- **Residue on Ignition** ⟨281⟩
  Sample: 2.0 g
  Analysis: Ignite the *Sample* at a temperature of 575 ± 25°.
  Acceptance criteria: NMT 0.5%
- **Iron** ⟨241⟩
  Sample: The residue obtained in the test for *Residue on Ignition*
  Analysis: Dissolve the *Sample* in 4 mL of hydrochloric acid with the aid of gentle heating, dilute with water to 50 mL, and mix. Dilute 25 mL of the resulting solution with water to 47 mL.
  Acceptance criteria: NMT 10 µg/g
- **Sulfur Dioxide**
  Sample suspension: Mix 20 g with 200 mL water to obtain a smooth suspension, and filter.
  Analysis: To 100 mL of the clear filtrate add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue color.
  Acceptance criteria: NMT 2.7 mL of 0.01 N iodine VS is consumed (0.008%).
- **Oxidizing Substances**
  Sample: 4.0 g
  Analysis: Add 50.0 mL of water to the *Sample* in a glass-stoppered, 125-mL conical flask. Insert the stopper, and swirl for 5 min. Decant into a glass-stoppered, 50-mL centrifuge tube, and spin to clarify. Transfer 30.0 mL of clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. [Note—Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.]
  Acceptance criteria: NMT 12.6 mL of 0.002 N sodium thiosulfate VS is required (0.018%).



SPECIFIC TESTS

- **Botanic Characteristics:** Polygonal, rounded, or spheroidal granules up to about 35 µm in diameter, and usually having a circular or several-rayed central cleft.
- **Loss on Drying** ⟨731⟩
  Analysis: Dry a sample at 120° for 4 h.
  Acceptance criteria: NMT 14.0%
- **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩**:** The total aerobic microbial count does not exceed 5×10^2 cfu/g, and the total combined molds and yeasts count does not exceed 5×10^1 cfu/g.
- **pH** ⟨791⟩
  Sample: 20.0 g ± 100 mg
  Analysis: Prepare a slurry of the *Sample* in 100 mL of water in a suitable nonmetallic container. Agitate continuously at a moderate rate for 5 min, then stop agitation, and immediately determine the pH potentiometrically to the nearest 0.1 unit.
  Acceptance criteria: 4.5–7.0

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.

Stavudine

$C_{10}H_{12}N_2O_4$ 224.21

Thymidine, 2′,3′-didehydro-3′-deoxy-;
1-(2,3-Dideoxy-β-D-*glycero*-pent-2-enofuranosyl)thymine [3056-17-5].

DEFINITION

Stavudine contains NLT 98.0% and NMT 102.0% of stavudine ($C_{10}H_{12}N_2O_4$), calculated on an anhydrous and solvent-free basis.

IDENTIFICATION

Storax

DEFINITION
Storax is a balsam obtained from the trunk of *Liquidambar orientalis* Miller, known in commerce as Levant Storax, or of *Liquidambar styraciflua* L., known in commerce as American Storax (Fam. Hamamelidaceae).

CONTAMINANTS
• **ARTICLES OF BOTANICAL ORIGIN** ⟨561⟩, *Pesticide Residue Analysis*: Meets the requirements

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩
Sample: 2 g
Analysis: Dry the *Sample* at 105° for 2 h.
Acceptance criteria: It loses NMT 20.0% of its weight.
• **ALCOHOL-INSOLUBLE SUBSTANCES**
Sample: 10 g of mixed Storax
Analysis: Heat the *Sample* in a beaker at 105° for 30 min, take up the residue in 100 mL of hot alcohol, pass through counter-balanced filters or a tared filter crucible, and wash the residue with small portions of hot alcohol until the last washing is colorless or practically so.
Acceptance criteria: The weight of the residue, after drying at 105° for 1 h, does not exceed 5.0% of the weight of Storax taken.

USP Monographs

www.webofpharma.com

- **ALCOHOL-SOLUBLE SUBSTANCES**

Analysis: Evaporate the combined alcohol filtrate and washings obtained in the test for *Alcohol-Insoluble Substances* at a temperature not exceeding 60°, and dry the residue at 105° for 1 h.

Acceptance criteria: The weight of the yellow-to-brown residue of purified Storax is NLT 70.0% of the weight of Storax taken. [NOTE—The purified Storax obtained in the test for *Alcohol-Soluble Substances* meets the requirements of the following tests: *Fats and Fixed Oils, Acid Value* and *Saponification Value*, and *Cinnamic Acid*.]

- **FATS AND FIXED OILS** ⟨401⟩, *Acid Value*

Sample: 1 g of purified Storax

Analysis: Dissolve the *Sample* in 50 mL of neutralized alcohol, add 0.5 mL of phenolphthalein TS, and titrate with 0.5 N sodium hydroxide VS.

Acceptance criteria: 50–85 for Levant Storax; 36–85 for American Storax

- **FATS AND FIXED OILS** ⟨401⟩, *Saponification Value*

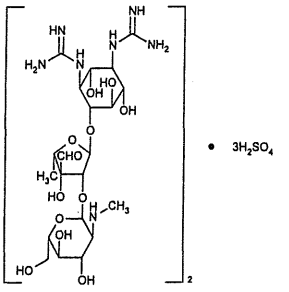
Sample: 2 g of purified Storax

Analysis: Mix the *Sample* with 50 mL of solvent hexane, add 25.0 mL of 0.5 N alcoholic potassium hydroxide VS, and allow the mixture to stand for 24 h with frequent agitation. Then add 0.5 mL of phenolphthalein TS, and titrate the excess alkali with 0.5 N hydrochloric acid VS.

Acceptance criteria: 160–200

- **CINNAMIC ACID**

Sample solution: 2 g of purified Storax in 25 mL of 0.5 N alcoholic potassium hydroxide



Analysis: Boil the *Sample solution* for 1 h under a reflux condenser. Add 0.5 mL of phenolphthalein TS, neutralize with 0.5 N sulfuric acid, and evaporate the alcohol on a steam bath. Dissolve the residue in 50 mL of water, and shake the solution with 20 mL of ether. Shake the separated ether with 5 mL of water, adding the washing to the water solution, and discard the ether extract. Add to the water solution 10 mL of diluted sulfuric acid, and shake with four 20-mL portions of ether. Wash the combined ether extracts with 5 mL of water, rejecting the water washing. Transfer to a flask, and distill off the ether. Add to the residue 100 mL of water, and boil the mixture vigorously for 15 min under a reflux condenser. Filter while hot, and allow the filtrate to cool to about 25°. White crystals of cinnamic acid separate. Collect and dry the cinnamic acid by vacuum filtration. Repeat the extraction of the residue twice by boiling each time under a reflux condenser, as previously described, with the filtrate from the preceding crystallization, and collect the additional cinnamic acid in the same crucible. Finally, wash the cinnamic acid with two 10-mL portions of ice-cold water, dry at 80°, and weigh. To 50 mg of the cinnamic acid obtained as directed above, add 5 mL of 2 N sulfuric acid, heat, and add potassium permanganate TS.

Acceptance criteria: The weight of the cinnamic acid is NLT 25.0% of the weight of purified Storax taken. A portion of the acid recrystallized from hot water melts at 134°–135°. After adding the 2 N sulfuric acid, and heating and adding potassium permanganate TS, the odor of benzaldehyde is perceptible.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Streptomycin Sulfate

$(C_{21}H_{39}N_7O_{12})_2 \cdot 3H_2SO_4$ 1457.38

D-Streptamine, *O*-2-deoxy-2-(methylamino)-α-L-glucopyranosyl-(1→2)-*O*-5-deoxy-3-C-formyl-α-L-lyxofuranosyl-(1→4)-*N*,*N*′-bis(aminoiminomethyl)-, sulfate (2:3) (salt).

Streptomycin sulfate (2:3) (salt) [3810-74-0].

» Streptomycin Sulfate has a potency equivalent to not less than 650 µg and not more than 850 µg of streptomycin ($C_{21}H_{39}N_7O_{12}$) per mg.

Packaging and storage—Preserve in tight containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards ⟨11⟩—
USP Streptomycin Sulfate RS

Identification—

A: Dissolve 5 g of ferric chloride in 50 mL of 0.1 N hydrochloric acid. Transfer 2.5 mL of this stock solution to a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Prepare *Iron reagent* at the time of use. Dissolve the specimen in water, and dilute with water to obtain a solution containing about 1 mg of streptomycin per mL. To 5 mL of this solution add 2.0 mL of 1 N sodium hydroxide, and heat in a water bath for 10 minutes. Cool in ice water for 3 minutes, then add 2.0 mL of 1.2 N hydrochloric acid, and mix. Add 5 mL of *Iron reagent*, and mix: a violet color is produced.

B: It responds to the tests for *Sulfate* ⟨191⟩.

pH ⟨791⟩: between 4.5 and 7.0, in a solution containing 200 mg of streptomycin per mL.

Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

Other requirements—Where the label states that Streptomycin Sulfate is sterile, it meets the requirements for *Sterility Tests* and *Bacterial endotoxins* under *Streptomycin for Injection*. Where the label states that Streptomycin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Streptomycin for Injection*.

Assay—

Mobile phase—Use 70 mM sodium hydroxide. During use, store in a plastic bottle flushed with a blanket of helium above the liquid surface. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

USP Monographs

www.webofpharma.com

Standard preparation—Dissolve an accurately weighed quantity of USP Streptomycin Sulfate RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 0.03 mg per mL. Sonicate for 1 minute, and mix.

Assay preparation—Transfer about 30 mg of Streptomycin Sulfate, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, sonicate for 1 minute, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix.

System suitability solution—Heat about 10 mL of the *Standard preparation* at 75° for 1 hour. Allow to cool.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an electrochemical detector, a gold working electrode, a pH silver–silver chloride reference electrode, a 4-mm × 5-cm guard column that contains packing L46, and a 4-mm × 25-cm analytical column that contains packing L46. The electrochemical detector is used in the integrated amperometric mode with a range of 300 nC, an output of 1 V full scale, and a rise time of 0.5 second, positive polarity. The potential is programmed as follows.

Step	Time (seconds)	Potential (V)	Integration
1	0.00	+0.1	
2	0.20	+0.1	begins
3	0.40	+0.1	ends
4	0.41	−2.0	
5	0.42	−2.0	
6	0.43	+0.6	
7	0.44	−0.1	
8	0.50	−0.1	

The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution,* and measure the peak areas as directed for *Procedure:* the relative retention times are about 0.5 for the main degradation product and 1.0 for streptomycin; and the resolution, *R,* between the two peaks is not less than 3. Chromatograph the *Standard preparation,* and measure the peak areas as directed for *Procedure:* the tailing factor is not more than 2; the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5%.

[NOTE—If variation of retention time or increase of tailing occurs, clean the columns with 0.2 M sodium hydroxide. Carefully maintain the working and reference electrodes.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in each mg of Streptomycin Sulfate taken by the formula:

$$1000(CP/W_U)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Streptomycin Sulfate RS in the *Standard preparation; P* is the designated streptomycin content, in µg per mg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in USP Streptomycin Sulfate RS; W_U is the weight, in mg, of Streptomycin Sulfate taken to prepare the *Assay preparation;* and r_U and r_S are the streptomycin peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Streptomycin Injection

» Streptomycin Injection contains an amount of Streptomycin Sulfate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of streptomycin ($C_{21}H_{39}N_7O_{12}$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards ⟨11⟩—
USP Streptomycin Sulfate RS

Identification—

Iron reagent—Dissolve 5 g of ferric chloride in 50 mL of 0.1 N hydrochloric acid. Transfer 2.5 mL of this stock solution to a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Prepare the *Iron reagent* at the time of use.

Procedure—Dissolve the specimen in water, and dilute with water to obtain a solution containing about 1 mg of streptomycin per mL. To 5 mL of this solution add 2.0 mL of 1 N sodium hydroxide, and heat in a water bath for 10 minutes. Cool in ice water for 3 minutes, then add 2.0 mL of 1.2 N hydrochloric acid, and mix. Add 5 mL of *Iron reagent,* and mix: a violet color is produced.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.25 USP Endotoxin Unit per mg of streptomycin.

pH ⟨791⟩: between 5.0 and 8.0.

Other requirements—It meets the requirements for *Sterility* under *Streptomycin for Injection.* It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Mobile phase, Standard preparation, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Streptomycin Sulfate.*

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of streptomycin, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Proceed as directed in the *Assay* under *Streptomycin Sulfate.* Calculate the quantity, in mg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in each mL of the Injection taken by the formula:

$$20(CP/V)(r_U/r_S)$$

in which V is the volume, in mL, of Injection taken to prepare the *Assay preparation;* and the other terms are as defined therein.

Streptomycin for Injection

» Streptomycin for Injection contains an amount of Streptomycin Sulfate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of streptomycin ($C_{21}H_{39}N_7O_{12}$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution.*

USP Reference standards ⟨11⟩—
USP Streptomycin Sulfate RS

www.webofpharma.com

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* ⟨1⟩, *Specific Tests, Completeness and clarity of solutions.*

Identification—

A: Dissolve 5 g of ferric chloride in 50 mL of 0.1 N hydrochloric acid. Transfer 2.5 mL of this stock solution to a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Prepare *Iron reagent* at the time of use. Dissolve the specimen in water, and dilute with water to obtain a solution containing about 1 mg of streptomycin per mL. To 5 mL of this solution add 2.0 mL of 1 N sodium hydroxide, and heat in a water bath for 10 minutes. Cool in ice water for 3 minutes, then add 2.0 mL of 1.2 N hydrochloric acid, and mix. Add 5 mL of *Iron reagent*, and mix: a violet color is produced.

B: It responds to the tests for *Sulfate* ⟨191⟩.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.25 USP Endotoxin Unit per mg of streptomycin.

Sterility Tests ⟨71⟩ —It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

pH ⟨791⟩: between 4.5 and 7.0, in a solution containing 200 mg of streptomycin per mL.

Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

Other requirements—It meets the requirements for *Uniformity of Dosage Units* ⟨905⟩ and *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products.*

Assay—

Mobile phase, Standard preparation, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Streptomycin Sulfate.*

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Streptomycin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing about 0.025 mg of streptomycin per mL.

Assay preparation 2 (where the label states the quantity of streptomycin in a given volume of constituted solution)—Constitute Streptomycin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with water to obtain a solution containing about 0.025 mg of streptomycin per mL.

Procedure—Proceed as directed in the *Assay* under *Streptomycin Sulfate.* Calculate the quantity, in mg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(CP/1000)(L/D)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in the container, or in the volume of constituted solution taken; D is the concentration, in mg of streptomycin per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container, or in the volume of constituted solution taken, respectively; and the other terms are as defined therein.

Strontium Chloride Sr 89 Injection

$^{89}SrCl_2$ 159.9

Strontium chloride ($^{89}SrCl_2$) [38270-90-5].

» Strontium Chloride Sr 89 Injection is a sterile solution of radioactive strontium (^{89}Sr) processed in the form of strontium chloride in Water for Injection.

Strontium Chloride Sr 89 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{89} Sr as strontium chloride expressed in megabecquerels per mL (or in millicuries per mL) at the time indicated in the labeling. The strontium chloride content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount.

Specific activity: not less than 2.96 MBq (80 µCi) per mg of strontium at the time indicated in the labeling.

Packaging and storage—Preserve in single-dose containers that are adequately shielded.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of strontium chloride expressed as mg of strontium per mL; the amount of ^{89} Sr as labeled strontium chloride expressed as total megabecquerels (or millicuries) and concentration as megabecquerels per mL (or millicuries per mL) on the date and time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{89}Sr is 50.5 days.

Radionuclide identification (see *Radioactivity* ⟨821⟩)—Strontium 89 decays by beta emission to stable Yttrium 89 with 0.01% of disintegrations going via the metastable daughter ^{89m} Y with a half-life of 16 seconds, with which it rapidly establishes radioactive equilibrium. Its gamma-ray spectrum is identical to that of a specimen of strontium 89 in equilibrium with ^{89m} Y exhibiting bremsstrahlung and a gamma photopeak of 0.909 MeV. [NOTE—Use a plastic container to perform measurements.]

Bacterial Endotoxins Test ⟨85⟩—It meets the requirements, the limit of endotoxin content being not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 4.0 and 7.5.

Radionuclidic purity (see *Radioactivity* ⟨821⟩)—[NOTE—Use a plastic container to perform the following test.] Using a suitable counting assembly, determine the radioactivity of each gamma-emitting radionuclidic impurity, in kBq per MBq (or µCi per mCi) of ^{89}Sr, in the Injection by use of a calibrated system as directed under *Radioactivity* ⟨821⟩. The total activity of all gamma-emitting impurities is not greater than 370 kBq per 37 MBq (or 10 µCi per mCi) of ^{89} Sr at the expiration date stated in the labeling.

Chemical purity (Limit of aluminum)— [NOTE—The *Standard preparations* and the *Test preparation* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Nitric acid diluent—Dilute 40 mL of nitric acid with water to 1000 mL.

USP Monographs

www.webofpharma.com

Standard preparations—Transfer 2000 mg of aluminum metal to a 1000-mL volumetric flask, add 50 mL of 6 N hydrochloric acid, swirl to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Nitric acid diluent* to volume, and mix. Transfer 1.0-, 2.0-, and 4.0-mL portions of this solution to separate 100-mL volumetric flasks, dilute with *Nitric acid diluent* to volume, and mix. These solutions contain 0.01, 0.02, and 0.04 µg of Al per mL, respectively.

Test preparation—Transfer 1.0 mL of Injection to a 100-mL volumetric flask, and carefully add 4 mL of nitric acid. Dilute with water to volume, and mix.

Procedure—Determine the absorbances of the *Standard preparations* and the *Test preparation* at the aluminum emission line at 309.3 nm with an atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* ⟨852⟩) equipped with an aluminum hollow-cathode lamp and a flameless electrically heated furnace, using *Nitric acid diluent* as the blank. Plot the absorbances of the *Standard preparations* versus the contents of Al, in µg per mL, drawing the straight line best fitting the three points. From the graph so obtained, determine the quantity, in µg, of Al in each mL of the *Test preparation*. Calculate the quantity, in µg per g, of Al in the specimen taken by multiplying this value by 100: the limit is 2 µg per g.

Assay for radioactivity—Using a suitable counting assembly, determine the radioactivity, in MBq (or mCi) per mL, of the Injection by use of a calibrated system as directed under *Radioactivity* ⟨821⟩.

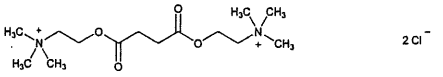
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it is not subject to the recommendation on *Container Content*.

Assay—

Potassium chloride solution—Dissolve 1.9 g of potassium chloride in water, dilute with water to 1000 mL, and mix. This solution contains 1000 µg of potassium per mL.

Strontium stock solution—Transfer 1.685 g of strontium carbonate, accurately weighed, to a 100-mL volumetric flask, and add water to dissolve. Add 10 mL of hydrochloric acid, dilute with water to volume, and mix to obtain a solution containing 10,000 µg of strontium per mL.

Standard preparations—Pipet 10 mL of *Strontium stock solution* into a 100-mL volumetric flask. Add 10 mL of hydrochloric acid, dilute with *Potassium chloride solution* to volume, and mix. Transfer 10 mL and 20 mL, respectively, of this solution into separate 100-mL volumetric flasks, dilute with *Potassium chloride solution* to volume, and mix. These *Standard preparations* contain 100 and 200 µg of strontium per mL.



Assay preparation—Pipet 0.1 mL of Injection into a small beaker. Add 5 mL of *Potassium chloride solution*, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the strontium emission line of 407.8 nm with an atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* ⟨852⟩) equipped with a strontium hollow-cathode lamp and a nitrous oxide–acetylene flame, using *Potassium chloride solution* as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of strontium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, in µg per mL, of strontium in the *Assay preparation*. Calculate the quantity, in µg, of strontium in each mL of the Injection taken by the formula:

$$51C$$

in which C is the concentration, in µg per mL, of strontium in the *Assay preparation*.

Succinylcholine Chloride

$C_{14}H_{30}Cl_2N_2O_4$ (anhydrous) 361.31

$C_{14}H_{30}Cl_2N_2O_4 \cdot 2H_2O$ 397.34

Ethanaminium, 2,2′-[(1,4-dioxo-1,4-butanediyl)bis(oxy)] bis[*N*,*N*,*N*-trimethyl]-, dichloride;
Choline chloride succinate (2:1) [71-27-2].
Dihydrate [6101-15-1].

DEFINITION

Succinylcholine Chloride contains NLT 96.0% and NMT 102.0% of succinylcholine chloride ($C_{14}H_{30}Cl_2N_2O_4$), calculated on the anhydrous basis.

[**CAUTION**—Succinylcholine chloride is a neuromuscular blocking agent. Great care should be taken when handling to avoid inhalation of dust or contact with skin.]

Succinylcholine Chloride Injection

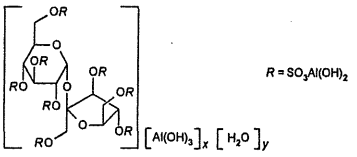
DEFINITION
Succinylcholine Chloride Injection is a sterile solution of Succinylcholine Chloride in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous succinylcholine chloride ($C_{14}H_{30}Cl_2N_2O_4$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩
Standard solution: 1 mg/mL of USP Succinylcholine Chloride RS in water
Sample solution: Nominally 1 mg/mL of succinylcholine chloride from Injection in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 1 µL
Developing solvent system: Acetone and 1 N hydrochloric acid (1:1)
Analysis
Samples: *Standard solution* and *Sample solution*
Proceed as directed in the chapter. To locate the spots, heat the plate at 105° for 5 min, cool, and spray with potassium bismuth iodide TS, then heat again at 105° for 5 min.
Acceptance criteria: Meets the requirements

ASSAY
• **PROCEDURE**
[NOTE—Because the *Mobile phase* used in this procedure has a fairly high concentration of chloride ion and a low pH, it is advisable to rinse the entire system with water following use of this *Mobile phase*.]
Mobile phase: Prepare a solution (1 in 10) of 1 N tetramethylammonium chloride in methanol. Pass this solution through a 0.45-µm membrane filter, and adjust with hydrochloric acid to a pH of 3.0.
Standard solution: 8.8 mg/mL of USP Succinylcholine Chloride RS prepared as follows. Transfer 88 mg of USP Succinylcholine Chloride RS to a 10-mL volumetric flask and add a volume of water corresponding to the solvent composition of the *Sample solution*. Dilute with *Mobile phase* to volume. Prepare the *Standard solution* concurrently with the *Sample solution*.
Sample solution: Nominally 8.0 mg/mL of succinylcholine chloride prepared as follows. Transfer a volume of Injection equivalent to 80 mg of anhydrous succinylcholine chloride to a 10-mL volumetric flask and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4-mm × 25-cm; packing L3
Flow rate: 0.75 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.5
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of anhydrous succinylcholine chloride ($C_{14}H_{30}Cl_2N_2O_4$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Succinylcholine Chloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of succinylcholine chloride in the *Sample solution* (mg/mL)



Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 2.0 USP Endotoxin Units/mg of succinylcholine chloride
• **PH** ⟨791⟩: 3.0–4.5
• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass, in a refrigerator.
• **LABELING:** Label it to indicate, as its expiration date, the month and year NMT 2 years from the month during which the Injection was last assayed and released by the manufacturer.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Succinylcholine Chloride RS

Sucralfate

$Al_8(OH)_{16}(C_{12}H_{14}O_{35}S_8)[Al(OH)_3]_x[H_2O]_y$ in which x = 8 to 10, and y = 22 to 31.

α-D-Glucopyranoside, β-D-fructofuranosyl-, octakis(hydrogen sulfate), aluminum complex.

Sucrose octakis(hydrogen sulfate) aluminum complex [54182-58-0].

» Sucralfate is the hydrous basic aluminum salt of sucrose octasulfate. It contains the equivalent of not less than 30.0 percent and not more than 38.0 percent of sucrose octasulfate ($C_{12}H_{14}O_{35}S_8$).

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—

USP Potassium Sucrose Octasulfate RS

[NOTE—Sucrosofate Potassium is USAN].

α-D-Glucopyranoside, 1,3,4,6-tetra-*O*-sulfo-β-D-fructofuranosyl, tetrakis (hydrogen sulfate), octapotassium salt, heptahydrate.

$C_{12}H_{14}K_8O_{35}S_8 \cdot 7H_2O$ 1413.64

[CAS-76578-81-9].

Anhydrous.

$C_{12}H_{14}K_8O_{35}S_8$ 1287.53

[CAS-73264-44-5].

Clarity and color of solution—Dissolve 1.0 g in 10 mL of 2 N sulfuric acid: the solution is clear and practically colorless.

Identification—

A: The retention time of the sucrose octasulfate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Add 100 mL of 0.1 N hydrochloric acid to about 500 mg of Sucralfate, and boil the mixture gently, with stirring, for 20 minutes until the sample is completely dissolved. Neutralize with 0.1 N sodium hydroxide, and allow to cool. Add 4 mL of alkaline cupric tartrate TS. Boil a small amount of this solution: a red precipitate of cuprous oxide is produced.

C: A solution in 3 N hydrochloric acid meets the requirements of the tests for *Aluminum* ⟨191⟩.

Acid-neutralizing capacity—Transfer about 250 mg, accurately weighed, to a 250-mL screw-capped bottle, add 100.0 mL of 0.1 N hydrochloric acid, previously heated to 37°, cap the bottle, place it in a 37° water bath, and stir the contents continuously for 1 hour. Cool to room temperature, and transfer 20.0 mL to a 100-mL beaker. Add 30 mL of water, and titrate with 0.1 N sodium hydroxide VS to a pH of 3.5. Perform a blank titration on a mixture of water and 0.1 N hydrochloric acid (30: 20.0). Calculate the mEq of acid consumed per g of Sucralfate taken by the formula:

$$5N(V_B - V_T)/W$$

where N is the exact normality of the sodium hydroxide VS; V_B and V_T are the volumes, in mL, of sodium hydroxide VS consumed by the blank and the test solution, respectively; and W is the weight, in g, of Sucralfate taken: not less than 12 mEq of acid is consumed.

Chloride ⟨221⟩—Transfer 500 mg to a 100-mL volumetric flask, add 30 mL of 2 N nitric acid, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL color comparison tube, add 3 mL of 2 N nitric acid and 2 mL of silver nitrate TS, dilute with water to 50 mL, and mix. Allow to stand, protected from direct sunlight, for 5 minutes. The sample shows no more turbidity than that produced in a solution containing 0.35 mL of 0.020 N hydrochloric acid: not more than 0.50% of chloride is found.

Arsenic, *Method II* ⟨211⟩: 4 ppm.

Limit of pyridine and 2-methylpyridine—

Internal standard solution—Transfer 1.0 mL of 3-methyl pyridine to a 50-mL volumetric flask, dilute with chloroform to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Standard stock solution—Transfer about 0.5 g each of 2-methylpyridine and pyridine to a 50-mL volumetric flask, dissolve in chloroform, dilute with chloroform to volume, and mix. Quantitatively dilute 5.0 mL of this solution with chloroform to 50.0 mL. Transfer 5.0 mL of this solution to a 50.0 mL volumetric flask, dilute with chloroform to volume, and mix.

Standard solution—Transfer 5.0 mL of *Standard stock solution* to a 20-mL volumetric flask, add 1.0 mL of the *Internal standard solution*, dilute with chloroform to volume, and mix.

Test solution—Sonicate about 1 g of Sucralfate, accurately weighed, in 10.0 mL of 1 M sodium hydroxide until a uniformly cloudy mixture is obtained. Extract this solution with three 5-mL portions of chloroform, and collect the chloroform extracts in a 20-mL volumetric flask. Add 1.0 mL of the *Internal standard solution*, dilute with chloroform to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a split injection system, and a 0.53-mm × 10-m capillary column coated with a 2.65-µm layer of phase G27. Helium is used as the carrier gas, at a pressure of 36-mm of mercury. The column temperature is maintained at 50°. The injection port temperature and the detector temperature are maintained at 150° and 200°, respectively. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times of pyridine, 2-methylpyridine, and 3-methylpyridine are about 0.42, 0.72, and 1.0, respectively; the resolution, R, between pyridine and 2-methylpyridine is not less than 3.5; the resolution, R, between 2-methylpyridine and 3-methylpyridine is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Separately calculate the quantities, in µg, of pyridine and 2-methylpyridine, if present, in the portion of Sucralfate taken by the formula:

$$20C(R_U/R_S)$$

in which C is the concentration, in µg per mL, of pyridine or 2-methylpyridine in the *Standard solution;* and R_U and R_S are the peak response ratios of the analyte to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.05% each of pyridine and 2-methylpyridine is found.

Limit of sucrose heptasulfate—

Mobile phase—Dissolve 99.1 g of ammonium sulfate in 900 mL of water, dilute with water to 1000 mL, and mix. Adjust with phosphoric acid to a pH of 3.5 ± 0.1, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

www.webofpharma.com

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay*.

Chromatographic system—Prepare as directed in the *Assay*.

Test solution—Prepare as directed for *Assay preparation* in the *Assay*.

Procedure—Inject about 50 µL of the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for sucrose heptasulfate and 1.0 for sucrose octasulfate. The ratio of the peak response of the sucrose heptasulfate peak to that of the sucrose octasulfate peak is not more than 0.1.

Aluminum content—Transfer about 1.0 g, accurately weighed, to a 250-mL volumetric flask, add 10 mL of 6.0 N hydrochloric acid, mix, and heat with continuous stirring in a water bath at 70° for 5 minutes. Cool to room temperature, dilute with water to volume, and mix. Filter the solution, discarding the first portion of the filtrate. Transfer 25.0 mL of the filtrate to a 250-mL beaker, add 25.0 mL of 0.05 M edetate disodium VS, add 20 mL of acetic acid-ammonium acetate buffer TS, and mix. Heat in a water bath at 70° for 5 minutes. Cool to room temperature, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 1.349 mg of aluminum: between 15.5% and 18.5% of aluminum is found, calculated on an "as is" basis.

Assay—

Mobile phase—Dissolve 132 g of ammonium sulfate in 900 mL of water, dilute with water to 1000 mL, and mix. Adjust with phosphoric acid to a pH of 3.5 ± 0.1, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Potassium Sucrose Octasulfate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 10 mg of anhydrous potassium sucrose octasulfate (as determined from the concentration of USP Potassium Sucrose Octasulfate RS corrected for water content by a titrimetric water determination) per mL.

Assay preparation—Transfer about 450 mg of Sucralfate, accurately weighed, to a 35-mL centrifuge tube, and shake at a moderate rate on a vortex mixer. While shaking add 10.0 mL of a mixture of 4.0 N sulfuric acid and 2.2 N sodium hydroxide (1:1). Sonicate with swirling for 5 minutes, keeping the temperature of the mixture below 30°. Without delay transfer the tube to a vortex mixer and while shaking at moderate rate, add an accurately measured volume, *V*, in mL, of 0.1 N sodium hydroxide to bring the pH of the solution to approximately 2, and dilute the solution with (15.0 − *V*) mL of water. Shake for 1 minute, and centrifuge for 5 minutes. Separate the clear supernatant layer, and allow it to stand at room temperature until the pH stabilizes. If the pH is not between 2.3 and 3.5, repeat the test using a different volume of 0.1 N sodium hydroxide. Use the clear supernatant layer.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 3.9-mm × 30-cm column that contains packing L8. The detector and column temperatures are maintained at 30°. The flow rate is about 1 mL per minute.

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the sucrose octasulfate peak is not less than 400 theoretical plates; the tailing factor for the sucrose octasulfate peak is not more than 4.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sucrose octasulfate ($C_{12}H_{14}O_{35}S_8$) in the portion of Sucralfate taken by the formula:

$$(974.75/1287.53)(25C)(r_U/r_S)$$

in which 974.75 and 1287.53 are the molecular weights of sucrose octasulfate and anhydrous potassium sucrose octasulfate, respectively; *C* is the concentration, in mg per mL, of anhydrous potassium sucrose octasulfate in the *Standard preparation;* and r_U and r_S are the peak responses of sucrose octasulfate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Sucralfate Tablets

» Sucralfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sucralfate ($Al_8(OH)_{16}(C_{12}H_{14}O_{35}S_8)[Al(OH)_3]_x[H_2O]_y$) corresponding to not less than 30.6 percent and not more than 37.4 percent of sucrose octasulfate ($C_{12}H_{14}O_{35}S_8$).

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—

USP Potassium Sucrose Octasulfate RS

[NOTE—Sucrosofate Potassium is USAN].

α-D-Glucopyranoside, 1,3,4,6-tetra-*O*-sulfo-β-D-fructofuranosyl, tetrakis (hydrogen sulfate), octapotassium salt, heptahydrate.

$C_{12}H_{14}K_8O_{35}S_8 \cdot 7H_2O$ 1413.64

[CAS-76578-81-9].

Anhydrous.

$C_{12}H_{14}K_8O_{35}S_8$ 1287.53

[CAS-73264-44-5].

Identification—

A: The retention time of the sucrose octasulfate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Shake a portion of finely powdered Tablets, equivalent to about 1 g of sucralfate, with 3 N hydrochloric acid, and filter: the solution so obtained meets the requirements of *Identification* test *C* under *Sucralfate*.

Disintegration ⟨701⟩: 15 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Acid-neutralizing capacity—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of sucralfate, to a 250-mL screw-capped bottle, and proceed as directed in the test for *Acid-neutralizing capacity* under *Sucralfate*, beginning with "add 100.0 mL of 0.1 N hydrochloric acid": not less than 12 mEq of acid is consumed.

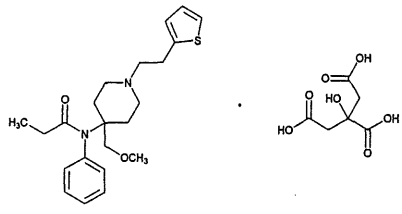
Assay—

Mobile phase, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Sucralfate*.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 450 mg of sucralfate, to a 35-mL

USP Monographs

www.webofpharma.com



centrifuge tube, and shake at a moderate rate on a vortex mixer. Proceed as directed for *Assay preparation* in the *Assay* under *Sucralfate* beginning with "While shaking, add 10.0 mL."

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Sucralfate*. Calculate the quantity, in mg, of sucrose octasulfate ($C_{12}H_{14}O_{35}S_8$) in the portion of Tablets taken by the formula:

$$(974.75/1287.53)(25C)(r_U/r_S)$$

in which the terms are as defined therein.

Sufentanil Citrate

$C_{22}H_{30}N_2O_2S \cdot C_6H_8O_7$ 578.67

Propanamide, *N*-[4-(methoxymethyl)-1-[2-(thienyl)ethyl]-4-piperidinyl]-*N*-phenyl-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1);
N-[4-(Methoxymethyl)-1-[2-(2-thienyl)ethyl]-4-piperidyl] propionanilide citrate (1:1) [60561-17-3].

DEFINITION

Sufentanil Citrate contains NLT 98.0% and NMT 102.0% of sufentanil citrate ($C_{22}H_{30}N_2O_2S \cdot C_6H_8O_7$), calculated on the dried basis.

[**CAUTION**—Handle Sufentanil Citrate with great care because it is a potent opioid analgesic. Great care should be taken to prevent inhaling particles of Sufentanil Citrate and exposing the skin to it.]

USP Sufentanil Citrate RS

Sufentanil Citrate Injection

DEFINITION
Sufentanil Citrate Injection is a sterile solution of Sufentanil Citrate in Water for Injection. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of sufentanil citrate ($C_{22}H_{30}N_2O_2S \cdot C_6H_8O_7$).
[**CAUTION**—Handle Sufentanil Citrate Injection with great care, because it is a potent opioid analgesic.]

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
Sample solution: 50 µg/mL
Medium: Use *Mobile phase* prepared as directed in the *Assay*. [NOTE—For samples that do not require dilution to achieve 50 µg/mL, use Water for Injection as the medium for the *Standard solution*.]
Acceptance criteria: Meets the requirements
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Mobile phase: Methanol, acetonitrile, and 0.13 M ammonium acetate (45:24:31). Adjust with glacial acetic acid or ammonium hydroxide to a pH of 7.2.
Standard solution: 0.075 mg/mL of USP Sufentanil Citrate RS in water
Sample solution: Use Sufentanil Citrate Injection.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 228 nm
Column: 4.6-mm × 25-cm; packing L1
Flow rate: 1.5 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sufentanil citrate ($C_{22}H_{30}N_2O_2S \cdot C_6H_8O_7$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sufentanil Citrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sufentanil citrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 6.25 USP Endotoxin Units/mL
• **pH** ⟨791⟩: 3.5–6.0
• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections
• **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sufentanil Citrate RS

Invert Sugar Injection

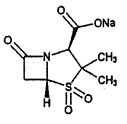
» Invert Sugar Injection is a sterile solution of a mixture of equal amounts of Dextrose and Fructose in Water for Injection, or an equivalent sterile solution produced by the hydrolysis of Sucrose, in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_6H_{12}O_6$. It contains no antimicrobial agents.
[NOTE—Invert Sugar Injection that is produced by mixing Dextrose and Fructose is exempt from the requirement of the test for *Completeness of inversion*.]

Packaging and storage—Preserve in single-dose containers, preferably of Type I or Type II glass, or of a suitable plastic material.
Labeling—The label states the total osmolar concentration in mOsmol per L.
Identification—Add a few drops of Injection to 5 mL of hot alkaline cupric tartrate TS: a copious red precipitate of cupric oxide is formed.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.5 USP Endotoxin Unit per mL.
pH ⟨791⟩: between 3.0 and 6.5.
Chloride ⟨221⟩—A 2.0-mL portion shows no more chloride than corresponds to 0.34 mL of 0.020 N hydrochloric acid (0.012%).
Limit of 5-hydroxymethylfurfural and related substances—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of invert sugar, with water to 500.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not more than 0.25.

Completeness of inversion—
Mobile phase—Use filtered, degassed water.
Standard preparation—Prepare a solution in water containing known concentrations of about 0.25 mg of sucrose and about 12.5 mg of dextrose per mL.
Test preparation—Transfer a volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100-mL volumetric flask, dilute with water to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.8-mm × 30-cm column that contains 9-µm packing L19, maintained at a constant temperature of about 40°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the sucrose elutes first, and the peak is baseline separated from the dextrose peak. The relative standard deviation for replicate injections is not more than 2.0%.

www.webofpharma.com

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the sucrose peaks. Calculate the quantity, in mg, of sucrose, in the volume of the Injection taken by the formula:



$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of sucrose in the *Standard preparation*, and r_U and r_S are the peak responses for sucrose obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 1.5% of the quantity of invert sugar in the volume of Injection taken, based on the value stated on the label, is found.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—Pipet 50 mL of alkaline cupric tartrate TS into a 400-mL beaker, add 48 mL of water, mix, and pipet into the mixture 2 mL of Injection that has been diluted quantitatively with water, if necessary, to a 5.0% concentration. Cover the beaker with a watch glass, heat the solution, regulating the heat so that boiling begins in 4 minutes, and continue boiling for 2.0 minutes. Filter the hot solution at once through a tared porcelain filtering crucible, wash the precipitate with water maintained at 60°, then with 10 mL of alcohol. Dry at 105° to constant weight. Perform a blank determination, and make any necessary correction. The corrected weight of the precipitate so obtained is not less than 204.0 mg and not more than 224.4 mg, corresponding to between 95.0 and 105.0 mg of $C_6H_{12}O_6$.

Sulbactam Sodium

$C_8H_{10}NNaO_5S$ 255.22

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-, 4,4-dioxide, sodium salt, (2*S*-*cis*)-;
Sodium (2*S*,5*R*)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate 4,4-dioxide [69388-84-7].

DEFINITION

Sulbactam Sodium contains NLT 886 µg/mg and NMT 941 µg/mg of sulbactam ($C_8H_{11}NO_5S$), calculated on the anhydrous basis.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩: Meets the requirements

ASSAY

- **PROCEDURE**

Buffer A: 5.4 g/L of monobasic potassium phosphate adjusted with dilute phosphoric acid to a pH of 4.0

Buffer B: 2.7 g/L of monobasic potassium phosphate adjusted with dilute phosphoric acid to a pH of 4.0

Mobile phase: See *Table 1*.

Table 1

Time (min)	Buffer A (%)	Acetonitrile (%)
0	98	2
7.5	50	50
8.5	50	50
9.0	98	2
12.5	98	2

Standard solution: 0.7 mg/mL of USP Sulbactam RS prepared as follows. Dissolve a suitable amount of USP Sulbactam RS in acetonitrile, using 2% of the final volume, and dilute with *Buffer B* to volume.

Sample solution: 0.77 mg/mL of Sulbactam Sodium prepared as follows. Dissolve a suitable amount of Sulbactam Sodium in acetonitrile, using 2% of the final volume, and dilute with *Buffer B* to volume.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4-mm × 15-cm; 3-µm packing L1
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 20 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 0.73%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the quantity, in µg, of sulbactam ($C_8H_{11}NO_5S$) in each mg of Sulbactam Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulbactam RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulbactam Sodium in the *Sample solution* (mg/mL)
P = potency of sulbactam in USP Sulbactam RS (mg/mg)
F = conversion factor, 1000 µg/mg

Acceptance criteria: 886–941 µg/mg on the anhydrous basis

IMPURITIES

- **ORGANIC IMPURITIES**

Buffer A, Buffer B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Diluent: 2 mL of acetonitrile diluted with *Buffer B* to 100 mL

System suitability solution: 0.7 µg/mL each of USP Sulbactam Related Compound A RS, USP Sulbactam Related Compound D RS, USP Sulbactam Related Compound E RS, and USP Sulbactam Related Compound F RS prepared as follows. Dissolve suitable amounts of USP Sulbactam Related Compound A RS, USP Sulbactam Related Compound D RS, USP Sulbactam Related Compound E RS, and USP Sulbactam Related Compound F RS in acetonitrile using 10% of the final volume, and sonicate as needed. Dilute with *Diluent* to volume. Protect this solution from light.

USP Monographs

www.webofpharma.com

Standard stock solution: 0.7 mg/mL of USP Sulbactam RS prepared as follows. Dissolve a suitable amount of USP Sulbactam RS in acetonitrile, using 2% of the final volume, and dilute with *Buffer B* to volume.
Standard solution: 0.7 µg/mL of USP Sulbactam RS from *Standard stock solution* in *Diluent*
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 1.5 between sulbactam related compound D and sulbactam related compound E, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Analysis
Samples: *Sample solution* and *Standard solution*
Calculate the percentage of each impurity in the portion of Sulbactam Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulbactam RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulbactam Sodium in the *Sample solution* (mg/mL)
P = potency of sulbactam in USP Sulbactam RS (mg/mg)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%.

Table 2

ASSAY

• **PROCEDURE**

Buffer: Dissolve 7.7 g of ammonium acetate in 992 mL of water and add 3.3 mL of glacial acetic acid. Pass through a suitable filter of 0.45-µm pore size under vacuum and degas with helium purging.

Solution A: Methanol, water, and *Buffer* (200:640:160)

Solution B: Methanol and acetonitrile (40:60)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	60	40
8.0	10	90
8.1	60	40
10.0	60	40

Diluent: Methanol and water (60:40)

Standard solution: 0.15 mg/mL of USP Sulconazole Nitrate RS in *Diluent*, prepared as follows. Transfer an appropriate quantity of USP Sulconazole Nitrate RS to a suitable volumetric flask, dissolve in 80% of the flask volume of *Diluent*, sonicate until dissolved, and dilute with *Diluent* to volume.

Sample solution: 0.15 mg/mL of Sulconazole Nitrate in *Diluent*, prepared as follows. Transfer an appropriate quantity of Sulconazole Nitrate to a suitable volumetric flask, dissolve in 80% of the flask volume of *Diluent*, sonicate until dissolved, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 2.1-mm × 10-cm; 1.7-µm packing L1

Flow rate: 0.5 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulconazole nitrate ($C_{18}H_{15}Cl_3N_2S \cdot HNO_3$) in the portion of Sulconazole Nitrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sulconazole Nitrate RS in the *Standard solution* (mg/mL)

C_U = concentration of Sulconazole Nitrate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%

• **ORGANIC IMPURITIES**

Buffer, Solution A, Solution B, Mobile phase, Diluent, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard solution: 1.5 µg/mL each of USP Sulconazole Nitrate RS and USP Sulconazole Related Compound A RS in *Diluent*, prepared as follows. Transfer appropriate quantities of USP Sulconazole Nitrate RS and USP Sulconazole Related Compound A RS to a suitable volumetric flask, dissolve in 80% of the flask volume of *Diluent*, sonicate until dissolved, and dilute with *Diluent* to volume.

Sample solution: 1.5 mg/mL of Sulconazole Nitrate in *Diluent*, prepared as follows. Transfer an appropriate quantity of Sulconazole Nitrate to a suitable volumetric flask, dissolve in 80% of the flask volume of *Diluent*, sonicate until dissolved, and dilute with *Diluent* to volume.

System suitability

Sample: *Standard solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Relative standard deviation: NMT 2.0% for sulconazole nitrate and sulconazole related compound A

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulconazole related compound A in the portion of Sulconazole Nitrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sulconazole related compound A from the *Sample solution*

r_S = peak response of sulconazole related compound A from the *Standard solution*

C_S = concentration of USP Sulconazole Related Compound A RS in the *Standard solution* (mg/mL)

C_U = concentration of Sulconazole Nitrate in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Sulconazole Nitrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_S = peak response of sulconazole nitrate from the *Standard solution*

C_S = concentration of USP Sulconazole Nitrate RS in the *Standard solution* (mg/mL)

C_U = concentration of Sulconazole Nitrate in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sulconazole related compound A	0.61	0.1
Sulconazole nitrate	1.0	—
Any individual unspecified impurity	—	0.10
Total impurities	—	2.0

• **Packaging and Storage:** Preserve in well-closed containers, protected from light.
• **USP Reference Standards** ⟨11⟩
USP Sulconazole Nitrate RS
USP Sulconazole Related Compound A RS
1-[2-(4-Chlorobenzyl)sulfinyl-2-(2,4-dichlorophenyl) ethyl]-1*H*-imidazole.
$C_{18}H_{15}Cl_3N_2OS$ 413.74

Triple Sulfa Vaginal Cream

DEFINITION
Triple Sulfa Vaginal Cream contains NLT 90.0% and NMT 110.0% of the labeled amounts of sulfathiazole ($C_9H_9N_3O_2S_2$), sulfacetamide ($C_8H_{10}N_2O_3S$), and sulfabenzamide ($C_{13}H_{12}N_2O_3S$).

IDENTIFICATION
• **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Mobile phase: Acetonitrile, 1 M tetrabutylammonium hydroxide, and water (22:10:78). Adjust with dilute phosphoric acid (1 in 10) to a pH of 7.7 ± 0.2, and mix for 5 min. If necessary, adjust to a pH of 7.7 ± 0.2, using dilute phosphoric acid (1 in 50) or 1 M tetrabutylammonium hydroxide.
Internal standard solution: 10 mg/mL of sulfapyridine in acetone
Standard solution: 0.068 mg/mL of USP Sulfathiazole RS, 0.058 mg/mL of USP Sulfacetamide RS, and 0.074 mg/mL of USP Sulfabenzamide RS prepared as follows. Transfer 34 mg of USP Sulfathiazole RS, 29 mg of USP Sulfacetamide RS, and 37 mg of USP Sulfabenzamide RS to a 50-mL volumetric flask. Add 2.0 mL of *Internal standard solution* and 30 mL of acetone, and shake for 10 min. If necessary, sonicate to effect solution. Dilute with acetone to volume. Pipet 5 mL of this solution into a 50-mL volumetric flask, and evaporate on a steam bath with the aid of a gentle stream of nitrogen to dryness. Dissolve the residue in *Mobile phase*, and dilute with *Mobile phase* to volume.
Sample solution: Nominally 0.069 mg/mL of sulfathiazole, 0.058 mg/mL of sulfacetamide, and 0.074 mg/mL of sulfabenzamide prepared as follows. Using a plastic syringe equipped with a suitable cannula, transfer a quantity of Vaginal Cream, nominally equivalent to 173 mg of sulfathiazole, 144 mg of sulfacetamide, and 184 mg of sulfabenzamide, to a 250-mL volumetric flask. Add 10.0 mL of *Internal standard solution* and 100 mL of acetone, and warm the flask on a steam bath while swirling the contents to dissolve the cream. Cool to room temperature, and dilute with acetone to volume. Pass the solution through filter paper, discarding the first 10 mL of the filtrate. Pipet 5 mL of the filtrate so obtained into a 50-mL volumetric flask, and evaporate on a steam bath with the aid of a gentle stream of nitrogen to dryness. Dissolve the residue in *Mobile phase*, and dilute with *Mobile phase* to volume. Cool the solution in an ice bath for 10 min, pass the cold solution through filter paper, discarding the first 10–15 mL of the filtrate, and collect 5 mL for analysis.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm

Tailing factor: NMT 1.5 for sulfacetamide, *Standard solution*
Relative standard deviation: NMT 2.0% for sulfacetamide, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sulfanilamide in the portion of Sulfacetamide Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sulfanilamide from the *Sample solution*
r_S = peak response of sulfanilamide from the *Standard solution*
C_S = concentration of USP Sulfanilamide RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulfacetamide Sodium in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Sulfacetamide Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*
r_S = peak response of sulfacetamide from the *Standard solution*
C_S = concentration of USP Sulfacetamide Sodium RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulfacetamide Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sulfanilamide	0.6	0.2
Sulfacetamide	1.0	—
Any single unspecified impurity	—	0.10
Total impurities	—	0.5

Sulfacetamide Sodium Ophthalmic Ointment

DEFINITION

Sulfacetamide Sodium Ophthalmic Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of sulfacetamide sodium ($C_8H_9N_2NaO_3S \cdot H_2O$). It is sterile.

IDENTIFICATION

• **A.**

Sample: Nominally 1 g of sulfacetamide sodium from a quantity of Ophthalmic Ointment

Analysis: Dissolve the *Sample* in 100 mL of ether in a separator, and extract the mixture with 25 mL of water. Wash the extract with 25 mL of ether, and warm the water extract on a steam bath to remove the last traces of ether. Adjust with 6 N acetic acid to a pH of 4–5, and filter. Wash the precipitate with water, and dry at 105° for 2 h. Use the precipitate in *Identification B*, *C*, and *D*.

Acceptance criteria: The sulfacetamide melts at 180°–184°.

• **B.**

Sample: 500 mg of the sulfacetamide from *IdentificationA*

Analysis: Place the *Sample* in a test tube, and heat gently until it boils.

Acceptance criteria: An oily liquid, which has the characteristic odor of acetamide, condenses on the walls of the test tube (distinction from the sublimates of sulfadiazine, sulfamerazine, and sulfamethazine, which are solids at room temperature).

• **C.**

Sample solution: 100 mg of the sulfacetamide from *IdentificationA* in 5 mL of water

Analysis: Add 5 drops of cupric sulfate TS to the *Sample solution*.

Acceptance criteria: A light bluish-green precipitate is formed, and it remains unchanged on standing.

• **D.**

Sample solution: 500 mg of the sulfacetamide from *IdentificationA* in 10 mL of dilute hydrochloric acid (1 in 10)

Analysis 1: To about one-half of the *Sample solution* add 2 mL of trinitrophenol TS.

Acceptance criteria 1: A very heavy flocculent or almost gelatinous precipitate is formed.

Analysis 2: To the remainder of the *Sample solution* add 3 drops of formaldehyde TS.

Acceptance criteria 2: A white precipitate is formed, and it changes to orange on standing (distinction from sulfamethoxypyridazine).

ASSAY

• **PROCEDURE**

Diluent: 20% methanol

Mobile phase: Methanol, glacial acetic acid, and water (10:1:89)

Standard stock solution: 5 mg/mL of USP Sulfacetamide Sodium RS prepared as follows. Transfer 50 mg of USP Sulfacetamide Sodium RS to a 40-mL centrifuge tube. Add 10.0 mL of *Diluent*, insert the stopper, and mix using a vortex mixer for 3 min to dissolve the Reference Standard. Add 7.5 mL of heptane, insert the stopper, and mix using a vortex mixer for another 3 min. Centrifuge to effect separation of the phases. Withdraw, and discard the upper heptane layer.

Standard solution: 0.03 mg/mL of USP Sulfacetamide Sodium RS in *Diluent* from the *Standard stock solution*

System suitability solution: 0.03 mg/mL of sulfanilamide in the *Standard solution*

Sample stock solution: Nominally 5 mg/mL of sulfacetamide sodium prepared as follows. Transfer 100 mg of sulfacetamide sodium from a quantity of Ophthalmic Ointment to a 40-mL centrifuge tube. Add 15.0 mL of heptane, insert the stopper, and mix using a vortex mixer for 3 min to dissolve the Ophthalmic Ointment. Add 20.0 mL of *Diluent*, insert the stopper, and mix using a vortex mixer for 3 min. Centrifuge to effect separation of the phases. Withdraw, and discard the upper heptane layer.

Sample solution: Nominally 0.03 mg/mL of sulfacetamide sodium in *Diluent* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 90 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3 between the sulfacetamide and sulfanilamide peaks, *System suitability solution*

Column efficiency: NLT 1500 theoretical plates, determined from the analyte peak, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sulfacetamide sodium ($C_8H_9N_2NaO_3S \cdot H_2O$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sulfacetamide Sodium RS, calculated on the anhydrous basis, in the *Standard solution* (mg/mL)

C_U = nominal concentration of sulfacetamide sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of sulfacetamide sodium monohydrate, 254.24

M_{r2} = molecular weight of anhydrous sulfacetamide sodium, 236.23

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **STERILITY TESTS** ⟨71⟩: Meets the requirements

• **OTHER REQUIREMENTS:** It meets the requirements for *Particulate and Foreign Matter* in *Ophthalmic Products—Quality Tests* ⟨771⟩, *Drug Product Quality, Universal Tests, Particulate and Foreign Matter*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.

• **USP REFERENCE STANDARDS** ⟨11⟩

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of prednisolone acetate ($C_{23}H_{30}O_6$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of prednisolone acetate to the internal standard peak from the *Sample solution*
R_S = peak response ratio of prednisolone acetate to the internal standard peak from the *Standard solution*
C_S = concentration of USP Prednisolone Acetate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of prednisolone acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements

• **OTHER REQUIREMENTS:** It meets the requirements for *Particulate and Foreign Matter* and *Container Contents* in *Ophthalmic Products—Quality Tests* ⟨771⟩, *Drug Product Quality, Universal Tests, Particulate and Foreign Matter* and *Container Contents*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes that are tamper-proof so that sterility is assured at time of first use.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Prednisolone Acetate RS
USP Sulfacetamide Sodium RS

Sulfacetamide Sodium and Prednisolone Acetate Ophthalmic Suspension

» Sulfacetamide Sodium and Prednisolone Acetate Ophthalmic Suspension is a sterile, aqueous suspension containing not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sulfacetamide sodium ($C_8H_9N_2NaO_3S.H_2O$) and prednisolone acetate ($C_{23}H_{30}O_6$). It may contain suitable preservatives, buffers, stabilizers, and suspending agents.

Packaging and storage—Preserve in tight containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards ⟨11⟩**—**

USP Prednisolone Acetate RS
USP Sulfacetamide Sodium RS

Identification—

A: Pass about 25 mL of the well-mixed Ophthalmic Suspension through a fine, sintered-glass filter, saving the filtrate. Wash the crystals in the funnel with a small amount of water. Dry the crystals at 105° for 3 hours: the IR absorption spectrum of a potassium bromide dispersion of the crystals exhibits maxima only at the same wavelengths as that of a similar preparation of USP Prednisolone Acetate RS.

B: To the filtrate saved from *Identification* test *A*, add 6 N acetic acid dropwise until the pH is between 4 and 5. Allow crystals of sulfacetamide to develop. Filter the crystals, wash with a small amount of water, and dry at 105° for 2 hours: the IR absorption spectrum of a potassium bromide dispersion of the crystals so obtained exhibits maxima only at the same wavelengths as a preparation of USP Sulfacetamide Sodium RS, similarly treated.

Sterility Tests ⟨71⟩: meets the requirements.

www.webofpharma.com

pH ⟨791⟩: between 6.0 and 7.4.

Assay for sulfacetamide sodium—

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (890:100:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Sulfacetamide Sodium RS in a mixture of water and methanol (4:1), and dilute quantitatively, and stepwise if necessary, with the same solvent mixture to obtain a solution having a known concentration of about 30 µg per mL.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 100 mg of sulfacetamide sodium, to a 100-mL volumetric flask, dilute with a mixture of water and methanol (4:1) to volume, and mix. Dilute 3.0 mL of this solution with the same solvent mixture to 100.0 mL, and mix.

System suitability preparation—Dissolve about 3 mg of sulfanilamide in 100 mL of the *Standard preparation*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined for the analyte peak is not less than 1500 theoretical plates; the resolution, *R*, between the sulfacetamide and sulfanilamide peaks is not less than 3; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 90 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sulfacetamide sodium ($C_8H_9N_2NaO_3S.H_2O$) in each mL of the Ophthalmic Suspension taken by the formula:

$$3.33(254.24/236.23)C(r_U/r_S)$$

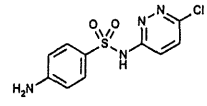
in which 254.24 and 236.23 are the molecular weights of sulfacetamide sodium monohydrate and anhydrous sulfacetamide sodium, respectively; *C* is the concentration, in µg per mL, calculated on the anhydrous basis, of USP Sulfacetamide Sodium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for prednisolone acetate—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Prednisolone Acetate RS in methanol to obtain a solution containing about 2 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, and dilute with a solvent mixture prepared by dissolving 2.72 g of monobasic potassium phosphate in 300 mL of water and 700 mL of methanol. The *Standard preparation* has a known concentration of about 0.04 mg per mL.

Assay preparation—Using a "To contain" pipet, transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 10 mg of prednisolone acetate, to a 250-mL volumetric flask. Rinse the pipet with the solvent mixture described under *Standard preparation*, collecting the rinsings in the flask, dilute with the same solvent mixture to volume, and mix.



Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of prednisolone acetate ($C_{23}H_{30}O_6$) in each mL of the Ophthalmic Suspension taken by the formula:

$$250(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Prednisolone Acetate RS in the *Standard preparation; V* is the volume, in mL, of Ophthalmic Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Sulfachlorpyridazine

$C_{10}H_9ClN_4O_2S$ 284.72

N^1-(6-Chloro-3-pyridazinyl)sulfanilamide [80-32-0].

» Sulfachlorpyridazine contains not less than 97.0 percent and not more than 103.0 percent of $C_{10}H_9ClN_4O_2S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—

USP Sulfachlorpyridazine RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).

B: The retention time of the main peak in the chromatogram of the *Assay preparation*, obtained as directed in the *Assay*, corresponds to that of the main peak observed in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

Clarity and color of solution—Dissolve 1.0 g of it in 50 mL of 0.1 N methanolic hydrochloric acid prepared by diluting 8.6 mL of hydrochloric acid with methanol to obtain 1000 mL of solvent: a clear solution is produced that is not deeper in color than pale yellow.

Acidity—Prepare a suspension of 3.0 g of it in 150.0 mL of carbon dioxide-free water, and heat at 70° for 5 minutes, maintaining the suspension. Cool rapidly in an ice bath to 20 ± 0.5°, stirring by mechanical means. Filter the suspension using vacuum, and collect the filtrate. Titrate 25.0 mL of the clear filtrate with 0.1 N sodium hydroxide VS, using 2 drops of thymolphthalein TS as the indicator. Transfer a second

www.webofpharma.com

25.0-mL portion of the clear filtrate to a 250-mL conical flask, add 10 mL of hydrochloric acid, and cool in an ice bath to 15°. Add about 25 g of crushed ice, prepared from frozen purified water, and titrate with 0.1 M sodium nitrite VS, stirring vigorously, until the titrated solution produces an immediate, stable, blue color on starch-iodide paper. The volume of 0.1 N sodium hydroxide consumed in the titration of the first 25.0-mL portion of the filtrate does not exceed the volume of 0.1 M sodium nitrite consumed in the titration of the second 25.0-mL portion of the filtrate by more than 0.5 mL.

Loss on drying ⟨731⟩: Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

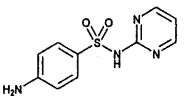
Assay—

pH 2.5 phosphate buffer—Dissolve 14 g of monobasic potassium phosphate in 1600 mL of water, adjust with phosphoric acid to a pH of 2.5 ± 0.1, dilute with water to 2000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *pH 2.5 phosphate buffer* and methanol (700:300). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Prepare a stock solution of USP Sulfachlorpyridazine RS in methanol having a known concentration of about 0.5 mg per mL. Transfer 3.0 mL of this stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter this solution through a nylon filter having a porosity of 0.5 µm or finer, and use the filtrate as the *Standard preparation*. The *Standard preparation* contains about 15 µg of USP Sulfachlorpyridazine RS per mL.

Assay preparation—Transfer about 50 mg of Sulfachlor pyridazine, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix. Transfer 3.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter this solution through a filter having a porosity of 0.5 µm or finer, and use the filtrate as the *Assay preparation*.



Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector, a 4.6-mm × 25-cm analytical column containing 5-µm packing L1, and a guard column containing 5-µm packing L1, and is maintained at about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_9ClN_4O_2S$ in the portion of Sulfachlorpyridazine taken by the formula:

$$(10/3)(C)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Sulfachlorpyridazine RS in the *Standard preparation;* and r_U and r_S are the sulfachlorpyridazine peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Sulfadiazine

$C_{10}H_{10}N_4O_2S$ 250.28

Benzenesulfonamide, 4-amino-*N*-2-pyrimidinyl-; *N*¹-2-Pyrimidinylsulfanilamide [68-35-9].

DEFINITION

Sulfadiazine contains NLT 98.0% and NMT 102.0% of $C_{10}H_{10}N_4O_2S$, calculated on the dried basis.

IDENTIFICATION

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B.**

Sample: 50 mg

Analysis: Carefully melt the *Sample* in a small test tube.

Acceptance criteria: A reddish brown color develops upon melting, and the fumes evolved during decomposition do not discolor moistened lead acetate test paper (distinction from sulfathiazole).

- **C.**

Sample: 1 g

Analysis 1: Gently heat the *Sample* in a small test tube until a sublimate is formed. Collect a few mg of the sublimate with a glass rod, and mix in a test tube with 1 mL of a solution (1 in 20) of resorcinol in alcohol. Add 1 mL of sulfuric acid, and mix by shaking.

Acceptance criteria 1: A deep red color appears at once.

Analysis 2: Cautiously dilute the mixture obtained in *Analysis 1* with 25 mL of ice-cold water, and add an excess of 6 N ammonium hydroxide.

Acceptance criteria 2: A blue or reddish blue color is produced.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile, water, and glacial acetic acid (12:87:1)

Standard solution: 1 mg/mL of USP Sulfadiazine RS in 0.025 N sodium hydroxide

Sample solution: 1 mg/mL of Sulfadiazine in 0.025 N sodium hydroxide

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%, five injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulfadiazine ($C_{10}H_{10}N_4O_2S$) in the portion of Sulfadiazine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response of sulfadiazine from the *Sample solution*
r_S = peak response of sulfadiazine from the *Standard solution*
C_S = concentration of USP Sulfadiazine RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulfadiazine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

  Diluent: Toluene and dimethylformamide (2:1)
  Standard solutions: 0.008, 0.041, 0.08, and 0.17 mg/mL in *Diluent*
  Sample solution: 8.3 mg/mL in *Diluent*
  Eluant: Chloroform, methanol, and ammonium hydroxide (30:12:1)
  Visualization: 11

SPECIFIC TESTS

- **CLARITY AND COLOR OF SOLUTION**
  Sample: 1 g
  Analysis: Dissolve the *Sample* in a mixture of 20 mL of water and 5 mL of 1 N sodium hydroxide.
  Acceptance criteria: The solution is clear and not more deeply colored than pale yellow.
- **ACIDITY**
  Sample: 2 g
  Analysis: Digest the *Sample* with 100 mL of water at about 70° for 5 min. Cool at once to room temperature, and filter. To 25.0 mL of the filtrate add 2 drops of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide.
  Acceptance criteria: NMT 0.20 mL is required to produce a pink color.
- **LOSS ON DRYING** ⟨731⟩
  Analysis: Dry a sample at 105° for 2 h.
  Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sulfadiazine RS

Sulfadiazine Tablets

DEFINITION

Sulfadiazine Tablets contain NLT 95.0% and NMT 105.0% of the labeled quantity of $C_{10}H_{10}N_4O_2S$.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B. MELTING RANGE OR TEMPERATURE,** *Class Ia* ⟨741⟩
  Sample solution: Equivalent to 100 mg/mL of sulfadiazine from finely powdered Tablets in chloroform
  Analysis: Transfer the *Sample solution* to a small filter. Wash with 5 mL of chloroform, and discard the filtrate. Triturate the residue with 10 mL of 6 N ammonium hydroxide for 5 min, add 10 mL of water, and filter. Warm the filtrate until most of the ammonia is expelled, cool, and add 6 N acetic acid until the reaction is distinctly acid: a precipitate of sulfadiazine is formed. Collect the precipitate on a filter, wash it with cold water, and dry at 105° for 1 h.
  Acceptance criteria: The sulfadiazine melts at 250°–254°.

ASSAY

- **PROCEDURE**

Silver Sulfadiazine

$C_{10}H_9AgN_4O_2S$ 357.14

Benzenesulfonamide, 4-amino-*N*-2-pyrimidinyl-, monosilver(1+) salt;
N[1]-2-Pyrimidinylsulfanilamide monosilver(1+) salt [22199-08-2].

DEFINITION

Silver Sulfadiazine contains NLT 98.0% and NMT 102.0% of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A, 197D, or 197K▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests, Silver*

Sample: 1 g in 15 mL of ammonium hydroxide and 15 mL of water in a 50-mL volumetric flask. Dilute with water to volume, and mix.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**

Solution A: 0.77 g/L of ammonium acetate in water. Adjust with glacial acetic acid to a pH of 5.2 ± 0.1.
Solution B: Methanol
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	98	2
4	98	2
16	40	60
20	40	60
22	20	80
32	20	80
34	98	2
40	98	2

Diluent: Acetonitrile, ammonium hydroxide, and water (5:6:90)
Standard solution: 0.05 mg/mL of USP Silver Sulfadiazine RS in *Diluent*. Sonicate, if necessary, to dissolve.
Sample solution: 0.05 mg/mL of Silver Sulfadiazine in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$) in the portion of Silver Sulfadiazine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Silver Sulfadiazine RS in the *Standard solution* (mg/mL)
C_U = concentration of Silver Sulfadiazine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

OTHER COMPONENTS

- **CONTENT OF SILVER**

Sample solution: Add 500 mg to 150 mL of water and 50 mL of nitric acid, and stir for 15 min.
Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Direct titration
Titrant: 0.1 N potassium thiocyanate VS or 0.1 N ammonium thiocyanate VS
Endpoint detection: Potentiometric
Analysis: Titrate the *Sample solution* with *Titrant* using a silver-based indicator electrode and a double-junction reference electrode. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N potassium thiocyanate VS or 0.1 N ammonium thiocyanate VS is equivalent to 10.79 mg of silver.
Acceptance criteria: 29.3%–30.5% of silver is found.

IMPURITIES

- **LIMIT OF NITRATE**

Standard solution: 200 µg/mL of nitrate from potassium nitrate
Sample solution: Add 30.0 mL of water to 2 g of Silver Sulfadiazine, stir for 20 min, and pass through a suitable, nitrate-free filter.
Instrumental conditions
Mode: UV-Vis
Analytical wavelength: 408 nm
Blank: Deionized water
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Pipet 3 mL of the *Sample solution* and *Blank* into separate test tubes. Pipet 1 mL of the *Standard solution* and 2 mL of water into a third test tube. Cool the three test tubes in an ice bath. Slowly add 7.0 mL of cold chromotropic acid solution, prepared by dissolving 50 mg of chromotropic acid in 100 mL of cold sulfuric acid, to each test tube, while swirling, and allow the test tubes to remain in the ice bath for 3 min after the addition of the chromotropic acid solution. Remove the test tubes from the ice bath, and allow to stand for 30 min. Concomitantly determine the absorbances of the *Sample solution* and the *Standard solution* with a suitable spectrophotometer, against the *Blank*.
Calculate the percentage of nitrate content in the portion of Silver Sulfadiazine taken:

www.webofpharma.com

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of nitrate in the *Standard solution* (µg/mL)
C_U = concentration of Silver Sulfadiazine in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.1%

• **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: 1.0 mg/mL of USP Silver Sulfadiazine RS and 0.001 mg/mL each of USP Sulfanilic Acid RS, USP Sulfanilamide RS, and sulfaguanidine in *Diluent*

Standard solution: 0.001 mg/mL of USP Silver Sulfadiazine RS in *Diluent*

Sample solution: 1.0 mg/mL of Silver Sulfadiazine in *Diluent*

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for sulfaguanidine and sulfanilamide are about 0.65 and 0.71, respectively.]

Suitability requirements

Resolution: NLT 2.0 between sulfaguanidine and sulfanilamide, *System suitability solution*

Relative standard deviation: NMT 5.0% for the sulfadiazine peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Silver Sulfadiazine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of silver sulfadiazine from the *Standard solution*
C_S = concentration of USP Silver Sulfadiazine RS in the *Standard solution* (mg/mL)
C_U = concentration of Silver Sulfadiazine in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Sulfanilic acid	0.27	0.27	0.3
Sulfaguanidine[a, b]	0.65	0.85	—
Sulfanilamide[b]	0.71	1.0	—
2-Aminopyrimidine[c]	0.82	0.48	0.3
Sulfadiazine[d]	1.00	—	—
Acetylsulfadiazine[e]	1.14	1.0	0.2
Specified unidentified impurity[f]	1.28	1.0	0.15
Individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	0.5

[a] 4-Amino-*N*-carbamimidoylbenzenesulfonamide.
[b] These are controlled using the limit for individual unspecified impurities.
[c] Pyrimidin-2-amine.
[d] 4-Amino-*N*-2-pyrimidinyl-benzenesulfonamide.
[e] *N*-{4-[*N*-(Pyrimidin-2-yl)sulfamoyl]phenyl}acetamide.
[f] This compound is a specified unknown impurity. No information is available about the chemical structure or chemical name for this impurity.

SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩

Analysis: Dry at 105° for 1 h.

Acceptance criteria: NMT 0.5%

Silver Sulfadiazine Cream

DEFINITION

Silver Sulfadiazine Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$).

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩

Standard solution: Dissolve 35 mg of USP Sulfadiazine RS in 4 mL of ammonium hydroxide, and add 16 mL of methanol.

Sample solution: Transfer a quantity of Cream equivalent to 50 mg of silver sulfadiazine to a stoppered 50-mL conical flask. Add 4 mL of ammonium hydroxide, and mix until a smooth paste has been obtained. Add 16 mL of methanol, shake for 5 min, and filter.

Developing solvent system: Chloroform, methanol, and ammonium hydroxide (7:4:1). Prepare the developing solvent by first mixing the chloroform and methanol, then adding the ammonium hydroxide.

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile, phosphoric acid, and water (99:1:900)

Diluent: Ammonium hydroxide in water (1 in 10)

Internal standard solution: 2 mg/mL of sulfamerazine in *Diluent*

Standard stock solution: 1 mg/mL of USP Silver Sulfadiazine RS in *Diluent*

Standard solution A: 0.29 mg/mL of USP Silver Sulfadiazine RS prepared by mixing 10.0 mL of *Standard stock solution*, 20 mL of alcohol, and 5.0 mL of *Internal standard solution*

USP Monographs

www.webofpharma.com

Standard solution B: 14 µg/mL of USP Silver Sulfadiazine RS prepared by mixing 2.0 mL of *Standard solution A* and 40 mL of *Mobile phase*

Sample stock solution: Nominally 0.29 mg/mL of silver sulfadiazine prepared as follows. Transfer a quantity of Cream equivalent to 10 mg of silver sulfadiazine to a 50-mL round-bottom centrifuge tube. Add about 30 mL of methanol, tightly seal the tube with a cap containing an inert liner, and mix, using a vortex mixer, for about 15 s. Centrifuge for 15 min. Aspirate, and discard the methanol. Care should be taken to avoid aspirating any of the residue. Transfer 5.0 mL of the *Internal standard solution* into the tube, and add 20 mL of alcohol. Replace the cap, and mix. Heat in a water bath at 60°, with periodic mixing, for 15 min to melt and disperse the Cream. While the mixture is still hot, transfer 10.0 mL of *Diluent* to the tube, and cool to room temperature.

Sample solution: Nominally 14 µg/mL of silver sulfadiazine prepared by mixing 2.0 mL of *Sample stock solution* and 40 mL of *Mobile phase*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 2 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution B*
Suitability requirements
Resolution: NLT 2.0 between sulfadiazine and sulfamerazine
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution B* and *Sample solution*
Calculate the percentage of the labeled amount of silver sulfadiazine ($C_{10}H_9AgN_4O_2S$) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio from the *Sample solution*
R_S = peak response ratio from *Standard solution B*
C_S = concentration of USP Silver Sulfadiazine RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of silver sulfadiazine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **Minimum Fill** ⟨755⟩**:** Meets the requirements

SPECIFIC TESTS
• **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩**:** It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Escherichia coli*, *Salmonella* species, and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 23 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g.
• **pH** ⟨791⟩
Analysis: Determine from the supernatant of a 50-mg/mL mixture of Cream in water
Acceptance criteria: 4.0–7.0

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in collapsible tubes or in tight, light-resistant containers.
• **USP Reference Standards** ⟨11⟩
USP Silver Sulfadiazine RS
USP Sulfadiazine RS

Sulfadiazine Sodium

$C_{10}H_9N_4NaO_2S$ 272.26
Benzenesulfonamide, 4-amino-*N*-2-pyrimidinyl-, monosodium salt;
*N*¹-2-Pyrimidinylsulfanilamide monosodium salt [547-32-0].

DEFINITION
Sulfadiazine Sodium contains NLT 99.0% and NMT 100.5% of sulfadiazine sodium ($C_{10}H_9N_4NaO_2S$), calculated on the dried basis.

IDENTIFICATION
• **A.**
Sample: 1.5 g
Analysis: Dissolve the *Sample* in 25 mL of water, and add 3 mL of 6 N acetic acid. A white precipitate of sulfadiazine is formed. Collect the precipitate on a filter, wash it well with cold water, and dry at 105° for 1 h.

Change to read:

Acceptance criteria 1: The infrared spectrum of the residue in ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020) matches the infrared spectrum of similarly prepared USP Sulfadiazine RS.
Acceptance criteria 2: The melting range of the residue as determined by the method for *Class 1a* in *Melting Range or Temperature* ⟨741⟩ is 250°–254°.
• **B. Identification Tests—General,** *Sodium* ⟨191⟩
Sample: 500 mg
Analysis: Ignite the *Sample*, and use the residue.
Acceptance criteria: Meets the requirements

ASSAY
• **Procedure**
Analysis: Proceed as directed in *Nitrite Titration* ⟨451⟩. Each mL of 0.1 M sodium nitrite is equivalent to 27.23 mg of sulfadiazine sodium ($C_{10}H_9N_4NaO_2S$).
Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES
• **Selenium** ⟨291⟩
Sample: 200 mg
Acceptance criteria: NMT 30 ppm

Sulfadiazine Sodium Injection

DEFINITION

Sulfadiazine Sodium Injection is a sterile solution of Sulfadiazine Sodium in Water for Injection. It contains, in each mL, NLT 237.5 mg and NMT 262.5 mg of sulfadiazine sodium ($C_{10}H_9N_4NaO_2S$).

IDENTIFICATION

• **A.**

Sample: Nominally 1.5 g of sulfadiazine sodium from 6 mL of Injection

Analysis: Dilute the *Sample* to 25 mL with water, and add 3 mL of 6 N acetic acid. A white precipitate of sulfadiazine is formed. Collect the precipitate on a filter, wash it well with cold water, and dry at 105° for 1 h.

Acceptance criteria 1: The melting range of the residue as determined by the method for *Class 1a* in *Melting Range or Temperature* ⟨741⟩ is 250°–254°.

Change to read:

Acceptance criteria 2: The infrared spectrum of the residue in ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020) matches the infrared spectrum of similarly prepared USP Sulfadiazine RS.

ASSAY

• **PROCEDURE**

Sample solution: Transfer a volume of Injection, equivalent to 500 mg of sulfadiazine sodium, into a beaker or a casserole.

Analysis: Proceed as directed in *Nitrite Titration* ⟨451⟩, beginning with "Add 20 mL of hydrochloric acid". Each mL of 0.1 M sodium nitrite is equivalent to 27.23 mg of sulfadiazine sodium ($C_{10}H_9N_4NaO_2S$).

Acceptance criteria: 237.5–262.5 mg/mL

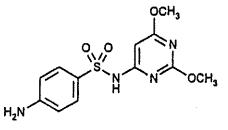
SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.1 USP Endotoxin Unit per mg of sulfadiazine sodium

• **pH** ⟨791⟩: 8.5–10.5

• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose, light-resistant containers of Type I glass.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sulfadiazine RS

Sulfadimethoxine

$C_{12}H_{14}N_4O_4S$ 310.33

Benzenesulfonamide, 4-amino-*N*-(2,6-dimethoxy-4-pyrimidinyl)-.

N^1-(2,6-Dimethoxy-4-pyrimidinyl)sulfanilamide [122-11-2].

» Sulfadimethoxine contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{14}N_4O_4S$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—

USP Sulfadimethoxine RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—

Solution: 1 in 100,000.

Medium: alcohol.

Absorptivities, calculated on the dried basis, at 272 nm do not differ by more than 3.0%.

C: To about 100 mg, add 3 mL of 2.5 N sodium hydroxide and 50 mL of water, mix until dissolved, and dilute with water to 100 mL. To about 5 mL of this solution, add 100 mg of phenol, and heat to boiling. Cool the solution, and add 0.5 mL of sodium hypochlorite TS and 3 drops of 2.5 N sodium hydroxide: a yellow color is produced.

D: To about 10 mg dissolved in 2 mL of diluted hydrochloric acid, add 3 drops of sodium nitrite solution (1 in 100), and dilute with water to 4 mL: the solution turns yellow. Add 1 mL of 2.5 N sodium hydroxide containing 10 mg of 2-naphthol: a red-orange precipitate is formed.

Melting range ⟨741⟩: between 197° and 202°.

Loss on drying ⟨731⟩: Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Assay—

Mobile phase—Dissolve 6 g of monobasic sodium phosphate in water to make 1000 mL. Adjust with 50% (w/v) sodium hydroxide solution to a pH of 7.0. Prepare a mixture of this solution and methanol (300:100). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Sulfadimethoxine RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL. Protect this solution from light.

Assay preparation—Transfer about 20 mg of Sulfadimethoxine, accurately weighed, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and swirl to dissolve. Dilute this solution with *Mobile phase* to volume, and mix. Protect this solution from light.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg,

www.webofpharma.com

of $C_{12}H_{14}N_4O_4S$ in the portion of Sulfadimethoxine taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Sulfadimethoxine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Sulfadimethoxine Soluble Powder

» Sulfadimethoxine Soluble Powder contains Sulfadimethoxine Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.
Labeling—Label it to indicate that it is for veterinary use only.
USP Reference standards ⟨11⟩—
USP Sulfadimethoxine RS
Identification—Shake a quantity equivalent to about 1 g with 5 mL of diluted hydrochloric acid and 10 mL of water. Filter, and to the filtrate add 2.5 N sodium hydroxide dropwise until a precipitate forms and redissolves. Add diluted hydrochloric acid dropwise until a precipitate forms. Collect the precipitate on a very fine filter, and wash it with water and with ether: the sulfadimethoxine so obtained meets the requirements for the *Identification* tests under *Sulfadimethoxine.*
Minimum fill ⟨755⟩: meets the requirements.
pH ⟨791⟩: between 7.0 and 8.0, in a solution (1 in 20).

Assay—
Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sulfadimethoxine.*
Assay preparation—Transfer an accurately weighed portion of Powder, equivalent to about 50 mg of sulfadimethoxine, to a 250-mL volumetric flask, add about 200 mL of *Mobile phase,* and swirl to dissolve. Dilute with *Mobile phase* to volume, and mix. Protect this solution from light.
Procedure—Proceed as directed in the *Assay* under *Sulfadimethoxine.* Calculate the quantity, in mg, of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$) in the portion of Powder taken by the formula:

$$250C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Sulfadimethoxine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Sulfadimethoxine Oral Suspension

» Sulfadimethoxine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.
Labeling—Label it to indicate that it is for veterinary use only.
USP Reference standards ⟨11⟩—
USP Sulfadimethoxine RS
Identification—Shake a quantity equivalent to about 50 mg with 50 mL of water, and add 2.5 N sodium hydroxide dropwise until the solution becomes clear. Add diluted hydrochloric acid dropwise until a precipitate forms. Collect the precipitate on a very fine filter, and wash it with water and with ether: the sulfadimethoxine so obtained meets the requirements for the *Identification* tests under *Sulfadimeth oxine.*
pH ⟨791⟩: between 5.0 and 7.0.

Assay—
Mobile phase,Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sulfadimethoxine.*
Assay preparation—Transfer an accurately measured volume of Suspension, previously mixed and free from air bubbles, equivalent to about 50 mg of sulfadimethoxine, to a 250-mL volumetric flask, add about 200 mL of *Mobile phase,* and swirl to dissolve. Dilute with *Mobile phase* to volume, and mix. Protect this solution from light.
Procedure—Proceed as directed in the *Assay* under *Sulfadimethoxine.* Calculate the quantity, in mg, of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$) in each mL of the Oral Suspension taken by the formula:

$$250(C/V)(r_U/r_S)$$

in which V is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation;* and the other terms are as defined therein.

Sulfadimethoxine Tablets

» Sulfadimethoxine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.
Labeling—Label the Tablets to indicate that they are for veterinary use only.
USP Reference standards ⟨11⟩—
USP Sulfadimethoxine RS
Identification—Shake a quantity of finely powdered Tablets, equivalent to about 1 g of sulfadimethoxine, with 5 mL of diluted hydrochloric acid and 10 mL of water. Filter, and to the filtrate add 2.5 N sodium hydroxide dropwise until a precipitate forms and redissolves. Add diluted hydrochloric acid dropwise until a precipitate forms. Collect the filtrate on a very fine filter, and wash it with water and with ether: the sulfadimethoxine so obtained meets the requirements for the *Identification* tests under *Sulfadimethoxine.*
Disintegration ⟨701⟩: 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

www.webofpharma.com

Assay—

Mobile phase, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sulfadimethoxine*.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of sulfadimethoxine, to a 250-mL volumetric flask, add about 200 mL of *Mobile phase*, and swirl to dissolve. Dilute with *Mobile phase* to volume, and mix. Filter if necessary to obtain a clear solution. Protect this solution from light.

Procedure—Proceed as directed in the *Assay* under *Sulfadimethoxine*. Calculate the quantity, in mg, of sulfadimethoxine ($C_{12}H_{14}N_4O_4S$) in the portion of Tablets taken by the formula:

$$250C(r_U/r_S)$$

in which the terms are as defined therein.

Sulfadimethoxine Sodium

$C_{12}H_{13}N_4NaO_4S$ 332.31

Benzenesulfonamide, 4-amino-*N*-(2,6-dimethoxy-4-pyrimidinyl)-, monosodium salt.

N^1-(2,6-Dimethoxy-4-pyrimidinyl)sulfanilamide monosodium salt [1037-50-9].

» Sulfadimethoxine Sodium contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{13}N_4NaO_4S$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—

USP Sulfadimethoxine RS

Identification—

A: To about 100 mg, add 50 mL of water, mix until dissolved, and dilute with water to 100 mL. To about 5 mL of this solution add 100 mg of phenol, and heat to boiling. Cool the solution, and add 0.5 mL of sodium hypochlorite TS and 3 drops of 2.5 N sodium hydroxide: a yellow color is produced.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

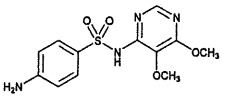
C: Dissolve 10 mg in 2 mL of diluted hydrochloric acid, add 3 drops of sodium nitrite solution (1 in 100), and dilute with water to 4 mL: the solution turns yellow. Add 1 mL of 2.5 N sodium hydroxide containing 10 mg of 2-naphthol: a red-orange precipitate is formed.

pH ⟨791⟩: between 8.0 and 9.5, in a solution (1 in 20).

Loss on drying ⟨731⟩—Dry it at 125° for 3 hours: it loses not more than 5.0% of its weight.

Assay—

Mobile phase, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sulfadimethoxine*.



Assay preparation—Transfer about 60 mg of Sulfadi methoxine Sodium, accurately weighed, to a 250-mL volumetric flask, add about 200 mL of *Mobile phase*, and swirl to dissolve. Dilute with *Mobile phase* to volume, and mix. Protect this solution from light.

Procedure—Proceed as directed in the *Assay* under *Sulfadimethoxine*. Calculate the quantity, in mg, of $C_{12}H_{13}N_4NaO_4S$ in the portion of Sulfadimethoxine Sodium taken by the formula:

$$(332.31/310.34)(250C)(r_U/r_S)$$

in which 332.31 and 310.34 are the molecular weights of sulfadimethoxine sodium and sulfadimethoxine, respectively; and the other terms are as defined therein.

Sulfadoxine

$C_{12}H_{14}N_4O_4S$ 310.33

Benzenesulfonamide, 4-amino-*N*-(5,6-dimethoxy-4-pyrimidinyl)-;

N^1-(5,6-Dimethoxy-4-pyrimidinyl)sulfanilamide [2447-57-6].

DEFINITION

Sulfadoxine contains NLT 99.0% and NMT 101.0% of sulfadoxine ($C_{12}H_{14}N_4O_4S$), calculated on the dried basis.

Sample solution: 6 µg/mL in 0.1 N sodium hydroxide

Acceptance criteria: Meets the requirements

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: Add 1 mL of phosphoric acid to water, and dilute to 1000 mL.

Mobile phase: Acetonitrile and *Solution A* (17:83)

Standard solution: 0.4 mg/mL of USP Sulfadoxine RS prepared as follows. Dissolve an appropriate amount of USP Sulfadoxine RS in a suitable container with acetonitrile using 17% of the final volume, then dilute with *Solution A* to volume.

Sample solution: 0.4 mg/mL of sulfadoxine prepared as follows. Dissolve an appropriate amount of sulfadoxine in a suitable container with acetonitrile using 17% of the final volume, then dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 2.0-mm × 10-cm; 3-µm packing L11

Flow rate: 0.3 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

USP Monographs

www.webofpharma.com

Suitability requirements
Tailing factor: NMT 1.8
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sulfadoxine ($C_{12}H_{14}N_4O_4S$) in the portion of Sulfadoxine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulfadoxine RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulfadoxine in the *Sample solution* (mg/mL)

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
• **ORGANIC IMPURITIES**
Diluent: Alcohol and ammonium hydroxide (9:1)
Standard solution: 0.10 mg/mL of USP Sulfadoxine RS in *Diluent*
Sample solution: 20 mg/mL of Sulfadoxine in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 10 µL
Developing solvent system: Chloroform, methanol, and dimethylformamide (20:2:1)
Spray reagent A: 1-in-10 solution of sulfuric acid in alcohol
Spray reagent B: 1-in-200 solution of *N*-(1-naphthyl) ethylenediamine dihydrochloride in alcohol
Analysis
Samples: *Standard solution* and *Sample solution*
Separately apply the *Sample solution* and the *Standard solution* to the *Adsorbent*. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and air dry. Spray the dried plate with *Spray reagent A*, and expose to nitrous fumes generated by adding 7 M sulfuric acid dropwise to a solution containing 10% sodium nitrite and 3% potassium iodide. Dry the plate in a current of warm air for 15 min, and spray with *Spray reagent B*.
Acceptance criteria: No spot in the *Sample solution*, other than the principal spot, is greater in size and intensity than the spot from the *Standard solution*.

SPECIFIC TESTS
• **MELTING RANGE OR TEMPERATURE** ⟨741⟩**:** 197°–200°
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sulfadoxine RS

Sulfadoxine and Pyrimethamine Tablets

DEFINITION
Sulfadoxine and Pyrimethamine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sulfadoxine ($C_{12}H_{14}N_4O_4S$) and NLT 90.0% and NMT 110.0% of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$).

IDENTIFICATION
• **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution* for pyrimethamine and sulfadoxine, as obtained in the *Assay*.
• **B.**
Diluent: Ammonium hydroxide and methanol (1 in 50)
Standard solution A: 10 mg/mL of USP Sulfadoxine RS in *Diluent*
Standard solution B: 0.5 mg/mL of USP Pyrimethamine RS in *Diluent*
Sample solution: Vigorously shake 700 mg of finely ground Tablet powder with 50 mL of *Diluent* for 3 min, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Heptane, chloroform, solution of methanol in alcohol (1 in 20), and glacial acetic acid (4:4:4:1)
Analysis
Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*
Allow the solvent front to move about two-thirds of the length of the plate, remove the plate, dry, and examine under short-wavelength UV light.
Acceptance criteria: The R_F values of the principal spots from the *Sample solution* correspond to the R_F values of the principal spots from the corresponding *Standard solution*.

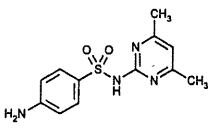
ASSAY
• **PROCEDURE**
Solution A: 1 mL of phosphoric acid in 1000 mL of water
Mobile phase: Acetonitrile and *Solution A* (17:83)
Standard solution: 0.4 mg/mL of USP Sulfadoxine RS and 0.02 mg/mL of USP Pyrimethamine RS prepared as follows. Transfer suitable amounts of USP Sulfadoxine RS and USP Pyrimethamine RS to a suitable volumetric flask. Dissolve in acetonitrile using about 17% of the final flask volume, then dilute with *Solution A* to volume.
Sample stock solution: Transfer an equivalent of about 200 mg of sulfadoxine and 10 mg of pyrimethamine from NLT 10 finely powdered Tablets to a 100-mL volumetric flask. Add about 28 mL of acetonitrile and sonicate for about 30 min. Allow to cool and dilute with *Solution A* to volume.
Sample solution: Nominally 0.4 mg/mL of sulfadoxine and 0.02 mg/mL of pyrimethamine in *Mobile phase* from *Sample stock solution*. Pass through a PVDF filter of 0.45-µm pore size. Discard the first 5 mL and use the remaining filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 2.0-mm × 10-cm; 3-µm packing L11
Flow rate: 0.3 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution*

USP Monographs

www.webofpharma.com

Suitability requirements
Resolution: NLT 1.5 between pyrimethamine and sulfadoxine
Tailing factor: NMT 1.6 for sulfadoxine; NMT 2.0 for pyrimethamine
Relative standard deviation: NMT 2.0% for both sulfadoxine and pyrimethamine
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amounts of sulfadoxine ($C_{12}H_{14}N_4O_4S$) and pyrimethamine ($C_{12}H_{13}ClN_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$



r_U = peak response of sulfadoxine or pyrimethamine from the *Sample solution*
r_S = peak response of sulfadoxine or pyrimethamine from the *Standard solution*
C_S = concentration of USP Sulfadoxine RS or USP Pyrimethamine RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sulfadoxine or pyrimethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each for sulfadoxine and pyrimethamine

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Medium: *pH 6.8 Phosphate Buffer*, prepared as directed in *Reagents, Indicators, and Solutions—Buffer Solutions*; 1000 mL
Apparatus 2: 75 rpm
Time: 30 min
Analysis: Determine the percentage of the labeled amounts of sulfadoxine ($C_{12}H_{14}N_4O_4S$) and pyrimethamine ($C_{12}H_{13}ClN_4$) dissolved, using the procedure set forth in the *Assay*, making any necessary modifications.
Tolerances: NLT 60% (*Q*) of the labeled amounts each of sulfadoxine ($C_{12}H_{14}N_4O_4S$) and pyrimethamine ($C_{12}H_{13}ClN_4$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩, *Content Uniformity*: Meet the requirements with respect to sulfadoxine and to pyrimethamine

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Pyrimethamine RS
USP Sulfadoxine RS

Sulfamethazine

$C_{12}H_{14}N_4O_2S$ 278.33
Benzenesulfonamide, 4-amino-*N*-(4,6-dimethyl-2-pyrimidinyl)-.
N^1-(4,6-Dimethyl-2-pyrimidinyl)sulfanilamide [57-68-1].

» Sulfamethazine contains not less than 99.0 percent and not more than 100.5 percent of $C_{12}H_{14}N_4O_2S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Sulfamethazine RS
Clarity and color of solution—Dissolve 1.0 g in a mixture of 20 mL of water and 5 mL of 1 N sodium hydroxide: the solution is clear and not more deeply colored than pale yellow.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).
B: To 0.10 g add 10 mL of water and just sufficient sodium hydroxide solution (1 in 250) to give a faint pink spot on phenolphthalein paper. Add 5 drops of cupric sulfate TS: a yellow-green precipitate is formed, and it becomes brown on standing.
Melting range ⟨741⟩: between 197° and 200°.
Acidity—Digest 3.0 g with 150 mL of carbon dioxide-free water at 70° for about 5 minutes, stirring occasionally to maintain suspension of the test specimen. Cool the mixture rapidly in an ice bath to 20 ± 0.5°, with mechanical stirring. Filter immediately, with vacuum, omitting washing of the solid but drying it thoroughly by suction. Add 2 drops of thymolphthalein TS to 25.0 mL of the filtrate, and titrate with 0.1 N sodium hydroxide VS. To a second 25.0-mL portion of the filtrate add 10 mL of hydrochloric acid. Cool the mixture to 15°, and titrate with 0.1 M sodium nitrite VS as directed under *Nitrite Titration* ⟨451⟩: the volume of 0.1 N sodium hydroxide consumed does not exceed the volume of 0.1 M sodium nitrite consumed by more than 0.5 mL.
Loss on drying ⟨731⟩—Dry about 1 g, accurately weighed, at 105° for 2 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.
Selenium ⟨291⟩: 0.003%, a 200-mg test specimen being used.

Ordinary impurities ⟨466⟩—
Test solution: acetone.
Standard solution: acetone.
Eluant: a mixture of ethyl acetate, methanol, and ammonium hydroxide (17:6:5).
Visualization: 11.
Assay—Proceed with Sulfamethazine as directed under *Nitrite Titration* ⟨451⟩. Each mL of 0.1 M sodium nitrite is equivalent to 27.83 mg of $C_{12}H_{14}N_4O_2S$.

Sulfamethazine Granulated

» Sulfamethazine Granulated contains Sulfamethazine mixed with suitable diluents, carriers, and inactive ingredients. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sulfamethazine ($C_{12}H_{14}N_4O_2S$).

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

www.webofpharma.com

Labeling—Label it to indicate that it is for veterinary use only. Label it also to indicate that it is for manufacturing, processing, or repackaging.

USP Reference standards ⟨11⟩—
USP Sulfamethazine RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for sulfamethazine, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay.*

Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 5 hours: it loses not more than 10% of its weight.

Powder fineness ⟨811⟩: not less than 95% passes a No. 20 sieve, and not more than 10% passes a No. 80 sieve.

Assay—

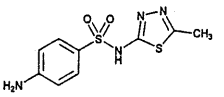
Mobile phase—Prepare a mixture of water, methanol, and glacial acetic acid (68:30:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Extractant—Prepare a mixture of 0.15 N hydrochloric acid and methanol (3:1).

Standard preparation—Prepare a solution of USP Sulfamethazine RS in *Extractant* having a known concentration of about 0.01 mg per mL.

Assay preparation—Transfer about 5 g of Sulfamethazine Granulated, accurately weighed, to a suitable container, add 250.0 mL of *Extractant,* and shake by mechanical means for 2 hours. Allow the mixture to settle, storing the mixture in a refrigerator if settling is allowed to continue overnight. Filter a portion of the supernatant, and transfer 10.0 mL of the clear filtrate to a 100-mL volumetric flask. Dilute with *Extractant* to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Extractant* to volume, and mix. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Assay preparation.* This solution contains about 0.01 mg of sulfamethazine per mL.

Derivatizing reagent—Dissolve 6.0 g of dimethylaminobenzaldehyde in 200 mL of glacial acetic acid, add 120 mL of methanol and 80 mL of water, mix, and degas. Prepare this reagent daily.



Chromatographic system—The liquid chromatograph is equipped with a guard column that contains packing L1, a 4.6-mm × 25-cm analytical column that contains 10-µm packing L1, a separate pump to deliver the *Derivatizing reagent* via a T-junction installed immediately postcolumn, a postcolumn derivatization coil consisting of 3-m × 0.5-mm inside-diameter polytef tubing, a flow cell, and a 450-nm detector. The *Mobile phase* flow rate is about 2 mL per minute, and the *Derivatizing reagent* flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, *k'*, for the sulfamethazine peak is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.5%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the sulfamethazine peaks. Calculate the quantity, in mg, of sulfamethazine ($C_{12}H_{14}N_4O_2S$) in each g of the Sulfamethazine Granulated taken by the formula:

$$100{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Sulfamethazine RS in the *Standard preparation; W* is the quantity, in g, of Sulfamethazine Granulated taken to prepare the *Assay preparation;* and r_U and r_S are the sulfamethazine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Sulfamethizole

$C_9H_{10}N_4O_2S_2$ 270.33

Benzenesulfonamide, 4-amino-*N*-(5-methyl-1,3,4-thiadiazol-2-yl)-;
*N*¹-(5-Methyl-1,3,4-thiadiazol-2-yl) sulfanilamide [144-82-1].

DEFINITION

Sulfamethizole contains NLT 98.0% and NMT 101.0% of sulfamethizole ($C_9H_{10}N_4O_2S_2$), calculated on the dried basis.

IDENTIFICATION

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sulfamethizole ($C_9H_{10}N_4O_2S_2$) in the portion of Sulfamethizole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulfamethizole RS in the *Standard solution* (µg/mL)
C_U = concentration of Sulfamethizole in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
  Sample solution: A 25.0-mL portion of the filtrate prepared in the test for *Acidity*
  Acceptance criteria: 0.014%; shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid.
- **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩
  Sample solution: A 25.0-mL portion of the filtrate prepared in the test for *Acidity*
  Acceptance criteria: 0.04%; shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid.
- **SELENIUM** ⟨291⟩: NMT 0.003%
- **ORDINARY IMPURITIES** ⟨466⟩
  Standard solution: Methanol
  Sample solution: Methanol
  Eluant: Acetone

  Acceptance criteria: Meets the requirements

SPECIFIC TESTS
- **MELTING RANGE OR TEMPERATURE** ⟨741⟩: 208°–212°
- **ACIDITY**
  Sample: 2.0 g
  Analysis: Digest the *Sample* with 100 mL of water at 70° for 5 min, cool immediately to about 20°, and filter. To 25.0 mL of the filtrate add 2 drops of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide. Save the remainder of the filtrate for the tests for *Chloride* and *Sulfate*.
  Acceptance criteria: NMT 0.50 mL is required for neutralization.
- **LOSS ON DRYING** ⟨731⟩
  Analysis: Dry at 105° for 2 h.
  Acceptance criteria: NMT 0.5%
- **CLARITY AND COLOR OF SOLUTION**
  Sample: 1.0 g
  Analysis: Dissolve the *Sample* in 20 mL of water and 5 mL of 1 N sodium hydroxide.
  Acceptance criteria: The solution is clear and not more than pale yellow.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sulfamethizole RS

Sulfamethizole Oral Suspension

DEFINITION
Sulfamethizole Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sulfamethizole ($C_9H_{10}N_4O_2S_2$), in a buffered aqueous suspension.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M**▲ (CN 1-May-2020)
  Sample: Equivalent to 500 mg of sulfamethizole from Oral Suspension
  Analysis: Transfer the *Sample* to a 50-mL centrifuge tube, add 30 mL of water, mix, and centrifuge the mixture. Decant, and discard the supernatant. Resuspend the residue in 15 mL of water, mix, and centrifuge the mixture. Decant, and discard the clear supernatant. Repeat the washing procedure an additional two times. Dissolve the residue in a mixture of 10 mL of 6 N ammonium hydroxide and 10 mL of water, and filter. Warm the filtrate until most of the ammonia is expelled, cool, and add 6 N acetic acid until the mixture is distinctly acid. A precipitate of sulfamethizole is formed. Collect the precipitate on a filter, wash it well with cold water, and dry at 105° for 2 h.
  Acceptance criteria: The infrared spectrum of the residue matches the infrared spectrum of similarly prepared USP Sulfamethizole RS.

ASSAY
- **PROCEDURE**
  Sample: An equivalent to 500 mg of sulfamethizole from Oral Suspension
  Analysis: Transfer the *Sample* to a beaker. Add 50 mL of water and 20 mL of hydrochloric acid, stir until dissolved, cool to 15°, and slowly titrate with 0.1 M sodium nitrite VS. Determine the endpoint potentiometrically using suitable electrodes. Each mL of 0.1 M sodium nitrite is equivalent to 27.03 mg of sulfamethizole ($C_9H_{10}N_4O_2S_2$).
  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meets the requirements for Oral Suspension packaged in single-unit containers
- **DELIVERABLE VOLUME** ⟨698⟩: Meets the requirements for Oral Suspension packaged in multiple-unit containers

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sulfamethizole RS

Sulfamethizole Tablets

Sulfamethoxazole Oral Suspension

DEFINITION
Sulfamethoxazole Oral Suspension contains NLT 95.0% and NMT 110.0% of the labeled quantity of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$).

IDENTIFICATION
• **A.**
Standard solution: Dissolve 100 mg of USP Sulfamethoxazole RS in 5 mL of ammonium hydroxide. Dilute with methanol to 50.0 mL.
Sample solution: Transfer a quantity of Oral Suspension, equivalent to 100 mg of sulfamethoxazole, into a 50-mL centrifuge tube. Add 5 mL of ammonium hydroxide, and shake gently. Add 25 mL of methanol, shake thoroughly for 3 min, centrifuge, decant the supernatant into a 50-mL volumetric flask, and dilute with methanol to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 50 µL
Developing solvent system: Alcohol, *n*-heptane, chloroform, and glacial acetic acid (25:25:25:7)
Spray reagent: 0.10 g of *p*-dimethylaminobenzaldehyde in 1 mL of hydrochloric acid. Dilute with alcohol to 100 mL.
Analysis
Samples: *Standard solution* and *Sample solution*
Apply the *Samples*, and allow the spots to dry. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with *Spray reagent*.
Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.
• **B.**
Sample: Transfer a quantity of Oral Suspension, equivalent to 500 mg of sulfamethoxazole, into a 50-mL centrifuge tube. Add 25 mL of water, mix, and centrifuge. Decant and discard the supernatant, resuspend the residue in 25 mL of water, mix, and centrifuge again. Decant and discard the clear supernatant. Repeat the washing procedure an additional two times.
Analysis: Dissolve the residue from the *Sample* in 10 mL of hydrochloric acid, and add 15 mL of sodium nitrite solution (1 in 100) and 5 mL of sodium hydroxide solution (1 in 10) containing 10 mg of 2-naphthol.
Acceptance criteria: A red-orange precipitate is produced.

ASSAY
• **PROCEDURE**
Sample solution: Mix a volume of Oral Suspension, equivalent to 1 g of sulfamethoxazole, with 20 mL of glacial acetic acid and 40 mL of water.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 M sodium nitrite VS
Endpoint detection: Potentiometric
Analysis: Add 15 mL of hydrochloric acid to the *Sample solution*. Cool to 15°, and titrate immediately with *Titrant*, using a calomel–platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 25.33 mg of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$).
Acceptance criteria: 95.0%–110.0%

PERFORMANCE TESTS
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meets the requirements for oral suspension packaged in single-unit containers
• **DELIVERABLE VOLUME** ⟨698⟩**:** Meets the requirements for oral suspension packaged in multiple-unit containers

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sulfamethoxazole RS

Sulfamethoxazole Tablets

DEFINITION
Sulfamethoxazole Tablets contain NLT 95.0% and NMT 105.0% of the labeled quantity of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$).

IDENTIFICATION
• **A.**
Standard solution: Dissolve 100 mg of USP Sulfamethoxazole RS in 5 mL of ammonium hydroxide. Dilute with methanol to 50.0 mL.
Sample solution: Transfer a quantity of finely powdered Tablets, equivalent to 100 mg of sulfamethoxazole, to a 50-mL centrifuge tube. Add 5 mL of ammonium hydroxide, and shake gently. Add 25 mL of methanol, shake thoroughly for 3 min, centrifuge, decant the supernatant into a 50-mL volumetric flask, and dilute with methanol to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 50 µL
Developing solvent system: Alcohol, *n*-heptane, chloroform, and glacial acetic acid (25:25:25:7)
Spray reagent: 0.10 g of *p*-dimethylaminobenzaldehyde in 1 mL of hydrochloric acid. Dilute with alcohol to 100 mL.
Analysis
Samples: *Standard solution* and *Sample solution*
Apply the *Samples*, and allow the spots to dry. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with *Spray reagent*.

Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution.*

• **B.**

Sample: A portion of finely powdered Tablets equivalent to 100 mg of sulfamethoxazole

Analysis: To the *Sample* add 2 mL of hydrochloric acid, 3 mL of sodium nitrite solution (1 in 100), and 1 mL of sodium hydroxide solution (1 in 10) containing 10 mg of 2-naphthol.

Acceptance criteria: A red-orange precipitate is formed.

ASSAY

• **PROCEDURE**

Sample solution: Dissolve NLT 20 finely powdered Tablets, equivalent to 500 mg of sulfamethoxazole, with 20 mL of glacial acetic acid and 40 mL of water, and add 15 mL of hydrochloric acid.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 M sodium nitrite VS

Endpoint detection: Potentiometric

Analysis: Cool the *Sample solution* to 15°, and titrate immediately with *Titrant* to a potentiometric endpoint using a calomel–platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 25.33 mg of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$).

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: Dilute hydrochloric acid (7 in 100); 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: USP Sulfamethoxazole RS in *Medium* at a known concentration

Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with *Medium* if necessary, in comparison to the *Standard solution.*

Instrumental conditions

Mode: UV

Analytical wavelength: 265 nm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) dissolved.

Tolerances: NLT 80% (*Q*) of the labeled amount of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sulfamethoxazole RS

Sulfamethoxazole and Trimethoprim Injection

DEFINITION

Sulfamethoxazole and Trimethoprim Injection is a sterile solution of Sulfamethoxazole and Trimethoprim in Water for Injection, which, when diluted with Dextrose Injection, is suitable for intravenous infusion. It contains NLT 90.0% and NMT 110.0% of the labeled quantities of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) and trimethoprim ($C_{14}H_{18}N_4O_3$).

IDENTIFICATION

• **A.** The R_F values of the principal spots of the *Sample solution* correspond to those of the *Standard solutions* of USP Trimethoprim RS (R_F about 0.5) and USP Sulfamethoxazole RS (R_F about 0.7), as obtained in the *Impurities* tests.

ASSAY

• **PROCEDURE**

Mobile phase: Mix 1400 mL of water, 400 mL of acetonitrile, and 2.0 mL of triethylamine in a 2000-mL volumetric flask. Allow to equilibrate to room temperature, and adjust with 0.2 N sodium hydroxide or dilute glacial acetic acid (1 in 100) to a pH of 5.9 ± 0.1. Dilute with water to volume, and pass through a filter of 0.45-µm pore size.

Standard stock solution: 0.32 mg/mL of USP Trimethoprim RS and 0.32*J* mg/mL of USP Sulfamethoxazole RS in methanol, where *J* is the ratio of the labeled amount, in mg, of sulfamethoxazole to the labeled amount, in mg, of trimethoprim in the dosage form

Standard solution: 0.032 mg/mL of USP Trimethoprim RS per mL and 0.032*J* mg/mL of USP Sulfamethoxazole RS per mL in *Mobile phase* from *Standard stock solution*

Sample stock solution: Transfer a volume of Injection, equivalent to 80 mg of sulfamethoxazole, to a 50-mL volumetric flask, and dilute with methanol to volume.

Sample solution: Nominally 0.16 mg/mL of sulfamethoxazole in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for trimethoprim and sulfamethoxazole are 1.0 and 1.8, respectively.]

Suitability requirements

Resolution: NLT 5.0 between sulfamethoxazole and trimethoprim

Tailing factor: NMT 2.0 for trimethoprim and sulfamethoxazole

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of trimethoprim ($C_{14}H_{18}N_4O_3$) and sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of trimethoprim or sulfamethoxazole from the *Sample solution*

r_S = peak response of trimethoprim or sulfamethoxazole from the *Standard solution*

C_S = concentration of the USP Trimethoprim RS or USP Sulfamethoxazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of trimethoprim or sulfamethoxazole in the *Sample solution* (mg/mL)

www.webofpharma.com

Acceptance criteria: 90.0%–110.0% each of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) and trimethoprim ($C_{14}H_{18}N_4O_3$)

IMPURITIES

• **LIMIT OF TRIMETHOPRIM DEGRADATION PRODUCT**

Solution A: 0.06 N hydrochloric acid solution

Standard solution A: 48 mg/mL of USP Trimethoprim RS in chloroform and methanol (1:1)

Standard solution B: 240 µg/mL of USP Trimethoprim RS in a mixture of chloroform and methanol (1:1) from *Standard solution A*

Sample solution: Transfer a volume of Injection, equivalent to 48 mg of trimethoprim and 240 mg of sulfamethoxazole, to a glass-stoppered, 50-mL centrifuge tube. Add 15 mL of *Solution A*, and mix. Add 15 mL of chloroform, shake for 30 s, and centrifuge at high speed for 3 min. Transfer the supernatant layer to a 125-mL separator. Extract the chloroform layer in the centrifuge tube with 15 mL of *Solution A*, centrifuge at high speed, and add the extract to the separator. Add 2 mL of sodium hydroxide solution (100 mg/mL) to the solution in the separator, and extract with three 20-mL portions of chloroform, collecting the organic layer in a 125-mL conical flask. Evaporate the chloroform under a stream of nitrogen to dryness. Dissolve the residue in 1 mL of a mixture of chloroform and methanol (1:1).

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 µL

Developing solvent system: Chloroform, methanol, and ammonium hydroxide (97: 7.5: 1)

Spray reagent: Freshly prepared mixture of ferric chloride solution (100 mg/mL) and potassium ferricyanide solution (50 mg/mL) (1:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* to separate points on the plate. Develop the chromatogram using *Developing solvent system* until the solvent front has moved at least 12 cm. Remove the plate from the developing chamber, air-dry, and spray with *Spray reagent*. Locate the bands by viewing under short-wavelength UV light. Trimethoprim produces a spot at about R_F 0.5, and the trimethoprim degradation product produces a spot at about R_F 0.6–0.7. [NOTE—There may be spots due to concentrate excipients at about R_F 0.1.]

Acceptance criteria: Any spot from the *Sample solution* at about R_F 0.6–0.7 is not greater in size and intensity than the spot produced by *Standard solution B* at about R_F 0.5, corresponding to NMT 0.5%.

• **LIMIT OF SULFANILAMIDE AND SULFANILIC ACID**

Solution A: Methanol and dehydrated alcohol (5:95)

Solution B: Dilute 1 mL of ammonium hydroxide with *Solution A* to 100 mL

Standard solution A: 10 mg/mL of USP Sulfamethoxazole RS in *Solution B*

Standard solution B: 0.05 mg/mL of USP Sulfanilamide RS in *Solution B*

Standard solution C: 0.03 mg/mL of USP Sulfanilic Acid RS in *Solution B*

Sample solution: Transfer a volume of Injection, equivalent to 32 mg of trimethoprim and 160 mg of sulfamethoxazole, into a 25-mL graduated cylinder. Dilute with *Solution B* to 16 mL.

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 µL

Developing solvent system: *Solution A*, heptane, chloroform, and glacial acetic acid (30:30:30:10)

Spray reagent (Modified Ehrlich's reagent): 100 mg of *p*-dimethylaminobenzaldehyde in 1 mL of hydrochloric acid. Dilute with alcohol to 100 mL.

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Apply the *Samples* to separate points on the plate. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved NLT 12 cm. Remove the plate from the developing chamber, air-dry, spray with *Spray reagent*, and allow the plate to stand for 15 min. Sulfamethoxazole produces a spot at about R_F 0.7.

Acceptance criteria: Any spots from the *Sample solution* at about R_F 0.5 or 0.1 are not greater in size or intensity than spots produced by *Standard solution B* and *Standard solution C*, respectively, corresponding to NMT 0.5% of sulfanilamide and 0.3% of sulfanilic acid.

SPECIFIC TESTS

• **pH** ⟨791⟩: 9.5–10.5

• **PYROGEN TEST** ⟨151⟩: Meets the requirements, the test dose being 0.5 mL/kg

• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose, light-resistant containers, preferably of Type I glass. It may be packaged in 50-mL multiple-dose containers.

• **LABELING:** Label it to indicate that it is to be diluted with 5% Dextrose Injection before administration.

• **USP REFERENCE STANDARDS** ⟨11⟩

Sulfamethoxazole and Trimethoprim Tablets

DEFINITION

Sulfamethoxazole and Trimethoprim Tablets contain NLT 93.0% and NMT 107.0% of the labeled amounts of sulfamethoxazole ($C_{10}H_{11}N_3O_3S$) and trimethoprim ($C_{14}H_{18}N_4O_3$).

IDENTIFICATION

• **A.**

Standard solution A: 0.4 mg/mL of USP Trimethoprim RS in methanol

Standard solution B: 2 mg/mL of USP Sulfamethoxazole RS in methanol

Sample solution: Transfer an amount of finely ground Tablets, equivalent to 4 mg of trimethoprim, to a 10-mL volumetric flask, add 8 mL of methanol, and warm for several min on a steam bath with frequent shaking. Cool, dilute with methanol to volume, and centrifuge briefly.

Chromatographic system

Mode: TLC

Application volume: 5 µL

Developing solvent system: Chloroform, isopropyl alcohol, and diethylamine (6:5:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* to separate points about 3 cm from one end of the plate. Dry the spots in a current of warm air, and develop the plate with *Developing solvent system* in a chamber that is lined with filter paper. Remove the plate, dry, and examine under short-wavelength UV light.

Acceptance criteria: The trimethoprim and sulfamethoxazole spots from the solution under test have the same R_F values as the spots from the corresponding *Standard solutions*.

ASSAY

• **PROCEDURE**

Mobile phase: Mix 1400 mL of water, 400 mL of acetonitrile, and 2.0 mL of triethylamine in a 2000-mL volumetric flask. Allow to equilibrate to room temperature, and adjust with 0.2 N sodium hydroxide or dilute glacial acetic acid (1 in 100) to a pH of 5.9 ± 0.1. Dilute with water to volume, and pass through a filter of 0.45-µm pore size.

Standard stock solution: 0.32 mg/mL of USP Trimethoprim RS and 0.32*J* mg/mL of USP Sulfamethoxazole RS in methanol, where *J* is the ratio of the labeled amount, in mg, of sulfamethoxazole to the labeled amount, in mg, of trimethoprim in the dosage form

Standard solution: 0.032 mg/mL of USP Trimethoprim RS per mL and 0.032*J* mg/mL of USP Sulfamethoxazole RS per mL in *Mobile phase* from *Standard stock solution*

Sample stock solution: Transfer from finely powdered Tablets (NLT 20), an equivalent to 160 mg of sulfamethoxazole, to a 100-mL volumetric flask. Add 50 mL of methanol and sonicate, with intermittent shaking, for 5 min. Allow to equilibrate to room temperature, dilute with methanol to volume, and filter. Use the filtrate in the preparation of the *Sample solution*.

Sample solution: Nominally 0.16 mg/mL of sulfamethoxazole in *Mobile phase* from *Sample stock solution*

Chromatographic system

- **ACIDITY**
  Sample: 2.0 g
  Analysis: Digest the *Sample* with 100 mL of water at 70° for 5 min, cool at once to 20°, and filter. To 25.0 mL of the filtrate add 2 drops of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide.
  Acceptance criteria: NMT 0.20 mL is required for neutralization.
- **LOSS ON DRYING** ⟨731⟩
  Analysis: Dry at 105° for 2 h.
  Acceptance criteria: NMT 0.5%
- **CLARITY AND COLOR OF SOLUTION**
  Sample solution: 1.0 g in a mixture of 20 mL of water and 5 mL of 1 N sodium hydroxide
  Acceptance criteria: The *Sample solution* is clear and not more deeply colored than pale yellow.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sulfapyridine RS

Sulfapyridine Tablets

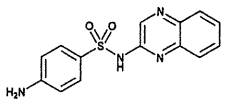
DEFINITION
Sulfapyridine Tablets contain NLT 95.0% and NMT 105.0% of the labeled quantity of sulfapyridine ($C_{11}H_{11}N_3O_2S$).

IDENTIFICATION
- **A. MELTING RANGE OR TEMPERATURE,** *Class Ia* ⟨741⟩
  Sample: Equivalent to 500 mg of sulfapyridine from finely powdered Tablets
  Analysis: Triturate the *Sample* with 5 mL of chloroform, and transfer to a small filter. Wash with another 5-mL portion of chloroform, and discard the filtrate. Triturate the residue with 10 mL of 6 N ammonium hydroxide for 5 min, add 10 mL of water, and filter. Warm the filtrate until most of the ammonia is expelled, cool, and add 6 N acetic acid until the reaction is distinctly acid. A precipitate of sulfapyridine is formed. Collect the precipitate on a filter, wash it well with cold water, and dry at 105° for 1 h. Also use the precipitate in *Identification* tests *B* and *C*.
  Acceptance criteria: The sulfapyridine so obtained melts between 189° and 192°.

Change to read:

- **B. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*▲ (CN 1-May-2020)
  Sample: Use the precipitate obtained in *Identification* test *A*.
  Acceptance criteria: Meet the requirements
- **C.**
  Sample solution: Add 5 mL of 3 N hydrochloric acid to 0.1 g from the precipitate obtained in *Identification* test *A*.
  Analysis: Boil gently the *Sample solution* for 5 min, then cool in an ice bath. Add 4 mL of sodium nitrite solution (1 in 100), dilute with water to 10 mL, and place the mixture in the ice bath for 10 min. To 5 mL of the cooled mixture add a solution of 50 mg of 2-naphthol in 2 mL of sodium hydroxide solution (1 in 10).
  Acceptance criteria: An orange-red precipitate is formed, and it darkens on standing.

ASSAY
- **NITRITE TITRATION** ⟨451⟩
  Sample: Finely powdered Tablets (NLT 20 Tablets) equivalent to 500 mg of sulfapyridine
  Analysis: Proceed as directed in the chapter, beginning with "and transfer to a suitable open vessel". Each mL of 0.1 M sodium nitrite is equivalent to 24.93 mg of sulfapyridine ($C_{11}H_{11}N_3O_2S$).
  Acceptance criteria: 95.0%–105.0%



PERFORMANCE TESTS
- **DISSOLUTION** ⟨711⟩
  Medium: 0.01 N hydrochloric acid; 900 mL
  Apparatus 2: 50 rpm
  Time: 60 min
  Standard solution: USP Sulfapyridine RS in *Medium*
  Sample solution: Filtered portion of solution under test, suitably diluted with 0.01 N sodium hydroxide in comparison to the *Standard solution*
  Instrumental conditions
  Mode: UV
  Analytical wavelength: Maximum absorbance at about 254 nm
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of sulfapyridine ($C_{11}H_{11}N_3O_2S$) dissolved.
  Tolerances: NLT 70% (*Q*) of the labeled amount of sulfapyridine ($C_{11}H_{11}N_3O_2S$) is dissolved.

  Sample solution: 10 µg/mL in 0.01 N sodium hydroxide
  Acceptance criteria: Meets the requirements

ASSAY
- **PROCEDURE**
  Mobile phase: 2 g/L of monobasic ammonium phosphate in a mixture of acetonitrile, glacial acetic acid, tetrahydrofuran, ammonium hydroxide, and water (400:10:5:2:583). Pass through a filter of 0.5-µm or finer pore size.
  Standard solution: 0.06 mg/mL of USP Sulfaquinoxaline RS in 0.01 N sodium hydroxide
  Sample solution: 0.06 mg/mL of Sulfaquinoxaline in 0.01 N sodium hydroxide
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 4-mm × 25-cm; packing L1
  Flow rate: 1 mL/min
  Injection size: 15 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 1.2
  Relative standard deviation: NMT 1.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of sulfaquinoxaline ($C_{14}H_{12}N_4O_2S$) in the portion of Sulfaquinoxaline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulfaquinoxaline RS in the *Standard solution* (mg/mL)
C_U = concentration of Sulfaquinoxaline in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **ORGANIC IMPURITIES**
  Sample solution: 4 mg/mL, prepared as follows. Dissolve 400 mg of Sulfaquinoxaline in 4 mL of 1 N sodium hydroxide, dilute with methanol to 100 mL, and mix.
  Standard solution A: 0.12 mg/mL of USP Sulfaquinoxaline Related Compound A RS in methanol
  Standard solution B: 0.04 mg/mL of sulfanilamide in methanol
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
  Application volume: 5 µL
  Developing solvent system: Chloroform, methanol, and ammonium hydroxide (60:40:20)
  Analysis: Separately apply each solution to the TLC plate, and proceed as directed in the chapter. When the solvent front has moved about three-fourths the length of the plate, remove the plate from the chamber, mark the solvent front, allow it to air-dry, and examine the plate under short-wavelength UV light.
  Acceptance criteria: No spot corresponding to sulfaquinoxaline related compound A in the chromatogram of the *Sample solution* is more intense than the principal spot in the chromatogram of *Standard solution A* (NMT 3.0%); and no spot, other than the principal spot and the sulfaquinoxaline related compound A spot, in the chromatogram of the *Sample solution* is more intense than the principal spot in the chromatogram of *Standard solution B* (NMT 1.0%).

SPECIFIC TESTS
- **ACIDITY**
  Sample: 2 g
  Analysis: Digest the *Sample* with 100 mL of water at about 70° for 5 min, cool to about 20°, and filter. Titrate 50 mL of the filtrate with 0.1 N sodium hydroxide VS to a pH of 7.0.
  Acceptance criteria: NMT 0.2 mL is required
- **LOSS ON DRYING** ⟨731⟩: Dry a sample at 105° for 4 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** ⟨11⟩

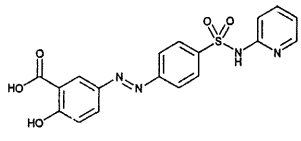
Sulfaquinoxaline Oral Solution

» Sulfaquinoxaline Oral Solution contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of sulfaquinoxaline ($C_{14}H_{12}N_4O_2S$).



Packaging and storage—Preserve in tight, light-resistant containers.
Labeling—Label it to indicate that it is for veterinary use only.
USP Reference standards ⟨11⟩—
USP Sulfaquinoxaline RS
Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.
Deliverable volume ⟨698⟩: meets the requirements.
pH ⟨791⟩: not less than 12.

Assay—
Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay* under *Sulfaquinoxaline*.
Standard preparation—Dissolve an accurately weighed quantity of USP Sulfaquinoxaline RS in 0.01 N sodium hydroxide to obtain a solution having a known concentration of about 0.7 mg per mL. Dilute an accurately measured volume of this solution quantitatively with water to obtain a solution having a known concentration of about 0.15 mg per mL.
Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 300 mg of sulfaquinoxaline, to a 2000-mL volumetric flask, dilute with water to volume, and mix.
Procedure—Separately inject equal volumes (about 8 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sulfaquinoxaline ($C_{14}H_{12}N_4O_2S$) in each mL of the Oral Solution taken by the formula:

$$2000(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Sulfaquinoxaline RS in the *Standard preparation*, V is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*, and r_U and r_S are the sulfaquinoxaline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Sulfasalazine

$C_{18}H_{14}N_4O_5S$ 398.39
Benzoic acid, 2-hydroxy-5-[[4-[(2-pyridinylamino)sulfonyl] phenyl]azo]-;
5-[[*p*-(2-Pyridylsulfamoyl)phenyl]azo]salicylic acid [599-79-1].

DEFINITION
Sulfasalazine contains NLT 97.0% and NMT 101.5% of $C_{18}H_{14}N_4O_5S$, calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Standard solution: Use the *Standard solution*, prepared as directed in the *Assay*.
Sample solution: Use the *Sample solution*, prepared as directed in the *Assay*.
Acceptance criteria: The visible absorption spectrum of the *Sample solution* corresponds to that of the *Standard solution*, as obtained from the *Assay*.

ASSAY
- **PROCEDURE**

Sample stock solution: 1.5 mg/mL of Sulfasalazine in 0.1 N sodium hydroxide
Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 1000-mL volumetric flask containing 750 mL of water, mix, add 20.0 mL of 0.1 N acetic acid, and dilute with water to volume.
Standard solution: 7.5 µg/mL of USP Sulfasalazine RS in the same medium as the *Sample solution*
Spectrometric conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV-Vis
Analytical wavelength: Maximum at about 359 nm
Blank: Water
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Concomitantly determine the absorbances of the *Samples*. Calculate the percentage of $C_{18}H_{14}N_4O_5S$ in the portion of Sulfasalazine taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Sulfasalazine RS in the *Standard solution* (µg/mL)
C_U = concentration of Sulfasalazine in the *Sample solution* (µg/mL)

Acceptance criteria: 97.0%–101.5% on the dried basis

IMPURITIES
INORGANIC IMPURITIES
- **Residue on Ignition** ⟨281⟩: NMT 0.5%
- **Chloride and Sulfate,** *Chloride* ⟨221⟩

Analysis: Digest 2.0 g of Sulfasalazine with 100 mL of water at 70° for 5 min. Cool immediately to room temperature, and filter. Transfer a 25-mL portion of the filtrate to a 50-mL beaker (retain the remainder of this filtrate for the *Sulfate* test). Add 1 mL of nitric acid, mix, and allow to stand for 5 min. Pass through a fine texture, retentive filter paper (Whatman No. 42, or equivalent).
Acceptance criteria: The filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).
- **Chloride and Sulfate,** *Sulfate* ⟨221⟩

Analysis: Transfer a 25-mL portion of the filtrate from the *Chloride* test to a 50-mL beaker. Add 1 mL of 3 N hydrochloric acid, mix, and allow to stand for 5 min. Pass through a fine

www.webofpharma.com

texture, retentive filter paper (Whatman No. 42, or equivalent).

Acceptance criteria: The filtrate shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.04%).

ORGANIC IMPURITIES

• **Procedure**

Standard stock solution: 10 mg/mL of USP Sulfasalazine RS in a mixture of alcohol and 2 M ammonium hydroxide (4:1)

Standard solutions: Dilute aliquots of the *Standard stock solution* stepwise with the same medium to obtain solutions having concentrations of 200, 150, 100, and 20 µg/mL, corresponding to 2.0%, 1.5%, 1.0%, and 0.2%, respectively (*Standard solutions A, B, C,* and *D*).

Sample solution: 10 mg/mL of Sulfasalazine in a mixture of alcohol and 2 M ammonium hydroxide (4:1)

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform, acetone, and formic acid (12:6:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Allow the spots to dry, and develop the chromatogram in an unequilibrated chamber until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, dry with the aid of a current of hot air, and examine the plate under short-wavelength UV light.

Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*. No spots, other than the principal spot, in the chromatogram of the *Sample solution* are larger or more intense than the principal spot of *Standard solution A* (2%), and the sum of the intensities of any secondary spots detected does not exceed 4%.

SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

Acceptance criteria: The visible absorption spectrum of the *Sample solution* corresponds to that of the *Standard solution*, as prepared in the *Assay*.

ASSAY

• **PROCEDURE**

Standard solution: 7.5 µg/mL of USP Sulfasalazine RS in the same medium as the *Sample solution*

Sample stock solution: Nominally 1.5 mg/mL of sulfasalazine prepared as follows. Dissolve an appropriate amount of sulfasalazine from finely powdered Tablets (NLT 20) in 0.1 N sodium hydroxide in a suitable volumetric flask.

Sample solution: Nominally 7.5 µg/mL of sulfasalazine prepared as follows. Transfer 5.0 mL of the *Sample stock solution* to a 1000-mL volumetric flask containing 750 mL of water. Mix, add 20.0 mL of 0.1 N acetic acid, and dilute with water to volume.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: UV

Analytical wavelength: Maximum at about 359 nm

Blank: Water

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Concomitantly determine the absorbances of the *Samples*.

Calculate the percentage of the labeled amount of sulfasalazine ($C_{18}H_{14}N_4O_5S$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Sulfasalazine RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of sulfasalazine in the *Sample solution* (µg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩**:** Proceed as directed in the *Procedure* for *Method B* in *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms*.

Acid stage

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 120 min

At the end of 120 min, determine the amount of sulfasalazine ($C_{18}H_{14}N_4O_5S$) dissolved by using the following method.

Mobile phase: Isopropanol, acetonitrile, water, and glacial acetic acid (11: 7: 22: 0.4)

Standard solution: 55.6 µg/mL of USP Sulfasalazine RS in 0.1 N sodium hydroxide

Sample solution: Pass about 7 mL of the solution under test through a membrane filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for sulfasalazine is about 7.7 min.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulfasalazine ($C_{18}H_{14}N_4O_5S$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sulfasalazine RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NMT 10% of the labeled amount of sulfasalazine ($C_{18}H_{14}N_4O_5S$) is dissolved.

Buffer stage

Medium: pH 7.5 phosphate buffer; 900 mL

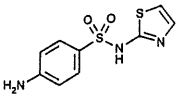
Apparatus 1: 100 rpm

Time: 60 min

At the end of 60 min, determine the amount of sulfasalazine ($C_{18}H_{14}N_4O_5S$) dissolved by using the chromatographic method as described in *Acid stage*.

Tolerances: NLT 85% (*Q*) of the labeled amount of sulfasalazine ($C_{18}H_{14}N_4O_5S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sulfasalazine RS

Sulfathiazole

$C_9H_9N_3O_2S_2$ 255.32

Benzenesulfonamide, 4-amino-*N*-2-thiazolyl-. *N*¹-2-Thiazolylsulfanilamide [72-14-0].

» Sulfathiazole contains not less than 99.0 percent and not more than 100.5 percent of $C_9H_9N_3O_2S_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

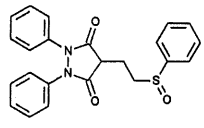
Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: To 100 mg add 5 mL of 3 N hydrochloric acid, and boil gently for about 5 minutes. Cool in an ice bath, add 4 mL of sodium nitrite solution (1 in 100), dilute with water to 10 mL, and place the mixture in an ice bath for 10 minutes. To 5 mL of the cooled mixture add a solution of 50 mg of 2-naphthol



USP Monographs

www.webofpharma.com

in 2 mL of sodium hydroxide solution (1 in 10): an orange-red precipitate is formed, and it darkens on standing.
Melting range, *Class I* ⟨741⟩: between 200° and 204°.
Acidity—Digest 2 g with 100 mL of water at about 70° for 5 minutes, cool at once to about 20°, and filter. Titrate 25 mL of the filtrate with 0.10 N sodium hydroxide, using 2 drops of phenolphthalein TS as the indicator: not more than 0.5 mL is required to produce a pink color. (Retain the remainder of the filtrate for the tests for *Chloride* ⟨221⟩ and for *Sulfate* ⟨221⟩.)
Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.
Chloride ⟨221⟩—A 25-mL portion of the filtrate prepared as directed in the test for *Acidity* shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).
Sulfate ⟨221⟩—A 25-mL portion of the filtrate prepared as directed in the test for *Acidity* shows no more sulfate than corresponds to 0.2 mL of 0.02 N sulfuric acid (0.04%).

Ordinary impurities ⟨466⟩—
Test solution: methanol.
Standard solution: methanol.
Eluant: a mixture of 1-propanol and 1 N ammonium hydroxide (22:3).
Visualization: 1.
Assay—Proceed with Sulfathiazole as directed under *Nitrite Titration* ⟨451⟩. Each mL of 0.1 M sodium nitrite is equivalent to 25.53 mg of $C_9H_9N_3O_2S_2$.

Sulfinpyrazone

$C_{23}H_{20}N_2O_3S$ 404.48
3,5-Pyrazolidinedione, 1,2-diphenyl-4-[2-(phenylsulfinyl) ethyl]-;
1,2-Diphenyl-4-[2-(phenylsulfinyl) ethyl]-3,5-pyrazolidinedione [57-96-5].

DEFINITION
Sulfinpyrazone contains NLT 98.5% and NMT 101.5% of $C_{23}H_{20}N_2O_3S$, calculated on the dried basis.

IDENTIFICATION

Solution B: 0.1 N acetic acid, 0.1 N potassium hydroxide, and water (6:5:14). Adjust to a pH of 5.0.
Diluent: Acetonitrile and *Solution B* (4:1)
Standard solution: 10 µg/mL of USP Sulfinpyrazone RS in *Diluent*
Sample solution: 2 mg/mL of Sulfinpyrazone in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 4.6-mm × 10-cm; packing L1
Flow rate: 3 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for sulfinpyrazone is about 4.0–4.6 min.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Sample solution* into the chromatograph, record the chromatograms, and measure the responses of the major peaks.
Acceptance criteria: The sum of the peak responses, other than that of the sulfinpyrazone peak, from the *Sample solution* is NMT four times the sulfinpyrazone peak response from the *Standard solution* (2.0%), and no single peak response is greater than twice the sulfinpyrazone peak response from the *Standard solution* (1.0%).

SPECIFIC TESTS
- **LOSS ON DRYING** ⟨731⟩: Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Sulfinpyrazone RS

Sulfinpyrazone Capsules

DEFINITION
Sulfinpyrazone Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of sulfinpyrazone ($C_{23}H_{20}N_2O_3S$).

IDENTIFICATION
- **A.**

Solution A: 5% of methanol in dehydrated alcohol
Sample: Equivalent to 400 mg of sulfinpyrazone from Capsules
Analysis: Boil the *Sample* in 20 mL of *Solution A*, and filter. Add water to the filtrate until the solution becomes turbid, allow to stand until crystals form (1–2 h), remove the crystals by filtration, and dry at 105° for 1 h.

USP Monographs

www.webofpharma.com

Acceptance criteria: The sulfinpyrazone obtained melts between 128° and 134°.

Change to read:

• **B. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Sample: Use the sulfinpyrazone crystals obtained from *Identification* test *A* under *Sulfinpyrazone*.
Acceptance criteria: Meet the requirements

ASSAY
• **PROCEDURE**
Solution A: Acetonitrile and tetrahydrofuran (4:1)
Solution B: Diluted phosphoric acid (3 in 1000)
Mobile phase: *Solution A* and *Solution B* (35:65)
Internal standard solution: 2 mg/mL of benzoic acid in acetonitrile
Standard solution: 0.5 mg/mL of USP Sulfinpyrazone RS prepared as follows. Transfer 100 mg of USP Sulfinpyrazone RS to a 200-mL volumetric flask. Add 100 mL of acetonitrile, mix, add 10.0 mL of *Internal standard solution*, and dilute with acetonitrile to volume. Filter, discarding the first 5 mL of the filtrate.
Sample solution: Nominally 0.5 mg/mL of sulfinpyrazone prepared as follows. Remove, as completely as possible, the contents of NLT 20 Capsules, weigh, and mix. Transfer a portion of the powder, equivalent to 100 mg of sulfinpyrazone, to a 200-mL volumetric flask. Add 100 mL of acetonitrile, mix, add 10.0 mL of *Internal standard solution*, and dilute with acetonitrile to volume. Filter, discarding the first 5 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 4.6-mm × 10-cm; packing L1
Flow rate: 3 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoic acid and sulfinpyrazone are about 0.2 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 13 between the benzoic acid and sulfinpyrazone peaks
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sulfinpyrazone ($C_{23}H_{20}N_2O_3S$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of sulfinpyrazone to the internal standard from the *Sample solution*
R_S = peak response ratio of sulfinpyrazone to the internal standard from the *Standard solution*
C_S = concentration of USP Sulfinpyrazone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sulfinpyrazone in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Medium: *pH 6.8 Phosphate Buffer* (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL
Apparatus 1: 100 rpm
Time: 45 min
Standard solution: Prepare a solution having a known concentration of USP Sulfinpyrazone RS in *Medium*.
Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: Absorption maximum at about 259 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the percentage of sulfinpyrazone ($C_{23}H_{20}N_2O_3S$) dissolved.
Tolerances: NLT 75% (*Q*) of the labeled amount of sulfinpyrazone ($C_{23}H_{20}N_2O_3S$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS

USP Sulfinpyrazone RS

Sulfisoxazole

$C_{11}H_{13}N_3O_3S$ 267.30
Benzenesulfonamide, 4-amino-*N*-(3,4-dimethyl-5-isoxazolyl)-.
N[1]-(3,4-Dimethyl-5-isoxazolyl)sulfanilamide [127-69-5].

» Sulfisoxazole contains not less than 99.0 percent and not more than 101.0 percent of $C_{11}H_{13}N_3O_3S$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Sulfisoxazole RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The UV absorption spectrum of a 1 in 100,000 solution in pH 7.5 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), prepared by dissolving about 100 mg of Sulfisoxazole, accurately weighed, in 10 mL of sodium hydroxide solution (1 in 250) and adding sufficient amounts of the buffer solution to make 100 mL, then diluting 10 mL of the resulting solution with the buffer solution to 1000 mL, exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Sulfisoxazole RS, concomitantly measured.

C: Dissolve about 10 mg in 2 mL of 3 N hydrochloric acid with the aid of heat, cool for 5 minutes in an ice bath, add 3 drops of sodium nitrite solution (1 in 100), and dilute with water to 4 mL: a yellow solution is produced. Add 1 mL of sodium hydroxide solution (1 in 10) containing 10 mg of 2-naphthol: an orange-red precipitate is formed.

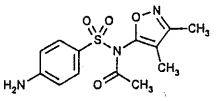
Melting range ⟨741⟩: between 194° and 199°.
Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.
Selenium ⟨291⟩: 0.003%, a 200-mg test specimen being used.

Ordinary impurities ⟨466⟩—
Test solution: ethyl acetate.
Standard solution: ethyl acetate.
Eluant: a mixture of acetone, cyclohexane, and glacial acetic acid (5:4:1).
Visualization: 1.

Assay—Place about 800 mg of Sulfisoxazole, accurately weighed, in a 250-mL conical flask, add 50 mL of dimethylformamide, shake thoroughly to dissolve the solid, add 5 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate with 0.1 N lithium methoxide in toluene VS to a blue endpoint, taking precautions against absorption of atmospheric carbon dioxide. Perform a blank

www.webofpharma.com

determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 26.73 mg of $C_{11}H_{13}N_3O_3S$.



Sulfisoxazole Tablets

» Sulfisoxazole Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{11}H_{13}N_3O_3S$.

Packaging and storage—Preserve in well-closed, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Sulfisoxazole RS
Identification—Extract a quantity of powdered Tablets, equivalent to about 1 g of sulfisoxazole, with 50 mL of alcohol by boiling on a steam bath for 3 minutes, then immediately filter into a beaker. Allow to stand until a quantity of fine, needle-like crystals form. Cool, filter off the crystals, recrystallize from a small volume of alcohol, and dry at 105°: the crystals respond to *Identification* test *A* under *Sulfisoxazole.*

Dissolution ⟨711⟩—
Medium: dilute hydrochloric acid (1 in 12.5); 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.
Procedure— [NOTE—Because of the pH-dependent nature of the UV absorption spectrum, prepare the standard and specimen solutions in the same strength of acid at approximately equal concentrations.] Determine the amount of $C_{11}H_{13}N_3O_3S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 267 nm of filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Sulfisoxazole RS in the same medium.
Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{11}H_{13}N_3O_3S$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Assay—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 800 mg of sulfisoxazole, transfer to a 250-mL conical flask, and proceed as directed in the *Assay* under *Sulfisoxazole,* beginning with "add 50 mL of dimethylformamide."

Sulfisoxazole Acetyl

$C_{13}H_{15}N_3O_4S$ 309.34
Acetamide, *N*-[(4-aminophenyl)sulfonyl]-*N*-(3,4-dimethyl-5-isoxazolyl)-.
N-(3,4-Dimethyl-5-isoxazolyl)-*N*-sulfanilylacetamide [80-74-0].

» Sulfisoxazole Acetyl contains not less than 98.0 percent and not more than 100.5 percent of $C_{13}H_{15}N_3O_4S$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Sulfisoxazole Acetyl RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020)

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 10 µg per mL.
Medium: alcohol.
Absorptivities at 290 nm, calculated on the dried basis, do not differ by more than 3.0%.
Melting range ⟨741⟩: between 192° and 195°.
Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Ordinary impurities ⟨466⟩—
Test solution: methanol.
Standard solution: methanol.
Eluant: a mixture of toluene and acetone (1:1).
Visualization: 1.
Other requirements—It meets the requirements for *Residue on ignition,* and *Selenium* under *Sulfisoxazole.*
Assay—Transfer about 1 g of Sulfisoxazole Acetyl, accurately weighed, to a 250-mL beaker. Add 15 mL of glacial acetic acid, swirl to dissolve, then add 25 mL of hydrochloric acid and 80 mL of water. Proceed as directed under *Nitrite Titration* ⟨451⟩, beginning with "Cool to about 15°." Each mL of 0.1 M sodium nitrite is equivalent to 30.94 mg of $C_{13}H_{15}N_3O_4S$.

Sulfisoxazole Acetyl Oral Suspension

» Sulfisoxazole Acetyl Oral Suspension contains an amount of Sulfisoxazole Acetyl equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of sulfisoxazole ($C_{11}H_{13}N_3O_3S$).

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Sulfisoxazole Acetyl RS
Identification—Centrifuge a portion of it, wash the separated solid by centrifugation with several portions of water, and recrystallize from hot alcohol: the crystals so obtained respond to *Identification* tests *A* and *B* under *Sulfisoxazole Acetyl.*

Uniformity of dosage units ⟨905⟩—
FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume ⟨698⟩—
FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.
pH ⟨791⟩: between 5.0 and 5.5.
Assay—Transfer an accurately measured volume of Oral Suspension, previously mixed, equivalent to about 1 g of

www.webofpharma.com

sulfisoxazole, to a 250-mL beaker. Add 40 mL of hydrochloric acid and 25 mL of glacial acetic acid, and swirl to dissolve. Cautiously add 100 mL of water, and proceed as directed under *Nitrite Titration* ⟨451⟩, beginning with "Cool to about 15°." Each mL of 0.1 M sodium nitrite is equivalent to 26.73 mg of sulfisoxazole ($C_{11}H_{13}N_3O_3S$).

Precipitated Sulfur

S 32.07
Sulfur [7704-34-9].

DEFINITION
Precipitated Sulfur contains NLT 99.5% and NMT 100.5% of sulfur (S), calculated on the anhydrous basis.

IDENTIFICATION
• **A.** It burns in the air to sulfur dioxide, which can be recognized by its characteristic odor.

ASSAY
• **PROCEDURE**
Sample: 60 mg of Precipitated Sulfur
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N sodium hydroxide VS
Endpoint detection: Visual
Analysis: Proceed as directed in *Oxygen Flask Combustion* ⟨471⟩, using a 1000-mL flask and using a mixture of 10 mL of water and 5.0 mL of hydrogen peroxide TS as the absorbing liquid. When the combustion is complete, fill the lip of the flask with water; loosen the stopper; then rinse the stopper, the sample holder, and the sides of the flask with water; and remove the stopper assembly. Heat the contents of the flask to boiling, and boil for 2 min. Cool to room temperature, add phenolphthalein TS, and titrate with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 1.603 mg of sulfur (S).
Acceptance criteria: 99.5%–100.5% on the anhydrous basis

OTHER COMPONENTS
• **OTHER FORMS OF SULFUR**
Sample: 1.0 g
Analysis: Shake the *Sample* with 5 mL of carbon disulfide.
Acceptance criteria: It dissolves quickly, with the exception of a small quantity of insoluble matter that is usually present.

IMPURITIES
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.3%

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method I* ⟨921⟩**:** NMT 0.5%
• **REACTION**
Sample: 2.0 g
Analysis: Agitate the *Sample* with 10 mL of water, and filter.
Acceptance criteria: The filtrate is neutral to litmus.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sulfur Ointment

DEFINITION
Sulfur Ointment contains NLT 9.5% and NMT 10.5% of sulfur (S).

Precipitated Sulfur	100 g
Mineral Oil	100 g
White Ointment	800 g
To make	1000 g

Levigate the *Precipitated Sulfur* with the *Mineral Oil* to a smooth paste, and then incorporate with the *White Ointment*.

ASSAY
• **PROCEDURE**
Sample: 500 mg in a suitable conical flask
Analysis: Add 5 mL of nitric acid and 3 mL of bromine to the *Sample*, warm slightly, and allow to stand overnight. Heat gently on a steam bath until the excess bromine has been dissipated. Add 30 mL of water and then 30 mL of ether, and swirl to dissolve most of the ointment base. Transfer the mixture to a separator, with the aid of a 20-mL and a 10-mL portion of ether, followed by two 10-mL portions of water. Shake the mixture, and draw off the water layer into a suitable beaker or flask. Extract the ether layer with two 40-mL portions of water each containing 1 mL of hydrochloric acid. Heat the combined water extracts on a steam bath to remove all traces of ether. Dilute the solution with water to about 200 mL, heat to boiling, and add slowly, with constant stirring, about 20 mL of hot barium chloride TS. Heat on a steam bath for 1 h, then collect the precipitate on a filter, wash it well with hot water, dry, and ignite to constant weight. The weight of the barium sulfate so obtained, multiplied by 0.1374, represents the weight of sulfur (S).
Acceptance criteria: 9.5%–10.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in well-closed containers, and avoid prolonged exposure to excessive heat.

Sublimed Sulfur

S 32.07
Sulfur [7704-34-9].

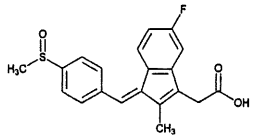
DEFINITION
Sublimed Sulfur, dried over phosphorus pentoxide for 4 h, contains NLT 99.5% and NMT 100.5% of sulfur (S).

IDENTIFICATION
• **A.** It burns in the air to sulfur dioxide, which can be recognized by its characteristic odor.

ASSAY
• **PROCEDURE**
Sample: 60 mg of Sublimed Sulfur previously dried over phosphorous pentoxide for 4 h
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N sodium hydroxide VS
Endpoint detection: Visual
Analysis: Proceed as directed in *Oxygen Flask Combustion* ⟨471⟩, using a 1000-mL flask and using a mixture of 10 mL

USP Monographs

www.webofpharma.com



of water and 5.0 mL of hydrogen peroxide TS as the absorbing liquid. When the combustion is complete, fill the lip of the flask with water; loosen the stopper; then rinse the stopper, sample holder, and sides of the flask with water; and remove the stopper assembly. Heat the contents of the flask to boiling, and boil for about 2 min. Cool to room temperature, add phenolphthalein TS, and titrate with *Titrant*. Perform a blank determination and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 1.603 mg of sulfur (S).
Acceptance criteria: 99.5%–100.5% dried over phosphorous pentoxide for 4 h

IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.5%
- **ARSENIC,** *Method I* ⟨211⟩
Test preparation: Digest 750 mg of Sublimed Sulfur with 20 mL of 6 N ammonium hydroxide for 3 h, filter, and evaporate the clear filtrate on a steam bath to dryness. Add 15 mL of 2 N sulfuric acid and 1 mL of 30% hydrogen peroxide solution, evaporate to strong fumes of sulfur trioxide, and cool. Add cautiously 10 mL of water, and again evaporate to strong fumes, repeating, if necessary, to remove any trace of hydrogen peroxide. Cool, and dilute cautiously with water to 35 mL.
Acceptance criteria: NMT 4 ppm

SPECIFIC TESTS
- **SOLUBILITY IN CARBON DISULFIDE**
Sample: 1 g
Acceptance criteria: The *Sample* dissolves slowly and usually incompletely in about 2 mL of carbon disulfide.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sulindac

$C_{20}H_{17}FO_3S$ 356.41
1*H*-Indene-3-acetic acid, 5-fluoro-2-methyl-1-[[4-(methylsulfinyl) phenyl]methylene]-, (*Z*)-;
cis-5-Fluoro-2-methyl-1-[(*p*-methylsulfinyl)benzylidene] indene-3-acetic acid [38194-50-2].

DEFINITION
Sulindac contains NLT 98.0% and NMT 102.0% of sulindac ($C_{20}H_{17}FO_3S$), calculated on the dried basis.

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **RESIDUAL SOLVENTS** ⟨467⟩

Solvent: Dimethylsulfoxide

Acceptance criteria: Meets the requirements except that chloroform is NMT 500 ppm

- **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.6 µg/mL of USP Sulindac RS and 3 µg/mL each of USP Sulindac Related Compound A RS, USP Sulindac Related Compound B RS, and USP Sulindac Related Compound C RS in *Diluent*. Sonicate for 2–5 min.

Sample solution: 600 µg/mL of Sulindac in *Diluent*. Sonicate for 2–5 min.

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 4.0 between sulindac and sulindac related compound A and between sulindac related compound A and sulindac related compound B

Relative standard deviation: NMT 2.0% for any peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of sulindac related compound A, sulindac related compound B, and sulindac related compound C in the portion of Sulindac taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the specified impurity from the *Sample solution*

r_S = peak response of the corresponding related compound from the *Standard solution*

C_S = concentration of the corresponding related compound in the *Standard solution* (µg/mL)

C_U = concentration of Sulindac in the *Sample solution* (µg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Sulindac taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any individual unspecified impurity from the *Sample solution*

r_S = peak response of sulindac from the *Standard solution*

C_S = concentration of USP Sulindac RS in the *Standard solution* (µg/mL)

C_U = concentration of Sulindac in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sulindac	1.0	—
Sulindac related compound A[a]	1.25	0.5
Sulindac related compound B[b]	1.34	0.5
Sulindac related compound C[c]	1.67	0.5
Any individual unspecified impurity	—	0.10
Total impurities	—	1.0

[a] (*E*)-2-{5-Fluoro-2-methyl-1-[4-(methylsulfinyl)benzylidene]-1*H*-inden-3-yl} acetic acid.

[b] (*Z*)-2-{5-Fluoro-2-methyl-1-[4-(methylsulfonyl)benzylidene]-1*H*-inden-3-yl} acetic acid.

[c] (*Z*)-2-{5-Fluoro-2-methyl-1-[4-(methylthio)benzylidene]-1*H*-inden-3-yl}acetic acid.

SPECIFIC TESTS

- **LOSS ON DRYING** ⟨731⟩

Analysis: Dry under vacuum at 100° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Sulindac RS

USP Sulindac Related Compound A RS

$C_{20}H_{17}FO_2S$ 340.41

Sulindac Tablets

DEFINITION

Sulindac Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sulindac ($C_{20}H_{17}FO_3S$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV-Vis spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: 0.1% formic acid in water

Solution B: 0.1%formic acid in acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	70	30
8.0	70	30
15.0	10	90
18.0	10	90
18.1	70	30
20.0	70	30

Diluent: Acetonitrile and water (50:50)
System suitability solution: 0.018 mg/mL each of USP Sulindac RS, USP Sulindac Related Compound A RS, USP Sulindac Related Compound B RS, and USP Sulindac Related Compound C RS in *Diluent*
Standard solution: 0.2 mg/mL of USP Sulindac RS in *Diluent*
Sample solution: Nominally 0.2 mg/mL of sulindac in *Diluent* prepared as follows. Dissolve a quantity nominally equivalent to 20 mg of sulindac from finely powdered Tablets in 70 mL of *Diluent* in a 100-mL volumetric flask. Shake by mechanical means for 60 min and dilute with *Diluent* to volume. Shake for another 5 min. Centrifuge the solution for 10 min and inject the supernatant.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 330 nm. For *Identification B*, use a diode array detector in the range of 200–400 nm.
Column: 2.1-mm × 15-cm; 1.7-µm packing L1
Column temperature: 45°
Flow rate: 0.3 mL/min
Injection volume: 2 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—See *Table 2* for the relative retention times.]
Suitability requirements
Resolution: NLT 4.0 between sulindac and sulindac related compound A; NLT 4.0 between sulindac related compound A and sulindac related compound B, *System suitability solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sulindac ($C_{20}H_{17}FO_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sulindac RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sulindac in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: 0.1 M pH 7.2 phosphate buffer prepared as directed in *Reagents, Indicators, and Solutions—Buffer Solutions*, except to use twice the stated quantities of the monobasic potassium phosphate solution and of the sodium hydroxide solution; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: 20 µg/mL of USP Sulindac RS in *Medium*
Sample solution: Pass 20 mL of the solution under test through a suitable filter, transfer 10 mL of the filtrate to a 100-mL volumetric flask, and dilute with *Medium* to volume.
Blank: *Medium*
Instrumental conditions
Mode: UV
Analytical wavelength: Maximum absorbance at about 326 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sulindac ($C_{20}H_{17}FO_3S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Sulindac RS in the *Standard solution* (mg/mL)
D = dilution volume
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of sulindac ($C_{20}H_{17}FO_3S$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Solution A, Solution B, Mobile phase, Diluent, and **Chromatographic system:** Proceed as directed in the *Assay*.
Standard solution: 0.018 mg/mL each of USP Sulindac RS, USP Sulindac Related Compound A RS, USP Sulindac Related Compound B RS, and USP Sulindac Related Compound C RS in *Diluent*. Sonicate for 2–5 min and mix with inversion.
Sample solution: Nominally 0.6 mg/mL of sulindac in *Diluent* prepared as follows. Dissolve a quantity nominally equivalent to 60 mg of sulindac from finely powdered Tablets in 70 mL of *Diluent* in a 100-mL volumetric flask. Shake by mechanical means for 60 min and dilute with *Diluent* to volume. Shake for another 5 min. Centrifuge the solution for 10 min. Collect and inject the supernatant.
System suitability
Sample: *Standard solution*
[NOTE—See *Table 2* for the relative retention times.]
Suitability requirements
Resolution: NLT 4.0 between sulindac and sulindac related compound A; NLT 4.0 between sulindac related compound A and sulindac related compound B
Relative standard deviation: NMT 2.0% for sulindac, sulindac related compound B, and sulindac related compound C
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sulindac related compound B or sulindac related compound C in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sulindac related compound B or sulindac related compound C from the *Sample solution*
r_S = peak response of sulindac related compound B or sulindac related compound C from the *Standard solution*
C_S = concentration of the corresponding related compound in the *Standard solution* (mg/mL)
C_U = nominal concentration of sulindac in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

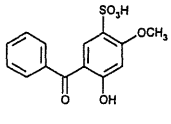
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

www.webofpharma.com

r_U = peak response of any individual unspecified impurity from the *Sample solution*
r_S = peak response of sulindac from the *Standard solution*
C_S = concentration of USP Sulindac RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sulindac in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2



Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sulindac	1.0	—
Sulindac related compound A	1.26	—[a]
Sulindac related compound B	1.36	0.5
Sulindac related compound C	1.70	0.5
Individual unspecified impurity	—	0.1
Total impurities	—	3.0

[a] Sulindac related compound A is controlled in the API. Therefore, no individual acceptance criteria is needed. Sulindac related compound B and sulindac related compound C are both degradants and process impurities.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sulindac RS
  USP Sulindac Related Compound A RS
  (*E*)-2-{5-Fluoro-2-methyl-1-[4-(methylsulfinyl) benzylidene]-1*H*-inden-3-yl}acetic acid.
  $C_{20}H_{17}FO_3S$ 356.41
  USP Sulindac Related Compound B RS
  (*Z*)-2-{5-Fluoro-2-methyl-1-[4-(methylsulfonyl) benzylidene]-1*H*-inden-3-yl}acetic acid.
  $C_{20}H_{17}FO_4S$ 372.41
  USP Sulindac Related Compound C RS
  (*Z*)-2-{5-Fluoro-2-methyl-1-[4-(methylthio)benzylidene]-1*H*-inden-3-yl}acetic acid.
  $C_{20}H_{17}FO_2S$ 340.41

Sulisobenzone

$C_{14}H_{12}O_6S$ 308.31
Benzenesulfonic acid, 5-benzoyl-4-hydroxy-2-methoxy-.
5-Benzoyl-4-hydroxy-2-methoxybenzenesulfonic acid [4065-45-6].

» Sulisobenzone contains not less than 97.0 percent and not more than 103.0 percent of $C_{14}H_{12}O_6S$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

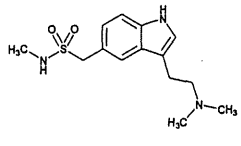
USP Reference standards ⟨11⟩—
USP Sulisobenzone RS

Change to read:

▲***Spectroscopic Identification Tests*** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)—
Solution: 10 µg per mL.
Medium: water.
Absorptivities, calculated on the anhydrous basis, do not differ by more than 3.0%.

Water Determination, *Method I* ⟨921⟩: not more than 2.0%.

Assay—Accurately weigh about 0.25 g of Sulisobenzone, and dissolve in 5 mL of water in a conical flask. Add 50 mL of dehydrated isopropyl alcohol, titrate with 0.1 N tetrabutylammonium hydroxide VS, and determine the two endpoints potentiometrically. V_1 and V_2 are the volumes, in mL, of titrant needed to reach the first and second endpoints, respectively. To determine the blank value caused by tertiary amines present as impurities in the titrant, dissolve $V_1/5$ mL of 0.5 N hydrochloric acid VS in 50 mL of dehydrated isopropyl alcohol, and subsequently add $(5 - V_1/5)$ mL of water. Titrate with 0.1 N tetrabutylammonium hydroxide VS, and determine the two endpoints potentiometrically. V_{1B} and V_{2B} are the volumes, in mL, of titrant needed to reach the first and second endpoints, respectively. The blank value V_{BV}, in mL, is obtained by the formula:



$$V_{2B} - V_{1B}$$

Calculate the percentage of $C_{14}H_{12}O_6S$ in the portion of Sulisobenzone taken by the formula:

$$308.31C[2V_1 - (V_2 - V_{BV})](1/W)(0.001)100$$

in which 308.31 is the molecular weight of Sulisobenzone; C is the concentration, in moles per L, of the 0.1 N tetrabutylammonium hydroxide VS; W is the weight, in g, of Sulisobenzone taken; 0.001 is the conversion factor for converting mL to L; and 100 is the conversion factor to percentage.

Sumatriptan

$C_{14}H_{21}N_3O_2S$ 295.40
1*H*-Indole-5-methanesulfonamide, 3-[2-(dimethylamino) ethyl]-*N*-methyl-;
3-[2-(Dimethylamino)ethyl]-*N*-methyl-1*H*-indole-5-methanesulfonamide [103628-46-2].

DEFINITION
Sumatriptan contains NLT 98.0% and NMT 102.0% of sumatriptan ($C_{14}H_{21}N_3O_2S$), calculated on the anhydrous and solvent-free basis.

Sumatriptan Injection

DEFINITION

Sumatriptan Injection is a sterile solution of Sumatriptan Succinate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$).

IDENTIFICATION

- **A.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: Add 1.7 mL of butylamine, 0.66 mL of phosphoric acid, and 3.7 g of monobasic sodium phosphate to 900 mL of water. Mix, and adjust with 1 N sodium hydroxide to a pH of 7.5 ± 0.1. Dilute with water to 1000 mL.
Mobile phase: Acetonitrile and *Buffer* (17:83)
Diluent: Acetonitrile and water (50:50)
Standard solution: 0.14 mg/mL of USP Sumatriptan Succinate RS in *Diluent*
Sample solution: Nominally 0.1 mg/mL of sumatriptan from the Injection in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 227 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection size: 10 µL
Run time: About 3 times the retention time of sumatriptan
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sumatriptan Succinate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sumatriptan in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sumatriptan free base, 295.40
M_{r2} = molecular weight of sumatriptan succinate, 413.49

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩**:** 4.2–5.3
- **OSMOLALITY AND OSMOLARITY** ⟨785⟩**:** 270–330 mOsmol/kg
- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** Meets requirements
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** It contains NMT 29.2 USP Endotoxin Units/mg of sumatriptan.
- **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements under *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type 1 glass. Store between 2° and 30°, protected from light.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sumatriptan Succinate RS

www.webofpharma.com

Sumatriptan Nasal Spray

DEFINITION

Sumatriptan Nasal Spray is an aqueous, buffered solution of Sumatriptan. It is supplied in a form suitable for nasal administration. It contains NLT 90.0% and NMT 110.0% of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M**▲ (CN 1-May-2020)

Sample: To the contents of one vial of Nasal Spray add 1 mL of a saturated sodium chloride solution. Add 1 mL of a saturated solution of sodium carbonate, and shake vigorously for about 30 s. To the solution so obtained add 2 mL of isopropyl alcohol, shake vigorously for about 30 s, and allow to stand until the phases separate. Transfer the organic phase to a suitable glass vial. Repeat the extraction with a second 2-mL portion of isopropyl alcohol, and transfer the organic phase to the same vial. Evaporate the solution under a stream of nitrogen. Dry the residue in an oven at 100° for 30 min, allow to cool to room temperature in a desiccator, and prepare a mull by the addition of 1–2 drops of mineral oil.

Acceptance criteria: Meets the requirements

Add the following:

▲• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.▲ 1S (USP41)

ASSAY

Change to read:

• **PROCEDURE**

Buffer: Dissolve 1.7 mL of dibutylamine, 0.6 mL of phosphoric acid, and 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of 50% (w/v) sodium hydroxide to a pH of 6.5, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (25:75)

Diluent: Dissolve 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of 50% (w/v) sodium hydroxide to a pH of 6.5, and dilute with water to 1 L. Mix 750 mL of the resulting solution with 250 mL of acetonitrile.

System suitability solution: 0.14 mg/mL of USP Sumatriptan Succinate RS and 0.07 mg/mL of USP Sumatriptan Succinate Related Compound C RS in *Diluent*

Standard solution: 0.14 mg/mL of USP Sumatriptan Succinate RS in *Diluent*

Sample solution: Nominally equivalent to 0.1 mg/mL of sumatriptan in *Diluent* from an appropriate volume of Nasal Spray

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm × 20-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

▲Run time: NLT 4 times the retention of sumatriptan▲ 1S (USP41)

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for sumatriptan succinate related compound C and sumatriptan are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between sumatriptan succinate related compound C and sumatriptan, *System suitability solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of ▲USP Sumatriptan Succinate RS▲ (ERR 1-Oct-2018) in the *Standard solution* (mg/mL)

C_U = nominal concentration of sumatriptan in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of sumatriptan, ▲295.40▲ 1S (USP41)

M_{r2} = molecular weight of sumatriptan succinate, ▲413.49▲ 1S (USP41)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DELIVERABLE VOLUME**

Analysis: Test 10 vials separately. Weigh each vial before and after actuation, and calculate the individual volume delivered, in µL, then calculate the mean volume delivered:

$$\text{Result} = (W_1 - W_2)/D$$

W_1 = weight of the individual vial before actuation (mg)

W_2 = weight of the individual vial after actuation (mg)

D = density of the nasal solution

Acceptance criteria: The volume of each spray delivered is between 80 and 120 µL, and the mean volume is between 90 and 110 µL.

IMPURITIES

Sumatriptan Tablets

DEFINITION

Sumatriptan Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K.**▲ (CN 1-May-2020) The IR spectrum exhibits main bands at or near (±1) wavenumbers (cm^{-1}) 1708, 1567, 1339, 1300, 1235, 1207, 989, and 844.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer solution A: 2.9 g/L of monobasic sodium phosphate, 1.3 mL/L of dibutylamine, and 0.4 mL/L of phosphoric acid in water. Adjust with 10 N sodium hydroxide to a pH of 6.5.
Buffer solution B: 3.9 g/L of monobasic sodium phosphate. Adjust with 10 N sodium hydroxide to a pH of 6.5 before dilution.
Mobile phase: Acetonitrile and *Buffer solution A* (1:3)
Diluent: Acetonitrile and *Buffer solution B* (1:3)
Standard solution: Equivalent to 0.1 mg/mL of sumatriptan from USP Sumatriptan Succinate RS in *Diluent*
Sample stock solution: Nominally 1–2 mg/mL of sumatriptan from NLT 5 Tablets prepared as follows. Transfer the Tablets to a suitable volumetric flask. Add *Diluent* to fill 60%–80% of the flask volume. Sonicate for 15–20 min with intermittent shaking. Dilute with *Diluent* to volume.
Sample solution: Nominally 0.1 mg/mL of sumatriptan in *Diluent* from the *Sample stock solution*. Pass through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 282 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 10 µL
Run time: NLT 1.7 times the retention time of sumatriptan
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sumatriptan Succinate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sumatriptan, 295.4
M_{r2} = molecular weight of sumatriptan succinate, 413.5

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Test 1
Medium: 0.01 N hydrochloric acid; 900 mL
Apparatus 2: 30 rpm
Time: 15 min
Standard solution: 0.025 mg/mL of USP Sumatriptan Succinate RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Dilute with *Medium* if necessary.
Instrumental conditions
Mode: UV
Detector: about 282 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
D = dilution factor
M_{r1} = molecular weight of sumatriptan, 295.4
M_{r2} = molecular weight of sumatriptan succinate, 413.5
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of sumatriptan is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 0.01 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 15 min
Standard solution: (L/900) mg/mL of USP Sumatriptan Succinate RS in *Medium*, where L is the Tablet label claim in mg
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Instrumental conditions
Mode: UV
Detector: About 282 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
M_{r1} = molecular weight of sumatriptan, 295.4
M_{r2} = molecular weight of sumatriptan succinate, 413.5
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of sumatriptan is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: 0.01 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 30 min

www.webofpharma.com

Standard solution: 0.035 mg/mL of USP Sumatriptan Succinate RS in *Medium*
Sample solution: Dilute the solution if necessary and pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Instrumental conditions
Mode: UV
Detector: About 283 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
D = dilution factor
M_{r1} = molecular weight of sumatriptan, 295.4
M_{r2} = molecular weight of sumatriptan succinate, 413.5
L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of sumatriptan is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Diluent: 0.1 N hydrochloric acid
Buffer: 1.9 g/L of ammonium acetate. Adjust with acetic acid to a pH of 4.1.
Solution A: Acetonitrile and methanol (90:10)
Solution B: *Solution A* and *Buffer* (5:95)
Solution C: *Solution A* and *Buffer* (22:78)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution B (%)	Solution C (%)
0	100	0
14.5	100	0
21	0	100
28	0	100
29	100	0
37	100	0

System suitability solution: 0.1 mg/mL each of USP Sumatriptan Succinate RS and USP Sumatriptan Succinate Related Compound C RS in *Diluent*
Sensitivity solution: 0.7 µg/mL of USP Sumatriptan Succinate Related Compound C RS in *Diluent*
Sample solution: Nominally 1.25 mg/mL of sumatriptan from NLT 5 Tablets in *Diluent* prepared as follows. Transfer the Tablets to a suitable volumetric flask. Add *Diluent* to fill 80% of the flask volume. Sonicate for 5 min to disperse the Tablets completely. Allow to cool to room temperature for NLT 15 min. Dilute with *Diluent* to volume. Centrifuge a portion of the solution at NLT 3000 RM for 10 min. Alternatively, the *Sample solution* may be filtered using a suitable filter. Use the supernatant or filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 282 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 50°
Flow rate: 2 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Sensitivity solution*
Suitability requirements
Resolution: NLT 1.5 between sumatriptan and sumatriptan succinate related compound C, *System suitability solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*
Analysis
Sample: *Sample solution*
Calculate the percentage of each impurity as well as any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*
r_T = sum of peak responses for all peaks in the *Sample solution*
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

M_{r4} = molecular weight of sumatriptan, 295.4

Acceptance criteria: NMT 0.6%

- **PROCEDURE 2**

Diluent and **System suitability solution:** Prepare as directed in the *Assay*.

Buffer: Dissolve 1.7 mL of dibutylamine, 0.6 mL of phosphoric acid, and 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of 50% (w/v) sodium hydroxide to a pH of about 7.5, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (20:80)

Identification solution: 3 mg/mL of USP Sumatriptan Succinate Related Impurities RS in *Mobile phase*

Sample solution: 2.8 mg/mL of Sumatriptan Succinate in *Diluent*

Chromatographic system: Prepare as directed in the *Assay*. After making sure that the resolution criteria are met, chromatograph the *Identification solution*, and record the peak responses as directed in the *Analysis*. Identify the peaks according to *Table 1*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Sumatriptan Succinate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity
r_T = sum of all the peak responses

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
[3-[2-(Dimethylamino-*N*-oxide) ethyl]-1*H*-indol-5-yl]-*N*-methylmethanesulfonamide	0.3	0.2
[3-[2-(Aminoethyl)]-1*H*-indol-5-yl]-*N*-methylmethane sulfonamide	0.4	0.1
[3-[2-(Methylamino)ethyl]-1*H*-indol-5-yl]-*N*-methyl methanesulfonamide	0.6	0.5

Sumatriptan Compounded Oral Suspension

DEFINITION

Sumatriptan Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$).

Prepare Sumatriptan Compounded Oral Suspension containing 5 mg/mL of sumatriptan as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sumatriptan (as Sumatriptan Succinate)	500 mg (700 mg)
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), *NF*, and Vehicle for Oral Suspension, *NF*, a sufficient quantity to make	100 mL

Place the required number of tablets in a suitable mortar, and comminute to a fine powder, or add *Sumatriptan Succinate* powder to the mortar. Add 25 mL of *Vehicle* in portions, mixing thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and 0.01 M dibutylamine in 0.025 M aqueous monobasic sodium phosphate dihydrate (25:75), adjusted with 1 N sodium hydroxide to a pH of 8.0. Filter and degas.

Standard stock solution: 4.0 mg/mL of USP Sumatriptan Succinate RS in *Mobile phase*

Standard solution: 0.12 mg/mL of sumatriptan prepared with *Standard stock solution* and *Mobile phase*

Sample solution: 0.15 mg/mL of sumatriptan prepared from Oral Suspension and 0.1 M hydrochloric acid. Pass through a 0.22-µm syringe filter into a 0.3-mL polypropylene sample vial.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 282 nm
Column: 4.6-mm × 10-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for sumatriptan is about 11 min.]
Suitability requirements
Relative standard deviation: NMT 1.5% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sumatriptan ($C_{14}H_{21}N_3O_2S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of sumatriptan in the *Standard solution* (mg/mL)
C_U = nominal concentration of sumatriptan in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **pH** ⟨791⟩: 3.6–4.6

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator.
• **BEYOND-USE DATE:** NMT 14 days after the date on which it was compounded when stored in a refrigerator
• **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sumatriptan Succinate RS

Absorbable Surgical Suture

DEFINITION
Absorbable Surgical Suture is a sterile, flexible strand prepared from collagen derived from healthy mammals or from a synthetic polymer. Suture prepared from synthetic polymer may be in either monofilament or multifilament form. It is capable of being absorbed by living mammalian tissue, but may be treated to modify its resistance to absorption. Its diameter and tensile strength correspond to the size designation indicated on the label, within the limits prescribed herein. It may be modified with respect to body or texture. It may be impregnated or treated with a suitable coating, softening, or antimicrobial agent. It may be colored by a color additive approved by the FDA. The collagen suture is designated as either Plain Suture or Chromic Suture. Both types consist of processed strands of collagen, but Chromic Suture is processed by physical or chemical means so as to provide greater resistance to absorption in living mammalian tissue.

IMPURITIES
• **SOLUBLE CHROMIUM COMPOUNDS**
Standard solution: 2.83 µg/mL of potassium dichromate in water
Sample solution: 5 mL of the fluid prepared as directed in the *Extractable Color* test
Analysis: To 5 mL each of the *Standard solution* and *Sample solution* add 2 mL of a solution (1 in 100) of diphenylcarbazide in alcohol and 2 mL of 2 N sulfuric acid.
Acceptance criteria: Any color that develops in the *Sample solution* is not more intense than that in the *Standard solution* [1 ppm of chromium (Cr)].

SPECIFIC TESTS
[NOTE—If the Suture is packaged with a fluid, make the required measurements for the first four of the following tests within 2 min after removing it from the fluid.]
• **LENGTH**
Sample: A length of Suture
Analysis: Determine the length of the *Sample* without stretching.
Acceptance criteria: The length of each strand is NLT 95.0% of the length stated on the label.

Change to read:

• **SUTURES—DIAMETER** ⟨861⟩
Sample: 10 strands of Suture
Analysis: Determine the diameter as directed in the chapter.
Acceptance criteria
Collagen suture: The average diameter, and NLT 20, of the 30 measurements on the 10-strand *Sample* are within the limits on average diameter in *Table 1* for the size stated on the label. None of the individual ▲observed measurements should be less than or greater than the limits on individual diameter in *Table 1*.▲ (USP 1-Dec-2019)
Synthetic suture: The average diameter of the strands being measured is within the tolerances prescribed in *Table 2* for the size stated on the label. None of the ▲individual observed measurements should be less than or greater than the limits on individual diameter in *Table 2*.▲ (USP 1-Dec-2019)
• **TENSILE STRENGTH** ⟨881⟩, *Surgical Suture*
Sample: NLT 10 strands of Suture
Analysis: Determine the tensile strength of the *Sample* as directed in the chapter.
Acceptance criteria
Collagen suture: The tensile strength, determined as the minimum strength for each individual strand tested, and calculated as the average strength from any one lot, is as set forth in *Table 1*. If NMT 1 strand fails to meet the limit on individual strands, repeat the test with NLT 20 additional strands: the requirements of the test are met if none of the additional strands falls below the limit on individual strands, and if the average strength of all the strands tested does not fall below the stated limit in *Table 1*.
Synthetic suture: The minimum tensile strength of each size of synthetic suture, calculated as the average strength from any one lot, is as set forth in *Table 2*.
• **SUTURES—NEEDLE ATTACHMENT** ⟨871⟩: Suture on which eyeless needles are swaged meets the requirements.

Change to read:

• **STERILITY TESTS** ⟨71⟩: ▲Suture that is claimed to be sterile▲ (USP 1-Dec-2019) meets the requirements.

Change to read:

• **EXTRACTABLE COLOR** (if Suture is dyed)
Matching solutions: Prepare by combining the colorimetric solutions (CS) in the proportions indicated in *Table 3*, and adding water, if necessary, to make 10.0 parts. [See

USP Monographs

www.webofpharma.com

Reagents, Indicators, and Solutions—Solutions, Colorimetric Solutions (CS) for composition.]

Table 3. Matching Solutions

Color of Suture (Extractable Color)	Parts of Each CS per 10 Parts of Total Volume		
	Cobaltous Chloride CS	Ferric Chloride CS	Cupric Sulfate CS
Yellow-brown	0.2	1.2	—
Pink-red	1.0	—	—
Green-blue	—	—	2.0
Violet	1.6	—	8.4

Sample: NLT 250 mg of Suture

Analysis: Place the *Sample* in a conical flask containing 1.0 mL of water for each 10 mg of the *Sample.* ▲For microsutures use 2.5 mL of water for each 25 mg of the *Sample.*▲ (USP 1-Dec-2019) Close the flask, and allow it to stand at 37 ± 0.5° for 24 h. Cool. Decant the water from the Suture, and compare it with the *Matching solution.* ▲Where fibrous extraneous material may affect the color, filter the solution before performing the color determination.▲ (USP 1-Dec-2019)

Acceptance criteria: Any color present is not more intense than that of the appropriate *Matching solution.* ▲Where fibrous extraneous material may affect the color, filter the solution before performing the color determination.▲ (USP 1-Dec-2019)

ADDITIONAL REQUIREMENTS

- **▲PACKAGING AND STORAGE:▲** Preserve dry or in fluid, in containers (packets) so designed that sterility is maintained until the container is opened. A number of such containers may be placed in a box.

Change to read:

- **▲LABELING:▲** The label of each individual container (packet) of Suture indicates the size, length, type of Suture, ▲including the material composition as well as the physical configuration (e.g., monofilament/multifilament, twisted/braided),▲ (USP 1-Dec-2019) kind of needle (if a needle is included), number of Sutures (if multiple), lot number, and name of the manufacturer or distributor. If removable needles are used, the labeling so indicates. Suture size is designated by the metric size (gauge number) and the

corresponding USP size. The label of the box indicates also the address of the manufacturer, packer or distributor, and the composition of any packaging fluids used.

Nonabsorbable Surgical Suture

DEFINITION

Change to read:

Nonabsorbable Surgical Suture is a flexible strand of material that is ▲not absorbed in▲ (USP 1-Dec-2019) living mammalian tissue. It may be in either monofilament or multifilament form. If it is a multifilament strand, the individual filaments may be combined by ▲▲ (USP 1-Dec-2019) twisting, braiding, or any combination thereof. It may be either sterile or nonsterile. Its diameter and tensile strength correspond to the size designation indicated on the label, within the limits prescribed herein. It may be modified with respect to body or texture, or to reduce capillarity, and may be suitably bleached. It may be impregnated or treated with a suitable coating, softening, or antimicrobial agent. It may be colored by a color additive approved by the FDA.

Nonabsorbable Surgical Suture is classed and typed as follows. Class I Suture is composed of silk or synthetic fibers of monofilament, twisted, or braided construction where the coating, if any, does not significantly affect thickness (e.g., braided silk, polyester, or nylon; monofilament nylon or polypropylene). Class II Suture is composed of cotton or linen fibers or coated natural or synthetic fibers where the coating significantly affects thickness but does not contribute significantly to strength (e.g., virgin silk sutures). Class III Suture is composed of monofilament or multifilament metal wire.

[a] The tensile strength of sizes smaller than USP size 8-0 (metric size 0.4) is measured by straight pull. The tensile strength of sizes larger than USP size 2-0 (metric size 3) of monofilament Class III (metallic) Nonabsorbable Surgical Suture is measured by straight pull. Silver wire ▲(silver-coated fabric)▲ (USP 1-Dec-2019) meets the tensile strength values of Class I Sutures but is tested in the same manner as Class III Sutures.

[b] The limits on knot-pull tensile strength apply to Nonabsorbable Surgical Suture that has been sterilized. For nonsterile Sutures of Class I and Class II, the limits are 25% higher.

[▲c] To convert from N to kg, divide N by 1.0197 and round to one significant figure.

[d] USP sizes may not represent all sizes commercially available. For sizes other than those listed in the table, suture manufacturers must generate appropriate diameters and tensile strength data to support use.▲ (USP 1-Dec-2019)

- **TENSILE STRENGTH** ⟨881⟩, *Surgical Suture*
  Sample: NLT 10 strands of Suture
  Analysis: Determine the tensile strength of the *Sample* as directed in the chapter. Average all observations obtained.
  Acceptance criteria: The average tensile strength is NLT that set forth in *Table 1* for the class and the size stated on the label.
- **SUTURES—NEEDLE ATTACHMENT** ⟨871⟩**:** Suture on which eyeless needles are swaged meets the requirements.
- **STERILITY TESTS** ⟨71⟩**:** Suture that is claimed to be sterile meets the requirements.
- **EXTRACTABLE COLOR** (if Suture is dyed)
  Matching solutions: Prepare by combining the colorimetric solutions (CS) in the proportions indicated in *Table 2*, and adding water, if necessary, to make 10.0 parts. [See *Reagents, Indicators, and Solutions—Solutions, Colorimetric Solutions (CS)* for composition.]

Table 2. Matching Solutions

	Parts of Each CS per 10 Parts of Total Volume		
Color of Suture (Extractable Color)	Cobaltous Chloride CS	Ferric Chloride CS	Cupric Sulfate CS
Yellow-brown	0.2	1.2	—
Pink-red	1.0	—	—
Green-blue	—	—	2.0
Violet	1.6	—	8.4

Sample: NLT 250 mg of Suture
Analysis: Place the *Sample* in a conical flask containing 1.0 mL of water for each 10 mg of the *Sample*. Cover the flask with a short-stemmed funnel, heat the contents of the flask at the boiling point for 15 min, cool, and restore the volume by the addition of water, if necessary, to replace that lost by evaporation. Decant the water from the Suture, and compare it with the *Matching solution*.
Acceptance criteria: Any color present is not more intense than that of the appropriate *Matching solution*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve nonsterilized Suture in well-closed containers. Preserve sterile Suture dry or in fluid, in containers (packets) so designed that sterility is maintained until the container is opened. A number of such containers may be placed in a box.
- **LABELING:** The label of each individual container (packet) of Suture indicates the material from which the Suture is made, the size, construction, and length of the Suture, whether it is sterile or nonsterile, kind of needle (if a needle is included), number of sutures (if multiple), lot number, and name of the manufacturer or distributor. If removable needles are used, the labeling so indicates. Suture size is designated by the metric size (gauge number) and the corresponding USP size. The label of the box indicates also the address of the manufacturer, packer or distributor, and the composition of any packaging fluids used.

Tacrolimus

$C_{44}H_{69}NO_{12} \cdot H_2O$ 822.03

(−)-(3*S*,4*R*,5*S*,8*R*,9*E*,12*S*,14*S*,15*R*,16*S*,18*R*,19*R*,26a*S*)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-[(*E*)-2-[(1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl]-14,16-dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclotricosine-1,7,20,21(4*H*,23*H*)-tetrone monohydrate [109581-93-3].

DEFINITION

Tacrolimus contains NLT 98.0% and NMT 102.0% of tacrolimus ($C_{44}H_{69}NO_{12}$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩, *Infrared Spectroscopy*: 197M▲** (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Protect solutions containing tacrolimus from light.
Solution A: 6 mM phosphoric acid
Solution B: Acetonitrile and *tert*-butyl methyl ether (81:19)
Solution C: *Solution A* and *Solution B* (4:1)
Solution D: *Solution A* and *Solution B* (1:4)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution C (%)	Solution D (%)
0	72	28
30	72	28
53	15	85
54	72	28
60	72	28

Diluent: Acetonitrile and water (7:3)
System suitability solution: 3 mg/mL of USP Tacrolimus System Suitability Mixture RS in *Diluent*. Allow the solution to stand for 3 h at ambient temperature before use.
Standard solution: 3 mg/mL of USP Tacrolimus RS in *Diluent*. Allow the solution to stand for 3 h at ambient temperature before use.
Sample solution: 3 mg/mL of Tacrolimus in *Diluent*. Allow the solution to stand for 3 h at ambient temperature before use.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 15-cm; 3-µm packing L1
Temperatures
Column: 60°
Autosampler: 4°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—See *Table 3* for relative retention times.]
Suitability requirements
Resolution: NLT 3.0 between ascomycin and tacrolimus, *System suitability solution*
Relative standard deviation: NMT 1.0% for the sum of the responses of tacrolimus, tacrolimus open ring, and tacrolimus 19-epimer, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tacrolimus ($C_{44}H_{69}NO_{12}$) in the portion of Tacrolimus taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = sum of the peak responses of tacrolimus open ring, tacrolimus 19-epimer, and tacrolimus from the *Sample solution*
r_S = sum of the peak responses of tacrolimus open ring, tacrolimus 19-epimer, and tacrolimus from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
C_U = concentration of Tacrolimus in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **ORGANIC IMPURITIES, PROCEDURE 1**

Use *Organic Impurities, Procedure 1* when the impurity profile includes tacrolimus methylacrylaldehyde and tacrolimus diene. It is suggested that new columns be conditioned with about 500 mL of alcohol before use to meet the resolution criterion.
Mobile phase: Hexane, *n*-butyl chloride, and acetonitrile (7:2:1). Add *n*-butyl chloride to hexane, and mix well before adding acetonitrile. After adding acetonitrile, mix the *Mobile phase* for 2 h to get a clear solution. Any deviations from the ratio of components in the *Mobile phase* and the order of mixing will result in a two-phase solution.
System suitability solution: 0.1 mg/mL each of USP Tacrolimus RS and USP Tacrolimus Related Compound A RS in *Mobile phase*
Sample solution: 2.0 mg/mL of Tacrolimus in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: Two 4.6-mm × 25-cm columns; 5-µm packing L20
Column temperature: 28 ± 2°
Flow rate: 1.5 mL/min. Adjust the *Flow rate* so that the retention time of tacrolimus is approximately 15 min.
Injection volume: 20 µL
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.1 between tacrolimus and tacrolimus related compound A
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Sample: *Sample solution*
Calculate the percentage of each impurity in the portion of Tacrolimus taken:

$$\text{Result} = (r_U/F_i) \times \{1/[r_T + \Sigma(r_U/F_i)]\} \times 100$$

r_U = peak response of each impurity from the *Sample solution*
F_i = relative response factor for each corresponding impurity (see *Table 2*)

USP Monographs

www.webofpharma.com

r_T = peak response of tacrolimus from the *Sample solution*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tacrolimus methylacryl aldehyde[a]	0.55	16.7	0.2

Tacrolimus	1.0	1.0	—
Tacrolimus 19-epimer[d, e]	1.1	—	—
Tacrolimus open ring[d, f]	1.3	—	—
Any individual unspecified impurity	—	1.0	0.2
Total impurities[g]	—	—	0.3

[a] (*E*)-3-[[(1*R*,3*R*,4*R*)-4-Hydroxy-3-methoxycyclohexyl]-2-methylacrylaldehyde.
[b] (14*E*,18*E*)-17-Allyl-1-hydroxy-12-[(*E*)-2-(4-hydroxy-3-methoxycyclohexyl)-1-methylvinyl]-23,25-dimethoxy-13,19,21,27-tetramethyl-11,28-dioxa-4-azatricyclo[22.3.1.0^{4,9}] octacosa-14,18-diene-2,3,10,16-tetrone.
[c] Specified unidentified impurity.
[d] For informational purposes only; not to be reported.
[e] (3*S*,4*R*,5*S*,8*R*,9*E*,12*S*,14*S*,15*R*,16*S*,18*R*,19*S*,26a*S*)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a,hexadecahydro-5,19-dihydroxy-3-{(*E*)-2-[1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16,dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclotricosine-1,7,20,21(4*H*,23*H*)-tetrone.
[f] (3*S*,4*R*,5*S*,8*R*,12*S*,14*S*,15*R*,16*S*,18*R*,26a*S*,*E*)-8-Allyl-5,6,11,12,13,14,15,16,17,18,24,25,26,26a-tetradecahydro-5,15,20,20-tetrahydroxy-3-{(*E*)-2-[1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-3*H*-pyrido[2,1-*c*][1,4] oxaazacyclotricosine-1,7,19,21(4*H*,8*H*,20*H*,23*H*)-tetrone.
[g] Total impurities limit does not include tacrolimus open ring and tacrolimus 19-epimer.

• **ORGANIC IMPURITIES, PROCEDURE 2**

Use *Organic Impurities, Procedure 2* when the impurity profile includes ascomycin, desmethyl tacrolimus, tacrolimus 8-epimer, and tacrolimus 8-propyl analog. Protect solutions containing tacrolimus from light.

Solution A, Solution B, Solution C, Solution D, Mobile phase, Diluent, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard solution: 30 µg/mL of USP Tacrolimus RS in *Diluent*. Allow the solution to stand for 3 h at ambient temperature before use.

Reporting threshold solution: 1.5 µg/mL of USP Tacrolimus RS in *Diluent*

Peak identification solution 1: 10 µg/mL of USP Tacrolimus 8-epimer RS in acetonitrile

Peak identification solution 2: 10 µg/mL of USP Tacrolimus 8-propyl Analog RS in acetonitrile

System suitability

[NOTE—Identify the related compounds by the relative retention times provided in *Table 3*.]

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between tacrolimus and ascomycin, *System suitability solution*

Relative standard deviation: NMT 10.0% for the sum of the responses of tacrolimus and tacrolimus 19-epimer, *Standard solution*

Analysis

Samples: *Sample solution, Standard solution, Reporting threshold solution, Peak identification solution 1,* and *Peak identification solution 2*

Calculate the percentage of each impurity in the portion of Tacrolimus taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = sum of the peak responses of tacrolimus 19-epimer and tacrolimus from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

C_U = concentration of Tacrolimus in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 3*. Identify tacrolimus 8-epimer and tacrolimus 8-propyl analog using *Peak identification solution 1* and *Peak identification solution 2*. Report impurity peaks with responses NLT that of the peak in the *Reporting threshold solution* (0.05%). Disregard peaks with retention times less than 3 min.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tacrolimus open ring[a, b]	0.52	—
Ascomycin 19-epimer (if present)[c, d]	0.54	0.1
Tacrolimus 19-epimer[b, e]	0.63	—

Tacrolimus Capsules

DEFINITION

Tacrolimus Capsules contain NLT 93.0% and NMT 105.0% of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectrum of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  Allow the *Standard solution* and *Sample solution* to stand for 3 h at ambient temperature before use. Protect solutions containing tacrolimus from light.
  Solution A: 6 mM phosphoric acid

USP Monographs

www.webofpharma.com

Solution B: 50 g/L of polyoxyethylene (23) lauryl ether. [NOTE—Polyoxyethylene (23) lauryl ether is also called Brij-35.]
Solution C: Acetonitrile and *Solution B* (7:3)
Mobile phase: Acetonitrile, *tert*-butyl methyl ether, and *Solution A* (335:55:600)
Standard solution: 50 µg/mL of USP Tacrolimus RS in *Solution C*
Sample solution: Equivalent to 50 µg/mL of tacrolimus from NLT 10 Capsules in *Solution C*. [NOTE—Sonicate, and stir with a magnetic stirrer.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm. When this procedure is used for *Identification* test *B*, use a diode array detector set at 200–400 nm.
Column: 4.0-mm × 5.5-cm; 3-µm packing L1
Column temperature: 60°
Flow rate: 1 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for tacrolimus 19-epimer and tacrolimus are 0.67 and 1.0, respectively.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 3.0% for the sum of the tacrolimus and tacrolimus 19-epimer peaks
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Sample solution*
r_S = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–105.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩
Test 1
Medium: Hydroxypropylcellulose in water (1:2 × 10^4), adjusted with 6% phosphoric acid to a pH of 4.5; 900 mL
Apparatus 2: 50 rpm with sinker (see *Dissolution* ⟨711⟩, *Figure 2a*)
Time: 90 min
Mobile phase: Acetonitrile, methanol, water, and 6% phosphoric acid (46: 18: 36: 0.1)
Standard stock solution: (*L*/360) mg/mL in acetonitrile, where *L* is the Capsule label claim in mg
Standard solution: To 20.0 mL of the *Standard stock solution* add 50.0 mL of *Medium*, and mix to obtain solutions with known concentrations as indicated in *Table 1*. Allow the solution to stand for NLT 6 h at 25° before use.
Sample solution: Pass 10 mL of the solution under test through a G4 glass filter. To 5.0 mL of the filtrate add 2.0 mL of acetonitrile, and mix. Allow the solution to stand for NLT 1 h at 25° before use.

Table 1

Capsule Strength (mg)	Final Concentration (µg/mL)
0.5	0.4
1	0.8
5	4

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 50°
Flow rate: Adjust the flow rate so that the retention time of tacrolimus is approximately 14 min.
Injection volume: See *Table 2*.

Table 2

Capsule Strength (mg)	Injection Volume (µL)
0.5	800
1	400
5	80

[NOTE—For products with strengths other than those listed in *Table 2*, adjust the *Injection volume* to deliver an equivalent amount of tacrolimus into the column.]
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 1.5 between tacrolimus 19-epimer and tacrolimus
Tailing factor: NMT 1.5
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times (100/L)$$

r_U = peak response of tacrolimus from the *Sample solution*
r_S = peak response of tacrolimus from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
D = dilution factor of the *Sample solution*
V = volume of *Medium*, 900 mL
L = label claim (mg/Capsule)

Tolerances: NLT 80% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.
Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
[NOTE—Allow the *Standard solution* to stand for 3 h at ambient temperature before use. Protect solutions containing tacrolimus from light.]

www.webofpharma.com

Buffer: Dissolve 6 g of sodium dodecyl sulfate and 8.28 g of monobasic sodium phosphate in 6000 mL of water. Adjust with 2 N sodium hydroxide to a pH of 7.0.
Medium: *Buffer*; 900 mL
Apparatus 2: 50 rpm, with sinkers
Time: 60 min
Standard stock solution: 0.2 mg/mL of USP Tacrolimus RS in alcohol and *Medium* (3:7). [NOTE—Dissolve USP Tacrolimus RS in alcohol using 30% of the final volume. Sonicate until dissolved, and dilute with *Medium* to volume.]
Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 5 µg/mL.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Solution A: 6 mM phosphoric acid
Mobile phase: Acetonitrile, *tert*-butyl methyl ether, and *Solution A* (335:50:600)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: 4.0-mm × 5.5-cm; 3-µm packing L1
Column temperature: 60°
Flow rate: 1.2 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for tacrolimus 19-epimer and tacrolimus are 0.67 and 1.0, respectively.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 5.0% for the sum of the areas of tacrolimus and tacrolimus 19-epimer
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Sample solution*
r_S = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.
Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: 50 mg/L of hydroxypropylcellulose in water. Adjust with phosphoric acid to a pH of 4.5; 900 mL.
Apparatus 2 (without sinker) and **Time:** Proceed as directed in *Test 1*.
Buffer: 3.6 g/L of monobasic potassium phosphate in water. Adjust with diluted phosphoric acid to a pH of 2.5.
Mobile phase: *Buffer* and acetonitrile (1:1)
Standard stock solution: 0.1 mg/mL of USP Tacrolimus RS in acetonitrile
Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of (*L*/900) mg/mL, where *L* is the Capsule label claim in mg.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 10-cm; 5-µm packing L1
Column temperature: 60°
Flow rate: 1.3 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for tacrolimus 19-epimer, tacrolimus open ring, and tacrolimus are 0.67, 0.79, and 1.0, respectively.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Sample solution*
r_S = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.
Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Medium: Hydroxypropylcellulose in water (1 in 20,000), adjusted with phosphoric acid to a pH of 4.5. See *Table 3* for the volume.

Table 3

Capsule Strength (mg)	Volume of Medium (mL)
0.5	500
1	900
5	900

Apparatus 2: 50 rpm, with sinkers
Time: 120 min
Diluent: 1 mg/mL of hydroxypropylcellulose in water. Sonicate as needed to dissolve.
Buffer: To a solution of 1 g/L of sodium 1-hexanesulfonate in water add 0.1 mL/L of trifluoroacetic acid.
Mobile phase: Acetonitrile, methanol, and *Buffer* (550:50:400)
Standard stock solution: Dissolve USP Tacrolimus RS in acetonitrile. See *Table 4* for the concentrations (*L* is the Capsule label claim in mg).

Table 4

Capsule Strength (mg)	Concentration (mg/mL)
0.5	*L*/25
1	*L*/45
5	*L*/45

www.webofpharma.com

Standard solution: Dilute the *Standard stock solution* with *Diluent*. See *Table 5* for the concentrations (*L* is the Capsule label claim in mg).

Table 5

Capsule Strength (mg)	Concentration (mg/mL)
0.5	*L*/500
1	*L*/900
5	*L*/900

Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 60°
Flow rate: 1 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium* (mL) (see *Table 3*)

Tolerances: NLT 75% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.
Medium: 0.05 g/L hydroxypropylcellulose in water. Adjust with phosphoric acid to a pH of 4.5; 900 mL.
Apparatus 2: 50 rpm, with sinkers
Time: 90 min
Solution A: 0.1 mL/L of trifluoroacetic acid in water
Mobile phase: Acetonitrile and *Solution A* (50:50)
Standard stock solution: 0.22 mg/mL of USP Tacrolimus RS in acetonitrile
Standard solution: (*L*/900) mg/mL of USP Tacrolimus RS from the *Standard stock solution* in *Medium*, where *L* is the label claim in mg/Capsule
Sample solution: Centrifuge a portion of the solution under test. Use the supernatant.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: 2.1-mm × 15-cm; 3.5-µm packing L7
Column temperature: 60°
Flow rate: 0.8 mL/min
Injection volume: 750 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for tacrolimus 19-epimer (tautomer 1), tacrolimus open-ring (tautomer 2), and tacrolimus are 0.55, 0.79, and 1.0, respectively.]
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 4.0% for the peaks due to tautomer 1, tautomer 2, and tacrolimus.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus, tacrolimus open-ring, and tacrolimus 19-epimer from the *Sample solution*
r_S = sum of the peak responses of tacrolimus, tacrolimus open-ring, and tacrolimus 19-epimer from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.

▲**Test 6:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.
Dilute phosphoric acid: Transfer 7.1 mL of phosphoric acid to a 100 mL volumetric flask, and dilute with water to volume.
Medium: 50 mg/L of hydroxypropyl cellulose in water. Adjust with *Dilute phosphoric acid* to a pH of 4.5; 900 mL.
Apparatus 2: 50 rpm
Time: 60 min
Buffer: 3.6 g/L of monobasic potassium phosphate in water. Adjust with *Dilute phosphoric acid* to a pH of 2.5.
Mobile phase: Acetonitrile and *Buffer* (1:1)
Standard stock solution: 0.11 mg/mL of USP Tacrolimus RS in acetonitrile
Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of (*L*/900) mg/mL, where *L* is the label claim in mg/Capsule.
Sample solution: Centrifuge a portion of the solution under test. Use the supernatant.
Chromatographic system

www.webofpharma.com

Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Sample solution*
r_S = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved. ▲ (RB 1-Aug-2018)

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

• **Organic Impurities, Procedure 1**

Use *Organic Impurities, Procedure 1* when the impurity profile includes tacrolimus diene and tacrolimus regioisomer. It is suggested that new columns be conditioned with about 500 mL of ethanol before use to meet the resolution criterion.

Mobile phase: Hexane, *n*-butyl chloride, and acetonitrile (7:2:1). Add *n*-butyl chloride to hexane, and mix well before adding acetonitrile. After adding acetonitrile, mix the *Mobile phase* for 2 h to get a clear solution. Any deviations from the ratio of components in the *Mobile phase* and the order of mixing will result in a two-phase solution.

System suitability solution: 0.1 mg/mL each of USP Tacrolimus RS and USP Tacrolimus Related Compound A RS in *Mobile phase*

Sample solution: Transfer the contents of a suitable number of Capsules (equivalent to about 5 mg of tacrolimus for 0.5-mg Capsules or 10 mg of tacrolimus for 1-mg and 5-mg Capsules) into a centrifuge tube. Add 1.5 mL of a mixture of *n*-butyl chloride and acetonitrile (2:1), sonicate in an ultrasonic bath for 2 min, add 3.5 mL of *n*-hexane, and mix. Centrifuge this solution, and collect the supernatant or pass the solution through a 0.5-µm membrane filter. Use the solution within 30 min of preparation.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Columns: Two 4.6-mm × 25-cm columns; 5-µm packing L20
Column temperature: 28 ± 2°
Flow rate: 1.5 mL/min. Adjust the *Flow rate* so that the retention time of tacrolimus is approximately 15 min.
Injection volume: 20 µL
Run time: 3 times the retention time of tacrolimus

System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.1 between tacrolimus and tacrolimus related compound A
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%

Analysis
Sample: *Sample solution*
Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/F_i) \times \{1/[r_T + \Sigma(r_U/F_i)]\} \times 100$$

r_U = peak response of each impurity from the *Sample solution*
F_i = relative response factor for each corresponding impurity (see *Table 6*)
r_T = peak response of tacrolimus from the *Sample solution*

Acceptance criteria: See *Table 6*. Disregard peaks due to the solvent.

Table 6

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tacrolimus diene[a]	0.79	2.2	0.3
Tacrolimus regioisomer[b]	0.88	1.0	0.5
Tacrolimus impurity 1[c]	0.96	1.0	0.3
Tacrolimus related compound A[d]	0.96	—	—
Tacrolimus	1.0	—	—
Tacrolimus 19-epimer[e,f]	1.1	—	—
Tacrolimus open ring[e,g]	1.3	—	—
Any individual unspecified impurity	—	1.0	0.2
Total impurities	—	—	1.0

[a] (14*E*,18*E*)-17-Allyl-1-hydroxy-12-[(*E*)-2-(4-hydroxy-3-methoxycyclohexyl)-1-methylvinyl]-23,25-dimethoxy-13,19,21,27-tetramethyl-11,28-dioxa-4-azatricyclo[22.3.1.0^{4,9}] octacosa-14,18-diene-2,3,10,16-tetrone.
[b] (4*E*,11*E*)-10-Allyl-7,8,10,13,14,15,16,17,18,19,20,21,26,22,28,28a-hexadecahydro-7,21-dihydroxy-3-(4-hydroxy-3-methoxycyclohexyl)-16,18-dimethoxy-4,6,12,14,20-pentamethyl-17,21-epoxy-3*H*-pyrido[2,1-*c*][1,4] oxaazacyclopentacosine-1,9,22,23(6*H*,25*H*)-tetrone.
[c] Tacrolimus impurity 1 is a specified, unidentified impurity.
[d] Tacrolimus related compound A is listed here to indicate the relative retention time of this compound. It is used in the procedure to evaluate system suitability and is not to be reported. It is not to be included in total impurities.
[e] Tacrolimus open ring and tacrolimus 19-epimer are isomers of tacrolimus, which are present in equilibrium with the active ingredient. They are not to be reported as degradation products and are not included in total impurities.
[f] (3*S*,4*R*,5*S*,8*R*,9*E*,12*S*,14*S*,15*R*,16*S*,18*R*,19*S*,26a*S*)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-{(*E*)-2-[(1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclotricosine-1,7,20,21(4*H*,23*H*)-tetrone.
[g] (3*S*,4*R*,5*S*,8*R*,12*S*,14*S*,15*R*,16*S*,18*R*,26a*S*,*E*)-8-Allyl-5,6,11,12,13,14,15,16,17,18,24,25,26,26a-tetradecahydro-5,15,20,20-tetrahydroxy-3-{(*E*)-2-[(1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-3*H*-pyrido[2,1-*c*][1,4] oxaazacyclotricosine-1,7,19,21(4*H*,8*H*,20*H*,23*H*)-tetrone.

• **Organic Impurities, Procedure 2**

Use *Organic Impurities, Procedure 2* when the impurity profile includes tacrolimus hydroxy acid and tacrolimus 8-epimer. It is suggested to equilibrate the column overnight with a mixture of *Solution C* and *Solution D* (17:3) before performing this procedure. Allow the *System suitability solution*, *Standard solution*, and *Sample solution* to stand for 3 h at ambient temperature before use. Protect solutions containing tacrolimus from light.

Solution A: 6 mM phosphoric acid
Solution B: Acetonitrile and *tert*-butyl methyl ether (81:19). [NOTE—The ratio of acetonitrile to *tert*-butyl methyl ether is critical.]
Solution C: *Solution A* and *Solution B* (4:1)
Solution D: *Solution A* and *Solution B* (1:4)

USP Monographs

www.webofpharma.com

Mobile phase: See *Table 7*.

Table 7

Time (min)	Solution C (%)	Solution D (%)
0	74	26
45	74	26
60	15	85
75	15	85
76	74	26
85	74	26

Solution E: 50 g/L of polyoxyethylene (23) lauryl ether in *Solution A*. [NOTE—Polyoxyethylene (23) lauryl ether is also called Brij-35.]
Diluent: Acetonitrile and *Solution E* (7:3)
System suitability solution: 1.5 mg/mL of USP Tacrolimus System Suitability Mixture RS in *Diluent*
Standard solution: 7.5 µg/mL of USP Tacrolimus RS in *Diluent*
Sensitivity solution: 1.5 µg/mL of USP Tacrolimus RS in *Diluent* from *Standard solution*
Peak identification solution 1: 10 µg/mL of USP Tacrolimus 8-epimer RS in *Diluent*
Peak identification solution 2: 10 µg/mL of USP Tacrolimus 8-propyl Analog RS in *Diluent*
Sample solution: Equivalent to 1.5 mg/mL of tacrolimus in *Diluent*. [NOTE—Shake the mixture on a mechanical shaker for 30 min, and pass through a suitable filter.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 15-cm; 3-µm packing L1
Column temperature: 60°
Flow rate: 1.5 mL/min
Injection volume: 40 µL
System suitability
Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*
Suitability requirements
Resolution: NLT 3.0 between tacrolimus and ascomycin, *System suitability solution*
Relative standard deviation: NMT 10.0% for the sum of the responses of tacrolimus and tacrolimus 19-epimer, *Standard solution*
Signal-to-noise ratio: NLT 10.0, *Sensitivity solution*
Analysis
Samples: *Standard solution*, *Peak identification solution 1*, *Peak identification solution 2*, and *Sample solution*
Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = sum of the peak responses of tacrolimus 19-epimer and tacrolimus from the *Standard solution*
C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tacrolimus in the *Sample solution* (mg/mL)
P = potency of tacrolimus in USP Tacrolimus RS (mg/mg)
F = relative response factor (see *Table 8*)

Acceptance criteria: See *Table 8*. Identify tacrolimus 8-epimer and tacrolimus 8-propyl analog using *Peak identification solution 1* and *Peak identification solution 2*. Disregard peaks that are smaller than the tacrolimus peak in the *Sensitivity solution*.

Table 8

Tacrolimus Compounded Oral Suspension

DEFINITION

Tacrolimus Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$).

Prepare Tacrolimus Compounded Oral Suspension 0.5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tacrolimus capsules[a] equivalent to	50 mg of tacrolimus
Vehicle: a 1:1 mixture of Ora-Plus[b] and Syrup, *NF*, a sufficient quantity to make	100 mL

[a] Prograf 5-mg capsules, Astellas Pharma US, Inc., Deerfield, IL.

[b] Paddock Laboratories, Minneapolis, MN.

Calculate the quantity of each ingredient required for the total amount to be prepared. Empty the required number of *Tacrolimus capsules* in a suitable mortar. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tacrolimus liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

www.webofpharma.com

Tacrolimus powder is not interchangeable with *Tacrolimus capsules* and should not be used.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and deionized distilled water (65:35). Filter and degas.

Standard stock solution: 0.5 mg/mL of USP Tacrolimus RS in acetonitrile

Standard solution: Pipet 1.0 mL of *Standard stock solution* into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a nominal concentration of 50 µg/mL of tacrolimus. [NOTE—The *Standard solution* is relatively unstable, and the *Assay* should proceed immediately.]

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 50 µg/mL of tacrolimus. [NOTE—The *Sample solution* is relatively unstable, and the *Assay* should proceed immediately.]

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 70°

Flow rate: 1.7 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for tacrolimus is about 6.4 min.]

Suitability requirements

Column efficiency: NLT 2500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of tacrolimus in the *Sample solution* (µg/mL)

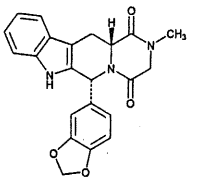
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 4.1–5.1

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.



• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature

• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Tacrolimus RS

Tadalafil

$C_{22}H_{19}N_3O_4$ 389.40

Pyrazino[1′,2′:1,6]pyrido[3,4-*b*]indole-1,4-dione, 6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methyl-, (6*R*-12a*R*)-;

(6*R*,12a*R*)-2,3,6,7,12,12a-Hexahydro-2-methyl-6-[3,4-(methylenedioxy)phenyl] pyrazino[1′,2′:1,6]pyrido[3,4-*b*] indole-1,4-dione [171596-29-5].

DEFINITION

Tadalafil contains NLT 97.5% and NMT 102.5% of tadalafil ($C_{22}H_{19}N_3O_4$), calculated on the dried basis.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Identification solution*, as obtained in the test for *Enantiomeric and Diastereomeric Purity*.

ASSAY

• **PROCEDURE**

Solution A: Add 1.0 mL of trifluoroacetic acid to 1 L of water.

Mobile phase: Acetonitrile and *Solution A* (45:55)

Standard solution: 0.1 mg/mL of USP Tadalafil RS in acetonitrile and *Solution A* (1:1); prepare by first dissolving the standard in acetonitrile, and then diluting with *Solution A* to final volume.

Sample solution: 0.1 mg/mL of Tadalafil in acetonitrile and *Solution A* (1:1); prepare by first dissolving the sample in acetonitrile, and then diluting with *Solution A* to final volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: 285 nm

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tadalafil ($C_{22}H_{19}N_3O_4$) in the portion of Tadalafil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)

USP Monographs

www.webofpharma.com

C_U = concentration of Tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–102.5% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.10%, using a 1-g sample

• **ORGANIC IMPURITIES**

[NOTE—Do not use sonication during the preparation of analyte solutions.]

Solution A: Add 1.0 mL of trifluoroacetic acid to 1 L of water.

Solution B: Acetonitrile

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the column.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
3	85	15
30	5	95
33	5	95

Standard solution: 0.4 µg/mL of USP Tadalafil RS in acetonitrile and *Solution A* (1:1); prepare by first dissolving the standard in acetonitrile, and then diluting with *Solution A* to final volume.

Sensitivity solution: 0.2 µg/mL of USP Tadalafil RS in acetonitrile and *Solution A* (1:1) from the *Standard solution*

System suitability stock solution: To generate the 6*R*,12a*S* diastereomer of tadalafil, dissolve 4.0 mg of Tadalafil in 50 mL of a mixture of isopropyl alcohol and acetonitrile (1:1). Add 1.0 mL of 1.0 M tetrabutylammonium hydroxide in methanol, and allow to stand at room temperature for 40 min. Add 1.0 mL of trifluoroacetic acid, and dilute with a mixture of isopropyl alcohol and acetonitrile (1:1) to 100 mL.

System suitability solution: Dissolve 40 mg of Tadalafil in 50 mL of acetonitrile. Add 2.0 mL of the *System suitability stock solution*, and dilute with *Solution A* to 100 mL.

Sample solution: 0.4 mg/mL of Tadalafil in acetonitrile and *Solution A* (1:1); prepare by first dissolving the sample in acetonitrile, and then diluting with *Solution A* to final volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution, Sensitivity solution,* and *System suitability solution*

[NOTE—The relative retention times for tadalafil and the 6*R*,12a*S* diastereomer of tadalafil are about 1.0 and 1.03, respectively.]

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Peak-to-valley ratio: The ratio of the height of the 6*R*, 12a*S* diastereomer peak to the height of the valley between the 6*R*,12a*S* diastereomer peak and tadalafil is NLT 3.3, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tadalafil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of tadalafil from the *Standard solution*

C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)

C_U = concentration of Tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria

[NOTE—Disregard peaks due to the 6*R*,12a*S* and 6*S*, 12a*R* diastereomers of tadalafil, which co-elute at a retention time of about 1.03 relative to tadalafil. The diastereomers are controlled in the test for *Enantiomeric and Diastereomeric Purity*.]

Individual impurities: NMT 0.1%

Total impurities: NMT 0.3%

Reporting level for impurities: 0.05%

• **ENANTIOMERIC AND DIASTEREOMERIC PURITY**

Mobile phase: Hexanes and isopropyl alcohol (50:50)

Diluent: Hexanes, isopropyl alcohol, and acetonitrile (40:40:20)

Identification solution: 0.5 mg/mL of USP Tadalafil RS in *Diluent*. [NOTE—This solution is used for *Identification* test *B*.]

Standard stock solution: 50 µg/mL of USP Tadalafil RS in *Diluent*

Standard solution: 0.5 µg/mL of USP Tadalafil RS in *Diluent* from the *Standard stock solution*

System suitability stock solution: To generate the 6*R*,12a*S* diastereomer of tadalafil, dissolve 25 mg of Tadalafil in 40 mL of *Diluent*. Add 1.0 mL of 1.0 M tetrabutylammonium hydroxide in methanol, and allow to stand at room temperature for 20 min. Add 1.0 mL of trifluoroacetic acid, and dilute with *Diluent* to 50 mL.

System suitability solution: Transfer 1.0 mL of the *System suitability stock solution* and 10 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Sensitivity solution: 0.25 µg/mL of USP Tadalafil RS in *Diluent* from *Standard solution*

Sample solution: 0.5 mg/mL of Tadalafil in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: 222 nm

Column: 4.6-mm × 25-cm; 10-µm packing L51

Analysis
Samples: *Identification solution, Standard solution,* and *Sample solution*
Calculate the percentage of each stereoisomer impurity in the portion of Tadalafil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each stereoisomer impurity from the *Sample solution*
r_S = peak response of tadalafil from the *Standard solution*
C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)
C_U = concentration of Tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2.*

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
6*R*,12a*S* diastereomer[a]	0.79	0.1
Tadalafil	1.0	—
6*S*,12a*S* enantiomer[b]	1.4	0.1
6*S*,12a*R* diastereomer[c]	1.7	0.1

[a] (6*R*,12a*S*)-6-(1,3-Benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methylpyrazino[1′,2′:1,6]pyrido[3,4-*b*]indole-1,4-dione.
[b] (6*S*,12a*S*)-6-(1,3-Benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methylpyrazino[1′,2′:1,6]pyrido[3,4-*b*]indole-1,4-dione.
[c] (6*S*,12a*R*)-6-(1,3-Benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methylpyrazino[1′,2′:1,6]pyrido[3,4-*b*]indole-1,4-dione.

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry a sample under vacuum at 105° for 3 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tadalafil RS

Tadalafil Tablets

DEFINITION
Tadalafil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy* **197D** or **197K**▲ (CN 1-May-2020)
Standard: Add 10 mg of USP Tadalafil RS to 15 mL of water. Shake for 20 min, centrifuge for 10 min, and discard the supernatant. Suspend the precipitate in 8 mL of ethyl acetate, and shake for 5 min. Centrifuge for 10 min, and collect the supernatant. Dry the supernatant under a stream of nitrogen. The supernatant may be heated up to 70° to aid evaporation of the ethyl acetate. [NOTE—Ethyl acetate must be completely removed to prevent interference in the spectrum.]
Sample: Transfer a quantity of Tablets, equivalent to 10–20 mg of tadalafil, into a suitable container. Add 15 mL of water, and shake for 10 min, or until the Tablets are completely dispersed. Centrifuge for 10 min, and discard the supernatant. Suspend the precipitate in 8 mL of ethyl acetate, and shake for 5 min. Centrifuge for 10 min, and collect the supernatant. Dry the supernatant under a stream of nitrogen. The supernatant may be heated up to 70° to aid evaporation of the ethyl acetate. [NOTE—Ethyl acetate must be completely removed to prevent interference in the spectrum.]
Acceptance criteria: Meets the requirements over the range from 1700–400 cm^{-1}
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY
• **PROCEDURE**
Mobile phase: Acetonitrile, water, and trifluoroacetic acid (35: 65: 0.1)
Diluent: Acetonitrile and water (1:1)
Standard solution: 0.25 mg/mL of USP Tadalafil RS in *Diluent*
System suitability solution: To partially convert tadalafil to the 6*R*,12a*S* diastereomer, transfer 25 mL of the *Standard solution* into a suitable container. Add 0.25 mL of 5 N sodium hydroxide, mix well, and let stand for 30 min. Neutralize the solution to pH 7 by drop-wise addition of trifluoroacetic acid. [NOTE—This solution is stable for 1 month when stored in a refrigerator.]
Sample solution: Place NLT 20 Tablets into an appropriate size volumetric flask. Fill the flask about halfway with *Diluent,* and shake the mixture for about 15 min to disintegrate the Tablets. If any large fragments remain, sonicate the solution for 2 min or until fragments are dispersed. Dilute with *Diluent* to volume, and mix. Allow the solution to stand for at least 1 h to further aid Tablet dissolution. If necessary, shake the solution and perform a secondary dilution to obtain a final nominal concentration of 0.25 mg/mL. Centrifuge or filter the solution. [NOTE—The initial concentration before a secondary dilution step should not exceed 6 mg/mL.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 285 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L7
Column temperature: 35°
Flow rate: 1.0 mL/min
Injection volume: 10 µL
System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times for tadalafil and the 6*R*,12a*S* diastereomer of tadalafil are about 1.0 and 1.2, respectively.]
Suitability requirements
Resolution: NLT 3 between tadalafil and the 6*R*,12a*S* diastereomer peak, *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

USP Monographs

www.webofpharma.com

r_S = peak response from the *Standard solution*
C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: 0.5% sodium dodecyl sulfate; 1000 mL
Apparatus 2: 50 rpm
Time: 10 and 30 min
Mobile phase: Methanol and water (50:50)
Standard stock solution: 0.25 mg/mL of USP Tadalafil RS in acetonitrile and water (1:1)
Standard solution: 0.0075 mg/mL of USP Tadalafil RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 5.0-cm; 3.5-µm packing L7
Column temperature: 40°
Flow rate: 2.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$) dissolved at each time point (Q_i):

$$Q_{10} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$Q_{30} = (Q_{10} \times v/V) + [(r_U/r_S) \times (C_S/L) \times (V - v) \times 100]$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium*, 1000 mL
v = volume of the sample withdrawn at initial time point (mL)

Tolerances: NLT 40% *(Q)* of the labeled amount of tadalafil is dissolved in 10 min and NLT 80% *(Q)* of the labeled amount of tadalafil is dissolved in 30 min.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩
Procedure for content uniformity
Diluent: Acetonitrile and water (1:1)
Standard solution: 0.1–0.2 mg/mL of USP Tadalafil RS in *Diluent*
Sample solution: Add 1 Tablet to a suitable volumetric flask to prepare a solution having a nominal concentration of 0.1–0.2 mg/mL of tadalafil. Add a volume of *Diluent* equivalent to 50% of the volume of the flask, and mechanically shake for 15 min. Dilute with *Diluent* to volume, and pass a portion of the solution through a suitable filter of 0.45-µm pore size, discarding the first 2–3 mL.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Cell: 0.1 cm
Analytical wavelength: Absorption maximum at about 285 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tadalafil RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements for coated Tablets

IMPURITIES

• **ORGANIC IMPURITIES**
Mobile phase, Diluent, Standard solution, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
Sensitivity solution: 0.25 µg/mL of USP Tadalafil RS in *Diluent* from the *Standard solution*
System suitability
Samples: *Standard solution, System suitability solution,* and *Sensitivity solution*

Tadalafil Compounded Oral Suspension

DEFINITION

Tadalafil Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$).

Prepare Tadalafil Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tadalafil tablets[a] equivalent to	500 mg
Vehicle: A 1:1 mixture of Ora-Plus[b] and Ora-Sweet[b], a sufficient quantity to make	100 mL

[a] Adcirca 20-mg tablets, Eli Lilly and Company, Indianapolis, IN.
[b] Perrigo Pharmaceuticals, Allegan, MI.

Place the required number of tablets in a suitable mortar, and comminute to a fine powder. Wet the powder with a small amount of the *Vehicle*, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tadalafil liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Solution A: 10 mM sodium phosphate adjusted with phosphoric acid to a pH of 3.0. Pass through a nylon filter of 0.45-µm pore size.

Solution B: Water adjusted with phosphoric acid to a pH of 3.0

Mobile phase: Acetonitrile and *Solution A* (60:40)

Diluent: Acetonitrile and *Solution B* (50:50)

Standard stock solution: 5 mg/mL of tadalafil prepared from USP Tadalafil RS in acetonitrile. Mix well, and store at 2°–8°.

Standard solution: Transfer 2.0 mL of the *Standard stock solution* into a 500-mL volumetric flask, and dilute with *Diluent* to volume. Mix well. Centrifuge an aliquot for 5 min at 14,000 rpm. Protect from light, and store at 2°–8°.

Sample solution: Transfer 2.0 mL of Oral Suspension into a 500-mL volumetric flask, and dilute with *Diluent* to volume. Mix well. Centrifuge an aliquot for 5 min at 14,000 rpm. Protect from light, and store at 2°–8°.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Temperatures

Autosampler: 5°

Column: 30°

Flow rate: 0.8 mL/min

Injection volume: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for tadalafil is about 4.5 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tadalafil ($C_{22}H_{19}N_3O_4$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tadalafil from the *Sample solution*

r_S = peak response of tadalafil from the *Standard solution*

C_S = concentration of tadalafil in the *Standard solution* (mg/mL)

C_U = nominal concentration of tadalafil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩: 4.3–5.3

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or controlled room temperature.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or controlled room temperature.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Tadalafil RS

Talc

DEFINITION

Talc is a powdered, selected, natural, hydrated magnesium silicate. Pure talc has the formula $Mg_3Si_4O_{10}(OH)_2$. It may contain variable amounts of associated minerals among which chlorites (hydrated aluminum and magnesium silicates), magnesite (magnesium carbonate), calcite (calcium carbonate), and dolomite (calcium and magnesium carbonate) are predominant.

IDENTIFICATION

- **A. INFRARED ABSORPTION:** The IR spectrum of a potassium bromide dispersion of it exhibits maxima at 3677 ± 2 cm^{-1}, at 1018 ± 2 cm^{-1}, and at 669 ± 2 cm^{-1}.
- **B. PROCEDURE**

Sample: 100 mg

Analysis: Mix about 200 mg of anhydrous sodium carbonate and 2 g of anhydrous potassium carbonate, and melt in a platinum crucible. To the melt add the *Sample*, and continue heating until fusion is complete. Cool, and transfer the fused mixture to a dish or beaker with the aid of about 50 mL of hot water. Add hydrochloric acid to the liquid until effervescence ceases, then add 10 mL more of the acid, and evaporate the mixture on a steam bath to dryness. Cool, add 20 mL of water, boil, and filter the mixture. Save the insoluble residue for use in *Identification* test *C*.

To 5 mL of the filtrate add 1 mL of 6 N ammonium hydroxide and 1 mL of ammonium chloride TS. Filter, if necessary, and add 1 mL of dibasic sodium phosphate TS to the filtrate.

Acceptance criteria: A white, crystalline precipitate of magnesium ammonium phosphate is formed.

- **C. PROCEDURE**

Sample: 100 mg of the insoluble residue from *Identification* test *B*

Analysis: In a lead or platinum crucible and using a copper wire, mix the *Sample* with about 10 mg of sodium fluoride and a few drops of sulfuric acid to give a thin slurry. Cover the crucible with a thin transparent plate of plastic under which a drop of water is suspended, and warm gently.

www.webofpharma.com

Acceptance criteria: Within a short time, a white ring is rapidly formed around the drop of water.

ASSAY

• **CONTENT OF MAGNESIUM**

Lanthanum chloride solution: To 5.9 g of lanthanum oxide slowly add 10 mL of hydrochloric acid, and heat to boiling. Allow to cool, and dilute with water to 100 mL.

Magnesium standard stock solution: 10 µg/mL of magnesium, prepared by diluting an 8.365 mg/mL solution of magnesium chloride in diluted hydrochloric acid with water (1 in 100)

Magnesium standard solutions: Into four identical 100-mL volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution*, transfer respectively 2.5, 3.0, 4.0, and 5.0 mL of *Magnesium standard stock solution*, and dilute with water to volume.

Sample stock solution: [**CAUTION**—Perchlorates mixed with heavy metals are known to be explosive. Take proper precautions while performing this analysis.]

Weigh 500 mg of Talc in a 100-mL polytetrafluoroethylene dish. Add 5 mL of hydrochloric acid, 5 mL of lead-free nitric acid, and 5 mL of perchloric acid. Stir gently, then add 35 mL of hydrofluoric acid, and evaporate slowly on a hot plate to moist dryness (until about 0.5 mL remains). To the residue, add 5 mL of hydrochloric acid, cover with a watch glass, heat to boiling, and allow to cool. Rinse the watch glass and the dish with water, transfer to a 50-mL volumetric flask, and dilute with water to volume.

Sample solution: Dilute the *Sample stock solution* with water (1 in 200). Transfer 4.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution*, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Magnesium emission line at 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Magnesium standard solutions* and *Sample solution*

Concomitantly determine the absorbance of the solutions.

Acceptance criteria: 17.0%–19.5%

IMPURITIES

• **WATER-SOLUBLE SUBSTANCES**

Sample: 10.0 g

Analysis: To the *Sample* add 50 mL of carbon dioxide-free water, heat to boiling, and boil under a reflux condenser for 30 min. Allow to cool, filter, and dilute with carbon dioxide-free water to 50.0 mL. Test with litmus paper. Evaporate 25.0 mL of the filtrate to dryness, dry at 105° for 1 h, and weigh the residue.

Acceptance criteria: The filtrate is neutral to litmus paper, and the weight of the residue is NMT 5 mg (0.1%).

• **LIMIT OF IRON**

Iron standard stock solution: 250 µg/mL of iron from 4.840 g ferric chloride in a 150 g/L solution of hydrochloric acid in water. Prepare immediately before use.

Iron standard solutions: Into four 100-mL volumetric flasks, each containing 50.0 mL of 0.5 N hydrochloric acid, transfer respectively 2.0, 2.5, 3.0, and 4.0 mL of the *Standard iron stock solution*, and dilute each flask with water to volume.

Sample stock solution: Transfer 10.0 g of Talc to a conical flask fitted with a reflux condenser. Gradually add 50 mL of 0.5 N hydrochloric acid while stirring, and heat on a water bath for 30 min. Allow to cool. Transfer the mixture to a beaker, and allow the undissolved material to settle. Filter the supernatant into a 100-mL volumetric flask, retaining as much as possible of the insoluble material in the beaker. Wash the residue and the beaker with three 10-mL portions of hot water. Wash the filter with 15 mL of hot water, allow the filtrate to cool, and dilute with water to 100.0 mL.

Sample solution: Transfer 2.5 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 50.0 mL of 0.5 N hydrochloric acid, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Iron emission line at 248.3 nm

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Iron standard solutions* and *Sample solution*

Concomitantly determine the absorbance of the solutions. Make any correction using a deuterium lamp.

Acceptance criteria: NMT 0.25%

• **LIMIT OF LEAD**

Sample solution: Use the *Sample stock solution* as directed in the test for *Limit of Iron*.

Diluent: Nitric acid in water (1 in 100)

Lead standard stock solution: 10 µg/mL of lead prepared as follows. Dissolve 160 mg of lead nitrate in 100 mL of *Diluent*, and dilute with water to 1000 mL. Dilute this solution with water (1 in 10).

Lead standard solutions: Into four identical 100-mL volumetric flasks, each containing 50.0 mL of 0.5 N hydrochloric acid, transfer respectively 5.0, 7.5, 10.0, and 12.5 mL of *Lead standard stock solution*, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Lead emission line at 217.0 nm

Lamp: Lead hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Lead standard solutions* and *Sample solution*

Concomitantly determine the absorbance of the solutions.

Acceptance criteria: NMT 10 ppm

• **LIMIT OF CALCIUM**

Lanthanum chloride solution: Prepare as directed in the *Assay*.

Calcium standard stock solution: 100 µg/mL of calcium, prepared immediately before use by diluting a 3.67 mg/mL solution of calcium chloride dihydrate in diluted hydrochloric acid with water (1 in 10)

Calcium standard solutions: Into four identical 100-mL volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution*, transfer respectively 1.0, 2.0, 3.0, and 4.0 mL of *Calcium standard stock solution*, and dilute each solution with water to volume.

Sample stock solution: Prepare as directed in the *Assay*.

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution*, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

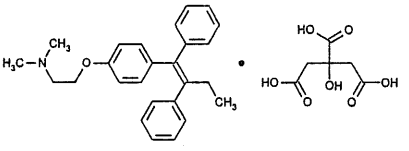
Samples: *Aluminum standard solutions* and *Sample solution*
Concomitantly determine the absorbance of the solutions.
Acceptance criteria: NMT 2.0%

• **ABSENCE OF ASBESTOS**
[NOTE—Suppliers of Talc may use one of the following methods to determine the absence of asbestos.]
Proceed as directed for *Procedure 1* or *Procedure 2*. If either test is positive, perform *Procedure 3*.
Procedure 1: Infrared Absorption
The IR absorption spectrum of a potassium bromide dispersion of Talc at the absorption band at 758 ± 1 cm^{-1}, using scale expansion, may indicate the presence of tremolite or chlorite. If the absorption band remains after ignition of the substance at 850° for at least 30 min, it indicates the presence of tremolite. In the range 600 cm^{-1} to 650 cm^{-1} using scale expansion, any absorption band or shoulder may indicate the presence of serpentines.
Procedure 2: Use the following conditions (see *X-Ray Diffraction* ⟨941⟩):
Cu Kα monochromatic 40 kV radiation, 24–30 mA; the incident slit is set at 1°; the detection slit is set at 0.2°; the goniometer speed is 1/10° 2Θ/min; the scanning range is 10°–13° 2Θ and 24°–26° 2Θ; the sample is not oriented. Prepare a random sample, and place on the sample holder. Pack and smooth its surface with a polished glass microscope slide. Record the diffractograms: the presence of amphiboles is detected by a diffraction peak at 10.5 ± 0.1° 2Θ, and the presence of serpentines is detected by diffraction peaks at 24.3 ± 0.1° 2Θ to 12.1 ± 0.1° 2Θ.
Procedure 3: The presence of asbestos (see *Optical Microscopy* ⟨776⟩) is shown if there is a range of length to width ratios of 20:1 to 100:1, or higher for fibers longer than 5 µm; if there is a capability of splitting into very thin fibrils; and if there are two or more of the following four criteria: (1) parallel fibers occurring in bundles, (2) fiber bundles displaying frayed ends, (3) fibers in the form of thin needles, and (4) matted masses of individual fibers and/or fibers showing curvature.

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩
Intended for topical administration
Total aerobic microbial count: NMT 100 cfu/g
Total combined molds and yeasts count: NMT 50 cfu/g
Intended for oral administration
Total aerobic microbial count: NMT 1000 cfu/g
Total combined molds and yeasts count: NMT 100 cfu/g



• **ACIDITY AND ALKALINITY:** Boil 2.5 g of Talc with 50 mL of carbon dioxide-free water under reflux. Filter under vacuum. To 10 mL of the filtrate, add 0.1 mL of bromothymol blue TS. Add 0.01 N hydrochloric acid until the indicator changes color. To a second 10 mL of the filtrate, add 0.1 mL of phenolphthalein TS. Add 0.01 N sodium hydroxide until the indicator turns pink.
Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid is required to change the color of the bromothymol blue indicator. NMT 0.3 mL of 0.01 N sodium hydroxide is required to change the color of the phenolpthalein indicator to pink.

• **LOSS ON IGNITION** ⟨733⟩
Sample: 1 g
Analysis: Ignite at 1075 ± 25° to constant weight.
Acceptance criteria: It loses NMT 7.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
• **LABELING:** The label states, where applicable, that the substance is suitable for oral or topical administration. The certificate of analysis states the absence of asbestos. It also indicates which method specified in the test for *Absence of Asbestos* was used for analysis.

Tamoxifen Citrate

$C_{26}H_{29}NO \cdot C_6H_8O_7$ 563.64
Ethanamine, 2-[4-(1,2-diphenyl-1-butenyl)phenoxy]-*N*,*N*-dimethyl, (*Z*)-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1).
(*Z*)-2-[*p*-(1,2-Diphenyl-1-butenyl)phenoxy]-*N*,*N*-dimethylethylamine citrate (1:1) [54965-24-1].

» Tamoxifen Citrate contains not less than 99.0 percent and not more than 101.0 percent of $C_{26}H_{29}NO \cdot C_6H_8O_7$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Monographs

USP Reference standards ⟨11⟩—
USP Tamoxifen Citrate RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy, 197K*▲ (CN 1-May-2020): a single band in the 1700 to 1740 cm^{-1} region of the spectrum.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 20 µg per mL.
Medium: methanol.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%.

Limit of *E*-isomer—
Mobile phase—Prepare a methanol solution containing, in each liter, 320 mL of water, 2 mL of glacial acetic acid, and 1.08 g of sodium 1-octanesulfonate.
Standard preparation—Dissolve a suitable quantity, accurately weighed, of USP Tamoxifen Citrate RS in *Mobile phase* to obtain a solution having a known concentration of about 600 µg per mL.
Test preparation—Using about 30 mg of Tamoxifen Citrate, accurately weighed, proceed as directed under *Standard preparation*.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L11. The flow rate is about 0.7 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the responses of the major peak: the relative standard deviation is not more than 3.0%, and the relative retention time of the minor *E*-isomer peak to that of the *Z*-isomer peak is not greater than 0.93.
Procedure—Separately introduce equal volumes (about 20 µL) of the *Test preparation* and the *Standard preparation* into the liquid chromatograph by means of a suitable sampling valve. Measure the minor peak responses for the *E*-isomer obtained from the *Standard preparation* and the *Assay preparation*. Calculate the quantity, in mg, of *E*-isomer ($C_{26}H_{29}NO \cdot C_6H_8O_7$) in the portion of Tamoxifen Citrate taken by the formula:

$$0.05C(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the *E*-isomer as the citrate, based on its declared content in USP Tamoxifen Citrate RS in the *Standard preparation*, and the r_U and r_S are the minor peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. The *E*-isomer content is not more than 0.3% of tamoxifen citrate ($C_{26}H_{29}NO \cdot C_6H_8O_7$).

Iron ⟨241⟩—Accurately weigh 1.0 g, and transfer to a suitable crucible. Add sufficient sulfuric acid to wet the substance, and carefully ignite at a low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 10 mL of warm 0.1 N hydrochloric acid, and digest for about 5 minutes. Transfer the contents of the crucible with the aid of small portions of water to a 50-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL from the volumetric flask into a color-comparison tube, dilute with water to 45 mL, add 2 mL of hydrochloric acid, and mix. The limit is 0.005%.

Related impurities—
Test preparation A—Disperse about 3 g in 100 mL of water in a separator. Over a 10-minute period add 50 mL of 0.5 N sodium hydroxide, with mixing. Extract with two 50-mL portions of ether, and combine the extracts. Wash with 20 mL of water, remove the water layer, and dry the ether layer over anhydrous sodium sulfate. Evaporate the ether layer under nitrogen, and dry in vacuum at room temperature for 2 hours. Accurately weigh 1.5 g of the residue into a 10-mL volumetric flask, add 5.0 mL of a mixture of 5 volumes of acetic anhydride and 95 volumes of pyridine, and heat at 60° for 10 to 15 minutes. Cool, dilute with the same solvent mixture to volume, and mix.
Test preparation B—Using the same acetic anhydride-pyridine mixture, prepare a 1:200 dilution of *Test preparation A*.
Chromatographic system (see *Chromatography* ⟨621⟩)—Typically, the gas chromatograph is equipped with a flame-ionization detector, and contains a 4-mm × 1-m glass column packed with 5% liquid phase G17 on 100- to 120-mesh support S1AB conditioned at 300° for 24 hours. The column and injection port temperatures are maintained at about 260° and the detector temperature at about 300°. Dry helium is used as the carrier gas at a flow rate of about 60 mL per minute. In a suitable chromatogram, five replicate injections of *Test preparation B* show a relative standard deviation of not more than 3.0%.
Procedure—Inject equal portions (about 2 µL), accurately measured, of *Test preparation A* and *Test preparation B* into the chromatograph, and record the chromatograms from 0.1 to 5.0, relative to the retention time of the major peak. Measure the individual areas of the peaks other than those produced by the solvent and the tamoxifen on the chromatograms obtained from *Test preparation A*, and calculate their sum. No single peak area is greater than the total area of the tamoxifen peak on the chromatogram obtained from *Test preparation B* (0.5%), and the sum of the peak areas is not greater than twice the total area of the tamoxifen peak on the chromatogram obtained from *Test preparation B* (1.0%).

Assay—Weigh accurately about 1 g of Tamoxifen Citrate, and dissolve in 150 mL of glacial acetic acid. Titrate the solution with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass indicator electrode and a silver-silver chloride reference electrode. Each mL of 0.1 N perchloric acid is equivalent to 56.36 mg of $C_{26}H_{29}NO \cdot C_6H_8O_7$.

Tamoxifen Citrate Tablets

» Tamoxifen Citrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tamoxifen ($C_{26}H_{29}NO$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Tamoxifen Citrate RS

Identification—
A: The UV absorption spectrum of the *Test preparation*, obtained as directed in the test for *Content uniformity*, exhibits

USP Monographs

www.webofpharma.com

maxima and minima at the same wavelengths as that of the *Standard preparation,* concomitantly measured.

B: To 1 Tablet contained in a 15-mL tube add 4 mL of pyridine and 2 mL of acetic anhydride: an immediate yellow color is produced on shaking. Then heat gently on a steam bath: a rose-pink to a deep red color develops, indicating the presence of citrate ion.

Dissolution ⟨711⟩—

Medium: 0.02 N hydrochloric acid; 1000 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of tamoxifen ($C_{26}H_{29}NO$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 275 nm of filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Tamoxifen Citrate RS in the same *Medium.*

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{26}H_{29}NO$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Standard solution—Dissolve an accurately weighed quantity of USP Tamoxifen Citrate RS in methanol to obtain a solution having a known concentration of about 15 µg per mL.

Test solution—Place 1 Tablet in a 100-mL volumetric flask, and crush with a stirring rod. Add about 75 mL of methanol, and shake for about 5 minutes. Dilute with methanol to volume, mix, and filter the solution through paper. Pipet 10 mL of the filtrate into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells at the wavelength of maximum absorbance at about 275 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of tamoxifen ($C_{26}H_{29}NO$) in the Tablets taken by the formula:

$$(371.51/563.64)(TC/D)(A_U/A_S)$$

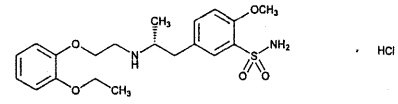
in which 371.51 and 563.64 are the molecular weights of tamoxifen and tamoxifen citrate, respectively; T is the labeled quantity, in mg, of tamoxifen in the Tablet; C is the concentration, in µg per mL, of USP Tamoxifen Citrate RS in the *Standard solution;* D is the concentration, in µg per mL, of tamoxifen in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and A_U and A_S are the absorbances of the *Test solution* and the *Standard solution,* respectively.

Assay—

Mobile phase—Prepare a methanol solution containing, in each liter, 320 mL of water, 2 mL of glacial acetic acid, and 1.08 g of sodium 1-octanesulfonate.

Standard preparation—Dissolve a suitable quantity, accurately weighed, of USP Tamoxifen Citrate RS in *Mobile phase* to obtain a solution having a known concentration of about 200 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of tamoxifen, to a stoppered, 50-mL centrifuge tube. Pipet 30 mL of *Mobile phase* into the tube, and shake by mechanical means for not less than 15 minutes. Centrifuge at about 1000 rpm, pipet 5 mL of the clear supernatant into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.



Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph by means of a suitable sampling valve, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of tamoxifen ($C_{26}H_{29}NO$) in the portion of Tablets taken by the formula:

$$0.15C(371.51/563.64)(r_U/r_S)$$

in which 371.51 and 563.64 are the molecular weights of tamoxifen and tamoxifen citrate, respectively; C is the concentration, in µg per mL, of USP Tamoxifen Citrate RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Tamsulosin Hydrochloride

$C_{20}H_{28}N_2O_5S \cdot HCl$ 444.97

Benzenesulfonamide, 5-[2-[[2-(2-ethoxyphenoxy)ethyl] amino]propyl]-2-methoxy-, monohydrochloride, (*R*)-; (–)-(*R*)-5-[2-[[2-(*o*-Ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide monohydrochloride [106463-17-6].

DEFINITION

Tamsulosin Hydrochloride contains NLT 98.0% and NMT 102.0% of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$), calculated on the dried basis.

Tamsulosin Hydrochloride Capsules

DEFINITION
Tamsulosin Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE 1**
Solution A: Dilute 20 mL of hydrochloric acid with water to 1000 mL.
Solution B: Dissolve 8.7 mL of perchloric acid and 3.0 g of sodium hydroxide in 1900 mL of water. Adjust with 1 N sodium hydroxide to a pH of 2.0, and add sufficient water to make 2000 mL.
Mobile phase: Acetonitrile and *Solution B* (3:7)
Internal standard solution: 0.4 mg/mL of propylparaben in a mixture of acetonitrile and water (3:7)
Standard stock solution: 0.5 mg/mL of USP Tamsulosin Hydrochloride RS in a mixture of acetonitrile and water (3:7)
Standard solution: Transfer 2.0 mL of the *Standard stock solution* to a suitable container, add 5.0 mL of the *Internal standard solution*, and add *Mobile phase* to make 40 mL.
Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the powder, equivalent to about 1 mg of tamsulosin hydrochloride based on the label claim, into a Teflon-lined, screw-capped centrifuge tube. Place approximately 100 glass balls with a diameter of about 5 mm into the tube, add 20 mL of 0.05 N sodium hydroxide, heat at 50° for 10 min, and shake well for 30 min. Add to the solution 15 mL of a mixture of acetonitrile and *Solution A* (2:1), and shake well. Add 5.0 mL of the *Internal standard solution*, and shake well. Centrifuge at 1500 rpm for 10 min, and use the supernatant, passing it, if necessary, through a membrane filter of 0.5-µm or smaller pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.0-mm × 15-cm or 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.0 mL/min for the 4.0-mm column and 1.3 mL/min for the 4.6-mm column. [NOTE—The flow rate can be adjusted as needed to achieve a recommended retention time of approximately 6 min for tamsulosin.]
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 12 between tamsulosin and propylparaben. [NOTE—The elution order is tamsulosin hydrochloride followed by propylparaben.]
Relative standard deviation: NMT 2.0% for the ratios of the peak areas for tamsulosin and the internal standard
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times [C_S \times (V_S/W)] \times 100$$

R_U = peak area ratio of tamsulosin to the internal standard from the *Sample solution*
R_S = peak area ratio of tamsulosin to the internal standard from the *Standard solution*
C_S = concentration of USP Tamsulosin Hydrochloride RS in the *Standard stock solution* (mg/mL)
V_S = volume of the *Standard stock solution* taken to prepare the *Standard solution* (mL)
W = amount of tamsulosin hydrochloride, based on the label claim, taken to prepare the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%
• **PROCEDURE 2:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 2*.

www.webofpharma.com

Solution B and **Mobile phase:** Proceed as directed for *Procedure 1*.

Buffer: Dissolve 3.4 g of monobasic potassium phosphate in 1 L of water. Adjust with 2 N sodium hydroxide to a pH of 5.80 ± 0.05.

Standard solution: Prepare a solution containing 1.2 mg/mL of USP Tamsulosin Hydrochloride RS in methanol. Dilute with *Buffer* to obtain a solution containing 3.2 µg/mL.

Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the Capsule contents, equivalent to 1.6 mg of tamsulosin hydrochloride, into a 100-mL volumetric flask. Add 20 mL of methanol, stir for 30 min, sonicate for 30 min, and stir again for 30 min. Add 40 mL of methanol, sonicate for another 30 min, and stir for another 60 min. Dilute with methanol to volume, mix well, and allow the solution to stand for 5 min. Dilute 5 mL of this solution with *Buffer* to 25 mL, and allow the solution to stand for 5 min. Pass through a PVDF filter of 0.45-µm pore size, discarding the first 5 mL of the filtrate.

Chromatographic system: Proceed as directed for *Procedure 1*, except use an *Injection volume* of 50 µL.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 3:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 3*.

Solution B and **Mobile phase:** Proceed as directed for *Procedure 1*.

Buffer: Dissolve 6.9 g of monobasic sodium phosphate monohydrate in 1 L of water, and adjust with 5 N sodium hydroxide to a pH of 7.2 ± 0.05.

Standard solution: Prepare a solution containing 0.5 mg/mL of USP Tamsulosin Hydrochloride RS in a mixture of methanol and water (1:1), and dilute a portion of this solution with methanol to obtain a solution containing 0.03 mg/mL.

Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the Capsule contents, equivalent to 0.8 mg of tamsulosin hydrochloride, into a 25-mL volumetric flask. Add 5 mL of *Buffer*, shake for 15 min, add 10 mL of methanol, shake for 1 h, and dilute with methanol to volume. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system: Proceed as directed for *Procedure 1*, except use an *Injection volume* of 20 µL.

System suitability and **Analysis:** Proceed as directed for *Procedure 2*.

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 4:** For Capsules labeled to meet the requirements of *Dissolution Test 4*, proceed as directed for *Procedure 1*.

• **PROCEDURE 5:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 5*.

Solution B, Mobile phase, and **Chromatographic system:** Proceed as directed for *Procedure 1*.

Diluent: Methanol and water (75:25)

Standard solution: Prepare a solution containing 0.016 mg/mL of USP Tamsulosin Hydrochloride RS in *Diluent*.

Sample solution: Transfer the contents of 10 Capsules (equivalent to 4 mg of tamsulosin hydrochloride) into a 250-mL volumetric flask. Add 200 mL of *Diluent*, stir, and sonicate simultaneously for at least 2 h. Cool, and dilute with *Diluent* to volume. Pass through a suitable filter.

System suitability and **Analysis:** Proceed as directed for *Procedure 2*.

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 6:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 6*.

Solution B and **Mobile phase:** Proceed as directed for *Procedure 1*.

Buffer: Dissolve 6.8 g of monobasic potassium phosphate and 0.9 g of sodium hydroxide in 1 L of water. Adjust with sodium hydroxide solution to a pH of 6.8 ± 0.05.

Diluent A: Acetonitrile and *Buffer* (1:1)

Diluent B: Acetonitrile and *Solution B* (1:1)

Standard solution: Prepare a solution containing 0.4 mg/mL of USP Tamsulosin Hydrochloride RS in *Diluent A*, using sonication as necessary. Dilute 2 mL of this solution with *Diluent B* to 100 mL.

Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the Capsule contents, equivalent to 4 mg of tamsulosin hydrochloride, into a 100-mL volumetric flask. Add 60 mL of *Diluent A*, and sonicate with intermittent shaking to disperse the pellets completely. Cool, and dilute with *Diluent A* to volume. Centrifuge, transfer 5 mL of supernatant solution to a 25-mL volumetric flask, and dilute with *Diluent B* to volume. Pass through a nylon membrane filter of 0.45-µm pore size.

Chromatographic system: Proceed as directed for *Procedure 1*, except use an *Injection volume* of 20 µL.

System suitability and **Analysis:** Proceed as directed for *Procedure 2*.

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 7:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 7*.

Solution B and **Mobile phase:** Proceed as directed for *Procedure 1*.

Buffer: Dissolve 76 g of tribasic sodium phosphate in 1 L of water.

Diluent: 0.1 N hydrochloric acid and *Buffer* (3:1), adjusted with diluted hydrochloric acid or sodium hydroxide solution to a pH of 7.0

Standard solution: 0.0016 mg/mL of USP Tamsulosin Hydrochloride RS in *Diluent*

Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the Capsule contents, equivalent to 0.4 mg of tamsulosin hydrochloride, into a 250-mL volumetric flask, and dilute with *Diluent* to volume. Stir for 24 h by mechanical means at 40° protected from light. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system: Proceed as directed for *Procedure 1*, except use an *Injection volume* of 50 µL.

System suitability and **Analysis:** Proceed as directed for *Procedure 2*.

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 8:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 8*.

www.webofpharma.com

Solution B, Mobile phase, and **Chromatographic system:** Proceed as directed for *Procedure 1*.

Standard solution: Prepare a solution containing 0.1 mg/mL of USP Tamsulosin Hydrochloride RS in methanol. Dilute 5 mL of this solution with *Mobile phase* to 20 mL.

Sample solution: Weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the Capsule contents, equivalent to 2.5 mg of tamsulosin hydrochloride, into a 100-mL volumetric flask. Add 25 mL of 0.1 N sodium hydroxide, and sonicate for 30 min. Add 30 mL of *Mobile phase*, shake by mechanical means for 30 min, and dilute with *Mobile phase* to volume. Centrifuge, and pass through a PVDF membrane filter of 0.45-µm pore size, discarding the first few mL of the filtrate.

System suitability and **Analysis:** Proceed as directed for *Procedure 2*.

Acceptance criteria: 90.0%–110.0%

• **PROCEDURE 9:** For Capsules labeled to meet the requirements of *Dissolution Test 9*, proceed as directed for *Procedure 1*.

• **PROCEDURE 10:** Use this *Procedure* for Capsules labeled to meet the requirements of *Dissolution Test 10*.

Solution A, Solution B, and **Mobile phase:** Proceed as directed for *Procedure 1*.

Diluent: Acetonitrile and water (3:7)

Standard stock solution: 0.62 mg/mL of USP Tamsulosin Hydrochloride RS in *Diluent*

Internal standard solution: 0.5 mg/mL of propylparaben in *Diluent*

Standard solution: Transfer 2.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, add 5.0 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

Sample solution: Weigh and crush the contents of NLT 20 Capsules and transfer the powder equivalent to 1.2 mg of tamsulosin hydrochloride into a 50-mL volumetric flask. Add 25 mL of 0.05 N sodium hydroxide solution, heat at 50° for 15 min, and shake mechanically for 60 min. Sonicate for 30 min with intermittent shaking and add 15 mL of a mixture of *Solution A* and acetonitrile (1:2). Sonicate for another 15 min with intermittent shaking. Add 5 mL of *Internal standard solution*, dilute with a mixture of *Solution A* and acetonitrile (1:2) to volume, and mix well. Centrifuge the solution for 10 min and pass the solution through a suitable glass fiber filter.

Chromatographic system: Proceed as directed for *Procedure 1*.

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 12 between tamsulosin and propylparaben. [NOTE—The elution order is tamsulosin hydrochloride followed by propylparaben.]

Relative standard deviation: NMT 2.0% for each peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of tamsulosin to the internal standard from the *Sample solution*

R_S = peak area ratio of tamsulosin to the internal standard from the *Standard solution*

C_S = concentration of USP Tamsulosin Hydrochloride RS in the *Standard stock solution* (mg/mL)

C_U = nominal concentration of tamsulosin hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1

Acid stage medium: Dissolve 2.0 g of sodium chloride in 5.7 mL of hydrochloric acid, and add water to make up to 1000 mL. To 500 mL of this fluid add 1 mL of polysorbate 80 aqueous solution (3 g in 200 mL of water) just before the test; 500 mL.

Buffer stage medium: pH 7.2 phosphate buffer (dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water, add 90 mL of 0.2 N sodium hydroxide and 500 mL of water, adjust with 0.2 N sodium hydroxide or 0.2 N hydrochloric acid to a pH of 7.2 ± 0.05, and dilute with water to 1000 mL); 500 mL

Apparatus 2: 100 rpm, with sinker (see *Dissolution* ⟨711⟩, *Figure 2a*)

Times: 2, 3, and 8 h

Procedure: Perform the test using *Acid stage medium*. At 2 h after the start of the test, withdraw 10.0 mL of the solution under test (T1). Drain the *Acid stage medium* immediately by suction through a tube capped with a 60-mesh stainless wire screen. Rinse the drain tube while adding the *Buffer stage medium* previously warmed, and continue the test. At 3 h after the start of the test (1 h after replacement of the *Medium*), withdraw 10.0 mL of the solution under test (T2), replace the same volume with warmed *Buffer stage medium*, and continue the test. At 8 h after the start of the test (6 h after the replacement of the *Medium*), withdraw 10.0 mL of the solution under test (T3).

Internal standard solution: 0.008 mg/mL of propylparaben in acetonitrile and water (3:7)

Standard solution: Prepare a solution containing 0.5 mg/mL of USP Tamsulosin Hydrochloride RS in acetonitrile and water (3:7). Transfer 4.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Acid stage medium* to volume. Transfer 4.0 mL of this dilution to another 100-mL volumetric flask, and dilute with *Acid stage medium* to volume. This solution has a known concentration (C_S) of about 0.8 µg/mL of tamsulosin hydrochloride. Transfer 10.0 mL of this last dilution to a test tube, and add 2.0 mL of the *Internal standard solution*.

Sample solutions: Add 2.0 mL of the *Internal standard solution* to T1, mix well, and pass through a suitable filter of 0.5-µm pore size, discarding the first 5 mL. Add 1.0 mL of 0.5 N hydrochloric acid and 2.0 mL of *Internal standard solution* to T2, mix well, and pass through a suitable filter of 0.5-µm pore size, discarding the first 5 mL. Add 1.0 mL of 0.5 N hydrochloric acid and 2.0 mL of *Internal standard solution* to T3. Mix well, and pass through a suitable filter of 0.5-µm pore size, discarding the first 5 mL.

Chromatographic system: Proceed as directed in the *Assay, Procedure 1*, but use the *Standard solution* described for *Dissolution*, and an *Injection volume* of 250 µL instead of 10 µL.

Analysis: Calculate the peak area ratios (R_{T1}, R_{T2}, R_{T3}, and R_S) of tamsulosin to the internal standard for all *Sample solutions* and the *Standard solution*. Calculate the percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each of the following time points.

www.webofpharma.com

At 2 h:

$$D_1 = [(C_S \times V)/L] \times (R_{T1}/R_S) \times 100$$

At 3 h:

$$D_2 = [(C_S \times V)/L] \times [(R_{T2}/R_S) + (R_{T1}/R_S)] \times 100$$

At 8 h:

$$D_3 = [(C_S \times V)/L] \times [(R_{T3}/R_S) + (R_{T2}/R_S \times V_{T2}/V) + (R_{T1}/R_S)] \times 100$$

C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 500 mL
L = label claim (mg/Capsule)
V_{T2} = volume of the withdrawn aliquot of T2, 10 mL

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved (%)
2	13–34
3	47–68
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Acid stage medium: 0.003% Polysorbate 80, pH 1.2 (dilute 8.5 mL of hydrochloric acid with water to 900 mL, add 0.03 mL of polysorbate 80, adjust with 0.2 N sodium hydroxide or 0.2 N hydrochloric acid to a pH of 1.2 ± 0.05, and dilute with water to 1000 mL); 500 mL
Buffer stage medium: pH 7.2 phosphate buffer (proceed as directed for *Test 1*); 500 mL
Apparatus 2: 100 rpm, with sinkers[1]
Times: 2 h for the *Acid stage medium* and 6 h for the *Buffer stage medium*; 8 h total test time
Procedure: Perform the test using *Acid stage medium*. At 2 h after the start of the test, withdraw a sample of the solution under test. Carefully discard the *Acid stage medium* and replace it with the *Buffer stage medium* previously warmed, and continue the test. At 6 h after the replacement of the *Medium*, withdraw a sample of the solution under test.
Standard stock solution: Transfer about 25.0 mg of USP Tamsulosin Hydrochloride RS to a 50-mL volumetric flask. Add 25 mL of methanol. Dilute with *Buffer stage medium* to volume. Sonicate until dissolved.
Standard solution: Dilute the *Standard stock solution* with *Buffer stage medium* to obtain a final concentration of 0.8 µg/mL.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Buffer solution: 3.4 g/L of monobasic potassium phosphate in water. Adjust with 2 N sodium hydroxide to a pH of 5.80 ± 0.05.
Mobile phase: Acetonitrile and *Buffer solution* (1:3)

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 2000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis: Calculate the concentration of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the *Medium* at each time point (C_i).
At 2 h:

$$C_1 = (r_U/r_S) \times C_S$$

At 6 h in the *Buffer stage medium* (8 h total test time):

$$C_2 = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (Q_i).
At 2 h:

$$Q_1 = (C_1 \times V) \times (100/L)$$

At 6 h in the *Buffer stage medium* (8 h total test time):

$$Q_2 = (C_1 + C_2) \times (V/L) \times 100$$

V = volume of *Medium* (mL)
L = label claim (mg/Capsule)

Tolerances: NMT 25% of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) is dissolved in 2 h. NLT 85% of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) is dissolved in 8 h.
The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Acid stage
Acid stage medium: 0.003% Polysorbate 80, pH 1.2 (proceed as directed for *Test 2*); 500 mL
Apparatus 2: 100 rpm, with sinkers
Time: 2 h
Procedure: Pass a portion of the solution under test through a suitable filter. Leave the remaining *Acid stage medium* in the vessel and proceed with the *Buffer stage*.
Tolerances: NMT 10% (Q) of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) is dissolved.
Buffer stage
Buffer stage concentrate: 0.1 M phosphate buffer, pH 11.6 (138 g of sodium phosphate monohydrate and 320 mL of 5 N sodium hydroxide in 10 L of water. Adjust with 5 N sodium hydroxide to a pH of 11.6 ± 0.05.)

[1] A suitable sinker is available as catalog number CAPWHT-2S from www.qla-llc.com.

www.webofpharma.com

Buffer stage medium: Add 500 mL of the *Buffer stage concentrate* to the remaining *Acid stage medium* in each vessel. The final pH is about 7.2.
Apparatus 2: 100 rpm, with sinkers
Times: 3 and 8 h, including the 2 h in the *Acid stage medium*
Standard stock solution: 0.5 mg/mL of USP Tamsulosin Hydrochloride RS in water and methanol (1:1)
Standard solution: Dilute the *Standard stock solution* with *Buffer stage medium* to obtain a final concentration of 0.3 µg/mL.
Sample solution: Pass a portion of the solution under test through a suitable filter.
pH 5.5 buffer solution: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 2 N sodium hydroxide to a pH of 5.5 ± 0.05.
Mobile phase: Acetonitrile and *pH 5.5 buffer solution* (2:3)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.5%
Analysis: Calculate the concentration of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (C_i).
At 3 h:

$$C_1 = (r_U/r_S) \times C_S$$

At 8 h:

$$C_2 = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the cumulative percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (Q_i):

$$Q_i = (C_1V_1 + \sum_{i=2}^{n-1} C_iV_S + C_nV) \times (100/L)$$

V_1 = volume of *Acid stage medium*, 500 mL
V_S = volume of the sample taken (mL)
C_n = concentration of tamsulosin hydrochloride at each time point (mg/mL)
V = volume of *Buffer stage medium*, 1000 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved (%)
3	65–85
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Acid stage medium: 0.003% Polysorbate 80, pH 1.2 (proceed as directed for *Test 2*); 500 mL
Buffer stage medium: pH 7.2 phosphate buffer (proceed as directed for *Test 1*); 500 mL
Apparatus 2: 100 rpm
Times: 2 h for the *Acid stage medium*, and 3 and 8 h for the *Buffer stage medium* (including the 2 h in the *Acid stage medium*)
Procedure: Perform the test using the *Acid stage medium*. At 2 h after the start of the test, withdraw a sample of the solution under test. Carefully discard the *Acid stage medium*, replace it with the *Buffer stage medium* previously warmed, and continue the test. At 1 and 6 h after the replacement of the *Medium*, withdraw a sample of the solution under test. Replace the volume of *Medium* withdrawn with the same volume of *Buffer stage medium*, previously warmed.
50 mM sodium perchlorate solution: Dissolve 7.0 g of monohydrate sodium perchlorate in 1 L of water, and add 5 mL of phosphoric acid.
Mobile phase: *50 mM sodium perchlorate solution* and acetonitrile (3:2)
Acid stage standard stock solution: Transfer 20 mg of USP Tamsulosin Hydrochloride RS to a 500-mL volumetric flask, add 25 mL of methanol, and sonicate until dissolved. Dilute with *Acid stage medium* to volume.
Acid stage standard solution: Dilute the *Acid stage standard stock solution* with *Acid stage medium* to obtain a final concentration of about 0.08 µg/mL.
Buffer stage standard stock solution: Transfer 20 mg of USP Tamsulosin Hydrochloride RS to a 250-mL volumetric flask, add 25 mL of methanol, and sonicate until dissolved. Dilute with *Buffer stage medium* to volume.
Buffer stage standard solution: Dilute the *Buffer stage standard stock solution* with *Buffer stage medium* to obtain a final concentration of about 0.8 µg/mL.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system

Tolerances: See *Table 3*.

Table 3

Time (h)	Amount Dissolved (%)
2	0–10
3	45–68
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified in the *Buffer stage* conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.
Acid stage medium: 0.003% Polysorbate 80, pH 1.2 (proceed as directed for *Test 2*); 500 mL
Buffer stage medium: pH 7.2 phosphate buffer (proceed as directed for *Test 1*); 500 mL
Apparatus 2: 50 rpm, with sinkers
Times: 2 h for the *Acid stage medium*, and 3 and 5 h for the *Buffer stage medium* (including the 2 h in the *Acid stage medium*)
Buffer solution: Dissolve 1.0 g of octanesulfonic acid sodium salt and 1.4 g of monobasic potassium phosphate in 1 L of water. Adjust with potassium hydroxide to a pH of 6.5 ± 0.05.
Mobile phase: *Buffer solution* and acetonitrile (3:2)
Standard stock solution: 0.04 mg/mL of USP Tamsulosin Hydrochloride RS in *Buffer stage medium*
Standard solution: Dilute the *Standard stock solution* with *Buffer stage medium* to obtain a final concentration of 0.8 µg/mL.
Sample solution: Centrifuge a portion of the solution under test at NMT 3000 rpm for NLT 20 min.
Procedure: Perform the test using *Acid stage medium*. At 2 h after the start of the test, withdraw a sample of the solution under test. Carefully discard the *Acid stage medium*, replace it with the *Buffer stage medium* previously warmed, and continue the test. At 1 and 3 h after the replacement of the *Medium*, withdraw a sample of the solution under test. Replace the volume of *Medium* withdrawn with the same volume of *Buffer stage medium*, previously warmed.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 3.9-mm × 7.5-cm; 5-µm packing L7
Column temperature: 30°
Flow rate: 1.5 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 4.0%
Analysis: Calculate the concentration of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (C_i).
At 2 h:

$$C_1 = (r_U/r_S) \times C_S$$

At 3 h:

$$C_2 = (r_U/r_S) \times C_S$$

At 5 h:

$$C_3 = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the cumulative percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (Q_i):

$$Q_i = (C_1V_1 + \sum_{i=2}^{n-1} C_iV_S + C_nV) \times (100/L)$$

V_1 = volume of *Acid stage medium*, 500 mL
V_S = volume of the sample taken (mL)
C_n = concentration of tamsulosin hydrochloride at each time point (mg/mL)
V = volume of *Buffer stage medium*, 500 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 4*.

Table 4

Time (h)	Amount Dissolved (%)
2	15–35
3	60–80
5	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 6: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

USP Monographs

Flow rate: 1.5 mL/min
Injection volume: 100 µL
System suitability
Samples: *Acid stage standard solution* and *Buffer stage standard solution*
Suitability requirements
Column efficiency: NLT 7000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis: Calculate the concentration of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (C_i).
At 2 h:

$$C_1 = (r_U/r_S) \times C_S$$

At 3 h:

$$C_2 = (r_U/r_S) \times C_S$$

At 8 h:

$$C_3 = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the cumulative percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (Q_i):

$$Q_i = (C_1V_1 + \sum_{i=2}^{n-1} C_iV_S + C_nV) \times (100/L)$$

V_1 = volume of *Acid stage medium*, 500 mL
V_S = volume of the sample taken (mL)
C_n = concentration of tamsulosin hydrochloride at each time point (mg/mL)
V = volume of *Buffer stage medium*, 500 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 5*.

Table 5

Time (h)	Amount Dissolved (%)
2	0–20
3	47–68
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.
Test 7: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.
Acid stage medium: 0.003% Polysorbate 80, in simulated gastric fluid without enzyme (pH 1.2) (prepare a solution containing 3.00 g of polysorbate 80 in 200 mL of water, and dilute 2 mL of this solution to 1 L with simulated gastric fluid without enzyme); 500 mL
Buffer stage medium: pH 7.2 phosphate buffer (proceed as directed for *Test 1*); 500 mL, deaerated
Apparatus 2: 100 rpm, with wire helix sinkers
Times: 2 h in the *Acid stage medium*, and 4 and 12 h in the *Buffer stage medium* (including the 2 h in the *Acid stage medium*)
Standard stock solution: 1 mg/mL of USP Tamsulosin Hydrochloride RS in alcohol
Acid stage standard solution: Dilute the *Standard stock solution* with *Acid stage medium* to obtain a final concentration of about 0.2 µg/mL.
Buffer stage standard solution: Dilute the *Standard stock solution* with *Buffer stage medium* to obtain a final concentration of about 0.8 µg/mL.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Procedure: Perform the test using *Acid stage medium*. At 2 h after the start of the test, withdraw a sample of the solution under test. Carefully discard the *Acid stage medium*, replace it with the *Buffer stage medium* previously warmed, and continue the test. At 2 and 10 h after the replacement of the *Medium*, withdraw a sample of the solution under test. Replace the volume of *Medium* withdrawn with the same volume of *Buffer stage medium*, previously warmed.
Mobile phase A: 2.76 g/L of monobasic sodium phosphate monohydrate in water. Adjust with phosphoric acid to a pH of 2.5 ± 0.05.
Mobile phase B: Acetonitrile
Gradient program: See *Table 6*.

Relative standard deviation: NMT 2.0%
Analysis: Calculate the concentration of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (C_i).
At 2 h:

$$C_1 = (r_U/r_S) \times C_S$$

At 3 h:

$$C_2 = (r_U/r_S) \times C_S$$

At 8 h:

$$C_3 = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*
r_S = peak response from the appropriate *Standard solution*
C_S = concentration of the appropriate *Standard solution* (mg/mL)

Calculate the cumulative percentage of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (Q_i):

$$Q_i = (C_1V_1 + \sum_{i=2}^{n-1} C_iV_S + C_nV) \times (100/L)$$

V_1 = volume of *Acid stage medium*, 500 mL
V_S = volume of the sample taken (mL)
C_n = concentration of tamsulosin hydrochloride at each time point (mg/mL)
V = volume of *Buffer stage medium*, 500 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 9*.

Table 9

Time (h)	Amount Dissolved (%)
2	0–20
3	45–65
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 10: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 10*.
Acid stage medium: Dissolve 2.0 g of sodium chloride and 5.7 mL of hydrochloric acid in 1000 mL of water. To 500 mL of this solution add 1 mL of polysorbate 80 aqueous solution (3 g in 200 mL of water) just before the test; 500 mL.
Buffer stage medium: pH 7.2 phosphate buffer (dissolve 68 g of monobasic potassium phosphate and 13.8 g of

www.webofpharma.com

sodium hydroxide in 10 L of water, and adjust with dilute sodium hydroxide solution or dilute phosphoric acid to a pH of 7.2); 500 mL

Apparatus 2: 100 rpm, with a suitable sinker

Times: 2, 3, and 8 h

Procedure: Perform the test using *Acid stage medium*. At 2 h after the start of the test, withdraw 10.0 mL of the solution under test. Drain the *Acid stage medium* immediately using a 60-mesh stainless wire screen. Add the *Buffer stage medium* previously warmed, and continue the test. At 3 h after the start of the test (1 h after replacement of the *Medium*), withdraw 10.0 mL of the solution under test, replace the same volume with warmed *Buffer stage medium*, and continue the test. At 8 h after the start of the test (6 h after the replacement of the *Medium*), withdraw 10.0 mL of the solution under test.

Standard stock solution: Prepare a solution containing 0.5 mg/mL of USP Tamsulosin Hydrochloride RS in acetonitrile and water (3:7).

Acid stage standard solution: Dilute the *Standard stock solution* with *Acid stage medium* to obtain a final concentration of about 0.8 µg/mL.

Buffer stage standard solution: Dilute the *Standard stock solution* with *Buffer stage medium* to obtain a final concentration of about 0.8 µg/mL.

Sample solution: Pass a portion of the solution under test through a suitable glass fiber filter, discarding the first 5 mL of the filtrate.

Chromatographic system: Proceed as directed in the *Assay, Procedure 10*, but use the *Injection volume* of 100 µL instead of 10 µL.

System suitability

Samples: *Acid stage standard solution* and *Buffer stage standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis: Calculate the concentration (C_i) of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*

r_S = peak response from the appropriate *Standard solution*

C_S = concentration of the appropriate *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V_1 \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_1 \times V_1) + (C_2 \times V)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_1 \times V_1) + (C_3 \times V) + (C_2 \times V_S)] \times (1/L) \times 100$$

C_i = concentration of tamsulosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

V_1 = volume of the *Acid stage medium*, 500 mL

L = label claim (mg/Capsule)

V = volume of the *Buffer stage medium*, 500 mL

V_S = volume of the *Sample solution* withdrawn and replaced with *Medium*, 10 mL

Tolerances: See *Table 10*.

Table 10

Time (h)	Amount Dissolved (%)
2	7–27
3	47–68
8	NLT 80

The percentages of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

Procedure for content uniformity

[NOTE—Use the following *Procedure for content uniformity* if *Procedure 1* is used in the *Assay*. For all other formulations, proceed as directed in *Uniformity of Dosage Units* ⟨905⟩.]

Solution A, Solution B, Mobile phase, and **Standard stock solution:** Prepare as directed in the *Assay, Procedure 1*.

Internal standard solution: 0.16 mg/mL of propylparaben in a mixture of acetonitrile and water (3:7)

Standard stock solution 1: Transfer 5.0 mL of the *Standard stock solution* to a 25-mL volumetric flask, and dilute with a mixture of acetonitrile and water (3:7) to volume.

Standard solution: Transfer 4.0 mL of *Standard stock solution 1* to a suitable container. Add 5.0 mL of the *Internal standard solution*, and add the *Mobile phase* to make 40 mL.

Sample solution: Place the contents of 1 Capsule into a Teflon-lined, screw-capped centrifuge tube. Place approximately 100 glass balls with a diameter of about 5 mm into the tube, add 20 mL of 0.05 N sodium hydroxide, heat at 50° for 10 min, and shake well for 30 min. Add 15 mL of a mixture of acetonitrile and *Solution A* (2:1) to the solution, and shake well. Add 5.0 mL of the *Internal standard solution*, and shake well. Centrifuge at 1500 rpm for 10 min, and use the supernatant, passing it if necessary through a membrane filter of 0.5-µm or smaller pore size.

Chromatographic system: Proceed as directed in the *Assay, Procedure 1* except use an *Injection volume* of 25 µL.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tamsulosin hydrochloride ($C_{20}H_{28}N_2O_5S \cdot HCl$) in the Capsule taken:

$$\text{Result} = (R_U/R_S) \times [C_S \times (V_S/L)] \times 100$$

R_U = peak area ratio of tamsulosin to the internal standard from the *Sample solution*

R_S = peak area ratio of tamsulosin to the internal standard from the *Standard solution*

C_S = concentration of USP Tamsulosin Hydrochloride RS in *Standard stock solution 1* (mg/mL)

V_S = volume of *Standard stock solution 1* taken to prepare the *Standard solution* (mL)

L = label claim (mg/Capsule)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

www.webofpharma.com

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tamsulosin Hydrochloride RS
(–)-(*R*)-5-[2-[[2-(*o*-Ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide monohydrochloride.
$C_{20}H_{28}N_2O_5S \cdot HCl$ 444.97

Tannic Acid

Tannin.
Tannic acid; Tannin [1401-55-4].

» Tannic Acid is a tannin usually obtained from nutgalls, the excrescences produced on the young twigs of *Quercus infectoria* Oliver, and allied species of *Quercus* Linné (Fam. Fagaceae), from the seed pods of Tara (*Caesalpinia spinosa*), or from the nutgalls or leaves of sumac (any of a genus *Rhus*).

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—
A: To 2 mL of a solution (1 in 10) add 1 drop of ferric chloride TS: a bluish black color or precipitate results.
B: To a solution (1 in 10) add an equal volume of gelatin solution (1 in 100): a precipitate is formed.
Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 12.0% of its weight.
Residue on ignition ⟨281⟩: not more than 1.0%.
Arsenic, *Method II* ⟨211⟩: 3 ppm.
Gum or dextrin—Dissolve 2 g in 10 mL of hot water: the solution is not more than slightly turbid. Cool, filter, and divide the filtrate into two equal portions. To one portion add 10 mL of alcohol: no turbidity is produced.
Resinous substances—To a portion of the filtrate obtained in the test for *Gum or dextrin* add 10 mL of water: no turbidity is produced.

Adhesive Tape

» Adhesive Tape consists of fabric and/or film evenly coated on one side with a pressure-sensitive, adhesive mixture. Its length is not less than 98.0 percent of that declared on the label, and its average width is not less than 95.0 percent of the declared width. If Adhesive Tape has been rendered sterile, it is protected from contamination by appropriate packaging.

Packaging and storage—Preserve in well-closed containers, and prevent exposure to excessive heat and to sunlight. Tape that has been rendered sterile is so packaged that the sterility of the contents of the package is maintained until the package is opened for use.
Labeling—The package label of Tape that has been rendered sterile indicates that the contents may not be sterile if the package bears evidence of damage or previously has been opened. The package label indicates the length and width of the Tape, and the name of the manufacturer, packer, or distributor.
Dimensions—Measure its length: it is not less than 98.0% of the labeled length. Measure its width at 5 locations evenly spaced along the center line of the Tape: the average of 5 measurements is not less than 95% of the labeled width of the Tape.
Tensile strength—Determine the tensile strength of Tape, after previously unrolling and conditioning it for not less than 4 hours in a standard atmosphere of 65 ± 2% relative humidity, at 21 ± 1.1° (70 ± 2°F), with a pendulum-type testing machine, as described under *Tensile Strength* ⟨881⟩. The Tape made from fabric has a tensile strength, determined warpwise, of not less than 20.41 kg (45 pounds) per 2.54 cm of width. The Tape made from film has a tensile strength of not less than 3 kg per 2.54 cm of width.
Adhesive strength—Determine the adhesive strength of Tape that is made from fabric by cutting a strip of the Tape 2.54 cm wide and approximately 15 cm long, and applying 12.90 sq cm, 2.54 cm by 5.08 cm, of one end of the strip to a clean plastic or glass surface by means of a rubber roller under a pressure of 850 g, passing the roller twice over the Tape at a rate of 30 cm per minute. Adjust the temperature of the plastic or glass surface and the Tape to 37°, and conduct the test immediately thereafter as directed under *Tensile Strength* ⟨881⟩, using a pendulum-type testing machine, the pull being exerted parallel with the warp and the plastic or glass surface: the average of not less than 10 tests is not less than 18 kg.
Sterility Tests ⟨71⟩ —Tape that has been rendered sterile meets the requirements.

Taurine

$C_2H_7NO_3S$ 125.15
Taurine
Ethanesulfonic acid, 2-amino-;
2-Aminoethane-1-sulfonic acid [107-35-7].

DEFINITION
Taurine contains NLT 98.0% and NMT 102.0% of taurine ($C_2H_7NO_3S$), calculated on the dried basis.

IDENTIFICATION

Change to read:

• **A.** **▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solutions*, as obtained in the *Assay*.

ASSAY

Change to read:

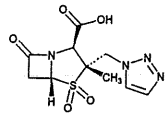
• **PROCEDURE**
Solution A: Water adjusted with acetic acid to a pH of 3.0.
Mobile phase: Acetonitrile and *Solution A* (80:20)
Standard stock solution: Prepare a solution containing 1.0 mg/mL of USP Taurine RS in *Mobile phase*.

www.webofpharma.com

Standard solutions: Using the *Standard stock solution* prepare three *Standard solutions* with concentrations of 0.4, 0.5, and 0.6 mg/mL of USP Taurine RS in *Mobile phase.*
Sample solution: 0.5 mg/mL of Taurine in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: Evaporative light-scattering detector (ELSD)
Drift tube temperature: 55° or optimize according to the manufacturer's recommendations to achieve optimal signal-to-noise ratio
Nebulizer gas: Nitrogen
Nebulizer gas flow rate: 1.5 L/min or optimize according to the manufacturer's recommendations to achieve optimal signal-to-noise ratio
Column: 3-mm × 10-cm; 2.5-µm packing L104
Column temperature: 25°
Flow rate: 0.4 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution* at 0.5 mg/mL
Suitability requirements
Column efficiency: NLT ▲6000▲ (RB 1-Mar-2019) theoretical plates
Tailing factor: NMT 1.5
Relative standard deviation: NMT ▲3%▲ (RB 1-Mar-2019)
Analysis
Samples: *Standard solutions* and *Sample solution*
Plot the logarithms of the taurine peak areas against the logarithms of taurine concentrations, in mg/mL, in the three *Standard solutions* and establish a calibration curve by least-squares regression. The correlation coefficient for the regression line is NLT ▲0.99. Inject the *Sample solution* three times and obtain the average value of taurine peak areas.▲ (RB 1-Mar-2019) Using the logarithm of the ▲average▲ (RB 1-Mar-2019) taurine peak area from the *Sample solution*, calculate the logarithm of taurine concentration from the calibration curve and calculate the concentration, *C*, in mg/mL, of taurine in the *Sample solution* by taking the antilog of the result.
Calculate the percentage of taurine ($C_2H_7NO_3S$) in the portion of Taurine taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of Taurine in the *Sample solution* (mg/mL), determined from the calibration curve
C_U = concentration of Taurine in the *Sample solution* (mg/mL)



Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.3%
• **CHLORIDE AND SULFATE** ⟨221⟩, *Chloride*
Standard: 0.50 mL of 0.020 N hydrochloric acid
Sample: 0.7 g of Taurine
Acceptance criteria: NMT 0.05%
• **CHLORIDE AND SULFATE** ⟨221⟩, *Sulfate*
Standard: 0.25 mL of 0.020 N sulfuric acid
Sample: 0.8 g of Taurine
Acceptance criteria: NMT 0.03%
• **IRON** ⟨241⟩**:** NMT 30 ppm
• **RELATED COMPOUNDS**
Sample solution: 10 mg/mL of Taurine in water
Standard solution: 0.05 mg/mL of USP Taurine RS in water, an equivalent concentration of about 0.5% of the *Sample solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography.*)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 5 µL
Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)
Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)
Analysis: Dry the plate at 80° for 30 min. Spray the plate with *Spray reagent*, and heat at 80° for about 10 min. Examine the plate under white light. [NOTE—The R_F value for the taurine spots should be about 0.2.]
Acceptance criteria: No secondary spot of the *Sample solution* is larger or more intense than the principal spot of the *Standard solution.*
Individual impurities: NMT 0.5%

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 105° for 3 h.
Acceptance criteria: NMT 0.3%

Tazobactam

$C_{10}H_{12}N_4O_5S$ 300.29
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3-methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-, 4,4-dioxide, [2*S*-(2α,3β,5α)]-;
(2*S*,3*S*,5*R*)-3-Methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 4,4-dioxide [89786-04-9].

$C_{10}H_{12}N_4O_5S \cdot ½H_2O$ 309.30
[428863-55-2].

DEFINITION
Tazobactam contains NLT 98.0% and NMT 102.0% of $C_{10}H_{12}N_4O_5S$, calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

• **A.** ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY
• **PROCEDURE**
Mobile phase: Dissolve 1.32 g of dibasic ammonium phosphate in 750 mL of water. Adjust with 5% v/v phosphoric acid to a pH of 2.5, and dilute with water to

USP Monographs

www.webofpharma.com

1000 mL. Add 30 mL of acetonitrile, mix, and pass through a filter of 0.2-µm pore size.

System suitability solution: 16 µg/mL of L-phenylalanine, 50 µg/mL of USP Tazobactam RS, and 8 µg/mL of USP Tazobactam Related Compound A RS in *Mobile phase*. Maintain the *System suitability solution* at 3° until injection. Prepare fresh daily. If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then this solution should be injected immediately after preparation.

Standard solution: 0.5 mg/mL of USP Tazobactam RS in *Mobile phase*. Cool, and maintain the *Standard solution* at 3° until injection. If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then this solution should be injected immediately after preparation.

Sample solution: 0.5 mg/mL of Tazobactam in *Mobile phase*. Cool, and maintain the *Sample solution* at 3° until injection. If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then this solution should be injected immediately after preparation.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 6.0 between tazobactam and L-phenylalanine, *System suitability solution*

Tailing factor: NMT 1.8, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tazobactam ($C_{10}H_{12}N_4O_5S$) in the portion of Tazobactam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tazobactam RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
- **ORGANIC IMPURITIES**

Mobile phase, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Blank: *Mobile phase*. Cool, and maintain the *Blank* at 3° until injection. If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then this solution should be injected immediately after preparation.

Sample solution: Prepare as directed in the *Assay*. Cool, and maintain the *Sample solution* at 3° until injection. If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then this solution should be injected immediately after preparation.

Analysis

Samples: *Blank* and *Sample solution*

Ignore any peaks of the *Sample solution* that correspond to any peaks of the *Blank*.

Calculate the percentage of each impurity in the portion of Tazobactam taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity in the *Sample solution*

r_T = sum of all the peak responses in the *Sample solution*

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tazobactam related compound A	0.29	1.0
L-Phenylalanine	0.71	—
Tazobactam	1.0	—
Any other individual impurity	—	0.1
Total impurities[a]	—	0.3

[a] Total of all impurities other than tazobactam related compound A.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** The level of bacterial endotoxins is such that the requirements of the relevant dosage form monograph(s) in which Tazobactam is used can be met.
- **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩

Sample solution: 10 mg/mL, in dimethylformamide

Acceptance criteria: +160° to +167° (t = 20°)

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.
- **pH** ⟨791⟩

Sample solution: 2.5 mg/mL

Acceptance criteria: 1.8–2.8

- **WATER DETERMINATION,** *Method I* ⟨921⟩**:** NMT 0.6% for the anhydrous form; 2.2–3.8% for the hemihydrate form

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** Where it is the hemihydrate form, the label so indicates.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Tazobactam RS

$C_7H_{12}N_4O_4S$ 248.26

www.webofpharma.com

Technetium Tc 99m Albumin Aggregated Injection

Albumins, blood serum, metastable technetium-99 labeled.

» Technetium Tc 99m Albumin Aggregated Injection is a sterile, aqueous suspension of Albumin Human that has been denatured to produce aggregates of controlled particle size that are labeled with ^{99m}Tc. It is suitable for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as aggregated albumin expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain antimicrobial, reducing, chelating, and stabilizing agents, buffers, and nonaggregated albumin human. Other chemical forms of radioactivity do not exceed 10 percent of the total radioactivity. Its production and distribution are subject to federal regulations (see *Biologics* ⟨1041⟩ and *Radioactivity* ⟨821⟩).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, at a temperature between 2° and 8°.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as aggregated albumin expressed as total megabecquerels (millicuries or microcuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours. In addition, the labeling states that it is not to be used if clumping of the albumin is observed and directs that the container be agitated before the contents are withdrawn into a syringe.
Particle size—Shake the Injection well, and determine the dimension of not less than 100 particles of a representative test specimen, using a suitable counting chamber, such as a hemacytometer grid, by optical microscopy. Not less than 90.0% of the observed aggregated particles have a diameter between 10 µm and 90 µm, and none of the observed particles have a diameter greater than 150 µm.
Bacterial Endotoxins Test ⟨85⟩—The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.
pH ⟨791⟩: between 3.8 and 8.0.
Radiochemical purity—Place a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* ⟨621⟩), and allow to dry. Develop the chromatogram over a period of about 3 to 4 hours by ascending chromatography, using dilute methanol (7 in 10), and air-dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Not less than 90% of the total radioactivity is found as aggregated albumin (at the point of application).

Place a measured volume of Injection in a centrifuge tube, and determine the net radioactivity in a suitable counting assembly. Centrifuge at approximately 2000 rpm for 5 to 10 minutes. Separate the supernatant by aspiration, and determine its net radioactivity in a suitable counting assembly. Determine the percentage of radioactivity in the supernatant taken by the formula:

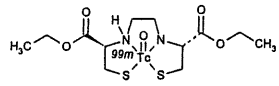
$$100(A/B)$$

in which *A* is the net radioactivity, in counts per minute, in the supernatant aliquot, and *B* is the total radioactivity, in counts per minute, in the tube prior to centrifugation. Not more than 10.0% of the radioactivity is found in the supernatant, which contains soluble and dispersed radiochemical impurities, following centrifugation.

Protein concentration—
Test preparation—Transfer 2.0 mL of Injection to a suitable centrifuge tube, and centrifuge at about 2000 rpm for 5 to 10 minutes. Decant the supernatant, and add 2.0 mL of Sodium Chloride Injection to wash the centrifuged aggregate. Centrifuge again at 2000 rpm for 5 to 10 minutes, decant the supernatant, and add 2.0 mL of Sodium Chloride Injection.
Standard preparation—To a second test tube add 2.0 mL of a solution containing 2.0 mg of Albumin Human per mL in 0.9 percent sodium chloride solution.
Procedure—To a third test tube add 2.0 mL of Sodium Chloride Injection to provide a blank. To each of the three tubes containing the *Test preparation*, *Standard preparation*, and blank, add 4.0 mL of biuret reagent TS, mix, and allow to stand for 30 minutes, accurately timed, for maximum color development. Additional mixing or slight heating may be required to dissolve the aggregated albumin completely, but the *Test preparation*, *Standard preparation*, and blank are to be treated identically. Determine the absorbances of the solutions from the *Test preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 540 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of aggregated albumin in each mL of the Injection taken by the formula:

$$2(A_U/A_S)$$

in which A_U and A_S are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively. The protein concentration is not more than 1 mg, as aggregated albumin, per 37 MBq (1 mCi) of Tc 99m at the time of administration.
Biological distribution—Inject intravenously between 0.075 MBq and 0.75 MBq (2 µCi and 20 µCi) of Injection, in a volume not exceeding 0.2 mL, into the caudal vein of each of three 20- to 25-g mice. [NOTE—Other animal species, such as Sprague-Dawley rats (weighing 100 g to 175 g), may be used.] Five to 10 minutes after the injection, sacrifice the animals, and carefully remove the liver and lungs of each by dissection. Place each organ and the remaining carcass in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container with an appropriate detector, using the same counting geometry. Determine the percentage of radioactivity in the liver and the lungs taken by the formula:



$$100(A/B)$$

in which *A* is the net radioactivity, in counts per minute, in the organ, and *B* is the total radioactivity, in counts per minute, in the lungs, liver, and carcass. Not less than 80.0% of the radioactivity is found in the lungs, and not more than 5.0% of

www.webofpharma.com

the radioactivity is found in the liver, in not less than two of the animals.
Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.
Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (μCi) per mL, of Injection by use of a calibrated system.

Technetium Tc 99m Bicisate Injection

» Technetium Tc 99m Bicisate Injection is a sterile, clear, colorless solution, suitable for intravenous administration, of bicisate dihydrochloride complexed to radioactive technetium (^{99m}Tc). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as a complex with bicisate, expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers, at controlled room temperature.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled bicisate expressed as total megabecquerels (or millicuries) per mL at the time of calibration; the expiration date and time; the lot number; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 175/*V* USP Endotoxin Units per mL, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.
Radiochemical purity—Prepare four vials of Injection and perform the test on each vial. Apply about 5 μL of Injection 2 cm from the bottom of a 2.5-cm × 7.5-cm thin-layer chromatographic silica gel sheet. Allow the spot to dry for 5 to 10 minutes. Position the plate in a pre-equilibrated chromatographic chamber containing HPLC grade ethyl acetate, and develop the chromatogram until the solvent front has moved 5 cm from the origin (see *Chromatography* ⟨621⟩). Remove the plate from the chamber, and allow to dry. Cut the chromatographic sheet 4.5 cm from the bottom. Separately count the activity on each piece in a dose calibrator or a gamma counter. The activity on the upper portion contains the ^{99m}Tc bicisate complex, and the activity on the lower section contains all radioimpurities. Calculate the percentage of radiochemical purity of the ^{99m}Tc Bicisate Injection by the formula:

$$100P/(P + C)$$

in which *P* is the count from the top part of the plate, and *C* is the count from the bottom part of the plate: not less than 90% of the total radioactivity is found as Tc^{99m} bicisate. Calculate the mean percent radiochemical purity of the four test vials.
Related radiochemical compounds— [NOTE—This test is performed on the same test specimen used to perform the *Radiochemical purity* test. Perform the tests in parallel with a minimal delay in spotting of the chromatographic media following the 30-minute Injection incubation period.] Apply about 2 μL of the Injection 1 cm from the bottom of a 2.5-cm × 7.5-cm reverse-phase thin-layer chromatographic plate (or equivalent), and allow the spot to air-dry thoroughly. Place the plate into a developing tank containing a mixture of acetone and 0.5 M ammonium acetate (60:40), develop to 7 cm, remove the plate, and air-dry (see *Chromatography* ⟨621⟩). Using a suitable calibrated scanner, determine the compounds present by calculating the retention factors for all peaks present. Compounds and approximate R_F values are as follows:

^{99m}Tc bicisate	0.15-0.44
^{99m}Tc(IV) bicisate	0.3-0.4
Tc99m Bicisate and Tc ^{99m}(IV) Bicisate	0.15-0.44
Hydrolyzed reduced Tc	0.00-0.14
Free pertechnetate and ^{99m}Tc ethylene cisteinate monomer	0.70-0.84
^{99m}Tc EDTA	0.95-1.0

Calculate the quantity of ^{99m}Tc(IV) ligand in the Injection by subtracting the Tc 99m Bicisate percentage obtained in the test for *Radiochemical purity* from the combined ^{99m}Tc Bicisate and ^{99m}Tc(IV) Bicisate Area percentage obtained in the *Related radiochemical compounds* test. The sum of the impurities is not greater than 10%.
Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements for *Injections and Implanted Drug Products* ⟨1⟩, except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of manufacture.
Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in Mbq (or in mCi) per mL, of the Injection by use of a calibrated system.

Technetium Tc 99m Disofenin Injection

» Technetium Tc 99m Disofenin Injection is a sterile, aqueous solution, suitable for intravenous administration, of disofenin that is labeled with ^{99m}Tc. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as a disofenin complex, expressed in megabecquerels (microcuries or millicuries) per

www.webofpharma.com

mL at the time indicated on the labeling. It contains a suitable reducing agent.

Packaging and storage—Preserve in single-dose or in multiple-dose containers sealed under a suitable inert atmosphere.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of preparation; the amount of ^{99m}Tc as expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of preparation; the expiration date and time; and a statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.
pH ⟨791⟩: between 4.0 and 5.0.
Radiochemical purity—The determination of radiochemical purity for this Injection requires the use of two separate chromatography systems.

System A—Apply a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 13 mm from one end of a 10- × 51-mm thin-layer chromatographic strip impregnated with silica gel (see *Chromatography* ⟨621⟩), and immediately develop the chromatogram over a suitable period by ascending chromatography, using methanol as the solvent. Allow the chromatogram to dry. Cut the chromatogram in two along a line about 13 mm from the top. Place the top and bottom strips into separate counting containers. Determine the radioactivity of each, using a suitable ionization chamber. Hydrolyzed Tc 99m and technetium-tin colloid are located at the origin of the bottom strip (R_F 0 to 0.1).

System B—Pretreat a 1.3- × 51-mm strip of chromatographic paper by soaking it for 1 minute in a 0.3 M carbonate-bicarbonate buffer, pH 9.0, prepared by dissolving 0.3 g of anhydrous sodium carbonate and 1.9 g of anhydrous sodium bicarbonate in 100 mL of water. Remove the paper strip, blot lightly with absorbent paper, and dry in an oven for about 45 minutes at 85°. Proceed as directed for *System A* using the pretreated chromatographic paper and a developing solvent of methyl ethyl ketone. Free pertechnetate is located at the solvent front (top strip). The sum of the percentage of radioactivity at the origin in *System A* and the percentage of radioactivity at the solvent front in *System B* is not greater than 10.0%.
Biological distribution—Inject between 75 MBq and 111 MBq (2 mCi and 3 mCi) of Injection, in a volume not exceeding 0.1 mL, into the caudal vein of each of three 25- to 40-g male albino mice. One hour after the injection, anesthetize and then decapitate the animals. Drain the blood of each separately into pre-weighed counting containers. Dissect the animals, and place the kidneys, liver, stomach (exclusive of duodenum), and gallbladder, and intestines, of each mouse into separate counting containers. Using a suitable counting assembly, determine the radioactivity of each container. Correct all radioactivity measurements for decay. Determine the percentage of radioactivity in the kidneys, liver, stomach, and gallbladder and intestines taken by the formula:

$$100(A/B)$$

in which A is the radioactivity, in counts per minute, in the organ, and B is the total radioactivity, in counts per minute, injected. Determine the percentage of radioactivity in the blood taken by the formula:

$$[100(C/W_S)0.07(W_R)]/B$$

in which C is the radioactivity, in counts per minute, in the specimen of blood, W_S is the weight, in g, of the blood specimen, 0.07 is the assumption that the total blood weight of the mouse is 7% of the total body weight, and W_R is the weight, in g, of the mouse. Not less than 70% of the injected radioactivity is present in the gallbladder and intestines, not more than 10.0% of the injected radioactivity is present in the liver, not more than 10.0% of the injected radioactivity is present in the kidneys, not more than 3.0% of the injected radioactivity is present in the stomach, and not more than 3.0% of the injected radioactivity is present in the blood, in not less than two mice.
Other requirements—It meets the requirements of the tests for *Radionuclide identification*, *Radionuclidic purity*, and *Bacterial endotoxins* under *Sodium Pertechnetate Tc 99m Injection*. It also meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the date of preparation, and except that it is not subject to the recommendation on *Container Content*.
Assay for radioactivity(see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (μCi or mCi) per mL, of Injection by the use of a calibrated system.

Technetium Tc 99m Exametazime Injection

2-Butanone, 3,3′-[(2,2-dimethyl-1,3-propanediyl)diimino]bis-dioxime-^{99m}Tc.
d,1-Hexamethylpropylene amine oxime-^{99m}Tc [105613-48-7].

» Technetium Tc 99m Exametazime Injection is a sterile, aqueous solution, suitable for intravenous administration, composed of the primary lipophilic complex of exametazime that is labeled with radioactive ^{99m}Tc. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as primary lipophilic exametazime complex expressed in megabecquerels (or in microcuries or millicuries) per mL at the date and time indicated in the labeling. It may contain antioxidants, reducing agents, and buffers. A stabilizing solution containing methylene blue and phosphate buffer may be added to the final radio labeled product to extend the expiration time. Other chemical forms of radioactivity (^{99m}Tc pertechnetate, ^{99m}Tc hydrolyzed reduced species, and ^{99m}Tc secondary exametazime complex) do not exceed 20.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers, at controlled room temperature.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the

USP Monographs

www.webofpharma.com

amount of ^{99m}Tc as labeled exametazime expressed as total megabecquerels (or as total microcuries or millicuries) and concentration as megabecquerels (or as microcuries or millicuries) per mL at the time of calibration; the expiration date and time; and a statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours. [NOTE—The label states that, upon constitution with Sodium Pertechnetate Tc 99m Injection, the beyond-use time is 30 minutes for the unstabilized Injection and between 4 hours and 6 hours for the stabilized Injection.]

pH ⟨791⟩: between 9.0 and 9.8 for unstabilized Injection, and between 6.5 and 7.5 for stabilized Injection.

Radiochemical purity—Prepare three 12- × 75-mm chromatographic tubes by packing with about 0.3 mL of fresh methyl ethyl ketone, 0.9% nonbacteriostatic sodium chloride solution, and a 50% acetonitrile solution, prepared with nonbacteriostatic water, respectively. To each of two 6- × 0.7-cm instant thin-layer chromatographic strips[1] and one 6- × 0.7-cm strip of chromatographic paper,[2] apply 5 µL of freshly prepared (within 2 minutes of reconstitution) Injection about 1 cm from the bottom of the strip. Do not allow to dry. Place one instant thin-layer chromatographic strip into the tube containing methyl ethyl ketone, the second instant thin-layer chromatographic strip into the tube containing the 0.9% sodium chloride solution, and the paper strip into the tube containing the 50% acetonitrile solution. The strips must not adhere to the sides of the tubes. Allow the chromatograms to develop until the solvent front has moved to the top of the strips. Remove the strips from the tubes, and allow the solvents to evaporate. Determine the radioactive distribution by scanning the strip sections, using a suitable collimated radiation detector. The difference between the radioactivity detected at the origin of the 0.9% sodium chloride strip and at the origin of the methyl ethyl ketone strip represents the primary lipophilic ^{99m} Tc exametazime complex. The radioactivity at the solvent front of the 0.9% sodium chloride strip represents the ^{99m} Tc pertechnetate radiochemical impurity. The radioactivity at the origin of the 50% acetonitrile strip represents the ^{99m} Tc hydrolyzed, reduced radiochemical impurity. The difference between the radioactivity detected at the origin of the methyl ethyl ketone strip and the origin of the 50% acetonitrile strip represents the secondary ^{99m} Tc exametazime complex radiochemical impurity. Not less than 80% of the total radioactivity is found as primary lipophilic ^{99m} Tc exametazime complex. [NOTE—Complete the measurement within 30 minutes after constitution of the unstabilized Injection and between 4 hours and 6 hours after constitution of the stabilized Injection.]

Biological distribution—Inject between 18.5 MBq and 37 MBq (between 0.5 mCi and 1 mCi) of Injection in a volume not exceeding 0.1 mL into the caudal vein of each of three 130- to 190-g Sprague-Dawley rats. Five to ten minutes after the injection, sacrifice the animals and carefully remove the brain, liver, and intestines (including gall bladder). Place each organ and the remaining carcass in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container with an appropriate detector, using the same counting geometry. Determine the percentage of radioactivity in the brain, liver, intestines, and remaining carcass by the formula:

$$100(A/B)$$

in which A is the net radioactivity, in counts per minute, in the organ, and B is the total radioactivity, in counts per minute in the brain, liver, intestines, and carcass. Not less than 1.5% of the radioactivity is found in the brain. Not more than 20% of the radioactivity is found in the intestines, and not more than 15% of the radioactivity is found in the liver, in not less than two of the animals.

Other requirements—It meets the requirements of the tests for *Radionuclidic identification* and *Radionuclide purity* and *Bacterial endotoxins* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (or µCi) per mL, of Injection by use of a calibrated system.

[1] ITLC/SG, 6- × 0.7-cm strip available from Biodex Medical Systems, Shirley, NY.

[2] Whatman Grade 31ET Chr, available from Whatman LabSales, Hillsboro, OR.

Technetium Tc 99m Mebrofenin Injection

» Technetium Tc 99m Mebrofenin Injection is a sterile aqueous solution of Stannous Fluoride and Mebrofenin labeled with radioactive technetium Tc 99m suitable for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc, as the complex with mebrofenin, expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. It may contain antimicrobial agents and buffers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, at controlled room temperature.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled mebrofenin expressed as total megabecquerels (or millicuries) and the concentration as megabecquerels per mL (or as millicuries per mL) on the date and time of calibration; the expiration date and time; and the statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

pH ⟨791⟩: between 4.2 and 5.7.

Radiochemical purity— [NOTE—The determination of radiochemical purity for this product requires the use of two separate chromatographic methods.]

Method 1—

pH 6.8 PHOSPHATE BUFFER—Mix 64 mL of 0.2 M monobasic sodium phosphate and 61 mL of 0.1 M dibasic sodium phosphate in a 1-liter volumetric flask, dilute with water to volume, and mix.

MOBILE PHASE —Prepare a filtered and degassed mixture of methanol and *pH 6.8 phosphate buffer* (625:375). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

USP Monographs

www.webofpharma.com

CHROMATOGRAPHIC SYSTEM (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 3.9-mm × 30-cm column that contains 10-µm packing L1. It is also equipped with a flow-through gamma ray detector having a cell volume of about 10 µL. A constant flow rate of about 1 mL per minute is maintained, and counts are recorded and charted at about 5-second intervals.

PROCEDURE —Constitute the Injection, and allow to stand for 15 minutes. Chromatograph a volume of Injection, with activity of 0.6 to 15 MBq (16 to 400 µCi), and record the chromatogram. The resolution between the secondary characteristic peak, eluting at about 3.5 minutes, and the principal peak, eluting at about 6 minutes, is not less than 1.5. The time interval between the elution of the Tc 99m pertechnetate peak, at about 2 minutes, and the principal peak is not less than 3.0 minutes. If the foregoing criteria are met, record the counts for the pertechnetate Tc 99m peak, the two complex peaks, a representative baseline segment, and the total counts for the chromatogram. Calculate the percentage of complexed radioactivity in the two characteristic peaks taken by the formula:

$$100C/(T - P)$$

in which C is the count of the complex peak of interest, T is the total count, and P is the pertechnetate peak count, each being corrected for the corresponding baseline count. The complexed radioactivity is not less than 90.0% in the principal peak and between 1% and 6% in the second characteristic peak. Calculate the percentage of all other complexed radioactivity (this excludes the main, secondary, and free pertechnetate peaks) taken by the formula:

$$100K/(T - P)$$

in which K is the sum of all other peaks, and T and P are as defined above. Record the result for use in the calculation as directed under *Method 2*.

Method 2—

CHROMATOGRAPHIC SYSTEM A (see *Chromatography* ⟨621⟩)—Prepare a 1.0- × 12.5-cm silicic acid-impregnated glass microfiber strip by dipping it in a 10% sodium chloride solution and removing the excess liquid by blotting. Dry the strip by heating in an oven at about 80°. Apply about 5 µL of the Injection with activity of about 3.7 MBq (100 µCi) about 1.5 cm from one end of the strip, and immediately develop the chromatogram in a chromatographic chamber containing saturated sodium chloride solution until the solvent front reaches a level about 1 cm from the top of the strip. Remove the strip from the chamber, and allow to air-dry. Separate the top and bottom portions of the chromatogram by cutting the strip in half, and record the counts separately for each portion. Calculate the percentage of unreduced pertechnetate taken by the formula:

$$100P/(P + C)$$

in which P is the count from the top half of the strip, and C is the count from the bottom half of the strip.

CHROMATOGRAPHIC SYSTEM B —Proceed as directed under *Chromatographic system A* except to use a 1.0- × 12.5-cm silica gel-impregnated glass microfiber strip, without preliminary treatment, and a mixture of acetonitrile and water (3:1) as the developing solvent. Calculate the percentage of reduced hydrolyzed Tc 99m taken by the formula:

$$100R/(R + D)$$

in which R is the count from the bottom half of the strip, and D is the count from the top half of the strip. The sum of the percentage of unreduced pertechnetate from *System A*, the percentage of reduced hydrolyzed Tc 99m from *System B*, and the percentage of other complexed radioactivity determined from *Method 1* is not greater than 10.0%.

Biological distribution—Inject 0.25 mL of Injection containing between 15 and 19 MBq (0.4 and 0.5 mCi) into the external jugular vein of each of three anesthetized male rats weighing between 150 and 350 g, and from which food has been withheld for 15 to 24 hours prior to the test. Thirty minutes after the injection, sacrifice the animals and carefully remove the liver, kidneys, and gastrointestinal tract of each rat. Place the organs in separate counting containers. Using a suitable counting assembly, determine the radioactivity in each container. Correct radioactivity measurements for decay. Determine the percentages of radioactivity in the liver, kidneys, and gastrointestinal tract taken by the formula:

$$100(A/B)$$

in which A is the radioactivity, in counts per minute, in the organ, and B is the average injected radioactivity, in counts per minute, in the corresponding standards. Not less than 75% of the injected radioactivity is found in the gastrointestinal tract, not more than 10% in the liver, and not more than 5% in the kidneys in not less than 2 of the rats.

Other requirements—It meets the requirements of the tests for *Radionuclide identification*, *Radionuclidic purity*, and *Bacterial endotoxins* under *Sodium Pertechnetate Tc 99m Injection*. It also meets the requirements for *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed and dispensed prior to the completion of the test for *Sterility*, the latter being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (or in mCi) per mL, of Injection by use of a calibrated system.

Technetium Tc 99m Medronate Injection

» Technetium Tc 99m Medronate Injection is a sterile, aqueous solution, suitable for intravenous administration, of sodium medronate and stannous chloride or stannous fluoride that is labeled with radioactive Tc 99m. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Tc 99m as stannous medronate complex expressed in megabecquerels (microcuries or millicuries) per mL at the date and time indicated in the labeling. It may contain antimicrobial agents, antioxidants, and buffers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

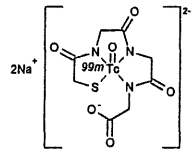
Packaging and storage—Preserve in single-dose or multiple-dose containers at a temperature specified in the labeling.

Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than $175/V$ USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in

www.webofpharma.com

which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 4.0 and 7.8.



Radiochemical purity—Not more than 10.0% of unbound Tc 99m (free pertechnetate), hydrolyzed Tc 99m, and technetium-tin colloid is present, determined as follows.

System A—Under an atmosphere of nitrogen, place a measured volume of Injection, such that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a paper chromatographic strip (see *Chromatography* ⟨621⟩). Immediately develop the chromatogram over a suitable period by ascending chromatography, using sodium chloride solution (0.9 in 100), and dry it under nitrogen. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Hydrolyzed Tc 99m and technetium-tin colloid are located at the origin (R_F 0 to 0.1).

System B—Proceed as directed for *System A*, except to develop the chromatogram in dilute methanol (85 in 100). Free pertechnetate is located at an R_F of 0.6 to 0.8. The sum of the percentage of radioactivity at the origin in *System A* plus the percentage of radioactivity at an R_F of 0.6 to 0.8 in *System B* is not greater than 10.0%.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*, and meets the requirements for *Labeling*, *Biological distribution*, and *Assay for radioactivity* under *Technetium Tc 99m Pyrophosphate Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Technetium Tc 99m Mertiatide Injection

$C_8H_8N_3Na_2O_6S^{99m}Tc$

Technetate(2-)-^{99m}*Tc*,[*N*-[*N*-[*N*-(mercaptoacetyl)-glycyl] glycyl]glycinato(5-)-*N*,*N*′,*N*″,*S*]-oxo-, disodium, (*SP*-5-25)-.

Disodium [*N*-[*N*-[*N*-(mercaptoacetyl)glycyl]glycyl]glycinato (5-)-*N*,*N*′,*N*″,*S*]-oxo[^{99m}Tc]technetate(V) [125224-05-7].

» Technetium Tc 99m Mertiatide Injection is a sterile aqueous solution, suitable for intravenous injection, that contains ^{99m}Tc in the form of a chelate of mertiatide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as mertiatide complex expressed in megabecquerels (or in microcuries or millicuries) per mL at the date and time indicated in the labeling. It contains uncomplexed betiatide, a suitable ^{99m}Tc reducing agent, a transfer ligand, and stabilizers.

Packaging and storage—Preserve in single-dose or multiple-dose containers.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled mertiatide expressed as total megabecquerels (or millicuries) and the concentration as megabecquerels per mL (or as millicuries per mL) on the date and time of calibration; the expiration date and time; and a statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 175/*V* USP Endotoxin Unit per mL, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 5.0 and 6.0.

Radiochemical purity—

Method 1 (Determination of hydrolyzed reduced technetium)—Apply about 5 to 10 µL (100 to 250 µCi) 15 mm from the bottom of a 25-mm × 20-cm strip of chromatographic paper (see *Chromatography* ⟨621⟩). Immediately develop the chromatogram by ascending chromatography using a solvent system consisting of a mixture of acetonitrile and water (60:40) until the solvent front has moved about 13 cm from the origin. Remove the strip, and allow to dry. Determine the radioactivity distribution by scanning the chromatogram using a suitable collimated radiation detector. Calculate the percentage of hydrolyzed reduced technetium by the formula:

$$100(A_{ht}/B_s)$$

in which A_{ht} is the sum of all the peaks at or near the origin, where R_F is less than 0.25, and B_s is the sum of all of the peaks: not more than 2.0% of hydrolyzed reduced technetium is found.

Method 2 (Simultaneous determination of free pertechnetate and ^{99m}Tc mertiatide)—

SOLUTION A —Prepare a filtered and degassed solution of monobasic potassium phosphate in water to obtain a solution containing 1.36 mg per mL. To each L of this solution, add 1.0 mL of triethylamine, and adjust with 1.0 N hydrochloric acid to a pH of between 4.9 and 5.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

SOLUTION B —Prepare a filtered and degassed solution of monobasic potassium phosphate in 900 mL of water, and add 100 mL of tetrahydrofuran to obtain a solution containing 1.36 mg per mL. To each L of this solution, add 1.0 mL of triethylamine, and adjust with 1.0 N hydrochloric acid to a pH of between 4.9 and 5.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

MOBILE PHASE —Mix specified portions of freshly prepared and degassed *Solution A* and *Solution B*.

TEST SOLUTION —Immediately before testing, dilute a portion of the Injection with *Water for Injection* to obtain a concentration of between 400 to 600 µCi. [NOTE—The extent to which the sample is diluted is determined by the sensitivity of the radiometric detector.]

CHROMATOGRAPHIC SYSTEM (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 3.9-mm × 15-cm column that contains packing L1 and a flow-through gamma-ray detector and is programmed to provide a *Mobile phase* consisting of variable mixtures of *Solution A* and *Solution B*. The system is equilibrated for 15 minutes with a *Mobile phase* consisting of a mixture of 90% *Solution A* and 10% *Solution B*. After injecting the *Test solution*, change the composition of the *Mobile phase* linearly over the next 30 minutes so that the final *Mobile phase* composition consists of

www.webofpharma.com

20% *Solution A* and 80% *Solution B*. Hold with this composition for 5 minutes and then change in reverse to a composition of 90% *Solution A* and 10% *Solution B* over a 5-minute period. The flow rate is about 1 mL per minute.

PROCEDURE —Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatograms by gradient elution (see the *Chromatographic system*). The retention time is between 1.8 and 2.2 minutes for ^{99m}Tc pertechnetate and between 10 and 14 minutes for ^{99m}Tc mertiatide. Calculate the percentage of ^{99m}Tc pertechnetate by the formula:

$$100(r_{pt}/r_s)$$

in which r_{pt} is the peak response of ^{99m}Tc pertechnetate, and r_s is the sum of all peak responses: not more than 6.0% of ^{99m}Tc pertechnetate is found.

Calculate the percentage of ^{99m}Tc mertiatide by the formula:

$$100(r_{mt}/r_s')$$

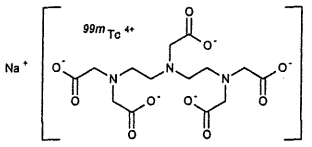
in which r_{mt} is the peak response of ^{99m}Tc mertiatide, and r_s' is the sum of all peak responses: not less than 90.0% of ^{99m}Tc mertiatide is found.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It also meets the requirement under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility Tests* ⟨71⟩, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity ⟨821⟩—Using a suitable counting assembly, determine the radioactivity, in Mbq (or millicuries) per mL, of the Injection by use of a calibrated system.

Technetium Tc 99m Oxidronate Injection

» Technetium Tc 99m Oxidronate Injection is a sterile, clear, colorless solution, suitable for intravenous administration, of radioactive technetium (^{99m}Tc) in the form of a chelate of oxidronate sodium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as chelate expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain buffers, preservatives, reducing agents, and stabilizers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.



Packaging and storage—Preserve in single-dose or multiple-dose containers.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled oxidronate expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

pH ⟨791⟩: between 2.5 and 7.0.

Other requirements—It meets the requirements for *Bacterial endotoxins, Radiochemical purity, Biological distribution, Other requirements*, and *Assay for radioactivity* under *Technetium Tc 99m Pyrophosphate Injection*.

Technetium Tc 99m Pentetate Injection

$C_{14}H_{18}N_3NaO_{10}{}^{99m}Tc$

Technetate(1-) ^{99m} Tc, [*N*,*N*-bis[2-[bis(carboxymethyl)amino] ethyl]glycinato(5-)]-, sodium.

Sodium [*N*,*N*-bis[2-[bis(carboxymethyl)amino]ethyl] glycinato(5-)]-technetate(1-)- ^{99m} Tc [65454-61-7].

» Technetium Tc 99m Pentetate Injection is a sterile solution of pentetic acid that is complexed with ^{99m}Tc in Sodium Chloride Injection. It is suitable for intravenous administration and may contain buffers. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as the pentetic acid complex expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, at a temperature between 2° and 8°.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled pentetic acid complex expressed as total megabecquerels (millicuries or microcuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 3.8 and 7.5.

Radiochemical purity—

Phosphate buffer—Dissolve 2.6 g of monobasic sodium phosphate and 3.0 g of anhydrous dibasic sodium phosphate in water to make 1000 mL. Adjust, if necessary, by the addition of 0.2 M phosphoric acid or 0.2 M sodium hydroxide, to a pH of 6.8 ± 0.05.

Procedure —Soak a 2.5- × 17.0-cm cellulose polyacetate strip in 100 mL of *Phosphate buffer* for 10 to 60 minutes.

USP Monographs

www.webofpharma.com

Remove the strip with forceps, taking care to handle the outer edges only. Place the strip between two absorbent pads, and blot to remove excess solution. Attach the strip to the support bridge of an electrophoresis chamber containing *Phosphate buffer* in each side of the chamber. Ensure that each end of the strip is in contact with *Phosphate buffer*. Mark the application line near the cathode end of the strip. Apply as a spot 1 µL of a 1 in 1000 solution of amaranth in *Phosphate buffer*. Adjacent to this, apply as a narrow streak 5 µL of Injection having an activity of about 1 mCi per mL, previously diluted with saline TS, if necessary. Attach the chamber cover, and perform the electrophoresis at 300 volts until the amaranth (red dye) has moved about four-fifths of the length of the strip. Remove the strip from the chamber, and blot the ends on paper towels. Using a suitable scanner and counting assembly, determine the radioactivity distribution. Labeled technetium pentetate migrates a distance that is 0.9 relative to that of amaranth. Hydrolyzed technetium Tc 99m is located at the origin and pertechnetate migrates a distance that is 0.7 relative to that of amaranth: the sum of the percentages of radioactivity of hydrolyzed technetium Tc 99m and pertechnetate is not greater than 10.0% of the total radioactivity on the strip.

Biological distribution—Inject intravenously between 0.075 MBq and 0.75 MBq (2 µCi and 20 µCi) of Injection, in a volume not exceeding 0.2 mL, into the caudal vein of each of three 20- to 25-g mice. Approximately 10 to 15 minutes after injection, place each animal in a suitable container and count the radioactivity of each with an appropriate radiation detector, using the same counting geometry, in order to determine the total activity injected. Approximately 24 hours after injection, repeat the radioactivity counting of each animal, as above. After correcting for decay, determine the percentage of radioactivity retained in each animal 24 hours after injection by the formula:

$$100(A/B)$$

in which A is the net radioactivity, in counts per minute (corrected for decay), in the animal at 24 hours, and B is the total radioactivity, in net counts per minute, at the time of injection. The percentage of injected radioactivity retained 24 hours after administration is not greater than 5.0% of the injected activity in any of the animals.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (µCi) per mL, of Injection by use of a calibrated system.

Sodium Pertechnetate Tc 99m Injection

Pertechnetic acid ($H^{99m}TcO_4$), sodium salt.
Sodium pertechnetate ($Na^{99m}TcO_4$) [23288-60-0].

» Sodium Pertechnetate Tc 99m Injection is a sterile solution, suitable for intravenous or oral administration, containing radioactive technetium (^{99m}Tc) in the form of sodium pertechnetate and sufficient Sodium Chloride to make the solution isotonic. Technetium 99m is a radioactive nuclide formed by the radioactive decay of molybdenum 99. Molybdenum 99 is a radioactive isotope of molybdenum and may be formed by the neutron bombardment of molybdenum 98 or as a product of uranium fission.

Sodium Pertechnetate Tc 99m Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc at the date and hour stated on the label. Other chemical forms of ^{99m}Tc do not exceed 5 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers.

Labeling—If intended for intravenous use, label it with the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*. Label it also to include the following: the time and date of calibration; the amount of ^{99m}Tc as sodium pertechnetate expressed as total megabecquerels (millicuries) and as megabecquerels (millicuries) per mL on the date and at the time of calibration; a statement of the intended use, whether oral or intravenous; the expiration date; and the statement "Caution—Radioactive Material." If the Injection has been prepared from molybdenum 99 produced from uranium fission, the label so states. The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Radionuclide identification (see *Radioactivity* ⟨821⟩)—Its gamma-ray spectrum is identical to that of a specimen of ^{99m}Tc that exhibits a major photopeak having an energy of 0.140 MeV.

Bacterial Endotoxins Test ⟨85⟩—The limit of endotoxin content is not more than $175/V$ USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 4.5 and 7.5.

Radiochemical purity—Place a volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* ⟨621⟩). Develop the chromatogram over a suitable period of time by ascending chromatography, using a mixture of acetone and 2 N hydrochloric acid (80:20). Allow the chromatogram to air-dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. The radioactivity of the pertechnetate band is not less than 95% of the total radioactivity in the test specimen. The R_F value for the pertechnetate band (approximately 0.9) falls within ±10.0% of the value found for a known sodium pertechnetate Tc 99m specimen when determined under identical conditions.

Radionuclidic purity—Using a suitable counting assembly, determine the radioactivity of each radionuclidic impurity, in kBq per MBq (µCi per mCi) of technetium 99m, in the Injection by use of a calibrated system as directed under *Radioactivity* ⟨821⟩.

For Injection prepared from technetium 99m derived from parent molybdenum 99 formed as a result of neutron bombardment of stable molybdenum—

MOLYBDENUM 99—The presence of molybdenum 99 in the Injection is shown by its characteristic gamma-ray spectrum. The most prominent photopeaks of this radioactive nuclide have energies of 0.181, 0.740, and 0.780 MeV. Molybdenum

USP Monographs

www.webofpharma.com

99 decays with a radioactive half-life of 66.0 hours. The amount of molybdenum 99 is not greater than 0.15 kBq per MBq (0.15 µCi per mCi) of technetium 99m per administered dose in the Injection, at the time of administration.

OTHER GAMMA-EMITTING RADIONUCLIDIC IMPURITIES —The total amount of other gamma-emitting radionuclidic impurities does not exceed 0.5 kBq per MBq (0.5 µCi per mCi) of technetium 99m, and does not exceed 92 kBq (2.5 µCi) per administered dose of the Injection, at the time of administration.

For Injection prepared from technetium 99m derived from parent molybdenum 99 formed as a result of uranium fission—*Gamma- and beta-emitting impurities*—

MOLYBDENUM 99—The Injection meets the requirements set forth for the Injection prepared by neutron irradiation of stable molybdenum (see foregoing).

IODINE 131—The most prominent photopeak of this radioactive nuclide has an energy of 0.364 MeV. Iodine 131 decays with a radioactive half-life of 8.08 days. The concentration of iodine 131 is not more than 0.05 kBq per MBq (0.05 µCi per mCi) of technetium 99m, at the time of administration.

RUTHENIUM 103—The most prominent photopeak of this radioactive nuclide has an energy of 0.497 MeV. Ruthenium 103 decays with a radioactive half-life of 39.5 days. The concentration of ruthenium 103 is not more than 0.05 kBq per MBq (0.05 µCi per mCi) of technetium 99m, at the time of administration.

STRONTIUM 89—Determine the presence of strontium 89 in the Injection by a counting system appropriate for the detection of particulate radiations. Strontium 89 decays by a beta emission with a maximum energy of 1.463 MeV, and a radioactive half-life of 52.7 days. Strontium 89 may be present in a concentration of not more than 0.0006 kBq per MBq (0.0006 µCi per mCi) of technetium 99m, at the time of administration.

STRONTIUM 90—Determine the presence of strontium 90 in the Injection by a counting system appropriate for the detection of particulate radiations. Strontium 90 decays by a beta emission with a maximum energy of 0.546 MeV, and a radioactive half-life of 27.7 years. Strontium 90 may be present in a concentration of not more than 0.00006 kBq per MBq (0.00006 µCi per mCi) of technetium 99m, at the time of administration.

ALL OTHER RADIONUCLIDIC IMPURITIES—Not more than 0.01% of all other beta and gamma emitters is present at the time of administration. Not more than 0.001 Bq of gross alpha impurity per 1 MBq (or 0.001 nCi of gross alpha impurity per 1 mCi) of technetium 99m is present at the time of administration.

Chemical purity—

Aluminum (To be determined if separation is accomplished by an alumina column in the preparation of the Injection)—

ALUMINUM STANDARD SOLUTION —Dissolve 35.17 mg, accurately weighed, of aluminum potassium sulfate dodecahydrate in water to make 1000.0 mL. Each mL of this solution contains 2 µg of Al.

PROCEDURE—Pipet 10 mL of *Aluminum standard solution* into each of two 50-mL volumetric flasks. To each flask add 3 drops of methyl orange TS and 2 drops of 6 N ammonium hydroxide, then add 0.5 N hydrochloric acid, dropwise, until the solution turns red. To one flask add 25 mL of sodium thioglycolate TS, and to the other flask add 1 mL of edetate disodium TS. To each flask add 5 mL of eriochrome cyanine TS and 5 mL of acetate buffer TS, and add water to volume. Immediately determine the absorbance of the solution containing sodium thioglycolate TS at the wavelength of maximum absorbance at about 535 nm, with a suitable spectrophotometer, using the solution containing the edetate disodium TS as a blank. Repeat the procedure using two 1.0-mL aliquots of Injection. Calculate the quantity, in µg per mL, of aluminum in the Injection taken by the formula:

$$20(T_U/T_S)$$

in which T_U and T_S are the absorbances of the solution from the Injection and the solution containing the aluminum standard, respectively. The concentration of aluminum ion in the Injection is not greater than 10 µg per mL.

Methyl ethyl ketone (To be determined if separation is accomplished by liquid-liquid extraction in the preparation of the Injection)—Place 1.0 mL of the Injection in a suitable container, and dilute with water to 20.0 mL. Add 2.0 mL of 1 N sodium hydroxide, mix, then add 2.0 mL of 0.1 N iodine, dropwise, and again mix. At the same time, prepare a standard by placing 1.0 mL of a solution of methyl ethyl ketone (1 in 1000) in a similar container and diluting with water to 20.0 mL. Add 2.0 mL of 1 N sodium hydroxide, mix, then add 2.0 mL of 0.1 N iodine, dropwise, and again mix. After 2 minutes, the turbidity of the test specimen does not exceed that of the standard (0.1%).

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (mCi) per mL, in Injection by use of a calibrated system.

Technetium Tc 99m Pyrophosphate Injection

» Technetium Tc 99m Pyrophosphate Injection is a sterile, aqueous solution, suitable for intravenous administration, of pyrophosphate that is labeled with ^{99m}Tc. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as pyrophosphate expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain antimicrobial agents, buffers, reducing agents, and stabilizers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers, at a temperature between 2° and 8°.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled tetrasodium pyrophosphate expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of

USP Monographs

www.webofpharma.com

the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 4.0 and 7.5.

Radiochemical purity—The determination of radiochemical purity for this product requires the use of two separate chromatography systems.

System A—Under an atmosphere of nitrogen, place a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 20 mm from one end of a thin-layer chromatographic strip impregnated with silica gel (see *Chromatography* ⟨621⟩), and allow to dry. Develop the chromatogram over a suitable period by ascending chromatography, using saline TS, and dry it under nitrogen. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Hydrolyzed Tc 99m and technetium-tin colloid are located at the origin (R_f 0 to 0.1).

System B—Proceed as directed for *System A*, except to develop the chromatogram in a mixture of methanol and acetone (1:1). Free pertechnetate is located at the solvent front. The sum of the percentage of radioactivity at the origin in *System A* plus the percentage of radioactivity at the solvent front in *System B* is not greater than 10.0%.

Biological distribution—Inject intravenously between 0.075 MBq and 75 MBq (2 µCi and 2 mCi) of Injection, in a volume not exceeding 0.2 mL, into the caudal or external jugular vein of each of three 175- to 250-g rats. Approximately 1 hour after the injection, sacrifice the animals, and carefully remove the liver, both kidneys, and one femur of each by dissection, freeing the femur from soft tissue. Remove the tail 20 to 30 mm above the injection site, and discard. Place each organ, both kidneys, and the remaining carcass in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container with an appropriate detector, using the same counting geometry. Determine the percentage of radioactivity in the liver, kidneys, and femur taken by the formula:

$$100(A/B)$$

in which *A* is the net radioactivity, in counts per minute, in the organ, and *B* is the total radioactivity, in counts per minute, in the liver, kidneys, femur, and carcass. Not more than 5.0% of the total radioactivity is found in the liver or in the kidneys, and not less than 1.0% of the total radioactivity is found in the femur, in not fewer than 2 of the rats.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (µCi) per mL, of the Injection by use of a calibrated system.

Technetium Tc 99m (Pyro- and trimeta-) Phosphates Injection

» Technetium Tc 99m (Pyro- and trimeta-) Phosphates Injection is a sterile, aqueous solution, suitable for intravenous administration, composed of sodium pyrophosphate, sodium trimetaphosphate, and stannous chloride labeled with radioactive Tc 99m. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as phosphate expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

pH ⟨791⟩: between 4.0 and 7.0.

Radiochemical purity—Place a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 10 mm from one end of a 10- × 50-mm strip of chromatographic paper (see *Chromatography* ⟨621⟩), and immediately develop the chromatogram over a period of 3 to 5 minutes by ascending chromatography, using saline TS, and air-dry. Determine the radioactivity distribution by scanning with a suitable collimated radiation detector. Not more than 10.0% of the total radioactivity is found at the point of application. Similarly prepare a second strip, and thoroughly dry the spot with nitrogen. Develop the chromatogram over a period of 35 to 45 seconds by ascending chromatography, using freshly distilled methyl ethyl ketone, and allow to dry. Determine the radioactivity distribution as previously directed. Not less than 90.0% of the total radioactivity is found at the point of application.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*, and the requirements of the tests for *Packaging and storage*, *Labeling*, *Bacterial endotoxins*, *Biological distribution*, and *Assay for radioactivity* under *Technetium Tc 99m Pyrophosphate Injection*. It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Technetium Tc 99m Red Blood Cells Injection

» Technetium Tc 99m Red Blood Cells Injection is a preparation of anticoagulated whole blood that is labeled with ^{99m}Tc. The cells are prepared for labeling by collection of an autologous sample of whole blood, which is anticoagulated with Heparin Sodium or anticoagulant dextrose solution.

Technetium Tc 99m Red Blood Cells Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of ^{99m}Tc as labeled blood cells expressed in megabecquerels (or in microcuries or millicuries) per mL at the time indicated in the labeling. It may contain anticoagulants, such as heparin or anticoagulant citrate solution, chelating agents, stannous chloride, and sodium hypochlorite. Other chemical forms of radioactivity do not exceed 10.0

www.webofpharma.com

percent of the total radioactivity. When derived from donor blood, its production and distribution derived from donor blood are subject to federal regulations (see *Biologics* ⟨1041⟩ and *Radioactivity* ⟨821⟩).

Caution— A strict aseptic technique must be followed for collection of the blood sample, along with the processing steps required to label it with Technetium Tc 99m. The blood samples must be labeled with the name of the patient and patient's identification code to prevent administration of the sample to other than the intended patient. In the event that donor blood is used, it must first be tested for viral contaminants and carefully typed and cross-matched to ensure compatibility with that of the recipient.

Packaging and storage—Preserve in adequately shielded single-dose or multiple-dose containers, at controlled room temperature.

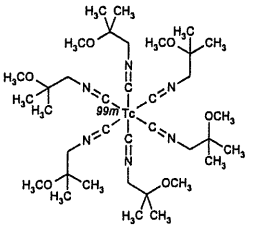
Labeling—Label it to include the following in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the patient's name and identification number; the type of anticoagulant used; the time and date of calibration; the amount expressed as total megabecquerels (or microcuries or millicuries) and concentration as megabecquerels (or microcuries or millicuries) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Clarity and color of solution—Observe the appearance and color of the supernatant diluted plasma obtained in the *Radiochemical purity* test procedure. The diluted plasma is clear and has a colorless to a very slight pink or yellow appearance. Samples that produce a distinctive red coloration are not acceptable for administration.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 5.5 and 8.0.

Radiochemical purity—Transfer 0.2 mL of the Injection to a centrifuge tube containing 2 mL of 0.9% sodium chloride solution. Centrifuge for five minutes, and carefully withdraw the diluted plasma by pipet. Measure the radioactivity in the plasma and red blood cells separately in a suitable counter. Calculate labeling efficiency by the formula:



$$100[A_{RBC}/(A_{RBC} + A_P)]$$

in which A_{RBC} is the activity in the red blood cells, and A_P is the activity in the plasma. Not less than 90% of the ^{99m}Tc present in the Injection is bound to the red blood cells.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (or μCi) per mL, of the Injection by use of a calibrated system.

Technetium Tc 99m Sestamibi Injection

$C_{36}H_{66}N_6O_6{}^{99m}Tc$

Technetium(1+)-^{99m}*Tc*,hexakis(1-isocyano-2-methoxy-2-methylpropane)-, (*OC*-6-11)-.

Hexakis(2-methoxy-2methylpropyl isocyanide)[^{99m}Tc] technetium(1+) [109581-73-9].

» Technetium Tc 99m Sestamibi Injection is a sterile, aqueous solution of tetrakis(2–methoxy-isobutyl isonitrile) copper (I) tetrafluoroborate that is labeled with ^{99m} Tc suitable for intravenous administration. It contains not less than 90 percent and not more than 110 percent of the labeled amount of ^{99m} Tc as a complex with sestamibi, expressed in megabecquerels (or in milicuries) per mL at the time indicated in the labeling. It contains reducing agents, a buffer, and an inert filler. Other chemical forms of radioactivity do not exceed 10 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of constitution; the volume of constitution; the amount of ^{99m}Tc as labeled sestamibi expressed as total megabecquerels (or millicuries) per mL at the time of constitution; the expiration date and time; the lot number; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 175/*V* USP Endotoxin Units per mL, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 5.0 and 6.0.

Radiochemical purity—

Preparation of the test vials—Constitute each of 4 vials with 1 mL (1875 ± 187.5 MBq, or 50 ± 5 mCi) of *Sodium Pertechnetate Tc 99m Injection*. Heat the vials in boiling water for 10 minutes. After heating, allow the vials to cool to room temperature for 15 minutes.

Method 1 (Thin-layer chromatography)—Apply 1 to 2 μL of Injection about 1 cm from the bottom of a 25-mm × 7.75-cm reverse-phase chromatographic plate, and allow to dry (see *Chromatography* ⟨621⟩). Position the plate in a chromatographic chamber and develop the chromatograms

USP Monographs

www.webofpharma.com

in a freshly prepared (not more than 4 hours) solvent system consisting of a mixture of acetonitrile, methanol, 3.85% ammonium acetate, and tetrahydrofuran (4:3:2:1) until the solvent front has moved about 6 cm from the origin. Remove the plate and allow it to air-dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable radiation detector. A mean of not less than 90% (area %) of the radioactivity is found at an R_F value between 0.3 and 0.6. Free pertechnetate is located at about the R_F 0.8 to 1.0, and radiocolloid is located at about R_F 0 to 0.1. The sum of the mean percentages of free pertechnetate and colloid does not exceed 10%.

Method 2 (High-pressure liquid chromatography)—

MOBILE PHASE—Prepare a filtered and degassed mixture of methanol, 0.05 M ammonium sulfate solution, and acetonitrile (45:35:20). Make adjustments if necessary (see *System Suitablity* under *Chromatography* ⟨621⟩).

CHROMATOGRAPHIC SYSTEM (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 3.9-mm × 30-cm column that contains 10-µm packing L1. It is also equipped with a flow-through gamma-ray detector. The flow rate is about 2 mL per minute. If ^{99m}Tc pentamibi dimethylvinyl isonitrile is present, the relative retention between the ^{99m}Tc sestamibi peak and the ^{99m}Tc pentamibi dimethylvinyl isonitrile peak is 1.3 to 1.5.

PROCEDURE—Inject about 5 µL (9.375 MBq or 250 µCi) of *Sodium Pertechnetate Tc 99m Injection* into the chromatograph, and adjust the integrator/recording device so that the peak is 25% to 100% of full scale. Separately inject equal volumes (about 5 µL, 9.375 MBq, or 250 µCi) of the injection under test into the chromatograph, record the chromatograms, and measure the area percentage for all of the peaks present. The retention time for ^{99m}Tc sestamibi is about 5 to 10 minutes. The retention time for ^{99m}Tc pentamibi dimethylvinyl isonitrile is about 6 to 13 minutes. Correct for the presence of colloid, which is not measured by this method, taken by the equation:

$$C_f = [(100\%) - (A_c)]/100$$

in which C_f is the correction factor, and A_c is the mean area percentage for the colloid obtained from *Method 1*. Obtain corrected area percentage by multiplying the correction factor (C_f) by the area percentage of the peaks present in the chromatogram. A mean of not less than 90% (corrected area percentage) of the total radioactivity is represented by ^{99m}Tc sestamibi, and a mean of not more than 5% (corrected area percentage) of the total radioactivity is present as ^{99m}Tc pentamibi dimethylvinyl isonitrile.

Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements for *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed and dispensed prior to the completion of the test for *Sterility*, the latter being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (or in mCi) per mL, of the Injection by use of a calibrated system.

Technetium Tc 99m Succimer Injection

meso-2,3-Dimercaptosuccinic acid, ^{99m}Tc complex.

» Technetium Tc 99m Succimer Injection is a sterile, clear, colorless, aqueous solution of succimer complexed with ^{99m}Tc. It is suitable for intravenous administration. It contains not less than 85.0 percent of the labeled amount of ^{99m}Tc as the succimer complex expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain reducing agents. Other chemical forms of radioactivity do not exceed 15.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose containers, at a temperature between 15° and 30°. Do not freeze or store above 30°. Protect from light.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled succimer expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours. In addition, the labeling states that it is not to be used if discoloration or particulate matter is observed. [NOTE—A beyond-use time of 30 minutes shall be stated on the label upon constitution with Sodium Pertechnetate Tc 99m Injection.]

Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

pH ⟨791⟩: between 2.0 and 3.0.

Radiochemical purity—Activate a 65- × 95-mm silicic acid thin-layer chromatographic plate by heating at 100-110° for 30 minutes. Cool over silica gel and immediately apply 1 µL of Injection, appropriately diluted, if necessary, to a radioactive concentration of 18.5 to 370 MBq (0.5 to 10 mCi) per mL, about 17 mm from one end of the chromatographic plate, and allow to dry. Develop the chromatogram over a period of about 30 to 45 minutes by ascending chromatography, using *n*-butanol saturated with 0.3 N hydrochloric acid, and air-dry. Determine the radioactive distribution by scanning the chromatogram with a suitable collimated radiation detector. Not less than 85% of the total radioactivity is found as succimer at an R_F between 0.45 and 0.70. Hydrolyzed ^{99m}Tc is located at the origin (R_F 0 to 0.15) and the unbound ^{99m}Tc is located at the solvent front (R_F 1.0).

Biological distribution—Inject intravenously between 3.7 MBq and 92.5 MBq (100 µCi and 2500 µCi) of Injection, in a volume of 0.2 to 0.25 mL, into the caudal vein of each of three 125-g to 225-g anesthetized Sprague-Dawley female rats. Clamp the opening of the urethra with a hemostat. Sacrifice the animals 1 hour after the injection, and carefully remove the kidneys, bladder, and liver and spleen of each as *three* separate organs by dissections. Place each organ and the remaining carcass (excluding the tail) in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container with an appropriate detector, using the same counting geometry. Determine the percentage of administered radioactive dose in each organ: not less than 40% of the administered radioactive dose is found in the kidneys and a ratio of not less than 6:1 of the

www.webofpharma.com

administered dose is found in the ratio kidneys/(liver and spleen), in not fewer than two of the animals.
Other requirements—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.
Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (μCi) per mL, of Injection by use of a calibrated system.

Technetium Tc 99m Sulfur Colloid Injection

Sulfur, colloidal, metastable technetium-99 labeled [7704-34-9].

» Technetium Tc 99m Sulfur Colloid Injection is a sterile, colloidal dispersion of sulfur labeled with radioactive ^{99m}Tc, suitable for intravenous administration.

Technetium Tc 99m Sulfur Colloid Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of ^{99m}Tc as sulfur colloid expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain chelating agents, buffers, and stabilizing agents. Other chemical forms of radioactivity do not exceed 8 percent of the total radioactivity. [NOTE—Agitate the container before withdrawing the Injection into a syringe.]

Packaging and storage—Store in single-dose or multiple-dose containers.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as sulfur colloid expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours; in addition, the labeling states that it is not to be used if flocculent material is visible and directs that the container be agitated before the Injection is withdrawn into a syringe.
Radionuclide identification (see *Radioactivity* ⟨821⟩)—It meets the requirements of the test for *Radionuclide identification* under *Sodium Pertechnetate Tc 99m Injection*.
Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.
pH ⟨791⟩: between 4.5 and 7.5.
Radionuclidic purity—It meets the requirements of the test for *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*.
Radiochemical purity—Place a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* ⟨621⟩), and allow to dry. Develop the chromatogram over a suitable period by ascending chromatography, using dilute methanol (8.5 in 10), and air-dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Not less than 92% of the total radioactivity is found as sulfur colloid (at the point of application).
Biological distribution—Inject intravenously between 0.075 MBq and 0.75 MBq (2 μCi and 20 μCi) of the Injection in a volume not exceeding 0.2 mL into the caudal vein of each of three 20-g to 25-g mice. Ten to 30 minutes after the injection, sacrifice the animals, and carefully remove the liver and lungs of each by dissection. Place each organ and remaining carcass in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container in an appropriate scintillation well counter, using the same counting geometry. Determine the percentage of radioactivity in the liver and the lungs taken by the formula:

$$100(A/B)$$

in which *A* is the net radioactivity, in counts per minute, in the organ, and *B* is the total radioactivity, in counts per minute, in the lungs, liver, and carcass. Not less than 80% of the radioactivity is found in the liver and not more than 5% of the radioactivity is found in the lungs, in two of the mice.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.
Assay for radioactivity(see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity, in MBq (μCi) per mL, of Injection by use of a calibrated system.

Technetium Tc 99m Tetrofosmin Injection

» Technetium Tc 99m Tetrofosmin Injection is a sterile aqueous solution, suitable for intravenous injection, that contains ^{99m}Tc in the form of a complex of tetrofosmin. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{99m}Tc as tetrofosmin complex expressed in MBq (or mCi) per mL at the date and time indicated in the labeling. It may contain reducing agents, stabilizers, and buffers. It contains no antimicrobial agents. Other chemical forms of radioactivity do not exceed 10.0 percent of the total.

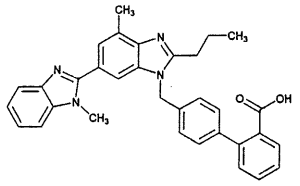
Packaging and storage—Preserve in adequately shielded single-dose or in multiple-dose containers. Protect from light. Store at a temperature not exceeding 25°.

USP Monographs

www.webofpharma.com

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{99m}Tc as labeled tetrofosmin expressed as total MBq (or mCi) and the concentration as megabecquerels per mL (or as mCi per mL) on the date and time of calibration; the expiration date and time; and a statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours.

Bacterial Endotoxins Test ⟨85⟩ —The limit of endotoxin content is not more than 175/*V* USP Endotoxin Unit per mL of the Injection, when compared with USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.



pH ⟨791⟩: between 8.3 and 9.1.

Radiochemical purity—To determine the amount of free technetium, apply a 10- to 20-µL volume of Injection about 3.0 cm from the bottom of a 2- × 20-cm instant thin-layer chromatographic silica gel strip (see *Chromatography* ⟨621⟩). Immediately develop the chromatogram by ascending chromatography to a height of 15 cm using a solvent system consisting of a mixture of acetone and dichloromethane (35:65). Allow the chromatogram to air-dry. Determine the radioactivity distribution of the chromatogram by scanning with a suitable radiation detector. The R_F value of the technetium Tc 99m tetrofosmin spot is approximately 0.5; the sum of radioactivity at the solvent front (unbound pertechnetate) and the origin (reduced hydrolyzed technetium and hydrophilic impurities) is not more than 10%.

Other requirements—It meets the requirements for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It meets also the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the date of manufacture.

Assay for radioactivity ⟨see *Radioactivity* ⟨821⟩⟩—Using a suitable counting assembly, determine the radioactivity, in MBq (µCi) per mL, of the Injection by use of a calibrated system.

Telmisartan

$C_{33}H_{30}N_4O_2$ 514.62

[1,1′-Biphenyl]-2-carboxylic acid, 4′-[(1,4′-dimethyl-2′-propyl[2,6′-bi-1*H*-benzimidazol]-1′-yl)methyl-];
4′-[[4-Methyl-6-(1-methyl-2-benzimidazolyl)-2-propyl-1-benzimidazolyl]methyl]-2-biphenylcarboxylic acid [144701-48-4].

DEFINITION

Telmisartan contains NLT 98.0% and NMT 101.0% of $C_{33}H_{30}N_4O_2$, calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)**:** USP Telmisartan RS[NOTE—Heating the solution may be necessary for complete dissolution.] Cool the solution in an ice bath, filter the crystals, and dry at 105°.
- **B.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the test for *Organic Impurities*.

ASSAY

- **PROCEDURE**

(See *Titrimetry* ⟨541⟩.)

Sample solution: 190 mg of Telmisartan in 5 mL of anhydrous formic acid. Dilute with 75 mL of acetic anhydride.

Analysis: Titrate with 0.1 M perchloric acid versus a blank determination under the same conditions. Each mL of 0.1 M perchloric acid is equivalent to 25.73 mg of $C_{33}H_{30}N_4O_2$.

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%. A 1-g sample is used.
- **ORGANIC IMPURITIES**

[NOTE—Freshly prepare sample solutions, and protect from light.]

Solution A: 2.0 g of monobasic potassium phosphate and 3.8 g of sodium 1-pentanesulfonate in 1 L of water. Adjust with 1 M phosphoric acid to a pH of 3.0.

Solution B: Acetonitrile and methanol (4:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
2	70	30
27	20	80
32	20	80
32.1	70	30
37	70	30

System suitability solution: Dissolve USP Telmisartan RS and USP Telmisartan Related Compound B RS in methanol (0.2 mL/mg of USP Telmisartan RS) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. The final concentration is 2.5 mg/mL of the USP Telmisartan RS and 2.5 µg/mL of USP Telmisartan Related Compound B RS in methanol.

Standard solution: Dissolve USP Telmisartan RS in methanol (0.2 mL/mg of USP Telmisartan RS) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. The final concentration is 0.025 mg/mL.

Sample solution: Dissolve Telmisartan in methanol (0.2 mL/mg of Telmisartan) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. The final concentration is 2.5 mg/mL.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.0-mm × 12.5-cm; 5-µm packing L1

www.webofpharma.com

Column temperature: 40°
Flow rate: 1 mL/min
Injection size: 2 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 3.0 between telmisartan and telmisartan related compound B, *System suitability solution*
Tailing factor: Between 0.9 and 1.5 for telmisartan related compound B, *System suitability solution*
Relative standard deviation: NMT 5.0% for the telmisartan peak, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual impurity in the portion of Telmisartan taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of telmisartan from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution*
C_U = concentration of Telmisartan in the *Sample solution*

Acceptance criteria: See *Table 2*. [NOTE—Calculate the total impurities from the sum of all impurity peaks greater than or equal to 0.05%.]

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Telmisartan related compound A[a]	0.3	0.1
Telmisartan amide[b]	0.7	0.1
Telmisartan related compound B[c]	0.9	0.1
Telmisartan diacid[d]	0.67	0.1
Telmisartan *tert*-butyl ester[e]	1.7	0.2
Telmisartan unknown impurity	1.8	0.2
Any other individual impurity	—	0.1
Total impurities	—	1.0

[a] 1,7′-Dimethyl-2′-propyl-1*H*,3′*H*-2,5′-bibenzo[*d*]imidazole.
[b] 4′-[(1,7′-Dimethyl-2′-propyl-1*H*,3′*H*-2,5′-bibenzo[*d*]imidazol-3′-yl)methyl] biphenyl-2-carboxamide.
[c] 4′-[(1,7′-Dimethyl-2′-propyl-1*H*,1′*H*-2,5′-bibenzo[*d*]imidazol-1′-yl)methyl] biphenyl-2-carboxylic acid.
[d] 1-[(2′-Carboxybiphenyl-4-yl)methyl]-4-methyl-2-propyl-1*H*-benzimidazole-6-carboxylic acid.
[e] *tert*-Butyl 4′-[(1,7′-dimethyl-2′-propyl-1*H*,3′*H*-2,5′-bibenzo[*d*]imidazol-3′-yl) methyl]biphenyl-2-carboxylate.

SPECIFIC TESTS
- **LOSS ON DRYING** ⟨731⟩: Dry 1.0 g of the sample at 105° to constant weight: it loses NMT 1.5%.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, and protect from light.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Telmisartan RS
  USP Telmisartan Related Compound B RS
  4′-[(1,7′-Dimethyl-2′-propyl-1*H*,1′*H*-2,5′-bibenzo[*d*] imidazol-1′-yl)methyl]biphenyl-2-carboxylic acid.
  $C_{33}H_{30}N_4O_2$ 514.62

Telmisartan Tablets

DEFINITION
Telmisartan Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet Spectroscopy*: **197U**▲ (CN 1-May-2020): The spectrum of the solution under test corresponds to that of the *Standard solution* as obtained in *Dissolution Test 1*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Diluent: 0.005 N methanolic solution of sodium hydroxide
Buffer: 2.0 g/L of ammonium dihydrogen phosphate. Adjust with 1 M phosphoric acid to a pH of 3.0.
Mobile phase: Methanol and *Buffer* (70:30)
Standard stock solution: 0.8 mg/mL of USP Telmisartan RS and 0.1 mg/mL of USP Telmisartan Related Compound A RS in *Diluent*
Standard solution: 0.11 mg/mL of USP Telmisartan RS and 0.013 mg/mL of USP Telmisartan Related Compound A RS in *Mobile phase* from the *Standard stock solution*. Pass the solution through a membrane filter of 0.45-µm pore size.
Sample solution: Transfer NLT 20 Tablets into a suitable volumetric flask, and add about 80% of the volume of *Diluent*. Swirl to disperse, and sonicate for about 10 min. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Pass the resulting solution through a membrane filter of 0.45-µm pore size. Further dilute quantitatively in *Mobile phase* to prepare a solution having a concentration of 0.11 mg/mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 298 nm
Column: 4.0-mm × 4-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 0.7 mL/min
Injection volume: 5 µL

System suitability
Sample: *Standard solution*
Suitability requirements
[NOTE—The relative retention times for telmisartan related compound A and telmisartan are 0.53 and 1.00, respectively.]
Resolution: NLT 3 between telmisartan and telmisartan related compound A
Tailing factor: NMT 2.0 for the telmisartan peak
Capacity factor: NLT 1.5
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) in the portion of Tablets taken:

www.webofpharma.com

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of telmisartan from the *Sample solution*
r_S = peak response of telmisartan from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of telmisartan in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1

Medium: pH 7.5 phosphate buffer (prepared by dissolving 13.61 g of potassium dihydrogen phosphate in about 800 mL of water, adjusting with 2 M sodium hydroxide to a pH of 7.5, and diluting with water to 1000 mL); 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Standard solution: Transfer about 44 mg of USP Telmisartan RS to a 100-mL volumetric flask. Add 1 mL of 0.1 M sodium hydroxide, and dilute with methanol to volume. Dilute this solution quantitatively with *Medium* to obtain a solution having a final concentration of about 0.011 mg/mL.
Sample solution
For Tablets labeled to contain 20 mg: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Further dilute the filtrate with *Medium* (1:2).
For Tablets labeled to contain 40 mg: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Further dilute the filtrate with *Medium* (1:4).
For Tablets labeled to contain 80 mg: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Further dilute the filtrate with *Medium* (1:8).
Instrumental conditions
Mode: UV
Analytical wavelength: 296 nm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the percentage of telmisartan ($C_{33}H_{30}N_4O_2$) dissolved:

$$\text{Result} = (A_U \times C_S \times V \times 100)/(A_S \times D \times L)$$

A_U = absorbance of the *Sample solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
A_S = absorbance of the *Standard solution*
D = dilution factor of the *Sample solution*
L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 75 rpm
Time: 45 min
Buffer: 2.72 g/L of potassium dihydrogen phosphate. Add 2 mL of triethylamine per liter of solution and adjust with phosphoric acid to a pH of 2.4.
Mobile phase: Acetonitrile and *Buffer* (40:60)
Standard stock solution: 0.44 mg/mL of USP Telmisartan RS prepared as follows. To a suitable amount of USP Telmisartan RS in a suitable volumetric flask add methanol, about 50% of the total volume. Sonicate to dissolve, cool to room temperature, and dilute with *Medium* to volume.
Standard solution: (L/900) mg/mL of USP Telmisartan RS in *Medium* from *Standard stock solution*, where L is the label claim in mg/Tablet
Sample solution: Pass portions of the solution under test through a suitable filter of 0.45-µm pore size and discard the first 3 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 298 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 1.6 times the retention time of telmisartan
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium, Apparatus 2, and **Instrumental conditions:** Proceed as directed in *Dissolution Test 1*.
Time: 20 min
Standard solution: 0.011 mg/mL of USP Telmisartan RS prepared as follows. Transfer about 44 mg of USP Telmisartan RS to a 100-mL volumetric flask. Add 1 mL of 0.1 M sodium hydroxide, and sonicate to dissolve. Dilute with methanol to volume and mix. Dilute this solution quantitatively with *Medium* to obtain a solution of the required final concentration.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and discard the first few milliliters. Dilute quantitatively with *Medium* as needed.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL

www.webofpharma.com

D = dilution factor of the *Sample solution*
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Diluent, Buffer, Mobile phase, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*
r_S = peak response of telmisartan from the *Sample solution*

Acceptance criteria: NMT 0.2% of any individual impurity

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

Change to read:

• **USP REFERENCE STANDARDS** ⟨11⟩

Telmisartan and Amlodipine Tablets

DEFINITION

Telmisartan and Amlodipine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount each of telmisartan ($C_{33}H_{30}N_4O_2$) and amlodipine ($C_{20}H_{25}ClN_2O_5$).

IDENTIFICATION

• **A.** The retention times of the two major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

• **B.** The UV spectra of the two major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Buffer: 0.022 M monobasic sodium phosphate dihydrate and 2 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and *Buffer* (40:60)

Diluent: Add 5 mL of triethylamine to 500 mL of water. Add 500 mL of acetonitrile and mix.

Standard stock solution 1: 0.4 mg/mL of USP Telmisartan RS in *Diluent*

Standard stock solution 2: 0.4 mg/mL of USP Amlodipine Besylate RS in *Diluent*

Standard solution: 0.08 mg/mL of USP Telmisartan RS and 0.03 mg/mL of USP Amlodipine Besylate RS in *Diluent* from *Standard stock solution 1* and *Standard stock solution 2*

Sample stock solution: Nominally 0.4 mg/mL of telmisartan and 0.1 mg/mL of amlodipine from Tablets prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask. Add acetonitrile to about 20% of the volume of the flask, and sonicate for 5 min with intermittent shaking. Add *Diluent* to about 80% of the volume of the flask and sonicate until the Tablets are completely dispersed. Dilute with *Diluent* to the volume. Centrifuge and use the supernatant.

Sample solution: Nominally 0.08 mg/mL of telmisartan and 0.02 mg/mL of amlodipine from *Sample stock solution* in *Diluent*. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 257 nm. For *Identification B*, use a diode array detector in the range of 200–350 nm.

Column: 4.6-mm × 25-cm; 5-µm packing L1

Temperatures

Autosampler: 10°

Column: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 20 min

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for amlodipine and telmisartan are 0.5 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0 for telmisartan; NMT 2.5 for amlodipine

Relative standard deviation: NMT 2.0% for telmisartan and amlodipine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of telmisartan from the *Sample solution*
r_S = peak response of telmisartan from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of telmisartan in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of amlodipine ($C_{20}H_{25}ClN_2O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of amlodipine from the *Sample solution*
r_S = peak response of amlodipine from the *Standard solution*
C_S = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of amlodipine besylate in the *Sample solution* (mg/mL)

USP Monographs

www.webofpharma.com

M_{r1} = molecular weight of amlodipine, 408.88
M_{r2} = molecular weight of amlodipine besylate, 567.05

Acceptance criteria: 90.0%–110.0% each of telmisartan and amlodipine

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩
Test 1
Test for telmisartan
Medium: pH 7.5 phosphate buffer (0.05 M monobasic potassium phosphate and 0.038 M sodium hydroxide in 1 L of water; adjusted with diluted sodium hydroxide solution to a pH of 7.5); 900 mL
Apparatus 2: 75 rpm
Time: 20 min
Buffer: 0.022 M monobasic sodium phosphate dihydrate and 2 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 6.0.
Mobile phase: Acetonitrile and *Buffer* (40:60)
Diluent: Add 5 mL of triethylamine to 500 mL of water. Add 500 mL of acetonitrile and mix.
Standard stock solution: 0.9 mg/mL of USP Telmisartan RS in *Diluent*. [NOTE—Sonication may be required to aid dissolution.]
Standard solution: 0.045 mg/mL of USP Telmisartan RS from *Standard stock solution* in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter with suitable pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 257 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Temperatures
Autosampler: 10°
Column: 30°
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: 12 min
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D) \times V \times (1/L) \times 100$$

r_U = peak response of telmisartan from the *Sample solution*
r_S = peak response of telmisartan from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*, if needed
V = volume of *Medium*, 900 mL
L = label claim of telmisartan (mg/Tablet)

Test for amlodipine
Medium: 0.01 N hydrochloric acid; 500 mL
Apparatus 2: 75 rpm
Time: 20 min
Mobile phase and **Chromatographic system:** Proceed as directed in *Test for telmisartan*.
Standard stock solution: 0.7 mg/mL of USP Amlodipine Besylate RS in *Medium*. [NOTE—Sonication may be required to aid dissolution.]
Standard solution: 0.03 mg/mL of USP Amlodipine Besylate RS from *Standard stock solution* in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter of suitable pore size.
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of amlodipine ($C_{20}H_{25}ClN_2O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D) \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of amlodipine from the *Sample solution*
r_S = peak response of amlodipine from the *Standard solution*
C_S = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*, if needed
V = volume of *Medium*, 500 mL
L = label claim of amlodipine (mg/Tablet)
M_{r1} = molecular weight of amlodipine, 408.88
M_{r2} = molecular weight of amlodipine besylate, 567.05

Tolerances: NLT 80% (*Q*) of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) is dissolved. NLT 80% (*Q*) of the labeled amount of amlodipine ($C_{20}H_{25}ClN_2O_5$) is dissolved.
Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Test for telmisartan
Medium: pH 7.5 phosphate buffer (6.805 g/L of monobasic potassium phosphate and 1.6 g/L of sodium hydroxide in water; adjusted with 5 N sodium hydroxide solution or phosphoric acid to a pH of 7.5); 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Buffer: 1.54 g/L of ammonium acetate in water. Adjust with acetic acid to a pH of 5.0.
Mobile phase: Acetonitrile and *Buffer* (50:50)
Diluent: 0.01 N hydrochloric acid
Standard stock solution: 0.56 mg/mL of USP Telmisartan RS, prepared as follows. Transfer a quantity of USP Telmisartan RS to a suitable volumetric flask. Add 40% of the total volume of both methanol and *Diluent*. Sonicate to dissolve. Dilute with *Diluent* to volume and mix well.
Standard solution
For Tablets labeled to contain 80 mg of telmisartan: 0.09 mg/mL of USP Telmisartan RS in *Medium* from the *Standard stock solution*
For Tablets labeled to contain 40 mg of telmisartan: 0.045 mg/mL of USP Telmisartan RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of amlodipine related compound D or amlodipine mannitol adduct in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of amlodipine related compound D or amlodipine mannitol adduct from the *Sample solution*
r_S = peak response of amlodipine from the *Standard solution*
C_S = concentration of USP Amlodipine Besylate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of amlodipine in the *Sample solution* (µg/mL)
F = relative response factor (see *Table 2*)
M_{r1} = molecular weight of amlodipine, 408.88
M_{r2} = molecular weight of amlodipine besylate, 567.05

Calculate the percentage of each individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual unspecified degradation product from the *Sample solution*
r_S = peak response of amlodipine from the *Standard solution*
C_S = concentration of USP Amlodipine Besylate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of amlodipine in the *Sample solution* (µg/mL)
M_{r1} = molecular weight of amlodipine, 408.88
M_{r2} = molecular weight of amlodipine besylate, 567.05

Acceptance criteria: See *Table 2*. Disregard any peak less than 0.1%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Besylate[a]	0.08	—	—
Amlodipine related compound D[b]	0.59	0.39	1.0
Amlodipine mannitol adduct	0.67	1.00	0.50
Amlodipine	0.74	—	—

Telmisartan related compound B[d, e]	0.86	—	—
Telmisartan	1.0	—	—
Any individual unspecified degradation product	—	—	0.2
Total degradation products	—	—	2.0

[a] Peak due to besylate (benzenesulfonic acid).
[b] 3-Ethyl 5-methyl 4-(2-chlorophenyl)-2-{[2-(1,3-dioxoisoindolin-2-yl)ethoxy]methyl}-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate.
[c] 1,7′-Dimethyl-2′-propyl-1*H*,3′*H*-2,5′-bibenzo[*d*]imidazole.
[d] Process impurities controlled in the drug substance.
[e] 4′-[(1,7′-Dimethyl-2′-propyl-1*H*,1′*H*-2,5′-bibenzo[*d*]imidazol-1′-yl)methyl]biphenyl-2-carboxylic acid.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Amlodipine Besylate RS
  USP Telmisartan RS

Telmisartan and Hydrochlorothiazide Tablets

DEFINITION

Telmisartan and Hydrochlorothiazide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) and NLT 90.0% and NMT 107.5% of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U.▲** (CN 1-May-2020) The spectrum of the solution under test corresponds to that of the *Standard solution*, as obtained by the *Assay*.
- **B.** The retention time of the two major peaks of the *Sample solution* corresponds to that of the two major peaks in *Standard solution A*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Diluent: 0.005 M methanolic solution of sodium hydroxide

Buffer: 2.0 g/L of ammonium dihydrogen phosphate. Adjust with phosphoric acid to a pH of 3.0.

Solution A: Methanol and acetonitrile (1:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Buffer (%)	Solution A (%)
0	85	15
3.50	85	15
3.51	45	55
7.70	45	55
7.71	20	80
12.0	20	80
12.1	85	15
15.5	85	15

Standard stock solution 1: 0.025 mg/mL of USP Benzothiadiazine Related Compound A RS in *Diluent*

Standard stock solution 2: 1.6 mg/mL or 3.2 mg/mL (required for analyzing the Tablet strength of 80 mg/12.5 mg) of USP Telmisartan RS, 0.5 mg/mL of USP Hydrochlorothiazide RS, and 2.5 µg/mL of USP Benzothiadiazine Related Compound A RS (from *Standard stock solution 1*) in *Diluent*

Standard solution A: Dilute *Standard stock solution 2* with a 1:1 solution of *Buffer* and *Solution A* to prepare 0.32 mg/mL of telmisartan, 0.1 mg/mL of hydrochlorothiazide, and 0.5 µg/mL of benzothiadiazine related compound A for Tablet

USP Monographs

www.webofpharma.com

strengths of 80 mg/25 mg and 40 mg/12.5 mg. The final concentrations for analyzing the Tablet strength of 80 mg/12.5 mg are 0.32 mg/mL of telmisartan, 0.05 mg/mL of hydrochlorothiazide solution, and 0.25 µg/mL of benzothiadiazine related compound A.

Sample stock solution: Transfer NLT 10 Tablets to a suitable volumetric flask, add 0.1 N sodium hydroxide solution (5% of the total volume of the flask), and shake until the Tablets have completely disintegrated. Add methanol (80% of the total volume of the flask). Sonicate for 10 min and stir vigorously for 30 min. Allow to cool to room temperature, dilute with methanol to volume, and mix. The concentration of the *Sample stock solution* is about 1.6 mg/mL of telmisartan. [NOTE—The hydrochlorothiazide concentration may vary depending on the ratio of telmisartan to hydrochlorothiazide in the Tablet.] Centrifuge a portion of the solution at 4000 rpm. [NOTE—To prevent heat from degrading the sample, do not extend the sonication time and maintain the bath temperature at NMT 22° by adding ice.]

Sample solution: Dilute 1 mL of the *Sample stock solution* to 5 mL in a 1:1 solution of *Buffer* and *Solution A*.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector
UV 270 nm: For hydrochlorothiazide
UV 298 nm: For telmisartan
Column: 4.0-mm × 12.5-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1.2 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution A*
Suitability requirements
Resolution: NLT 2.0 between hydrochlorothiazide and benzothiadiazine related compound A
Relative standard deviation: NMT 2.0% for both the telmisartan and hydrochlorothiazide peaks

Analysis
Samples: *Standard solution A* and *Sample solution*
Calculate the percentages of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of telmisartan or hydrochlorothiazide from the *Sample solution*
r_S = peak response of telmisartan or hydrochlorothiazide from *Standard solution A*
C_S = concentration of USP Telmisartan RS or USP Hydrochlorothiazide RS in *Standard solution A* (mg/mL)
C_U = nominal concentration of telmisartan or hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0% of telmisartan and 90.0%–107.5% of hydrochlorothiazide

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩
Test 1
Telmisartan
Medium: pH 7.5 phosphate buffer prepared as follows. 13.61 g/L of monobasic potassium phosphate in water. Adjust with 2 M sodium hydroxide to a pH of 7.5; 900 mL.
Apparatus 2: 75 rpm
Time: 30 min
Hydrochlorothiazide
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Analysis: Determine the amounts of telmisartan and hydrochlorothiazide dissolved by the following method.
Solution A: 5.0 g/L of ammonium dihydrogen phosphate in water. Adjust with phosphoric acid to a pH of 3.0.
Solution B: Acetonitrile
Standard stock solution: Appropriate amounts of USP Telmisartan RS and USP Hydrochlorothiazide RS in methanol
Sample solution: Pass a portion of the solution through a suitable filter of 0.45-µm pore size, discard the first few mL, and dilute with appropriate *Medium*, if necessary.
Telmisartan standard solution: Dilute the *Standard stock solution* with *Telmisartan Medium* to obtain a solution having a known concentration of telmisartan similar to that expected in the *Sample solution*.
Hydrochlorothiazide standard solution: Dilute the *Standard stock solution* with *Hydrochlorothiazide Medium* to obtain a solution having a known concentration of hydrochlorothiazide similar to that expected in the *Sample solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector
UV 270 nm: For hydrochlorothiazide

System suitability
Samples: *Telmisartan standard solution* and *Hydrochlorothiazide standard solution*
[NOTE—The relative retention times for hydrochlorothiazide and telmisartan are 0.33 and 1.0, respectively.]
Suitability requirements
Tailing factor: NMT 2.5 for both telmisartan and hydrochlorothiazide
Relative standard deviation: NMT 2%

USP Monographs

www.webofpharma.com

Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of telmisartan or hydrochlorothiazide from the *Sample solution*
r_S = peak response of telmisartan from the *Telmisartan standard solution* or hydrochlorothiazide from the *Hydrochlorothiazide standard solution*
C_S = concentration of telmisartan in the *Telmisartan standard solution* or hydrochlorothiazide in the *Hydrochlorothiazide standard solution* (mg/mL)
L = label claim for telmisartan or hydrochlorothiazide (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of telmisartan and hydrochlorothiazide is dissolved.

Test 2

If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Dissolve 6.8 g of monobasic potassium phosphate and 1.56 g of sodium hydroxide in 1 L of water; adjust with 10% sodium hydroxide solution to a pH of 7.5; 900 mL.

Apparatus 2: 75 rpm

Time: 30 min

Buffer: Dissolve 2.72 g of monobasic potassium phosphate in 1 L of water. Add 2 mL of triethylamine per liter of solution and adjust with phosphoric acid to a pH of 2.4.

Mobile phase: Acetonitrile and *Buffer* (35:65)

Telmisartan standard stock solution: 0.45 mg/mL of USP Telmisartan RS prepared as follows. To a suitable amount of USP Telmisartan RS in a suitable volumetric flask, add methanol to about 50% of the total volume. Sonicate to dissolve, cool to room temperature, and dilute with *Medium* to volume.

Hydrochlorothiazide standard stock solution: 0.28 mg/mL of USP Hydrochlorothiazide RS prepared as follows. To a suitable amount of USP Hydrochlorothiazide RS in a suitable volumetric flask, add methanol to about 50% of the total volume. Sonicate to dissolve, cool to room temperature, and dilute with *Medium* to volume.

Standard solution: (L/900) mg/mL each of USP Telmisartan RS and USP Hydrochlorothiazide RS in *Medium*, from *Telmisartan standard stock solution* and *Hydrochlorothiazide standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size and discard the first 3 mL of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

Run time: NLT 1.7 times the retention time of telmisartan

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for both telmisartan and hydrochlorothiazide

Column efficiency: NLT 1500 theoretical plates for both telmisartan and hydrochlorothiazide

Relative standard deviation: NMT 2.0% for both telmisartan and hydrochlorothiazide

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of telmisartan or hydrochlorothiazide from the *Sample solution*
r_S = peak response of telmisartan or hydrochlorothiazide from the *Standard solution*
C_S = concentration of USP Telmisartan RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) each of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

Test 3

If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Telmisartan

Medium: pH 7.5 phosphate buffer (dissolve 13.61 g of monobasic potassium phosphate in 1 L of water. Adjust with 2 N sodium hydroxide to a pH of 7.5); 900 mL

Apparatus 2: 75 rpm

Time: 20 min

Hydrochlorothiazide

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 15 min

Solution A: Transfer 10 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.

Solution B: Acetonitrile

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	70	30
12	30	70
13	70	30
17	70	30

Telmisartan standard stock solution: 0.9 mg/mL of USP Telmisartan RS prepared as follows. To a suitable amount of USP Telmisartan RS in a suitable volumetric flask, add methanol to 60% of the total volume. Sonicate to dissolve. Dilute with methanol to volume.

Hydrochlorothiazide standard stock solution: 0.35 mg/mL of USP Hydrochlorothiazide RS prepared as follows. To a suitable amount of USP Hydrochlorothiazide RS in a suitable volumetric flask, add methanol to about 10% of the total volume. Sonicate to dissolve. Dilute with *Hydrochlorothiazide Medium* to volume.

Telmisartan standard solution: Dilute the *Telmisartan standard stock solution* with *Telmisartan Medium* to obtain a solution having a known concentration of telmisartan similar to that of the *Sample solution*.

www.webofpharma.com

Hydrochlorothiazide standard solution: Dilute the *Hydrochlorothiazide standard stock solution* with *Hydrochlorothiazide Medium* to obtain a solution having a known concentration of hydrochlorothiazide similar to that of the *Sample solution*.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector

UV 270 nm: For hydrochlorothiazide

UV 298 nm: For telmisartan

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: NLT 2 times the retention time of telmisartan

System suitability

Samples: *Telmisartan standard solution* and *Hydrochlorothiazide standard solution*

[NOTE—The relative retention times for hydrochlorothiazide and telmisartan are 0.44 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0 for both telmisartan and hydrochlorothiazide

Relative standard deviation: NMT 2.0% for both telmisartan and hydrochlorothiazide

Analysis

Samples: *Telmisartan standard solution*, *Hydrochlorothiazide standard solution*, and *Sample solution*

Calculate the percentage of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of telmisartan or hydrochlorothiazide from the *Sample solution*

r_S = peak response of telmisartan or hydrochlorothiazide from the *Telmisartan standard solution* or *Hydrochlorothiazide standard solution*

C_S = concentration of USP Telmisartan RS or USP Hydrochlorothiazide RS in the *Telmisartan standard solution* or *Hydrochlorothiazide standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) each of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Diluent, Buffer, Solution A, Mobile phase, Standard stock solution 1, Standard solution A, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard stock solution 3: 1.6 mg/mL of USP Telmisartan RS and 0.5 mg/mL of USP Hydrochlorothiazide RS in *Diluent* for Tablet strengths of 40 mg/12.5 mg and 80 mg/25 mg. For the Tablet strength of 80 mg/12.5 mg, the concentrations are 1.6 mg/mL of USP Telmisartan RS and 0.25 mg/mL of USP Hydrochlorothiazide RS in *Diluent*.

Standard solution B: 1.25 µg/mL of USP Benzothiadiazine Related Compound A RS in *Diluent* from *Standard stock solution 1*. Dilute further with a 1:1 solution of *Buffer* and *Solution A* to prepare a 0.25-µg/mL solution for a Tablet strength of 80 mg/12.5 mg, and a 0.5-µg/mL solution for Tablet strengths of 40 mg/12.5 mg and 80 mg/25 mg.

Sensitivity solution: Dilute 10 mL of *Standard stock solution 3* with *Diluent* to 100 mL. Combine 1.0 mL of this solution with 2.0 mL of *Standard stock solution 1* and dilute with *Diluent* to 100 mL. Dilute 1 mL of this solution to 5 mL with a 1:1 solution of *Buffer* and *Solution A*.

System suitability

Samples: *Standard solution A* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.0 between hydrochlorothiazide and benzothiadiazine related compound A, *Standard solution A*

Relative standard deviation: NMT 2.0% for both the telmisartan and hydrochlorothiazide peaks, *Standard solution A*

Signal-to-noise ratio: NLT 3.0 for the telmisartan, hydrochlorothiazide, and benzothiadiazine related compound A peaks from the *Sensitivity solution*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzothiadiazine related compound A from the *Sample solution*

r_S = peak response of benzothiadiazine related compound A from *Standard solution B*

C_S = concentration of USP Benzothiadiazine Related Compound A RS in *Standard solution B* (mg/mL)

C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified degradation impurity related to hydrochlorothiazide in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified degradation impurity at 270 nm from the *Sample solution*

r_S = peak response of hydrochlorothiazide from *Standard solution A*

C_S = concentration of USP Hydrochlorothiazide RS in *Standard solution A* (mg/mL)

C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

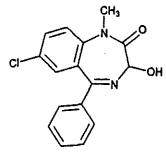
Calculate the percentage of each unspecified degradation impurity related to telmisartan in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified degradation impurity at 298 nm from the *Sample solution*

r_S = peak response of telmisartan from *Standard solution A*

C_S = concentration of USP Telmisartan RS in *Standard solution A* (mg/mL)



C_U = nominal concentration of telmisartan in the *Sample solution* (mg/mL)

www.webofpharma.com

Acceptance criteria
Individual impurities: NMT 1.0% of benzothiadiazine related compound A and NMT 0.2% of each individual unspecified degradation impurity related to telmisartan or hydrochlorothiazide
Total impurities: NMT 0.2% of the sum of all degradation products related to telmisartan and NMT 1.5% of the sum of all hydrochlorothiazide degradation products

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Benzothiadiazine Related Compound A RS
  4-Amino-6-chloro-1,3-benzenedisulfonamide.

Temazepam Capsules

DEFINITION
Temazepam Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of temazepam ($C_{16}H_{13}O_2N_2Cl$).
[**CAUTION**—Temazepam is a potent sedative: its powder should not be inhaled.]

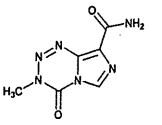
IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.
• **B. THIN-LAYER CHROMATOGRAPHY**
Standard solution: 5 mg/mL of USP Temazepam RS in methanol
Sample solution: Transfer a portion of Capsule contents equivalent to about 50 mg of temazepam to a 25-mL volumetric flask, add 10 mL of methanol, shake by mechanical means, and allow to settle. Use the supernatant layer.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 20 µL
Developing solvent system: Toluene, dioxane, methanol, and ammonium hydroxide (65:30:5:1)
Analysis: Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the

www.webofpharma.com

solvent front, air-dry, and examine the plate under short-wavelength UV light.
Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY
• **PROCEDURE**
Buffer: 2.7 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer* (47:53)
Internal standard solution: 0.2 mg/mL of benzophenone in a mixture of methanol and water (9:1)
Standard solution: 0.2 mg/mL of USP Temazepam RS in *Internal standard solution*
Sample solution: Nominally 0.2 mg/mL of temazepam in *Internal standard solution*, from the weighed and mixed contents of NLT 20 Capsules. Shake mechanically for 30 min. Allow the contents of the flask to settle, and then filter, discarding the first 5 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4-mm × 25-cm; packing L16
Flow rate: 2 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for temazepam and benzophenone are about 1.0 and 2.0, respectively.]
Suitability requirements
Resolution: NLT 1 between the temazepam peak and any other peak
Column efficiency: NLT 800 theoretical plates
Tailing factor: NMT 2
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of temazepam ($C_{16}H_{13}O_2N_2Cl$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$



R_U = peak response ratio of temazepam to the internal standard from the *Sample solution*
R_S = peak response ratio of temazepam to the internal standard from the *Standard solution*
C_S = concentration of USP Temazepam RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of temazepam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Buffer: Dissolve 2 g of sodium hydroxide in 450 mL of water in a 1-L volumetric flask. Adjust with acetic acid to a pH of 4.0, and dilute with water to volume. Deaerate.
Medium: *Buffer* with 0.05% polysorbate 80; 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Detector: UV 310 nm
Standard solution: USP Temazepam RS in *Medium*
Sample solution: Filter a portion of the solution under test. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.
Tolerances: NLT 80% (*Q*) of the labeled amount of temazepam ($C_{16}H_{13}O_2N_2Cl$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Temazepam RS

Temozolomide

$C_6H_6N_6O_2$ 194.15
Imidazo[5,1-*d*]-1,2,3,5-tetrazine-8-carboxamide, 3,4-dihydro-3-methyl-4-oxo-;
3,4-Dihydro-3-methyl-4-oxoimidazo[5,1-*d*]-*as*-tetrazine-8-carboxamide [85622-93-1].

DEFINITION
Temozolomide contains NLT 98.0% and NMT 102.0% of temozolomide ($C_6H_6N_6O_2$), calculated on the anhydrous basis.
[**CAUTION**—Temozolomide is cytotoxic. Great care should be taken to prevent inhaling particles of Temozolomide and exposure to the skin.]

Mobile phase, Diluent, and **Sample solution:** Proceed as directed in the *Assay*.
Standard solution: 1.0 µg/mL of USP Temozolomide RS in *Diluent*
System suitability solution: Mix 5 mL of 0.1 N hydrochloric acid and 5 mL of 1.0 mg/mL of USP Temozolomide RS in *Diluent*. Heat the container for 1 h on a steam or boiling water bath. [NOTE—The preparation forms 2-azahypoxanthine, temozolomide acid, and aminoimidazolecarboxamide.]
Chromatographic system: Proceed as directed in the *Assay*, using a run time of NLT 3.2 times the retention time of the temozolomide peak.
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.5 between temozolomide acid and temozolomide peaks
Analysis
Samples: *Sample solution*, *Standard solution*, and *System suitability solution*
Inject the *System suitability solution*, and identify the organic impurities according to the relative retention times given in *Table 1*.
Calculate the percentage of each individual impurity in the portion of Temozolomide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each impurity from the *Sample solution*
r_S = peak area of temozolomide from the *Standard solution*
C_S = concentration of USP Temozolomide RS in the *Standard solution* (mg/mL)
C_U = concentration of Temozolomide in the *Sample solution* (mg/mL)
F = relative response factor for each individual impurity (see *Table 1*)

Acceptance criteria: See *Table 1*. [NOTE—Disregard any unspecified impurity peaks less than 0.05%.]

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
2-Azahypoxanthine[a]	0.42	1.6	0.2
Temozolomide related compound A[b]	0.53	1.0	0.5
Temozolomide acid[c]	0.84	1.0	0.1
Temozolomide	1.0	—	—
Aminoimidazolecarboxamide[d]	1.37[e]	2.5	0.1
Cyanotemozolomide[f,g] (if present)	2.3	1.0	0.15
Any unspecified impurity	—	1.0	0.10
Total impurities	—	—	0.8

[a] 4a,5-Dihydro-4*H*-imidazo[4,5-*d*][1,2,3]triazin-4-one.
[b] 4-Diazo-4*H*-imidazole-5-carboxamide.
[c] 3-Methyl-4-oxo-3,4-dihydroimidazo[5,1-*d*][1,2,3,5]tetrazine-8-carboxylic acid.
[d] 5-Aminoimidazole-4-carboxamide. Two peaks may be observed, use the sum of the peak areas for calculation.
[e] It may vary and depend on the column.
[f] 3-Methyl-4-oxo-3,4-dihydroimidazo[5,1-*d*][1,2,3,5]tetrazine-8-carbonitrile.
[g] If possible from the manufacturing process.

SPECIFIC TESTS
• **WATER DETERMINATION** ⟨921⟩, *Method Ic*: NMT 0.4%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Temozolomide RS

Temozolomide Capsules

DEFINITION
Temozolomide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of temozolomide ($C_6H_6N_6O_2$).

IDENTIFICATION
• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩
Standard solution: 1 mg/mL of USP Temozolomide RS in acetonitrile
Sample solution: Transfer the contents of Capsules indicated in *Table 1* to a glass beaker containing a stir bar. Add acetonitrile according to *Table 1*. Stir for NLT 20 min. Sonicate for 10 min followed by a 30-s stirring to disperse any remaining solids. Allow the contents of the flask to settle.

Table 1

Capsule Strength (mg/Capsule)	Acetonitrile (mL)	Number of Capsules
5	50	4
20	50	1
100	100	1
140	140	1

250	10

Developing solvent system: Acetone and toluene (90:15)
Analysis: Spot the *Standard solution* and *Sample solution* approximately 2.5 cm from the bottom of the plate. Evaporate the solvent using a current of air. Place the plate in the developing chamber and allow the *Developing solvent system* to rise to approximately 75% of the plate height. Remove the plate from the developing chamber, mark the position of the solvent front, and allow the plate to dry in the fume hood. Observe the plate under 254 nm of UV light.
Acceptance criteria: The R_F value from the *Sample solution* corresponds to that from the *Standard solution.*

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

• **PROCEDURE**
Store the solutions containing temozolomide at 4°.
Solution A: 0.5% (v/v) of glacial acetic acid in water
Mobile phase: *Solution A* and methanol (96:4), containing 0.94 g/L of sodium 1-hexanesulfonate (0.005 M)
System suitability stock solution: 0.4 mg/mL of USP Temozolomide RS in *Mobile phase*
System suitability solution: Transfer 25 mL of 0.1 N hydrochloric acid and 25 mL of *System suitability stock solution* into a container. Heat the container at 80° for 4 h. [NOTE—The preparation forms 2-azahypoxanthine, temozolomide acid, and aminoimidazolecarboxamide.]
Standard solution: 0.1 mg/mL of USP Temozolomide RS in *Mobile phase* from *System suitability stock solution*
Sample stock solution: Place 10 Capsules in a suitable volumetric flask according to *Table 3.* Add 80% of the final volume of *Mobile phase* with agitation or stirring for NLT 1 h. Ensure that the Capsules are broken apart into small pieces and that contents are adequately dissolved. Dilute with *Mobile phase* to volume and mix well. Allow to sit for 30 min and mix again. Centrifuge 25 mL of this solution for 10 min or until the solution is clear. Pass the supernatant through a suitable filter of 0.45-µm pore size and discard the first few milliliters.

Table 3

Capsule Strength (mg/Capsule)	Volumetric Flask Size (mL)	Nominal Concentration (mg/mL)
5	500	0.1

140	2000	0.7
180	2000	0.9
250	2000	1.25

Sample solution: Nominally equivalent to 0.1 mg/mL of temozolomide in *Mobile phase* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 270 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Autosampler temperature: 4°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Tailing factor: NMT 1.9 for the temozolomide peak, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of temozolomide ($C_6H_6N_6O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of temozolomide from the *Sample solution*
r_S = peak response of temozolomide from the *Standard solution*
C_S = concentration of USP Temozolomide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of temozolomide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: Water; 500 mL (for 5 mg/Capsule), 900 mL (for all other strengths)
Apparatus 1: 100 rpm
Time: 30 min
Standard solution: Prepare a solution of USP Temozolomide RS in *Medium* according to *Table 4.*

Table 4

Capsule Strength (mg/Capsule)	Nominal Concentration (mg/mL)
5	0.01
20	0.022
100	0.11

5	1
20	1
100	0.1
140	0.05
180	0.05
250	0.05

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of temozolomide ($C_6H_6N_6O_2$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium*; 500 mL (for 5 mg/Capsule), 900 mL (for all other strengths)

L = label claim (mg/Capsule)

Tolerances: NLT 80% (Q) of the labeled amount of temozolomide ($C_6H_6N_6O_2$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **Organic Impurities**

Store the solutions containing temozolomide at 4°.

Mobile phase, System suitability stock solution, System suitability solution, and **Sample solution:** Prepare as directed in the *Assay*.

Sensitivity solution: 0.1 µg/mL of USP Temozolomide RS in *Mobile phase* from *System suitability stock solution*

Chromatographic system: Proceed as directed in the *Assay*, except for the *Run time*.

Run time: NLT twice the retention time of the temozolomide peak

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.5 between the temozolomide and aminoimidazolecarboxamide peaks, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each impurity from the *Sample solution*

r_T = sum of the relevant peak areas from the *Sample solution*

Acceptance criteria: See *Table 6*. The reporting threshold is 0.1%. Disregard any peak due to an excipient.

Table 6

Name	Relative Retention Time	Acceptance Criteria, NMT (%)	
		5 mg/Capsule or 20 mg/Capsule	All Other Strengths
2-Azahypoxanthine[a]	0.4	0.8	0.8
Temozolomide related compound A[b, c]	0.5	—	—
Temozolomide acid[d]	0.9	0.2	0.2
Temozolomide	1.0	—	—
Aminoimidazolecarboxamide[e]	1.4	1.2	1.0
Cyanotemozolomide[c, f]	2.3	—	—
Any unspecified impurity	—	0.2	0.2
Total impurities	—	1.7	1.2

[a] 4a,5-Dihydro-4*H*-imidazo[4,5-*d*][1,2,3]triazin-4-one.

[b] 4-Diazo-4*H*-imidazole-5-carboxamide.

[c] It is a process impurity and is listed for identification only. It is controlled in the drug substance. It is not reported for the drug product and should not be included in the total impurities.

[d] 3-Methyl-4-oxo-3,4-dihydroimidazo[5,1-*d*][1,2,3,5]tetrazine-8-carboxylic acid.

[e] 5-Aminoimidazole-4-carboxamide.

[f] 3-Methyl-4-oxo-3,4-dihydroimidazo[5,1-*d*][1,2,3,5]tetrazine-8-carbonitrile.

SPECIFIC TESTS

• **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩**:** The total aerobic microbial count is NMT 10^3 cfu/g, and the total combined molds and yeast count is NMT 5×10^2 cfu/g. It meets the requirements of the tests for the absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in tight containers, and store at controlled room temperature.

• **USP Reference Standards** ⟨11⟩

USP Temozolomide RS

USP Monographs

www.webofpharma.com

Temozolomide for Injection

DEFINITION

Temozolomide for Injection is a sterile, lyophilized mixture of Temozolomide and suitable added substances. It contains NLT 95.0% and NMT 105.0% of the labeled amount of temozolomide ($C_6H_6N_6O_2$).

[**CAUTION**—Temozolomide is cytotoxic. Great care should be taken to prevent inhaling particles of temozolomide and exposure to the skin.]

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A or 197K▲ (CN 1-May-2020)

Standard: Dissolve a suitable amount of USP Temozolomide RS in methylene chloride, using 2 mL of methylene chloride for each 5 mg of USP Temozolomide RS. Evaporate the methylene chloride under a stream of nitrogen to dryness, and use the residue.

Sample: Inject 40 mL of methylene chloride into the vial of Temozolomide for Injection and shake the vial for 30 min using a mechanical shaker. Allow the vial to sit for 15 min or until undissolved solids settle to the bottom. Pass 15 mL of the supernatant through a filter of 0.45-µm pore size. Discard the first 5 mL and collect the remaining filtrate into a 20-mL scintillation vial. Evaporate the methylene chloride under a stream of nitrogen to dryness, and use the residue.

Analysis

Samples: *Standard* and *Sample*

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE:** Store the solutions containing temozolomide at 2°–8°.

Solution A: 0.5% (v/v) glacial acetic acid in water

Mobile phase: *Solution A* and methanol (96:4), containing 0.94 g/L of sodium 1-hexanesulfonate (0.005 M)

System suitability stock solution: 0.2 mg/mL of USP Temozolomide RS in *Mobile phase*

System suitability solution: Transfer 50 mL of 0.1 N hydrochloric acid and 50 mL of the *System suitability stock solution* to a container. Heat the container at 80° for 4 h. Transfer 10 mL of this solution into a 25-mL volumetric flask and dilute with *Mobile phase* to volume. [NOTE—The preparation forms 2-azahypoxanthine, temozolomide acid, and aminoimidazolecarboxamide.]

Standard solution: 0.1 mg/mL of USP Temozolomide RS in *Mobile phase* from the *System suitability stock solution*

Sample stock solution: Nominally equivalent to 2.0 mg/mL of temozolomide in water, prepared as follows. Add 40 mL of water into each of five vials of Temozolomide for Injection and shake manually to dissolve. Combine the solutions from the 5 vials into a 250-mL volumetric flask and dilute with water to volume.

Sample solution: Nominally equivalent to 0.1 mg/mL of temozolomide in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Autosampler temperature: 2°–8°

Flow rate: 1 mL/min

Injection volume: 75 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Tailing factor: NMT 1.9 for the temozolomide peak, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of temozolomide ($C_6H_6N_6O_2$) in the portion of Temozolomide for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of temozolomide from the *Sample solution*

r_S = peak response of temozolomide from the *Standard solution*

C_S = concentration of USP Temozolomide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of temozolomide in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩, *Weight Variation*: Meets the requirements

IMPURITIES

- **ORGANIC IMPURITIES:** Store the solutions containing temozolomide at 2°–8°.

Mobile phase, System suitability stock solution, System suitability solution, and Sample solution: Prepare as directed in the *Assay*.

Sensitivity solution: 0.1 µg/mL of USP Temozolomide RS in *Mobile phase* from the *System suitability stock solution*

Chromatographic system: Proceed as directed in the *Assay*, except for the *Run time*.

Run time: NLT 2.5 times the retention time of the temozolomide peak

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.5 between the temozolomide and aminoimidazolecarboxamide peaks, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Temozolomide for Injection taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak area of each impurity from the *Sample solution*

r_T = sum of relevant peak areas from the *Sample solution*

F = relative response factor for each individual impurity (see *Table 1*)

Acceptance criteria: See *Table 1*. The reporting threshold is 0.1%. Disregard any peak due to an excipient.

SPECIFIC TESTS

- **pH** ⟨791⟩
  Sample solution: Add 40 mL of water into a vial of Temozolomide for Injection and manually shake to dissolve the solids.
  Acceptance criteria: 3.0–4.5
- **Bacterial Endotoxins Test** ⟨85⟩: Meets the requirements
- **Sterility Tests** ⟨71⟩: Meets the requirements
- **Particulate Matter in Injections** ⟨788⟩: Meets the requirements for small-volume injections
- **Other Requirements:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging*. Refrigerate at 2°–8°. After reconstitution, store the reconstituted product at room temperature. The reconstituted product must be used within 14 h, including infusion time.
- **USP Reference Standards** ⟨11⟩
  USP Temozolomide RS

Temozolomide Compounded Oral Suspension

DEFINITION

Temozolomide Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of temozolomide ($C_6H_6N_6O_2$).

Prepare Temozolomide Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Temozolomide capsules,[a] equivalent to	1 g of temozolomide
Povidone K-30, *USP*	500 mg
Anhydrous Citric Acid, *USP*	25 mg
Purified Water, *USP*	1.5 mL
Vehicle: a 1:1 mixture of Ora-Plus[b] and Ora-Sweet[b] (regular or sugar-free), a sufficient quantity to make	100 mL

[a] Temodar 100-mg capsules, Schering Corporation, Whitehouse, NJ.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Empty the required number of *Temozolomide capsules* in a suitable mortar. Add the *Povidone K-30* powder to the mortar, and triturate to a fine powder. [Note—Povidone is critical for physical stability.] Dissolve the *Anhydrous Citric Acid* in *Purified Water*. Add the mixture of *Anhydrous Citric Acid* and *Purified Water* to the mortar to wet the powder. Mix thoroughly to form a uniform paste. Add the *Vehicle* in small portions, and triturate to make a smooth mixture. Add increasing volumes of the *Vehicle* to make a temozolomide liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well. It is necessary to wear appropriate personal protective equipment and to perform this procedure in a biologic safety cabinet.

[**Caution**—Temozolomide is cytotoxic. Great care should be taken to prevent inhaling particles of temozolomide and exposure to the skin.]

ASSAY

- **Procedure**
  Solution A: 10 mM ammonium phosphate adjusted to a pH of 3.25
  Mobile phase: Methanol and *Solution A* (12:88). Filter and degas.
  Standard stock solution: 0.5 mg/mL of USP Temozolomide RS in *Mobile phase*. Transfer the mixture to a centrifuge tube, and centrifuge at 1,500 × g for 10 min. Pass the supernatant through a filter of 0.45-µm pore size, into a glass vial.
  Standard solution: 0.1 mg/mL of temozolomide prepared from *Standard stock solution* and *Mobile phase*
  Sample solution: Shake thoroughly each bottle of Oral Suspension. Immediately transfer 2.5 mL of Oral Suspension to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Vortex the sample for 30 s, centrifuge for 10 min at 1,500 × g, and pass through a membrane filter of 0.22-µm pore size. Pass at least 0.5 mL of sample through the filter before collecting the sample in a vial. Transfer 1.0 mL of the resultant solution to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.1 mg/mL of temozolomide.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 245 nm
  Column: 4.6-mm × 25-cm; 5-µm packing L1
  Flow rate: 1.0 mL/min
  Injection volume: 15 µL
  System suitability
  Sample: *Standard solution*
  [Note—The retention time for temozolomide is about 7.9 min.]
  Suitability requirements
  Tailing factor: NMT 2.0
  Relative standard deviation: NMT 2.0% for replicate injections
  Analysis
  Samples: *Standard solution* and *Sample solution*

USP Monographs

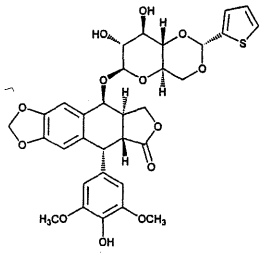
www.webofpharma.com

Calculate the percentage of the labeled amount of temozolomide ($C_6H_6N_6O_2$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Temozolomide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of temozolomide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%



SPECIFIC TESTS

- **pH** ⟨791⟩: 3.5–4.5

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant containers. Store in a refrigerator.
- **Beyond-Use Date:** NMT 60 days after the date on which it was compounded, when stored in a refrigerator
- **Labeling:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date.*
- **USP Reference Standards** ⟨11⟩
  USP Temozolomide RS

Teniposide

$C_{32}H_{32}O_{13}S$ 656.65

Furo[3′,4′:6,7]naphtho[2,3-*d*]-1,3-dioxol-6(5a*H*)-one, 5,8,8a,9-tetrahydro-5-(4-hydroxy-3,5-dimethoxyphenyl)-9-[4,6-*O*-(2-thienylmethylene)-β-D-glucopyranosyloxy]-, [5*R*-[5α,5aβ,8aα,9β(*R**)]]-;
4′-Demethylepipodophyllotoxin 9-[4,6-*O*-(*R*)-2-thenylidene-β-D-glucopyranoside];
(5*S*,5a*R*,8a*R*,9*R*)-9-(4-Hydroxy-3,5-dimethoxyphenyl)-8-oxo-5,5a,6,8,8a,9-hexahydrofuro[3′,4′:6,7]naphtho[2,3-*d*][1,3]dioxol-5-yl 4,6-*O*-(thiophen-2-ylmethylidene)-β-D-glucopyranoside [29767-20-2].

DEFINITION

Teniposide contains NLT 97.0% and NMT 103.0% of teniposide ($C_{32}H_{32}O_{13}S$), calculated on the anhydrous and solvent-free basis.

[**Caution**—Great care should be taken in handling teniposide, because it is a cytotoxic agent.]

IDENTIFICATION

Change to read:

- **A.** ▲**Spectroscopic Identification Tests** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

- **Procedure**

Buffer: 5 mM monobasic potassium phosphate in water
Solution A: Acetonitrile and *Buffer* (36:64). Adjust with dibasic potassium phosphate to an apparent pH of 7.0.
Solution B: Acetonitrile and water (90:10)
Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system for 15 min.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
25	100	0
60	0	100
66[a]	0	100

[a] This time may be adjusted if needed to be at least 2.2 times the retention time of the teniposide peak.

Diluent: Acetonitrile and *Buffer* (1:1)
Standard solution: 0.4 mg/mL of USP Teniposide RS, prepared as follows. Transfer USP Teniposide RS to a suitable volumetric flask, add acetonitrile equivalent to 10% of the final volume, and sonicate to dissolve. Dilute with *Diluent* to volume.
Sample solution: 0.4 mg/mL of Teniposide, prepared as follows. Transfer Teniposide to a suitable volumetric flask, add acetonitrile equivalent to 10% of the final volume, and sonicate to dissolve. Dilute with *Diluent* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 4-µm packing L11
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 0.85%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of teniposide ($C_{32}H_{32}O_{13}S$) in the portion of Teniposide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Teniposide RS in the *Standard solution* (mg/mL)
C_U = concentration of Teniposide in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the anhydrous and solvent-free basis

IMPURITIES

- **Residue on Ignition** ⟨281⟩

Analysis: Ignite the sample at 700°–800°.
Acceptance criteria: NMT 0.2%

Sample solution: 5 mg/mL in chloroform and methanol (9:1)

Acceptance criteria: −101.0° to −113.0°, at 20° on the anhydrous and solvent-free basis

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Teniposide RS

Teniposide Injection

DEFINITION

Teniposide Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of teniposide ($C_{32}H_{32}O_{13}S$). It is a sterile solution in a nonaqueous medium and may contain benzyl alcohol or other suitable preservatives.

[**CAUTION**—Great care should be taken in handling teniposide, because it is a cytotoxic agent.]

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: Acetonitrile and water (25:75)

Solution B: Acetonitrile and water (56:44)

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system for 10 min.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
4	100	0
16	64.5	35.5
36	64.5	35.5
60	0	100

www.webofpharma.com

Table 1 *(continued)*

Time (min)	Solution A (%)	Solution B (%)
90	0	100

Diluent: Acetonitrile and 5 µM monobasic potassium phosphate (1:1)

Standard solution: 0.4 mg/mL of USP Teniposide RS in *Diluent*, prepared as follows. Transfer a known amount of USP Teniposide RS into a suitable volumetric flask and add acetonitrile equivalent to 10% of the final volume. Dissolve with the aid of sonication and dilute with *Diluent* to volume.

Sample solution: Nominally equivalent to 0.4 mg/mL of teniposide in *Diluent*, prepared as follows. Dilute a portion of the Injection with *Diluent* to obtain a solution containing 0.4 mg/mL of teniposide.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing L11
Flow rate: 1.3 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of teniposide ($C_{32}H_{32}O_{13}S$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Teniposide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of teniposide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Solution B, Diluent, and **Sample solution:** Proceed as directed in the *Assay*.

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system for 10 min. [NOTE—The duration of initial isocratic hold may be adjusted from 4 min to up to 10 min to meet the resolution requirements and to achieve the retention time of the teniposide peak to about 35 min.]

Benzaldehyde stock solution: 0.15 mg/mL of USP Benzaldehyde RS in *Diluent*

Teniposide related compound A stock solution: 0.15 mg/mL of USP Teniposide Related Compound A RS, prepared as follows. Transfer USP Teniposide Related Compound A RS to a suitable volumetric flask, add acetonitrile equivalent to 20% of the final volume, and sonicate to dissolve. Dilute with *Diluent* to volume.

System suitability solution 1: 15 µg/mL each of USP Teniposide Related Compound A RS and USP Benzaldehyde RS in *Diluent* from *Teniposide related compound A stock solution* and *Benzaldehyde stock solution*

System suitability solution 2: Use the *Standard solution* in the *Assay*. [NOTE—USP Teniposide RS contains a small amount of *R*-3-thienylidene regioisomer.]

Chromatographic system: Proceed as directed in the *Assay*, except for the *Detectors*.
Detectors
UV 242 nm: For thiophenealdehyde
UV 220 nm: For all other impurities

System suitability
Samples: *System suitability solution 1* and *System suitability solution 2*
[NOTE—The relative retention times for benzaldehyde, teniposide related compound A, *R*-3-thienylidene regioisomer, and teniposide are about 0.42, 0.43, 0.97, and 1.0, respectively.]
Suitability requirements
Resolution 1: NLT 0.9 between benzaldehyde and teniposide related compound A, *System suitability solution 1*
Resolution 2: NLT 1.2 between *R*-3-thienylidene regioisomer and teniposide peaks, *System suitability solution 2*

Analysis
Sample: *Sample solution*
Calculate the percentage of each specified degradation product in the portion of Injection taken:

$$\text{Result} = r_U/\{\Sigma[r_U \times (1/F)] + r_T\} \times (1/F) \times 100$$

r_U = peak area of each specified degradation product from the *Sample solution* at 242 nm for thiophenealdehyde and 220 nm for all other impurities
F = relative response factor for each individual impurity (see *Table 2*)
r_T = peak area of teniposide from the *Sample solution* at 220 nm

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lignan P[a]	0.16	1.0	2.5
Thiophenealdehyde[b]	0.28	1.2	0.5
Teniposide	1.0	—	—
Picroteniposide[c]	1.11	1.0	0.25
Total specified degradation products	—	—	3.0

[a] 4′-Demethylepipodophyllotoxin 9-β-D-glucopyranoside.
[b] Thiophene-2-carbaldehyde. It is quantitated at 242 nm.
[c] (5*R*,5a*S*,8a*R*,9*S*)-9-[4,6-*O*-(*R*)-2-Thenylidene-β-D-glucopyranosyloxy]-5,8,8a,9-tetrahydro-5-(4-hydroxy-3,5-dimethoxyphenyl)furo[3′,4′:6,7]naphtho[2,3-*d*]-1,3-dioxol-6(5a*H*)-one.

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** It contains NMT 1.5 USP Endotoxin Units/mg of teniposide.
• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
• **pH** ⟨791⟩
Sample solution: Dilute 5 mL of Injection with 45 mL of water.
Acceptance criteria: 4.0–6.5
• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** It meets the requirements for small-volume injections.
• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

USP Monographs

www.webofpharma.com

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store under refrigeration and protect from light.
- **LABELING:** Label it to indicate that the Injection is to be diluted with a suitable parenteral vehicle prior to intravenous infusion.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Benzaldehyde RS
  USP Teniposide RS
  USP Teniposide Related Compound A RS
  4′-Demethylepipodophyllotoxin.
  $C_{21}H_{20}O_8$ 400.38

Terazosin Capsules

DEFINITION

Terazosin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{19}H_{25}N_5O_4 \cdot HCl$, calculated as the free base.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
  Diluent: 0.1 N hydrochloric acid
  Standard solution: 0.005 mg/mL of terazosin hydrochloride from USP Terazosin Hydrochloride RS in *Diluent*. Sonicate for 10 min to completely dissolve. Pass the solution through a nylon filter of 0.45-µm pore size.
  Sample solution: Combine the contents from 20 Capsules and transfer 10 mg into a 100-mL flask. Fill with *Diluent* to 50% of the volume of the flask. Sonicate the flask for 10 min. Allow it to cool to room temperature. Dilute with *Diluent* to volume. Further dilute 5 mL of this solution with *Diluent* to 100 mL, and mix well. Pass 10 mL of this preparation through a PTFE filter with a 0.45-µm pore size.
  Blank: Pass the *Diluent* through a PTFE filter of 0.45-µm pore size.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  [NOTE—Use an all-glass syringe.]
  Hydrochloric acid solution: Prepare 0.1 N methanolic hydrochloric acid by adding 0.85 mL of hydrochloric acid to 1 L of methanol.
  Diluent: *Hydrochloric acid solution* and water (2:3)
  Mobile phase: Acetonitrile and water (7:3). Pass through a nylon filter of 0.45-µm pore size. Add 10 mL/L of glacial acetic acid, and degas. After degassing, pipet 0.20 mL/L of diethylamine into the solution, and mix.
  Standard stock solution: 0.55 mg/mL of terazosin hydrochloride from USP Terazosin Hydrochloride RS in *Diluent*. Sonicate for 5 min to completely dissolve.
  Standard solution: 0.055 mg/mL of terazosin hydrochloride in *Diluent* from *Standard stock solution*. Pass through a PTFE filter of 0.45-µm pore size, discarding NLT the first 8 mL of filtrate.
  Sample solution: Combine the contents of NLT 20 Capsules and weigh a quantity equivalent to 10 mg of terazosin into a 200-mL flask. Add 100 mL of *Diluent*, and sonicate for NLT 10 min. Shake the flask mechanically for NLT 10 min. Repeat until the sample is well dispersed. Allow the solution to cool, and dilute with *Diluent* to volume. Pass through a PTFE filter of 0.45-µm pore size, discarding the first 8 mL of filtrate.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 4.6-mm × 15-cm; 5-µm packing L1
  Flow rate: 2.5 mL/min
  Injection size: 25 µL
  Run time: NLT twice the retention time of the terazosin peak
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 1.8 for the terazosin peak
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of terazosin ($C_{19}H_{25}N_5O_4$), based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U	= peak response of terazosin from the *Sample solution*
r_S	= peak response of terazosin from the *Standard solution*
C_S	= concentration of terazosin hydrochloride in the *Standard solution* (mg/mL)
C_U	= nominal concentration of terazosin in the *Sample solution* (mg/mL)
M_{r1}	= molecular weight of terazosin, 387.43
M_{r2}	= molecular weight of terazosin hydrochloride, 423.89

  Acceptance criteria: 90.0%–110.0%, calculated as the free base

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩
  Test 1
  Medium: Water; 900 mL
  Apparatus 2: 50 rpm, with sinkers
  Time: 60 min
  Standard solution: (387.44/423.89)(L/900) mg/mL of USP Terazosin Hydrochloride RS in *Medium*, where L is the Capsule label claim (terazosin), in mg
  Sample solution: At the designated time, withdraw 20 mL of the solution under test, and centrifuge at NMT 3000 rpm for 20 min.
  Capsule blank solution: Dissolve 10 empty Capsule shells in 900 mL of *Medium* heated to 37°. Centrifuge a portion of this solution for 20 min.
  Spectrometric conditions
  (See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.
  Mode: UV
  Analytical wavelength: UV 246 nm
  Cell length: 5 cm for Capsules labeled to contain 1 mg; 1 cm for Capsules labeled to contain 2 or 5 mg; 0.5 cm for Capsules labeled to contain 10 mg
  Blank: *Medium*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of terazosin dissolved:

$$\text{Result} = \{[A_U - (A_B/10)]/A_S\} \times C_S/L \times V \times 100$$

A_U	= absorbance of the *Sample solution*
A_B	= absorbance of the *Capsule blank solution*

USP Monographs

www.webofpharma.com

A_S = absorbance of the *Standard solution*
C_S = concentration of terazosin in the *Standard solution* (mg/mL)
L = terazosin label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of terazosin is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: Water; 900 mL
Apparatus 2: 50 rpm, with wire helix sinker.
Time: 30 min
0.1 M phosphate buffer: 13.6 g/mL of monobasic potassium phosphate and 4 mL/L of triethylamine in water. Adjust with phosphoric acid to a pH of 2.5 ± 0.05.
Mobile phase: Acetonitrile and *0.1 M phosphate buffer* (1:3)
Standard solution: (387.44/423.89)(L/900) mg/mL of USP Terazosin Hydrochloride RS in *Medium*, where L is the Capsule label claim (terazosin), in mg
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 246 nm
Column: 3.9-mm × 30-cm; 10-µm packing L11
Flow rate: 1.0 mL/min
Injection size: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of terazosin dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of terazosin in the *Standard solution* (mg/mL)
L = terazosin label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of terazosin is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES

Organic Impurities

• **Procedure**

Buffer: Dissolve 4.1 g of monobasic potassium phosphate and 1.1 g of sodium 1-heptanesulfonate monohydrate in 950 mL of water. Adjust with phosphoric acid to a pH of 3.0 ± 0.10. Dilute with water to 1 L. Pass through a nylon filter of 0.45-µm pore size.
Mobile phase: Acetonitrile and *Buffer* (6:19)
Standard solution: 0.003 mg/mL of terazosin hydrochloride from USP Terazosin Hydrochloride RS in *Mobile phase*
Sample solution: Transfer 15 mg of terazosin from the contents of 20 Capsules into a 50-mL volumetric flask. Dilute with *Mobile phase* to approximately half the volume of the flask. Sonicate for NLT 10 min, and shake the flask for NLT 20 min. Dilute with *Mobile phase* to volume, and pass through a nylon or Teflon filter of 0.45-µm pore size, discarding the first 5 mL of filtrate. The final concentration of the *Sample solution* is 0.3 mg/mL.
Sensitivity solution: 0.15 µg/mL of USP Terazosin Hydrochloride RS in *Mobile phase* from the *Standard solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 246 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 10 µL
Run time: NLT 1.2 times the retention time of terazosin for the *Standard solution* and *Sensitivity solution*; NLT 4.5 times the retention time of terazosin in the *Sample solution*
System suitability
Samples: *Standard solution* and *Sensitivity solution*
Capacity factor, k′: NLT 1.0 for the terazosin peak, *Standard solution*
Tailing factor: NMT 2.0 for the terazosin peak, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Signal-to-noise ratio: NLT 10 for the terazosin peak, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*
r_S = peak response of terazosin from the *Standard solution*
C_S = concentration of terazosin hydrochloride in the *Standard solution* (mg/mL)
C_U = nominal concentration of terazosin in the *Sample solution* (mg/mL)
F = relative response factor (see *Impurity Table 1*)
M_{r1} = molecular weight of terazosin, 387.43
M_{r2} = molecular weight of terazosin hydrochloride, 423.89

Acceptance criteria: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Piperazinyl-ADMQ[a]	0.52	1.1	0.4
Chloro ADMQ[b]	1.37	1.2	0.4
Bis-ADMQ-piperazine[c]	3.85	1.0	0.4
Any other individual, unspecified impurity	—	—	0.2
Total impurities	—	—	1.2

[a] *N*-(4-Amino-6,7 dimethoxy-2-quinazolinyl)piperazine.
[b] 2-Chloro-4-amino-6,7 dimethoxy-2-quinazoline.
[c] *N,N*-Bis-(4-amino-6,7 dimethoxy-2-quinazolinyl)piperazine.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in well-closed containers protected from moisture and light. Store at controlled room temperature.
• **Labeling:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

Terazosin Hydrochloride

$C_{19}H_{25}N_5O_4 \cdot HCl \cdot 2H_2O$ 459.92

Piperazine, 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-[(tetrahydro-2-furanyl)carbonyl]-, monohydrochloride, dihydrate.

1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(tetrahydro-2-furoyl)piperazine monohydrochloride dihydrate [70024-40-7].

Anhydrous 423.89

[63074-08-8].

www.webofpharma.com

» Terazosin Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{19}H_{25}N_5O_4 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at a temperature between 20° and 25°.

USP Reference standards ⟨11⟩—
USP Terazosin Hydrochloride RS
USP Terazosin Related Compound A RS
1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)piperazine, dihydrochloride.
$C_{14}H_{19}N_5O_2 \cdot 2HCl$ 362.25
USP Terazosin Related Compound B RS
1-(4-Hydroxy-6,7-dimethoxy-2-quinazolinyl))-4-[(tetrahydro-2-furanyl)carbonyl]piperazine.
$C_{19}H_{24}N_4O_5$ 388.42
USP Terazosin Related Compound C RS
1,4-Bis(4-amino-6,7-dimethoxy-2-quinazolinyl) piperazine, dihydrochloride.
$C_{24}H_{28}N_8O_4 \cdot 2HCl$ 565.45

Color and clarity of solution—Dissolve a quantity of Terazosin Hydrochloride in methanol solution (90 in 100) to obtain a 1 in 100 solution: this solution is clear and colorless to pale yellow, when compared to methanol solution (90 in 100).

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It meets the requirements of the tests for *Chloride* ⟨191⟩, a solution prepared by dissolving 100 mg in 10 mL of methanol solution (90 in 100) being examined.

Loss on drying ⟨731⟩—Dry it in vacuum at 105° for 3 hours: it loses not more than 9.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.2%, determined on a 1.0-g specimen.

Limit of tetrahydro-2-furancarboxylic acid—

Blank solution—Transfer 2.0 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with acetone to volume, and mix. Mix 5.0 mL of this solution and 5.0 mL of acetone; pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone; and discard the first 1 mL of the filtrate.

Internal standard solution—Transfer about 100 mg of capric acid, accurately weighed, to a 100-mL volumetric flask; dissolve in and dilute with acetone to volume; and mix. Transfer 10.0 mL of this solution and 2.0 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with acetone to volume, and mix.

Standard stock solution—Dissolve an accurately weighed amount of tetrahydro-2-furancarboxylic acid in acetone to obtain a solution having a known concentration of about 1.0 mg per mL. Dilute with acetone quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 100 µg per mL.

Standard solution—Transfer 5.0 mL of the *Standard stock solution* and 5.0 mL of *Internal standard solution* to a 50-mL centrifuge tube, and mix. Pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone; and discard the first 1 mL of the filtrate.

Test solution—Transfer about 100 mg of Terazosin Hydrochloride, accurately weighed, to a 50-mL centrifuge tube; add 5.0 mL of acetone and 5.0 mL of *Internal standard solution;* and shake for about 30 minutes. Centrifuge for about 10 minutes; pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone; and discard the first 1 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 10-m fused-silica capillary column coated with a 1.2-µm film of liquid phase G25. The column temperature is maintained at about 170°. The injection port is configured for splitless injection, and its temperature is maintained at about 230°. The detector temperature is maintained at about 240°. The carrier gas is helium, flowing at a rate of about 9 mL per minute. Chromatograph the *Blank solution,* and measure the peak responses as directed for *Procedure:* ensure that there are no extraneous peaks. Chromatograph the *Standard solution,* and measure the peak responses as directed for *Procedure:* the relative retention times are 1.0 for tetrahydro-2-furancarboxylic acid and 1.2 for capric acid; the resolution, *R,* between tetrahydro-2-furancarboxylic acid and capric acid is not less than 2.3; and the relative standard deviation, determined from the peak response ratios of tetrahydro-2-furancarboxylic acid to capric acid for replicate injections is not more than 6.5%.

Procedure—Separately inject equal volumes (about 0.2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of tetrahydro-2-furancarboxylic acid in the portion of Terazosin Hydrochloride taken by the formula:

$$(C/W)(R_U/R_S)$$

in which C is the concentration, in µg per mL, of tetrahydro-2-furancarboxylic acid in the *Standard solution; W* is the weight, in mg, of Terazosin Hydrochloride taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% is found.

Limit of 1-[(tetrahydro-2-furanyl)carbonyl] piperazine—

Derivatization solution—Dissolve about 2.0 g of 3,5-dinitrobenzoyl chloride in 250 mL of acetonitrile.

Phosphate buffer solution—Transfer about 96.3 g of dibasic potassium phosphate and 3.85 g of monobasic potassium phosphate, each accurately weighed, to a 500-mL volumetric flask. Dissolve in and dilute with water to volume. Adjust with phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100) to a pH of 8.0 ± 0.1. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. Adjust with phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100) to a pH of 8.0 ± 0.1.

Solution A—Use filtered and degassed water.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Blank solution—Use acetonitrile.

Standard solution—Dissolve an accurately weighed quantity of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL. Dilute quantitatively, and stepwise if necessary, with acetonitrile, to obtain a solution having a known concentration of about 5 µg per mL.

www.webofpharma.com

Test solution—Transfer about 125 mg of Terazosin Hydrochloride, accurately weighed, to a 25-mL volumetric flask; dissolve in and dilute with a mixture of acetonitrile and water (1:1) to volume; and mix.

Derivatization procedure—Transfer 5-mL portions of the *Blank solution,* the *Standard solution,* and the *Test solution,* each to a separate 100-mL volumetric flask, and proceed with each as follows. Add 5.0 mL of *Phosphate buffer solution,* and mix. Add 10.0 mL of *Derivatization solution* while swirling, allow to stand at room temperature for about 20 minutes, and mix. Dilute with a mixture of acetonitrile and water (1:1) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains packing L7. The flow rate is 1.5 mL per minute, except it is changed to 2.0 mL per minute during the period between 40 and 80 minutes. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–35	82	18	isocratic
35–40	82→10	18→90	linear gradient
40–75	10	90	isocratic
75–80	10→82	90→18	linear gradient
80–100	82	18	isocratic

Separately inject equal volumes (about 50 µL) of the derivatized *Blank solution* and the derivatized *Standard solution,* and measure the peak responses as directed for *Procedure,* ensuring that the peaks in the chromatogram of the derivatized *Standard solution* that correspond to those obtained from the derivatized *Blank solution* do not interfere with the determination: the retention time for 1-[(tetrahydro-2-furanyl)carbonyl]piperazine is more than 22 minutes; the column efficiency is not less than 3500 theoretical plates; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the derivatized *Standard solution* and the derivatized *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in the portion of Terazosin Hydrochloride taken by the formula:

$$2500(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in the *Standard solution; W* is the weight, in mg, of Terazosin Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak areas for 1-[(tetrahydro-2-furanyl)carbonyl]piperazine derivative obtained from the derivatized *Test solution* and the derivatized *Standard solution,* respectively: not more than 0.1% is found.

Related compounds—

pH 3.2 Citrate buffer, Standard stock preparation, and *Mobile phase*—Proceed as directed in the *Assay.*

Diluent 1—Dissolve 6.0 g of sodium citrate and 4.0 g of anhydrous citric acid in water, dilute with water to 1.0 L, and mix.

Diluent 2—Prepare a mixture of water, acetonitrile, and methanol (60:30:10).

Standard stock solution 1—Dissolve an accurately weighed quantity of USP Terazosin Related Compound A RS in *Diluent 1,* and dilute with *Diluent 1* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard stock solution 2—Dissolve an accurately weighed quantity of USP Terazosin Related Compound B RS in methanol, and dilute with methanol to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard stock solution 3—Dissolve an accurately weighed quantity of USP Terazosin Related Compound C RS in *Diluent 2,* and dilute with *Diluent 2* to obtain a solution having a known concentration of about 0.1 mg per mL.

Standard solution—Transfer 5.0 mL of *Standard stock preparation,* 4.0 mL of *Standard stock solution 1,* 4.0 mL of *Standard stock solution 2,* and 20 mL of *Standard stock solution 3* to a 100-mL volumetric flask containing about 60 mL of *Diluent 2.* Dilute with *Diluent 2* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Use the *Assay stock preparation* prepared as directed in the *Assay.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Mobile phase,* and record the peak responses as directed for *Procedure:* ensure that there are no significant interfering peaks. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.2 for terazosin related compound A, 1.0 for terazosin, 1.48 for terazosin related compound B, and 2.57 for terazosin related compound C; the resolution, *R,* between terazosin and terazosin related compound B is not less than 9.0; the column efficiency determined from the terazosin peak is not less than 12,000 theoretical plates; the tailing factor for the terazosin related compound C peak is not more than 3.0; and the relative standard deviation for replicate injections determined from the terazosin peak is not more than 2.0%, and not more than 5.0% determined from the terazosin related compound C peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 60 minutes, and measure the peak responses. Separately calculate the quantities, in mg, of terazosin related compound A and terazosin related compound C in the portion of Terazosin Hydrochloride taken by the formula:

$$200C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* and r_U and r_S are the peak responses for the corresponding related compound obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% of terazosin related compound A is found; and not more than 0.4% of terazosin related compound C is found. Calculate the quantity, in mg, of each impurity in the portion of Terazosin Hydrochloride taken by the formula:

$$200C(r_i/r_T)$$

in which C is the concentration, in mg per mL, of USP Terazosin Hydrochloride RS in the *Standard solution;* r_i is the peak response for each impurity, other than terazosin related compound A and terazosin related compound C, obtained from the *Test solution;* and r_T is the terazosin peak response obtained from the *Standard solution:* not more than 0.3% of any impurity eluting prior to the terazosin peak is found; not more than 0.1% of any other impurity is found; and not more than 0.6% of total impurities is found.

www.webofpharma.com

Assay—

pH 3.2 Citrate buffer—Dissolve 12.0 g of sodium citrate dihydrate and 28.5 g of anhydrous citric acid in 1.95 L of water. Adjust with anhydrous citric acid or sodium citrate to a pH of 3.2 ± 0.1. Dilute with water to 2.0 L, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.2 Citrate buffer* and acetonitrile (1685:315). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Terazosin Hydrochloride RS in *Mobile phase,* and dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard preparation—Transfer 10.0 mL of *Standard stock preparation* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume; and mix.

Assay stock preparation—Transfer about 100 mg of Terazosin Hydrochloride, accurately weighed, to a 200-mL volumetric flask; dissolve in and dilute with *Mobile phase* to volume; and mix.

Assay preparation—Transfer 10.0 mL of *Assay stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer l0.0 mL of this solution to a l00-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The column temperature is maintained at about 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Mobile phase,* and record the peak responses as directed for *Procedure:* ensure that there are no significant interfering peaks. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 12,000 theoretical plates; the tailing factor is not less than 0.9 and not more than 1.3; and the relative standard deviation for replicate injections is not more than 0.9%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for about 45 minutes, and measure the peak responses. Calculate the quantity, in mg, of $C_{19}H_{25}N_5O_4 \cdot HCl$ in the portion of Terazosin Hydrochloride taken by the formula:

$$10{,}000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Terazosin Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Terbinafine Compounded Oral Suspension

DEFINITION

Terbinafine Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled content of terbinafine ($C_{21}H_{25}N$). Prepare Terbinafine Compounded Oral Suspension containing 25 mg/mL of terbinafine as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Terbinafine (as Terbinafine Hydrochloride)	2500 mg (2810 mg)
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, *NF,* and Vehicle for Oral Suspension, *NF,* a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder or add *Terbinafine Hydrochloride* powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a terbinafine suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and water (2:3), with 0.15% triethylamine and 0.15% phosphoric acid. Make adjustments if necessary.

Standard stock solution: 1.0 mg/mL of USP Terbinafine Hydrochloride RS in methanol

Standard solution: Transfer 0.5 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume to obtain a solution containing 5 µg/mL of terbinafine, and pass through a suitable filter of 0.22-µm pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 1.0 mL to a 25-mL volumetric flask. Dilute with methanol to volume to obtain a nominal concentration of 1 mg/mL of terbinafine. Mix the sample again. Accurately pipet 0.5 mL of the diluted terbinafine solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a nominal concentration of 5 µg/mL of terbinafine.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 224 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L1

Flow rate: 0.4 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time of the terbinafine peak is 5.1 min.]

Suitability requirements

Relative standard deviation: NMT 5.8%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of terbinafine ($C_{21}H_{25}N$) in the volume of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of terbinafine in the *Standard solution* (µg/mL)

C_U = nominal concentration of terbinafine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 5.3–5.7

www.webofpharma.com

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a refrigerator.
- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded when stored at controlled room temperature or in a refrigerator
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date.*
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Terbinafine Hydrochloride RS

Terbinafine Tablets

DEFINITION
Terbinafine Tablets contain Terbinafine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of terbinafine ($C_{21}H_{25}N$).

IDENTIFICATION
- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Buffer solution: 0.85 g/L of monobasic potassium phosphate in water. Add 1 g of sodium 1-decanesulfonate and adjust with dilute phosphoric acid to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer solution* (2:3)
Standard solution: 0.2 mg/mL of USP Terbinafine Hydrochloride RS in *Mobile phase* (equivalent to 0.19 mg/mL of terbinafine)
Sample stock solution: Nominally equivalent to 0.5 mg/mL of terbinafine in *Mobile phase*, from crushed, finely powdered Tablets. [NOTE—Sonicate for 20 min with intermittent shaking.]
Sample solution: Nominally equivalent to 0.2 mg/mL of terbinafine in *Mobile phase*, from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 220 nm. For *Identification B*, use a diode array detector in the range of 200–400 nm.
Column: 3.9-mm × 15-cm; 5-µm packing L7
Flow rate: 1.8 mL/min
Injection volume: 5 µL
Run time: 1.5 times the retention time of the terbinafine peak
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of terbinafine ($C_{21}H_{25}N$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Terbinafine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of terbinafine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of terbinafine, 291.44
M_{r2} = molecular weight of terbinafine hydrochloride, 327.90

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION** ⟨711⟩

Medium: pH 3.0 citrate buffer; 500 mL
Apparatus 2: 50 rpm
Time: 30 min
Standard solution: 32 µg/mL of USP Terbinafine Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Dilute with *Medium*, if necessary.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: 283 nm
Cell: 1 cm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of terbinafine ($C_{21}H_{25}N$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times D \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Terbinafine Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
M_{r1} = molecular weight of terbinafine, 291.44
M_{r2} = molecular weight of terbinafine hydrochloride, 327.90
V = volume of *Medium*, 500 mL
D = dilution factor for the *Sample solution*

Tolerances: NLT 80% (Q) of the labeled amount of terbinafine ($C_{21}H_{25}N$) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES
- **ORGANIC IMPURITIES**

Buffer solution, Mobile phase, and **Sample solution:** Proceed as directed in the *Assay*.
Standard solution: 0.7 µg/mL of USP Terbinafine Hydrochloride RS in *Mobile phase* (equivalent to 0.6 µg/mL of terbinafine)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 220 nm
Column: 3.9-mm × 15-cm; 5-µm packing L7
Flow rate: 1.8 mL/min
Injection volume: 50 µL
Run time: 4 times the retention time of the terbinafine peak
System suitability
Sample: *Standard solution*

Relative standard deviation: NMT 2.0% for terbinafine, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of terbinafine hydrochloride ($C_{21}H_{25}N \cdot HCl$) in the portion of Terbinafine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of terbinafine from the *Sample solution*
r_S = peak response of terbinafine from the *Standard solution*
C_S = concentration of USP Terbinafine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Terbinafine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
- **ORGANIC IMPURITIES**

Protect all solutions containing Terbinafine Hydrochloride from light.

Buffer, Solution A, Solution B, Solution C, Mobile phase, Diluent, System suitability solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
Standard solution: 0.5 µg/mL each of USP Terbinafine Hydrochloride RS, USP Terbinafine Related Compound A RS, USP Terbinafine Related Compound B RS, USP Terbinafine Related Compound C RS, and USP Terbinafine Related Compound D RS in *Diluent*
Sample solution: 0.5 mg/mL of Terbinafine Hydrochloride in *Diluent*
Sensitivity solution: 0.25 µg/mL of USP Terbinafine Hydrochloride RS in *Diluent* from the *Standard solution*
System suitability
Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*
Suitability requirements
Resolution: NLT 2.0 between terbinafine related compound B and terbinafine, *System suitability solution*
Relative standard deviation: NMT 10% for terbinafine, *Standard solution*
Signal-to-noise ratio: NLT 10 for terbinafine, *Sensitivity solution*
Calculate the signal-to-noise ratio:

$$\text{Result} = (2H)/h$$

H = measured height of the terbinafine peak
h = amplitude of the average measured baseline noise

Analysis
Samples: *Standard solution* and *Sample solution*
Identify the peaks based on their relative retention times as given in *Table 2*.
Calculate the percentage of terbinafine related compound A, terbinafine related compound B, terbinafine related compound C, and terbinafine related compound D in the portion of Terbinafine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response of terbinafine related compound A, terbinafine related compound B, terbinafine related compound C, or terbinafine related compound D from the *Sample solution*
r_S = peak response of terbinafine related compound A, terbinafine related compound B, terbinafine related compound C, or terbinafine related compound D from the *Standard solution*
C_S = concentration of USP Terbinafine Related Compound A RS, USP Terbinafine Related Compound B RS, USP Terbinafine Related Compound C RS, or USP Terbinafine Related Compound D RS in the *Standard solution* (µg/mL)
C_U = concentration of Terbinafine Hydrochloride in the *Sample solution* (µg/mL)

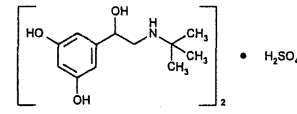
Calculate the percentage of terbinafine dimer or any other individual impurity in the portion of Terbinafine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of terbinafine dimer or any other individual impurity from the *Sample solution*
r_S = peak response of the terbinafine peak from the *Standard solution*
C_S = concentration of USP Terbinafine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of Terbinafine Hydrochloride in the *Sample solution* (µg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard any peak observed in the blank, and any peak less than 0.05%.

Table 2



Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Terbinafine related compound A[a]	0.1	—	0.1

Terbutaline Sulfate

$(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ 548.65
1,3-Benzenediol, 5-[2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-, sulfate (2:1) (salt).
(±)-α-[(*tert*-Butylamino)methyl]-3,5-dihydroxybenzyl alcohol sulfate (2:1) (salt) [23031-32-5].

» Terbutaline Sulfate contains not less than 98.0 percent and not more than 101.0 percent of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers, at controlled room temperature.
USP Reference standards ⟨11⟩—
USP Terbutaline Sulfate RS
USP Terbutaline Related Compound A RS
3,5-Dihydroxy-ω-*t*-butylaminoacetophenone sulfate.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.
Acidity—Dissolve 0.20 g in 10 mL of carbon dioxide-free water, and titrate with 0.020 N sodium hydroxide from a microburet to a pH of about 6, determining the endpoint potentiometrically, using a calomel-glass electrode system: not more than 0.50 mL of 0.020 N sodium hydroxide is required (0.3% as acetic acid).

www.webofpharma.com

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.2%.

Chromatographic purity—
Ion-pair solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*
Standard solution—Dissolve an accurately weighed quantity of USP Terbutaline Sulfate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 3 µg per mL.
Test solution—Use the *Assay preparation.*
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity, if present, in the portion of Terbutaline Sulfate taken by the formula:

$$5000(C/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Terbutaline Sulfate RS in the *Standard solution; W* is the weight, in mg, of Terbutaline Sulfate taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the terbutaline peak response obtained from the *Standard solution:* the sum of all impurities is not more than 1.0%.

Assay—
Ion-pair solution—Transfer 3.15 g of ammonium formate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust the solution with formic acid to a pH of about 3.0, add 5.49 g of sodium 1-hexanesulfonate, dilute with water to volume, and mix.
Mobile phase—Prepare a filtered and degassed mixture of *Ion-pair solution* and methanol (77:23). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
System suitability solution—Dissolve accurately weighed quantities of USP Terbutaline Sulfate RS and USP Terbutaline Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of 1.0 mg per mL and 0.4 mg per mL, respectively.
Standard preparation—Dissolve an accurately weighed quantity of USP Terbutaline Sulfate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.
Assay preparation—Transfer about 50 mg of Terbutaline Sulfate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times for terbutaline related compound A and terbutaline are 0.9 and 1.0, respectively; the resolution, *R,* between terbutaline related compound A and terbutaline is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor for the terbutaline peak is not more than 2.0; and the relative standard deviation for replicate injections determined from the terbutaline peak is not more than 2.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ in the portion of Terbutaline Sulfate taken by the formula:

$$50C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Terbutaline Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Terbutaline Sulfate Injection

» Terbutaline Sulfate Injection is a sterile solution of Terbutaline Sulfate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$.
[NOTE—Do not use the Injection if it is discolored.]

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light, at controlled room temperature.
USP Reference standards ⟨11⟩—
USP Terbutaline Sulfate RS
USP Terbutaline Related Compound A RS
3,5-Dihydroxy-ω-*t*-butylaminoacetophenone sulfate.

Identification—
A: Apply 2 µL of Injection and 2 µL of a solution of USP Terbutaline Sulfate RS in sodium chloride solution (0.9 in 100) containing 1 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a solvent system consisting of a mixture of isopropyl alcohol, cyclohexane, and formic acid (13:5:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry with a current of air. Spray the plate with a 1 in 50 solution of 4-aminoantipyrine in methanol, allow to air-dry, and spray with a 2 in 25 solution of potassium ferricyanide in a solvent prepared by mixing ammonium hydroxide with water (4:1): the R_F value of the principal spot obtained from the Injection corresponds to that obtained from the Standard solution.
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay.*
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 1250.0 USP Endotoxin Units per mg of terbutaline sulfate.
pH ⟨791⟩: between 3.0 and 5.0.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Terbutaline Sulfate.*
Assay preparation—Use Injection. If necessary, quantitatively dilute an accurately measured volume of Injection with water to obtain a solution having a concentration of about 1 mg per mL.

USP Monographs

www.webofpharma.com

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ in each mL of the Injection taken by the formula:

$$(LC/D)(r_U/r_S)$$

in which L is the labeled quantity, in mg per mL, of terbutaline sulfate in the Injection, C is the concentration, in mg per mL, of USP Terbutaline Sulfate RS in the *Standard preparation*, D is the concentration, in mg per mL, of terbutaline sulfate in the *Assay preparation*, based upon the labeled quantity, in mg per mL, of terbutaline sulfate in the Injection and the extent of dilution, and r_U and r_S are the terbutaline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Terbutaline Sulfate Compounded Oral Suspension

DEFINITION

Terbutaline Sulfate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of terbutaline sulfate $[(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4]$. Prepare Terbutaline Sulfate Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Terbutaline Sulfate	100 mg
Syrup, *NF*,[a] a sufficient quantity to make	100 mL

[a] Syrup, *NF*, containing 0.2% sodium benzoate.

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder or add *Terbutaline Sulfate* powder. Add the *Syrup, NF*, to make a terbutaline sulfate suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Syrup, NF*, to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: A solution of methanol and 20 mM monobasic potassium phosphate (2:23), adjusted with phosphoric acid to a pH of 3.6. Filter and degas.

Standard stock solution: 5 mg/mL of USP Terbutaline Sulfate RS in methanol

Standard solution: Transfer 0.2 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with water to volume to obtain a solution containing 10 µg/mL of terbutaline sulfate, and pass through a suitable filter of 0.22-µm pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 1.0 mL to a 10-mL volumetric flask. Dilute with *Mobile phase* to volume to obtain a nominal concentration of 100 µg/mL of terbutaline sulfate. Extract terbutaline sulfate from Oral Suspension with methanol. Accurately pipet 1 mL of Oral Suspension and 3 mL of *Mobile phase* in the barrel of a 5-mL plastic syringe. Shake, and pass through a suitable filter of 0.22-µm pore size into a 10-mL volumetric flask. Repeat the process with an additional 2 mL of methanol. Bring to a final volume of 10 mL with *Mobile phase* to obtain a nominal concentration of 10 µg/mL of terbutaline sulfate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 3.9-mm × 30-cm; 10-µm microphenyl packing L11

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for the terbutaline sulfate peak is 5 min.]

Suitability requirements

Relative standard deviation: NMT 2.2% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of terbutaline sulfate $[(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4]$ in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Terbutaline Sulfate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of terbutaline sulfate in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator.

• **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded when stored in a refrigerator

• **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Terbutaline Sulfate RS

Terbutaline Sulfate Tablets

» Terbutaline Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$.

Packaging and storage—Preserve in tight containers, at controlled room temperature.

USP Reference standards ⟨11⟩—

USP Terbutaline Sulfate RS

USP Terbutaline Related Compound A RS

3,5-Dihydroxy-ω-*t*-butylaminoacetophenone sulfate.

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

USP Monographs

www.webofpharma.com

Procedure—Determine the amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

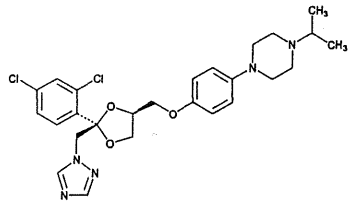
Tolerances—Not less than 75% *(Q)* of the labeled amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—

Ion-pair solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Terbutaline Sulfate.*

Standard preparation—Dissolve an accurately weighed quantity of USP Terbutaline Sulfate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL. Transfer 10.0 mL of the solution so obtained to a 100-mL volumetric flask, add 10 mL of 0.05 N sulfuric acid, dilute with water to volume, and mix.



Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of terbutaline sulfate, to a 100-mL volumetric flask. Add 10 mL of 0.05 N sulfuric acid and 20 mL of water, and shake for 15 minutes. Dilute with water to volume, mix, and filter.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of terbutaline sulfate $[(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4]$ in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Terbutaline Sulfate RS in the *Standard preparation;* and r_U and r_S are the terbutaline peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Terconazole

$C_{26}H_{31}Cl_2N_5O_3$ 532.46

Piperazine, 1-[4-[[2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)-, *cis*-.

cis-1-[*p*-[[2-(2,4-Dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-4-isopropylpiperazine [67915-31-5].

» Terconazole contains not less than 98.0 percent and not more than 102.0 percent of $C_{26}H_{31}Cl_2N_5O_3$, calculated on the dried basis.

Packaging and storage—Preserve in light-resistant containers. Store at room temperature.

USP Reference standards ⟨11⟩—

USP Terconazole RS

Identification, ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K.*▲ (CN 1-May-2020)

Specific rotation ⟨781S⟩: between −1° and +1° at 20°.

Test solution: 40 mg per mL solution in methylene chloride.

Loss on drying ⟨731⟩—Dry it in a vacuum at 80° for 4 hours: it loses not more than 0.75% of its weight, a 2.0-g specimen being used.

Residue on ignition ⟨281⟩: not more than 0.1%, a 2.0-g specimen being used.

Related compounds— [NOTE—Use the solutions within 24 hours if protected from light and within 1 hour if not protected from light.]

Solution A—Prepare and filter a 0.6% ammonium carbonate solution in water.

Solution B: acetonitrile.

Solution C: tetrahydrofuran.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve in and dilute with alcohol an accurately weighed quantity of USP Terconazole RS to obtain a solution having a known concentration of about 0.1 mg per mL.

Test solution—Dissolve in and dilute with alcohol an accurately weighed quantity of Terconazole to obtain a solution having a concentration of about 10 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as shown in the table below.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–15	80→55	20→25	0→20	linear gradient
15–17	55→0	25→80	20	linear gradient
17–20	0	80	20	isocratic
20–21	0→80	80→20	20→0	step gradient
21–25	80	20	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor for terconazole peak is not less than 0.9 and not more than 1.3; and the relative standard deviation for replicate injection is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. Identify the impurities using the relative retention times given in *Table 1.* Calculate the percentage of each terconazole related compound in the portion of Terconazole taken by the formula:

$$100(C_S/C_U)(r_U/r_S)(1/F)$$

in which C_S and C_U are the concentrations, in mg per mL, of terconazole in the *Standard solution* and the *Test solution,* respectively; r_U is the peak response of each impurity obtained from the *Test solution;* r_S is the peak response of terconazole obtained from the *Standard solution;* and F is the relative response factor for each impurity relative to terconazole.

USP Monographs

[52232-67-4].

DEFINITION

Teriparatide, also called rhPTH (1-34), is a single-chain peptide containing 34 amino acids identical to the 34 N-terminal amino acids of human parathyroid hormone. Teriparatide is produced by a method based on recombinant DNA (rDNA) technology. The host cell-derived protein content is below the limit approved by the competent authority. In addition, the host cell-derived and vector-derived DNA are below the limit approved by the competent authority. Teriparatide is a white to almost white powder. It contains NLT 95.0% and NMT 105.0% of teriparatide ($C_{181}H_{291}N_{55}O_{51}S_2$), calculated on the anhydrous, acetic acid-free, and chloride-free basis.

IDENTIFICATION

- **A.** The ratio of the retention time of the teriparatide peak of the *Sample solution* to that of the *Standard solution*, as obtained in the *Assay*, is 1.00 ± 0.03.
- **B. PEPTIDE MAPPING**

Solution A: 0.1% (v/v) trifluoroacetic acid in water

Solution B: Acetonitrile, trifluoroacetic acid, and water (60: 0.1: 40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	96	4
6	96	4
20	45	55
25	0	100
25.1	96	4
35	96	4

20 mM sodium phosphate buffer: 2.30 mg/mL of anhydrous dibasic sodium phosphate and 0.60 mg/mL of sodium phosphate monobasic monohydrate in water. Adjust with sodium hydroxide or phosphoric acid to a pH of 7.8 before final dilution.

Enzyme solution: About 0.25 mg/mL of *Staphylococcus aureus* V8 protease in *20 mM sodium phosphate buffer*. Stable for 72 h when stored at 2°–8°.

Standard solution: Prepare a 1.5 ± 0.15 mg/mL solution of USP Teriparatide RS in *20 mM sodium phosphate buffer*. Combine this solution with *Enzyme solution* for a teriparatide to protease ratio of 10:1 (w/w). Mix and incubate at 37° for 18–24 h. Quench the digestion by adding the volume of *Solution A* needed to reach a final digested teriparatide concentration of approximately 0.25 mg/mL. Stable for 72 h when stored at 2°–8°.

Sample solution: Prepare a 1.5 ± 0.15 mg/mL solution of Teriparatide in *20 mM sodium phosphate buffer*. Combine this solution with *Enzyme solution* for a Teriparatide to protease ratio of 10:1 (w/w). Mix and incubate at 37° for 18–24 h. Quench the digestion by adding the volume of *Solution A* needed to reach a final digested teriparatide concentration of approximately 0.25 mg/mL. Stable for 72 h when stored at 2°–8°.

Blank: Combine *20 mM sodium phosphate buffer* with *Enzyme solution* in the same proportions used for the *Standard solution* and the *Sample solution*. Mix and incubate at 37° for 18–24 h. Quench by adding the same volume of *Solution A* as for the *Standard solution* and the *Sample solution*. Stable for 72 h when stored at 2°–8°.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The *System suitability* procedure must be performed both before starting sample testing and at the end of each sample run.]

Suitability requirements

Chromatogram similarity: In the chromatogram from the *Standard solution*, identify the peaks due to digest fragments I, II, III, IV, and V. The chromatogram of the *Standard solution* corresponds to that of the typical chromatogram provided with the USP Certificate for USP Teriparatide RS.

Resolution: NLT 1.5 between peaks indicated as fragments III and I

Tailing factor: NMT 2.3 for the peak indicated as fragment IV

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

www.webofpharma.com

Record the chromatograms. For each of the five fragments, determine the ratio of the fragment retention time from the *Sample solution* to the corresponding fragment retention time from the *Standard solution* obtained from the first *System suitability* injection.

Acceptance criteria: The chromatographic profile of the *Sample solution* corresponds to that of the *Standard solution*. All five fragments, I, II, III, IV, and V, must be present. The fragment retention time ratio is 1.00 ± 0.03 for all five fragments.

• **C. BIOIDENTITY**

Basic medium: Sterile Dulbecco's modified Eagle's medium (DMEM) containing high glucose, L-glutamine, pyridoxine hydrochloride, and 25mM HEPES[1]

Growth medium: 10% fetal bovine serum (FBS) in *Basic medium* prepared as follows. To 450 mL of *Basic medium*, add 50 mL of heat inactivated irradiated FBS[2] and mix. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

Serum starve medium: 0.1% (w/v) bovine serum albumin (BSA)-fraction V in *Basic medium* prepared as follows. Add 0.50 g of BSA-fraction V to 500 mL of *Basic medium*, and mix. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

Vehicle: 150 mM sodium chloride, 0.1% (w/v) BSA-fraction V, and 0.001 N hydrochloric acid prepared as follows. Dissolve 1.75 g of sodium chloride and 0.2 g of BSA-fraction V in 180 mL of water. Add 20.0 mL of 0.01 N hydrochloric acid to the solution. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

600 mM IBMX solution: Add 0.30 g of 3-isobutyl-1-methyl-xanthine (IBMX) to 2.25 mL of dimethyl sulfoxide (DMSO) and vortex to dissolve. Aliquot and store at −18° to −24°.

Cell culture preparation: Culture UMR-106 rat osteogenic sarcoma cell line[3] in *Growth medium* at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2) atmosphere in a humidified incubator. Cells should be passaged when the cultures are approximately 65%–85% confluent as determined microscopically at an appropriate magnification (such as 200–400×). [NOTE—Do not allow the cells to go beyond 85% confluence for cell passage or analysis.] For cell passage, remove the media from the cells. Rinse the cells once with sterile Dulbecco's phosphate buffer saline (DPBS) without calcium and magnesium.[4] Rinse the cells with approximately 5–10 mL of 0.25% (w/v) trypsin in 1 mM EDTA solution,[5] and immediately remove all but approximately 1–2 mL of the 0.25% (w/v) trypsin with 1 mM EDTA solution from the cells. Allow the 0.25% (w/v) trypsin with 1 mM EDTA solution to remain on the cells for 1–2 min at a temperature ranging from room temperature to 37° until the cells begin to round and release from the culture surface. Resuspend the cells in an appropriate volume of *Growth medium* and count them. Cells are passaged into a T162 cm^2 flask with approximately 30 mL of *Growth medium* at 0.75–6 × 10^6 cells per flask.

Preparation of cells for analysis: Use cells that are between passages 4 and 20, 65%–85% confluent, and 2–5 days post-passage. Following the procedure described in *Cell culture preparation*, prepare an appropriate volume of cell solution at 0.75 × 10^5 viable cells per mL in *Growth medium*. To 96-well flat-bottom plates,[6] add 200 µL of cell solution per well. Mix cell solution frequently during dispensing to prevent cells from settling and to ensure consistent density throughout the plate. Incubate plates for 18–26 h at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2). Following the incubation, remove media from the cells and add 200 µL of *Serum starve medium* to each well. Incubate plates for 18–26 h at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2).

Diluent A: 1 mM IBMX in Hanks' balanced salt solution (HBSS) with phenol red[7] prepared as follows. Very slowly add 500 µL of warmed (30°–40°) *600 mM IBMX solution* to 300 mL of warmed HBSS with phenol red while continuously mixing on a stir plate. [NOTE—It is acceptable to substitute HBSS containing phenol red with HBSS without phenol red.[8] HBSS containing phenol red is preferred because it is easier to visualize the wells.]

Assay/lysis solution: 0.55 mM IBMX in assay/lysis buffer from a suitable cAMP immunoassay kit for 96-well plates[9] prepared as follows. Very slowly add 27.5 µL of warmed *600 mM IBMX solution* to 30 mL of warmed assay/lysis buffer.

Diluted cAMP-AP conjugate: Dilute the cAMP-alkaline phosphatase (AP) conjugate (1:100) with the conjugate dilution buffer from the same cAMP kit used for the *Assay/lysis solution*.[9] Prepare 2.5 mL of diluted conjugate per 96-well plate. Use within 4 h.

Standard stock solution: Dissolve the contents of 1 vial of USP Teriparatide RS in an appropriate volume of *Vehicle* to obtain a 250-µg/mL solution.

Standard solution: Prepare a 1-µM solution by mixing 82.4 µL of the *Standard stock solution* with 4.92 mL of *Vehicle*.

Sample stock solution: Prepare a 1-mg/mL solution of Teriparatide in *Vehicle*.

Sample solution: Prepare a 1-µM solution by mixing 20 µL of the *Sample stock solution* with 4.98 mL of *Vehicle*. [NOTE—Following the preparation of the *Standard solution* and *Sample solution*, the diluting and delivery of the samples to the cells must occur within 45 min. Dilutions must be made in borosilicate glass tubes. Allow all solutions to equilibrate to room temperature prior to use.]

Preparation of diluted standard solutions and sample solutions: Prepare three separate dilution sets from the *Standard solution* and *Sample solution* in borosilicate glass tubes at various concentrations (e.g., 3.0, 1.0, 0.333, 0.167, 0.0833, 0.0417, 0.0208, 0.0069, and 0.0023 nM) using *Diluent A*. [NOTE—Only a single standard and a single sample (three separate dilution sets for each) should be prepared and run for each assay plate. For each assay plate, a freshly prepared standard and sample must be used. Each assay consists of at least three independent runs (or three assay plates).]

Analysis: Following cell serum starvation, wash cells at least twice with 300 µL per well of HBSS without phenol red[4] at room temperature. Place 100 µL per well of each dilution prepared from the *Standard solution* and *Sample solution* into appropriate wells of the plate. [NOTE—See *Design and Development of Biological Assays* ⟨1032⟩ for helpful information on randomization of samples and plate layout.] Incubate the plates at 25 ± 2° for 20 ± 5 min with

gentle shaking. Discard the solutions and wash cells twice with 300 µL per well of HBSS without phenol red at room temperature. Add 100 µL per well of *Assay/lysis solution* and incubate the plates at 37 ± 2° for 30 ± 5 min to lyse the cells. Mix cell lysate with a multi-channel pipette prior to transfer. Transfer 60 µL of cell lysate to the appropriate wells of the 96-well assay plate from the cAMP immunoassay assay kit. Add 30 µL of *Diluted cAMP-AP conjugate* to each well containing the cell lysate that is derived from the cells treated with the *Diluted standard solutions* or *Diluted sample solutions*, and mix on a plate shaker for approximately 1–2 min. Add 60 µL of anti-cAMP antibody from the cAMP kit to the wells and incubate at 25 ± 2° for 60 ± 5 min on a plate shaker with gentle shaking. Discard the solutions and wash the plates six times with 300 µL per well of wash buffer from the cAMP kit, blotting the plate between each wash. Add 100 µL of substrate/enhancer solution from the cAMP kit to each well. Mix on a plate shaker for 1–2 min. Remove the plates from the shaker and incubate the plates at room temperature (such as 20°–27°) for 40 ± 10 min. Read the plate in a suitable microtiter plate luminescence reader.

Calculations: Fit a constrained 4-parameter logistic curve to the median relative light units (RLU) at each concentration from the *Diluted standard solutions* and *Diluted sample solutions*. Calculate the relative potency of each teriparatide sample compared to the standards of each run by EC_{50}. Determine the combined weighted percent mean relative potency of the runs following *Design and Analysis of Biological Assays* ⟨111⟩, *Combination of Independent Assays, Method 2*.

System suitability

Samples: *Diluted standard solutions* and *Diluted sample solutions*

Suitability requirements

Asymptote ratio: NLT 3.0 for the ratio of the upper asymptote to the lower asymptote of the 4-parameter logistic curve from each run of both the *Diluted standard solutions* and *Diluted sample solutions*

Slope: NLT 1.0 for each run

L term: NMT 0.2000 for each run. [NOTE—L term is determined by subtracting the log of the 95% lower confidence limit from the log of the 95% upper confidence limit of the relative potency.]

Combined assay L term: NMT 0.1500 [NOTE—See *Design and Analysis of Biological Assays* ⟨111⟩, *Combination of Independent Assays, Method 2* for the calculation.]

Acceptance criteria: 60%–120% of the relative potency to USP Teriparatide RS on the as-is basis

ASSAY

• **PROCEDURE**

0.2 M sulfate buffer: 28.4 g/L of anhydrous sodium sulfate in water. Adjust with 85% phosphoric acid to a pH of 2.3.

Solution A: Acetonitrile and *0.2 M sulfate buffer* (10:90)

Solution B: Acetonitrile and *0.2 M sulfate buffer* (50:50)

Mobile phase: *Solution A* and *Solution B* (63:37). [NOTE—The *Mobile phase* composition may be adjusted to obtain the desired retention time for the teriparatide main peak.]

Diluent: Acetonitrile and *0.2 M sulfate buffer* (25:75)

Standard solutions: Prepare in triplicate 250 µg/mL of USP Teriparatide RS in *Diluent*. Stable for 72 h when stored at 2°–8° in a sealed container.

Sample solutions: Prepare in duplicate approximately 250 µg/mL of Teriparatide in *Diluent*. Stable for 72 h when stored at 2°–8° in a sealed container. [NOTE—Teriparatide should be equilibrated and weighed in a controlled humidity chamber of 25 ± 5% relative humidity, then dissolved in *Diluent*. Determine the water content within 24 h of weighing.]

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Detector: UV 214 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L1

Temperatures

Autosampler: 2°–8°

Column: 40 ± 5°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

Run time: 15 min

System suitability

Samples: *Standard solutions*

[NOTE—The retention time for teriparatide is 7.5–11.7 min.]

Suitability requirements

Tailing factor: NMT 1.5 for the teriparatide peak

Relative standard deviation: NMT 1.25% calculated from the injection of three separate *Standard solutions*

Analysis

Samples: *Standard solutions* and *Sample solutions*

Calculate the concentration of teriparatide (C_S), in µg/mL, in each of the *Standard solutions*:

$$C_S = (L_S / V_S)$$

L_S = content of teriparatide in USP Teriparatide RS (µg)

V_S = volume of *Diluent* used for the *Standard solutions* (mL)

For each injection of the *Standard solution*, calculate a response factor (F_R):

$$F_R = (r_S / C_S)$$

r_S = peak response of teriparatide from the *Standard solution*

C_S = concentration of USP Teriparatide RS in the *Standard solution* (µg/mL)

Calculate the mean response factor (F_M) for all three *Standard solutions*.

Calculate the percentage (P_U) of teriparatide ($C_{181}H_{291}N_{55}O_{51}S_2$) in the portion of Teriparatide taken:

$$P_U = (r_U / F_M) \times [V_U / (W \times F)] \times 100$$

r_U = peak response of teriparatide from the *Sample solution*

F_M = mean response factor for all three *Standard solutions*

V_U = volume of *Diluent* used to prepare the *Sample solutions* (mL)

W = weight of Teriparatide taken to prepare the *Sample solutions* (mg)

F = conversion factor from mg to µg, 1000

Calculate the percentage of teriparatide ($C_{181}H_{291}N_{55}O_{51}S_2$) corrected for water, acetate, and chloride contents:

$$\text{Result} = P_U / [(100 - \%\text{ of water} - \%\text{ of acetate} - \%\text{ of chloride})/100]$$

Acceptance criteria: 95.0%–105.0% on the anhydrous, acetic acid-free, and chloride-free basis

OTHER COMPONENTS

• **ACETATE CONTENT**

Mobile phase: 0.01 N sulfuric acid in water

www.webofpharma.com

Standard solution 1: 0.072 mg/mL of acetate in *Mobile phase* prepared as follows. Weigh approximately 100 mg of anhydrous sodium acetate, place in a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Dilute 1 mL of this solution with *Mobile phase* to 10.0 mL. Stable for 72 h when stored at 2°–8°.

Standard solution 2: 0.144 mg/mL of acetate in *Mobile phase* prepared as follows. Weigh approximately 200 mg of anhydrous sodium acetate, place in a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Dilute 1 mL of this solution with *Mobile phase* to 10.0 mL. Stable for 72 h when stored at 2°–8°.

Standard solution 3: 0.216 mg/mL of acetate in *Mobile phase* prepared as follows. Weigh approximately 300 mg of anhydrous sodium acetate, place in a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Dilute 1 mL of this solution with *Mobile phase* to 10.0 mL. Stable for 72 h when stored at 2°–8°.

Sample solution: Under controlled relative humidity of 25 ± 5%, prepare in duplicate approximately 5 mg/mL of Teriparatide in *Mobile phase*. Stable for 72 h when stored at 2°–8°.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 9.0-mm × 25-cm; packing L22
Temperatures
Autosampler: 2°–8°
Column: Ambient
Flow rate: 1.0 mL/min
Injection volume: 100 µL
Run time: 12–15 min

System suitability
Samples: *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*
[NOTE—The retention time of acetate is 9.2–11.6 min.]
Suitability requirements
Tailing factor: NMT 1.5, *Standard solution 2*
Relative standard deviation: NMT 1.25% from triplicate injections, *Standard solution 2*
Percentage of deviation: NMT 2.0 for each concentration from triplicate injections, *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*

$$\text{Result} = \{[(r_S - b)/a]/C_S\} \times 100$$

r_S = peak response of acetate from *Standard solution 1*, *Standard solution 2*, or *Standard solution 3*
b = *y*-intercept of the calibration curve described in the *Analysis*
a = slope of the calibration curve described in the *Analysis*
C_S = concentration of acetate in *Standard solution 1*, *Standard solution 2*, or *Standard solution 3* (mg/mL)

Analysis
Samples: *Standard solutions* and *Sample solution*
Determine the peak response of acetate.
Calculate the concentration of acetate (C_S), in mg/mL, in the *Standard solutions*:

$$C_S = (W_S/V_S) \times F \times D$$

W_S = weight of anhydrous sodium acetate (corrected for purity) (mg)
V_S = initial volume of *Mobile phase*, 100 mL
F = ratio of molecular weight of acetate (59.04 g/mol) to molecular weight of anhydrous sodium acetate (82.03 g/mol), 0.7197
D = dilution factor from 1 mL to 10 mL, 0.1

Construct a least-squares calibration curve, using the peak area of the *Standard solutions* versus their acetate concentrations (mg/mL). Determine the concentration of acetate (C_U), in mg/mL, in the *Sample solution*, using the equation of a line for the calibration curve.
Calculate the percentage of acetate in the portion of Teriparatide taken:

$$\text{Result} = C_U \times (V_U/W_U) \times 100$$

C_U = concentration of acetate in the *Sample solution* (mg/mL)
V_U = volume of the *Sample solution* (mL)
W_U = weight of Teriparatide taken (mg)

Acceptance criteria: NMT 5.0%

• **CHLORIDE CONTENT**
Mobile phase: 1.7 mM sodium bicarbonate and 1.8 mM sodium carbonate in water
Standard stock solution: Dry a sufficient quantity of sodium chloride at 105° for approximately 30 min. Weigh about 165.9 mg of previously dried sodium chloride, and place in a 100-mL volumetric flask. Dilute with water to volume. Mix until completely dissolved. This solution contains the equivalent of 1000 µg/mL of chloride.
System suitability solution: Weigh approximately 150 mg of sodium nitrite, and place in a 100-mL volumetric flask. Dilute with water to volume. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Transfer 2.5 mL of the *Standard stock solution* to the same flask. Dilute with water to volume, and mix well.
Standard solutions: Transfer 1.0, 2.0, 3.0, and 4.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute with water to volume, and mix well.
Sample solution: Under controlled relative humidity of 25 ± 5%, prepare in duplicate 1.0 mg/mL of Teriparatide in water. Stable for 72 h when stored at ambient temperature.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Conductivity with anion suppressor current at 100 mA
Columns
Guard: 4.0-mm × 5.0-cm; packing L94
Analytical: 4.0-mm × 25-cm; 13-µm packing L94
Column temperature: Ambient
Flow rate: 2 mL/min
Injection volume: 50 µL
Run time: 10 min

System suitability
Sample: *System suitability solution*
[NOTE—Chloride elutes earlier than nitrite.]
Suitability requirements
Resolution: NLT 1.5 between chloride and nitrite peaks
Tailing factor: <2.0 for chloride and nitrite peaks
Relative standard deviation of standard curve: <3.0%
Relative standard deviation: <2.0% for chloride and nitrite peaks from five replicate injections

Analysis
Samples: *Standard solutions* and *Sample solution*
Inject the *Standard solutions* followed by the *Sample solution*.
Calculate the concentration of chloride (C_S), in µg/mL, in the *Standard stock solution*:

USP Monographs

www.webofpharma.com

$$C_S = (W_S/V_S) \times F \times D$$

W_S = weight of sodium chloride (mg)
V_S = volume of water, 100 mL
F = ratio of molecular weight of chloride (35.46 g/mol) to molecular weight of sodium chloride (58.45 g/mol), 0.607
D = conversion factor from mg to µg, 1000

Determine the concentrations of chloride, in µg/mL, in the *Standard solutions*.
Construct a least-squares calibration curve, using the peak area of the *Standard solutions* versus their chloride concentrations (µg/mL). Determine the concentration of chloride (C_U), in µg/mL, in the *Sample solution*, using the equation of a line for the calibration curve.
Calculate the percentage of chloride in the portion of Teriparatide taken:

$$\text{Result} = [(C_U \times V_U \times F)/W_U] \times 100$$

C_U = concentration of chloride in the *Sample solution* (µg/mL)
V_U = volume of the *Sample solution* (mL)
F = conversion factor from µg to mg, 0.001
W_U = weight of Teriparatide (mg)

Acceptance criteria: NMT 4.0%

PRODUCT-RELATED SUBSTANCES AND IMPURITIES

• **PRODUCT-RELATED IMPURITIES**

0.2 M sulfate buffer: 28.4 g/L of anhydrous sodium sulfate in water. Adjust with 85% phosphoric acid to a pH of 2.3.
Solution A: Acetonitrile and *0.2 M sulfate buffer* (10:90)
Solution B: Acetonitrile and *0.2 M sulfate buffer* (50:50)
[NOTE—If the sodium sulfate precipitates, gentle heating and continuous stirring may be required. The sodium sulfate should not re-precipitate if this procedure is followed.]
Mobile phase: See *Table 2*. [NOTE—The *Mobile phase* composition may be adjusted to obtain the desired retention time of the teriparatide peak. The *Solution B* percentage at 5 and 35 min should be changed to alter the retention time, but the same gradient slope should be maintained.]

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	65	35
35	60	40
45	0	100
45.1	100	0
55	100	0

System suitability solution: Use an appropriate solution containing approximately 0.8% of the first post-main peak in *Solution A*. [NOTE—Teriparatide containing the first post-main peak may be prepared by dissolving Teriparatide in water to obtain a concentration of 2 mg/mL. Adjust with hydrochloric acid to a pH of 3.0. Incubate this solution at 50° for 9 days. The solution may be aliquoted and stored frozen. Dilute 1:1 with *Solution A* prior to injection. The first post-main peak is a degradation product resulting from this process and elutes immediately after the teriparatide peak. The relative retention times for teriparatide and this first post-main peak are 1.00 and 1.05, respectively.]
Sample solution: Approximately 0.7 mg/mL of Teriparatide in *Solution A*
Blank: *Solution A*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L1
Temperatures
Autosampler: 5°
Column: 40°
Flow rate: 1.0 mL/min
Injection volume: 20 µL
System suitability
Sample: *System suitability solution*
[NOTE—The retention time for teriparatide is 19.8–24.8 min.]
Suitability requirements
Peak-to-valley ratio: The ratio of the height of the first post-main peak to the valley between the teriparatide peak and the first post-main peak is NLT 1.5.
Tailing factor: NMT 2.0 for the teriparatide peak
Analysis
Sample: *Sample solution*
Measure the peak responses for all integrated peaks.
Calculate the percentage of methionyl sulfoxides of teriparatide in the portion of Teriparatide taken:

$$\text{Result} = [(r_{Met+O(8)} + r_{Met+O(18)} + r_{Met+O(8,18)})/r_T] \times 100$$

$r_{Met+O(8)}$ = peak response of *Met+O(8)* teriparatide (oxidized on Met 8)
$r_{Met+O(18)}$ = peak response of *Met+O(18)* teriparatide (oxidized on Met 18)
$r_{Met+O(8,18)}$ = peak response of *Met+O(8,18)* teriparatide (oxidized on Met 8 and Met 18)
r_T = sum of all the peak responses

Calculate the percentage of the largest other related impurity of teriparatide in the portion of Teriparatide taken:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I = peak response of the largest other related impurity of teriparatide
r_T = sum of all the peak responses

Calculate the total percentage of teriparatide related impurities in the portion of Teriparatide taken:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I = sum of the peak responses of the teriparatide related impurities
r_T = sum of all the peak responses

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Met+O(8,18) teriparatide	0.38	—
Met+O(8) teriparatide	0.48	—
Met+O(18) teriparatide	0.58	—

USP Monographs

www.webofpharma.com

Table 3 *(continued)*

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Teriparatide	1.0	—
Total of methionyl sulfoxides of teriparatide [consisting of *Met+O(8)* teriparatide, *Met+O(18)* teriparatide, and *Met+O(8,18)*]	—	0.5
Largest other individual related impurities	—	0.5
Total impurities	—	2.5

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 50 USP Endotoxin Units/mg of Teriparatide drug substance
- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩: The total aerobic microbial count is NMT 100 cfu/g of Teriparatide drug substance.
- **WATER DETERMINATION** ⟨921⟩, *Method I, Method Ic*: NMT 10.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Unless otherwise prescribed, store in an airtight container, protected from light, at a temperature lower than –10°.
- **LABELING:** Label it to indicate that the material has been produced by methods based on recombinant DNA technology.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Teriparatide RS

Teriparatide Injection

DEFINITION

Teriparatide Injection is a sterile solution of Teriparatide in Water for Injection. It contains NLT 90.0% and NMT 105.0% of the labeled amount of teriparatide ($C_{181}H_{291}N_{55}O_{51}S_2$). The formulation may contain a suitable preservative.

IDENTIFICATION

- **A.** The ratio of the retention time of the teriparatide peak of the *Sample solution* to that of the *Standard solution* is 1.00 ± 0.03, as obtained in the *Assay*.
- **B. BIOIDENTITY**

Basic medium: Sterile Dulbecco's modified Eagle's medium (DMEM) containing high glucose, L-glutamine, pyridoxine hydrochloride, and 25 mM HEPES[1]

Growth medium: 10% fetal bovine serum (FBS) in *Basic medium* prepared as follows. To 450 mL of *Basic medium*, add 50 mL of heat inactivated irradiated FBS[2] and mix. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

Serum starve medium: 0.1% (w/v) bovine serum albumin (BSA)-fraction V in *Basic medium* prepared as follows. Add 0.50 g of BSA-fraction V to 500 mL of *Basic medium*, and mix. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

Vehicle: 150 mM sodium chloride, 0.1% (w/v) BSA-fraction V, and 0.001 N hydrochloric acid prepared as follows. Dissolve 1.75 g of sodium chloride and 0.2 g of BSA-fraction V in 180 mL of water. Add 20.0 mL of 0.01 N hydrochloric acid to the solution. Sterilize the solution by filtering the solution using a 0.22-µm, low-protein-binding, sterile filter unit and store at 2°–8°.

600 mM IBMX solution: Add 0.30 g of 3-isobutyl-1-methyl-xanthine (IBMX) to 2.25 mL of dimethyl sulfoxide (DMSO) and vortex to dissolve. Aliquot and store at –18° to –24°.

Cell culture preparation: Culture UMR-106 rat osteogenic sarcoma cell line[3] in *Growth medium* at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2) atmosphere in a humidified incubator. Cells should be passaged when the cultures are approximately 65%–85% confluent as determined microscopically at an appropriate magnification (such as 200–400×). [NOTE—Do not allow the cells to go beyond 85% confluence for cell passage or analysis.] For cell passage, remove the media from the cells. Rinse the cells once with sterile Dulbecco's phosphate buffer saline (DPBS) without calcium and magnesium.[4] Rinse the cells with approximately 5–10 mL of 0.25% (w/v) trypsin in 1 mM EDTA solution,[5] and immediately remove all but approximately 1–2 mL of the 0.25% (w/v) trypsin with 1 mM EDTA solution from the cells. Allow the 0.25% (w/v) trypsin with 1 mM EDTA solution to remain on the cells for 1–2 min at a temperature ranging from room temperature to 37° until the cells begin to round and release from the culture surface. Resuspend cells in an appropriate volume of *Growth medium* and count. Cells are passaged into a T162 cm^2 flask with approximately 30 mL of *Growth medium* at 0.75–6 × 10^6 cells per flask.

Preparation of cells for analysis: Use cells that are between passages 4 and 20, 65%–85% confluent, and 2–5 days post-passage. Following the procedure described in *Cell culture preparation*, prepare an appropriate volume of cell solution at 0.75 × 10^5 viable cells per mL in *Growth medium*. To 96-well flat-bottom plates,[6] add 200 µL of cell solution per well. Mix cell solution frequently during dispensing to prevent cells from settling and to ensure consistent density throughout the plate. Incubate plates for 18–26 h at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2). Following the incubation, remove media from the cells and add 200 µL of *Serum starve medium* to each well. Incubate plates for 18–26 h at 37 ± 2° and 10 ± 2% carbon dioxide (CO_2).

Diluent A: 1 mM IBMX in Hanks' balanced salt solution (HBSS) with phenol red[7] prepared as follows. Very slowly add 500 µL of warmed (30°–40°) *600 mM IBMX solution* to 300 mL of warmed HBSS with phenol red while continuously mixing on a stir plate. [NOTE—It is acceptable to substitute HBSS containing phenol red with HBSS without phenol red.[8] HBSS containing phenol red is preferred because it is easier to visualize the wells.]

Assay/lysis solution: 0.55 mM IBMX in assay/lysis buffer from a suitable cAMP immunoassay kit for 96-well plates[9] prepared as follows. Very slowly add 27.5 µL of warmed *600 mM IBMX solution* to 30 mL of warmed assay/lysis buffer.

[8] ThermoFisher catalog number 14025092 or suitable equivalent.
[9] ThermoFisher catalog number 4412182 or 4412183 or suitable equivalent.

www.webofpharma.com

Diluted cAMP-AP conjugate: Dilute the cAMP-alkaline phosphatase (AP) conjugate (1:100) with the conjugate dilution buffer from the same cAMP kit used for the *Assay/lysis solution*.[9] Prepare 2.5 mL of diluted conjugate per 96-well plate. Use within 4 h.

Standard stock solution: Dissolve the contents of 1 vial of USP Teriparatide RS in an appropriate volume of *Vehicle* to obtain a 250-µg/mL solution.

Standard solution: Prepare a 1-µM solution by mixing 82.4 µL of the *Standard stock solution* with 4.92 mL of *Vehicle*.

Sample solution: Prepare a 1-µM solution by diluting the Injection with *Vehicle*.

[NOTE—Following the preparation of the *Standard solution* and *Sample solution*, the diluting and delivery of the samples to the cells must occur within 45 min. Dilutions must be made in borosilicate glass tubes. Allow all solutions to equilibrate to room temperature prior to use.]

Preparation of diluted standard solutions and sample solutions: Prepare three separate dilution sets from the *Standard solution* and *Sample solution* in borosilicate glass tubes at various concentrations (e.g., 3.0, 1.0, 0.333, 0.167, 0.0833, 0.0417, 0.0208, 0.0069, and 0.0023 nM) using *Diluent A*. [NOTE—Only a single standard and a single sample (three separate dilution sets for each) should be prepared and run for each assay plate. For each assay plate, a freshly prepared standard and sample must be used. Each assay consists of at least three independent runs (or three assay plates).]

Analysis: Following cell serum starvation, wash cells at least twice with 300 µL per well of HBSS without phenol red[4] at room temperature. Place 100 µL per well of each dilution prepared from the *Standard solution* and *Sample solution* into appropriate wells of the plate. [NOTE—See *Design and Development of Biological Assays* ⟨1032⟩ for helpful information on randomization of samples and plate layout.] Incubate the plates at 25 ± 2° for 20 ± 5 min with gentle shaking. Discard the solutions and wash cells twice with 300 µL per well of HBSS without phenol red at room temperature. Add 100 µL per well of *Assay/lysis solution* and incubate the plates at 37 ± 2° for 30 ± 5 min to lyse the cells. Mix cell lysate with a multi-channel pipette prior to transfer. Transfer 60 µL of cell lysate to the appropriate wells of the 96-well assay plate from the cAMP immunoassay assay kit. Add 30 µL of *Diluted cAMP-AP conjugate* to each well containing the cell lysate that is derived from the cells treated with the *Diluted standard solutions* or *Diluted sample solutions*, and mix on a plate shaker for approximately 1–2 min. Add 60 µL of anti-cAMP antibody from the cAMP kit to the wells and incubate at 25 ± 2° for 60 ± 5 min on a plate shaker with gentle shaking. Discard the solutions and wash the plates six times with 300 µL per well of wash buffer from the cAMP kit, blotting the plate between each wash. Add 100 µL of substrate/enhancer solution from the cAMP kit to each well. Mix on a plate shaker for 1–2 min. Remove the plates from the shaker and incubate the plates at room temperature (such as 20°–27°) for 40 ± 10 min. Read the plate in a suitable microtiter plate luminescence reader.

Calculations: Fit a constrained 4-parameter logistic curve to the median relative light units (RLU) at each concentration from the *Diluted standard solutions* and *Diluted sample solutions*. Calculate the relative potency of each teriparatide sample compared to the standards of each run by EC_{50}. Determine the combined weighted percent mean relative potency of the runs following *Design and Analysis of Biological Assays* ⟨111⟩, *Combination of Independent Assays, Method 2*.

System suitability

Samples: *Diluted standard solutions* and *Diluted sample solutions*

Suitability requirements

Asymptote ratio: NLT 3.0 for the ratio of the upper asymptote to the lower asymptote of the 4-parameter logistic curve from each run of both the *Diluted standard solutions* and *Diluted sample solutions*

Slope: NLT 1.0 for each run

L term: NMT 0.2000 for each run. [NOTE—L term is determined by subtracting the log of the 95% lower confidence limit from the log of the 95% upper confidence limit of the relative potency.]

Combined assay L term: NMT 0.1500

[NOTE—See *Design and Analysis of Biological Assays* ⟨111⟩, *Combination of Independent Assays, Method 2* for the calculation.]

Acceptance criteria: 75%–125% of the relative potency to USP Teriparatide RS on the as-is basis

ASSAY

• **PROCEDURE**

0.2 M sulfate buffer: 28.4 g/L of anhydrous sodium sulfate in water. Adjust with 85% phosphoric acid to a pH of 2.3.

Solution A: Acetonitrile and *0.2 M sulfate buffer* (10:90)

Solution B: Acetonitrile and *0.2 M sulfate buffer* (50:50)

Mobile phase: *Solution A* and *Solution B* (61:39). [NOTE—The *Mobile phase* composition may be adjusted to obtain the retention time of approximately 8 min for the teriparatide main peak.]

Diluent for standard solution: Acetonitrile and *0.2 M sulfate buffer* (25:75)

0.27 M sulfate buffer: 38.8 g/L of anhydrous sodium sulfate in water. Adjust with 85% phosphoric acid to a pH of 2.3.

Diluent for sample solution: Acetonitrile and *0.27 M sulfate buffer* (31:69)

Standard solutions: Prepare in triplicate 100 µg/mL of USP Teriparatide RS in *Diluent for standard solution*. *Standard solutions* are stable for 48 h when stored at 2°–8° in a sealed container.

Sample solutions: Prepare in duplicate approximately 50–100 µg/mL of teriparatide in *Diluent for sample solution*. *Sample solutions* are stable for 48 h when stored at 2°–8° in a sealed container.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L1

Temperatures

Autosampler: 5°

Column: 40°

Flow rate: 0.8 mL/min

Injection volume: 25 µL

Run time: 20 min

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5 for the teriparatide peak

Relative standard deviation: NMT 1.25% calculated from three injections of one *Standard solution*

Analysis

Samples: *Standard solutions* and *Sample solutions*

Measure the peak responses corresponding to teriparatide. Calculate the concentration of teriparatide (C_S), in µg/mL, in each of the *Standard solutions*:

$$C_S = (L_S/V_S)$$

www.webofpharma.com

L_S = content of teriparatide in USP Teriparatide RS (µg)
V_S = volume of *Diluent for standard solution* used for each *Standard solution* (mL)

Determine the average concentration of teriparatide (C_M) for all three *Standard solutions*.
Calculate the mean response factor (F_M) for all three *Standard solutions*:

$$F_M = (r_M/C_M)$$

r_M = average peak response of teriparatide from the *Standard solutions*
C_M = average concentration of teriparatide in the *Standard solutions* (µg/mL)

Calculate the concentration of teriparatide (C_U), in µg/mL, in the portion of Injection taken:

$$C_U = (r_U \times F)/F_M$$

r_U = peak response of teriparatide from the *Sample solution*
F = dilution factor used to prepare the *Sample solution*
F_M = mean response factor for all three *Standard solutions*

Calculate the percentage of the labeled amount of teriparatide in the portion of Injection taken:

$$\text{Result} = (C_U/C_L) \times 100$$

C_U = concentration of teriparatide in the portion of Injection taken (µg/mL)
C_L = nominal concentration of teriparatide in the portion of Injection taken (µg/mL)

Acceptance criteria: 90.0%–105.0%

PRODUCT-RELATED SUBSTANCES AND IMPURITIES

• **PRODUCT-RELATED IMPURITIES**

0.2 M sulfate buffer: 28.4 g/L of anhydrous sodium sulfate in water. Adjust with 85% phosphoric acid to a pH of 2.3.
Solution A: Acetonitrile and *0.2 M sulfate buffer* (10:90)
Solution B: Acetonitrile and *0.2 M sulfate buffer* (50:50)
[NOTE—If the sodium sulfate precipitates, gentle heating and continuous stirring may be required. The sodium sulfate should not re-precipitate if this procedure is followed.]
Mobile phase: See *Table 1*. [NOTE—The *Mobile phase* composition may be adjusted to obtain the desired retention time of the teriparatide peak. *Solution B* percentage at 8 min and 68 min may also be changed, if necessary, to obtain the desired retention time, but the same gradient slopes should be maintained. A change of 0.5% of *Solution B* will alter the retention time of the main peak approximately 100 s.]

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
8	76	24
68	60	40
75	0	100
80	0	100

System suitability solution: Use an appropriate solution containing approximately 0.8% of the first post-main peak in *Solution A*. [NOTE—Teriparatide containing the first post-main peak may be prepared by dissolving teriparatide in water to obtain a concentration of 2 mg/mL. Adjust with hydrochloric acid to a pH of 3.0. Incubate this solution at 50° for 9 days. The solution may be aliquoted and stored frozen. Dilute 1:3 with *Solution A* to approximately the same concentration as the Injection portion prior to injection. The first post-main peak is a degradation product resulting from this process and elutes immediately after the teriparatide peak. The relative retention times for teriparatide and this first post-main peak are 1.00 and 1.02, respectively.]
Sample solution: Use the solution from an undiluted Injection container.
Blank: *Solution A*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L1
Temperatures
Autosampler: 5°
Column: 40°
Flow rate: 1.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—The retention time for teriparatide is 60.83–66.67 min.]
Suitability requirements
Peak-to-valley ratio: The ratio of the height of the first post-main peak to the valley between the teriparatide peak and the first post-main peak is NLT 1.5.
Tailing factor: NMT 2.0 for the teriparatide peak
Analysis
Sample: *Sample solution*
Measure the peak responses for all integrated peaks.
Calculate the percentage of a related impurity, rhPTH (1–30) (a cleavage product of teriparatide at Asn 30), in the portion of Injection taken:

$$\text{Result} = (r_{rhPTH(1-30)}/r_T) \times 100$$

$r_{rhPTH(1-30)}$ = peak response of rhPTH(1–30)
r_T = sum of all the peak responses excluding peaks due to added preservatives or excipients

Calculate the percentage of a related impurity, teriparatide succinimide (30) (formation of succinimide on Asn 30), in the portion of Injection taken:

$$\text{Result} = (r_{Suc}/r_T) \times 100$$

r_{Suc} = peak response of teriparatide succinimide (30)
r_T = sum of all the peak responses excluding peaks due to added preservatives or excipients

Calculate the percentage of the largest other related impurity of teriparatide in the portion of Injection taken:

$$\text{Result} = (r_i/r_T) \times 100$$

USP Monographs

www.webofpharma.com

r_i = peak response of the largest other related impurity of teriparatide
r_T = sum of all the peak responses excluding peaks due to added preservatives or excipients

Calculate the percentage of total related impurities in the portion of Injection taken:

$$\text{Result} = [(r_T - r_S)/r_T] \times 100$$

r_T = sum of all the peak responses excluding peaks due to added preservatives or excipients
r_S = peak response of teriparatide

Acceptance criteria: See *Table 2*.

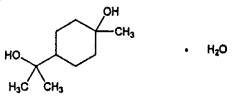

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
rhPTH (1–30)	0.77–0.78	1.2
Teriparatide succinimide (30)	0.98–0.99	1.2
Teriparatide	1.0	—
Largest other individual related impurity	—	1.0
Total impurities	—	7.0

SPECIFIC TESTS

Terpin Hydrate Oral Solution

DEFINITION
Terpin Hydrate Oral Solution contains, in each 100 mL, NLT 1.53 g and NMT 1.87 g of terpin hydrate ($C_{10}H_{20}O_2 \cdot H_2O$).

ASSAY
- **PROCEDURE**

Internal standard solution: 20 mg/mL of biphenyl in chloroform

Standard solution: Transfer 170 mg of USP Terpin Hydrate RS to a 100-mL volumetric flask, dissolve in 5 mL of alcohol, add 5.0 mL of *Internal standard solution*, and dilute with chloroform to volume.

Sample solution: Pipet 10 mL of Oral Solution into a separator. Add 20 mL of water and 10 mL of 5 N sodium hydroxide, and extract with three 25-mL portions of chloroform, filtering each, successively, through cotton. Rinse the cotton with chloroform. To the combined rinse and extracts add 5.0 mL of *Internal standard solution*.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 3.5-mm × 1.2-m glass; packed with 6% G1 on support S1A
Temperatures
Injection port: 260°
Detector: 260°
Column: 120°
Carrier gas: Nitrogen
Flow rate: Necessary to yield approximate retention times of 7 min for terpin and 11 min for biphenyl
Injection volume: 1 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between the terpin and biphenyl peaks
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the amount of terpin hydrate ($C_{10}H_{20}O_2 \cdot H_2O$) in 100 mL of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times W_S \times V$$

R_U = peak response ratio of terpin to biphenyl from the *Sample solution*
R_S = peak response ratio of terpin to biphenyl from the *Standard solution*
W_S = weight of USP Terpin Hydrate RS, calculated on the anhydrous basis (g)
V = volume of sample, 10 mL

Acceptance criteria: 1.53–1.87 g

SPECIFIC TESTS
- **ALCOHOL DETERMINATION,** *Method II* ⟨611⟩ : 90.0%–110.0% of the labeled amount of C_2H_5OH

  USP Terpin Hydrate RS

Terpin Hydrate and Codeine Oral Solution

» Terpin Hydrate and Codeine Oral Solution contains, in each 100 mL, not less than 1.53 g and not more than 1.87 g of terpin hydrate ($C_{10}H_{20}O_2 \cdot H_2O$), and not less than 180 mg and not more than 220 mg of codeine ($C_{18}H_{21}NO_3 \cdot H_2O$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Terpin Hydrate RS
USP Codeine Phosphate RS

Identification—
Developing solvent—Prepare a mixture of methylene chloride and methanol (9:1).
Standard solution A—Dissolve a suitable quantity of USP Terpin Hydrate RS in methylene chloride to obtain a solution having a concentration of about 3 mg per mL. [NOTE—A small volume of methanol may be used to aid dissolution of the terpin hydrate.]
Standard solution B—Transfer 20 mg of USP Codeine Phosphate RS to a suitable separator containing 10 mL of water, add 1 mL of 1 N sodium hydroxide, and mix. Add 10 mL of methylene chloride, and shake for 1 minute. Allow the layers to separate, and drain the lower organic layer into a suitable flask. Discard the aqueous layer.
Test solution—Transfer 10 mL of Oral Solution to a suitable separator containing 10 mL of water, and add 1 mL of 1 N sodium hydroxide. Add 10 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear lower organic layer as the *Test solution*.
Procedure—Apply separately 5 µL of *Standard solution A*, *Standard solution B*, and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a chromatographic chamber containing the *Developing solvent* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow the plate to dry. Examine the plate under short-wavelength UV light, and mark the location of the codeine spots. Spray the plate with phosphomolybdic acid TS, and heat at 105° for 5 minutes. The terpin hydrate spots appear blue on a yellow background. The R_F values of the spots due to terpin hydrate and codeine obtained from the *Test solution* correspond to those obtained from *Standard solutions A* and *B*, respectively.
Alcohol Determination, *Method II* ⟨611⟩: between 90.0% and 110.0% of the labeled amount of C_2H_5OH.

Assay for terpin hydrate—
Internal standard solution—Prepare a chloroform solution containing 20 mg of biphenyl and 2.6 mg of *N*-phenylcarbazole in each mL.
Standard preparation—Transfer about 26 mg of USP Codeine Phosphate RS and about 170 mg of USP Terpin Hydrate RS, both accurately weighed, to a separator, add 5 mL of alcohol, shake to dissolve the terpin hydrate, add 25 mL of water to dissolve the codeine phosphate, add 10 mL of 5 N sodium hydroxide, and extract with three 25-mL portions of

USP Monographs

www.webofpharma.com

chloroform, filtering each, successively, through cotton. Rinse the cotton with chloroform. To the combined rinse and extracts add 5.00 mL of *Internal standard solution*, and mix.

Assay preparation—Pipet 10 mL of Oral Solution into a separator, add 20 mL of water and 10 mL of 5 N sodium hydroxide, and extract with three 25-mL portions of chloroform, filtering each, successively, through cotton. Rinse the cotton with chloroform. To the combined rinse and extracts add 5.00 mL of *Internal standard solution*, and mix.

Chromatographic system and *System suitability*—Proceed as directed in the *Assay* under *Terpin Hydrate*. [NOTE—Heat the column to 230° to remove the *N*-phenylcarbazole and codeine from prior injections.]

Procedure—Inject about 1 µL of the *Standard preparation* into a suitable gas chromatograph, and record the chromatogram. Similarly, inject about 1 µL of the *Assay preparation*, and record the chromatogram. Calculate the quantity, in mg, of terpin hydrate ($C_{10}H_{20}O_2 \cdot H_2O$) in each mL of the Oral Solution taken by the formula:

$$0.1(190.28/172.27)W_S(R_U/R_S)$$

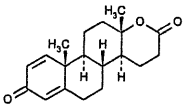
in which 190.28 and 172.27 are the molecular weights of terpin hydrate ($C_{10}H_{20}O_2 \cdot H_2O$) and anhydrous terpin ($C_{10}H_{20}O_2$); respectively, W_S is the weight, in mg, of USP Terpin Hydrate RS, calculated on the anhydrous basis; and R_U and R_S are the area-ratios of terpin to biphenyl obtained from the chromatograms for the *Assay preparation* and the *Standard preparation*, respectively.

Assay for codeine—

Internal standard solution—Prepare as directed under *Assay for terpin hydrate*.

Standard preparation—Evaporate the remaining *Standard preparation* for Oral Solution from the *Assay for terpin hydrate* nearly to dryness, and dissolve the residue in about 20 mL of chloroform.

Assay preparation—Evaporate the remaining *Assay preparation* for Oral Solution from the *Assay for terpin hydrate* nearly to dryness, and dissolve the residue in about 20 mL of chloroform.



Chromatographic system and *System suitability*—Proceed as directed in the *Assay* under *Terpin Hydrate*, except to maintain the temperature of the column at 230° instead of 120°.

Procedure—Proceed as directed under *Assay for terpin hydrate*, except to maintain the temperature of the column at 230° instead of 120°. The retention times for *N*-phenylcarbazole and codeine are about 7 minutes and 10 minutes, respectively. Calculate the quantity, in mg, of codeine ($C_{18}H_{21}NO_3 \cdot H_2O$) in each mL of the Oral Solution taken by the formula:

$$0.1(317.39/397.37)W_S(R_U/R_S)$$

in which 317.39 and 397.37 are the molecular weights of codeine ($C_{18}H_{21}NO_3 \cdot H_2O$) and codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4$), respectively; W_S is the weight, in mg, of USP Codeine Phosphate RS; and R_U and R_S are the area-ratios of codeine to *N*-phenylcarbazole obtained from the chromatograms for the *Assay preparation* and the *Standard preparation*, respectively.

Testolactone

$C_{19}H_{24}O_3$ 300.39

D-Homo-17a-oxaandrosta-1,4-diene-3,17-dione;
13-Hydroxy-3-oxo-13,17-secoandrosta-1,4-dien-17-oic acid δ-lactone [968-93-4].

DEFINITION

Testolactone contains NLT 95.0% and NMT 105.0% of testolactone ($C_{19}H_{24}O_3$), calculated on the dried basis.

ASSAY

• **PROCEDURE**

Isoniazid reagent: Dissolve 1.0 g of isoniazid in 500 mL of methanol. Add 1.25 mL of hydrochloric acid, and dilute with methanol to 1000 mL.

Standard stock solution: 30 µg/mL of USP Testolactone RS in chloroform

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Add 10.0 mL of *Isoniazid reagent*, place the flask in a water bath maintained at a temperature of 55 ± 2°, and allow to stand for 70 min. Cool, and dilute with chloroform to volume.

Sample stock solution: 30 µg/mL of Testolactone in chloroform

Sample solution: Transfer 5.0 mL of *Sample stock solution* to a 25-mL volumetric flask. Add 10.0 mL of *Isoniazid reagent*, place the flask in a water bath maintained at a temperature of 55 ± 2°, and allow to stand for 70 min. Cool, and dilute with chloroform to volume.

Blank solution: Transfer 5.0 mL of chloroform to a 25-mL volumetric flask. Add 10.0 mL of *Isoniazid reagent*, place the flask in a water bath maintained at a temperature of 55 ± 2°, and allow to stand for 70 min. Cool, and dilute with chloroform to volume.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum absorbance of 415 nm

Cell: 1 cm

Blank: *Blank solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of testolactone ($C_{19}H_{24}O_3$) in the portion of Testolactone taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Testolactone RS in the *Standard solution* (mg/mL)

www.webofpharma.com

C_U = concentration of Testolactone in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%

• **ORGANIC IMPURITIES**

Standard solution: 0.2 mg/mL of USP Testolactone RS in acetone

Sample solution: 5 mg/mL of Testolactone in acetone

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Adsorbent: Coat a 20- × 20-cm thin-layer chromatographic plate with a 0.25-mm layer of chromatographic silica gel mixture. Dry for 15 min at room temperature, heat at 105° for 1 h, and cool in a desiccator. Divide the area of the plate into three approximately equal sections, use the left and right sections for the *Sample solution* and the *Standard solution*, respectively, and use the center section for the blank.

Application volume: 10 µL for the *Standard solution*; 20 µL for the *Sample solution*

Developing solvent system: Butyl acetate and acetone (4:1)

Analysis: Apply the *Standard solution* and *Sample solution* 2.5 cm from the bottom of the designated sections of the plate, and dry the spots with a current of air. Develop the chromatogram in the *Developing solvent system*, until the solvent front has moved to within 1 cm of the top of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light.

Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, NMT two impurities are found in the chromatogram of the *Sample solution*, and the size and color of the spot representing any impurity obtained from the *Sample solution* are not greater or more intense than those of the principal spot of the *Standard solution*.

USP Testolactone RS

Testolactone Tablets

DEFINITION

Testolactone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of testolactone ($C_{19}H_{24}O_3$).

IDENTIFICATION

• **A.**

Hydroxylamine reagent: Mix 5 mL of a solution of hydroxylamine hydrochloride in methanol (3.5 in 100) with 15 mL of a solution of potassium hydroxide in methanol (5.6 in 100), and use this reagent within 2 h after mixing. Store the solution of hydroxylamine hydrochloride in methanol and the solution of potassium hydroxide in methanol in a refrigerator. Discard both after 1 month.

Iron reagent: Dissolve 1.5 g of ferric chloride in 30 mL of water, add 3 mL of perchloric acid and 15 mL of nitric acid, and heat the solution until dense, white fumes are produced. Cool, add 40 mL of water and 10 mL of nitric acid, and dilute with perchloric acid to 100 mL. [NOTE—This concentrate may be stored and used for several months.] Transfer 4.0 mL of this concentrate to a 100-mL volumetric flask, add 36 mL of alcohol, and dilute with water to volume.

Analysis: Place a portion of finely powdered Tablets, equivalent to 250 mg of testolactone, in a 100-mL volumetric flask. Add 85 mL of chloroform, and shake by mechanical means for 30 min. Add chloroform to volume, and centrifuge the solution. Transfer 2 mL of the supernatant to a small test tube, and evaporate with the aid of a gentle current of air to dryness. Add 0.1 mL of *Hydroxylamine reagent*, heat in a water bath at 60° for 1 min, then add 1 mL of *Iron reagent*.

Acceptance criteria: A rose-violet color is produced.

Change to read:

• **B. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Sample: Place a portion of finely powdered Tablets, equivalent to 100 mg of testolactone, in a glass-stoppered, 35-mL centrifuge tube. Add 20 mL of chloroform, insert the stopper, and shake by mechanical means for 10 min. Centrifuge the mixture, and filter the supernatant into a 50-mL beaker. Evaporate on a steam bath to dryness, and dry the residue under vacuum at 100° for 3 h.

Acceptance criteria: Meet the requirements

ASSAY

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 10 µg per mL.
Medium: methanol.
Melting range ⟨741⟩: between 153° and 157°.
Specific rotation ⟨781S⟩: between +101° and +105°.
Test solution: 10 mg per mL, in dioxane.
Loss on drying ⟨731⟩—Dry it in vacuum over phosphorus pentoxide for 4 hours: it loses not more than 1.0% of its weight.

Assay—
Standard preparation—Prepare as directed under *Single-Steroid Assay* ⟨511⟩, using USP Testosterone RS.
Assay preparation—Accurately weigh about 20 mg of Testosterone, previously dried; dissolve in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 mL; and mix.
Procedure—Proceed as directed for *Procedure* under *Single-Steroid Assay* ⟨511⟩, using a solvent system consisting of a mixture of benzene and ethyl acetate (1:1), through the fourth sentence of the second paragraph under *Procedure*. Then centrifuge the tubes for 5 minutes, and determine the absorbances of the supernatant in 1-cm cells at the wavelength of maximum absorbance at about 241 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{19}H_{28}O_2$ in the portion of Testosterone taken by the formula:

$$10C(A_U/A_S)$$

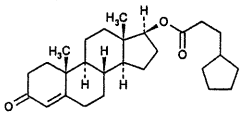
in which *C* is the concentration, in mg per mL, of USP Testosterone RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

Testosterone Injectable Suspension

» Testosterone Injectable Suspension is a sterile suspension of Testosterone in an aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{28}O_2$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

USP Monographs



www.webofpharma.com

USP Reference standards ⟨11⟩—
USP Testosterone RS
Identification—The testosterone obtained by filtration and washing, as directed in the *Assay*, and dried at 105° to constant weight, meets the requirements for *Identification* tests *A* and *B* under *Testosterone*.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 3.5 USP Endotoxin Units per mg of testosterone.
Uniformity of dosage units ⟨905⟩: meets the requirements.
pH ⟨791⟩: between 4.0 and 7.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Transfer an accurately measured volume of previously well-mixed Injectable Suspension, equivalent to about 100 mg of testosterone, to a fine-porosity, sintered-glass filtering crucible, previously dried at 105° for 1 hour, and filter with suction. If the filtrate is not clear, again pass it through the same filter into a second receiver. Wash the residue in the filter with several 5-mL portions of water until 2 mL of the last washing, when evaporated on a steam bath, leaves a negligible residue. [NOTE—If the Injectable Suspension is passed through the filter twice, rinse the first receiver with the portions of water before passing them through the filter.] Dry the crucible and the collected testosterone at 105° for 1 hour. Completely dissolve the testosterone with five 25-mL portions of methanol, passing each portion through the crucible under gentle suction, and transfer the combined methanol solution to a 200-mL volumetric flask. Rinse the crucible and receiver with two 25-mL portions of methanol, add the rinsings to the main solution, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with methanol to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Testosterone RS, in the same medium having a known concentration of about 10 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 241 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of $C_{19}H_{28}O_2$ in each mL of the Injectable Suspension taken by the formula:

$$(10C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Testosterone RS in the Standard solution, V is the volume, in mL, of Injectable Suspension taken, and A_U and A_S are the absorbances of the solution from the Injectable Suspension and the Standard solution, respectively.

Testosterone Cypionate

$C_{27}H_{40}O_3$ 412.60
Androst-4-en-3-one, 17-(3-cyclopentyl-1-oxopropoxy)-, (17β)-.
Testosterone cyclopentanepropionate [58-20-8].

» Testosterone Cypionate contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{40}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Cholesteryl Caprylate RS
$C_{35}H_{60}O_2$ 512.86
USP Testosterone Cypionate RS

Change to read:

Identification, ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).
Melting range ⟨741⟩: between 98° and 104°.
Specific rotation ⟨781S⟩: between +85° and +92°.
Test solution: 20 mg per mL, in chloroform.
Loss on drying ⟨731⟩—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.2%.
Free cyclopentanepropionic acid—Dissolve 500 mg in 10 mL of alcohol that previously has been neutralized to a faint blue color following the addition of 2 or 3 drops of bromothymol blue TS, and promptly titrate with 0.01 N sodium hydroxide VS: not more than 0.70 mL of 0.01 N sodium hydroxide is required (0.20% of cyclopentanepropionic acid).

Assay—
Internal standard solution—Dissolve 80 mg of USP Cholesteryl Caprylate RS in a mixture of methanol and chloroform (4:1) in a 100-mL volumetric flask, then add the same solvent mixture to volume.
Standard preparation—Weigh accurately about 10 mg of USP Testosterone Cypionate RS into a suitable vial, add by pipet 10 mL of *Internal standard solution*, and mix.
Assay preparation—Prepare as directed for *Standard preparation*, using an accurately weighed portion of about 10 mg of Testosterone Cypionate instead of the Reference Standard.
Procedure—Inject 1 µL of the *Assay preparation* and the *Standard preparation*, successively, into a suitable gas chromatograph fitted with a flame-ionization detector. Under typical conditions, the instrument contains a 3-mm × 1.2-m glass column packed with 1% (w/w) phase G6 on packing S1AB. The column temperature is maintained at 260° and the helium carrier gas flows at 50 mL per minute. In a suitable chromatogram, the resolution factor, R (see *Chromatography* ⟨621⟩), is not less than 3 between the internal standard and testosterone cypionate peaks, and five replicate injections of a single *Standard preparation* show a coefficient of variation of not more than 2% in the peak area ratio of testosterone cypionate to internal standard. Measure the areas under the peaks for testosterone cypionate and cholesteryl caprylate in each chromatogram. Calculate the ratio, R_U, of the area of the testosterone cypionate peak to the area of the internal standard peak in the chromatogram from the *Assay preparation*, and similarly calculate the ratio, R_S, in the chromatogram from the *Standard preparation*. Calculate the quantity, in mg, of $C_{27}H_{40}O_3$ in the portion of Testosterone Cypionate taken by the formula:

$$W(R_U/R_S)$$

in which W is the weight, in mg, of USP Testosterone Cypionate RS in the *Standard preparation*, and the other terms are as defined therein.

www.webofpharma.com

Testosterone Cypionate Injection

» Testosterone Cypionate Injection is a sterile solution of Testosterone Cypionate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{27}H_{40}O_3$. It may contain a suitable solubilizing agent.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

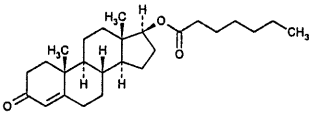
USP Reference standards ⟨11⟩—
USP Cholesteryl Caprylate RS
$C_{35}H_{60}O_2$ 512.86
USP Testosterone Cypionate RS

Identification—Dilute a suitable volume of Injection with chloroform to obtain a solution having a concentration of about 400 µg of testosterone cypionate per mL. Prepare a 20- × 20-cm thin-layer chromatographic plate (see *Chromatography* ⟨621⟩), coated with a 0.25-mm layer of chromatographic siliceous earth, by placing it in a developing chamber containing and equilibrated with a mixture of chloroform and corn oil (90:10), and allowing the solvent front to move about three-fourths of the length of the plate. Remove the plate, and allow the chloroform to evaporate. Apply 10 µL each of the solution under test and of a solution of USP Testosterone Cypionate RS in chloroform containing about 400 µg per mL on the plate, on a line about 2.5 cm from the bottom edge and about 1.5 cm apart. Place the plate in a developing chamber that contains and has been equilibrated with a mixture of methanol and water (90:10) previously saturated with corn oil. Develop the chromatogram until the solvent front has moved to about 10 cm above the line of application. Remove the plate, and heat in an oven at 105° for a few minutes. Spray the plate with a mixture of alcohol and sulfuric acid (3:1), and heat in an oven at 105° for 1 to 2 minutes. Observe the plate under long-wavelength UV light: the R_F value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Internal standard solution and *Standard preparation*—Prepare as directed in the *Assay* under *Testosterone Cypionate.*



Assay preparation—Transfer 1 mL of Injection, accurately measured, into a glass-stoppered, 50-mL centrifuge tube. Add 30 mL of a mixture of methanol and water (9:1), insert the stopper, and shake for 15 minutes. Centrifuge, remove the dilute methanol layer without disturbing the oil, and transfer it to a 200-mL volumetric flask. Repeat the extraction with three additional 30-mL portions of the dilute methanol, collecting the combined extracts in the volumetric flask. Dilute the combined extracts with the dilute methanol to volume, mix, and chill the contents of the flask to –8°. Remove the flask from the freezer, and immediately filter a portion of the contents. Allow the filtrate to reach room temperature, transfer a portion of it, equivalent to about 3 mg of testosterone cypionate, to a suitable vial, and evaporate to dryness. Add by pipet 3 mL of *Internal standard solution*, and shake vigorously to dissolve the residue.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Testosterone Cypionate.* Calculate the quantity, in mg, of $C_{27}H_{40}O_3$ in the portion of Injection taken by the formula:

$$600(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Testosterone Cypionate RS in the *Standard preparation;* and V is the volume, in mL, of the filtrate used in the *Assay preparation.*

Testosterone Enanthate

$C_{26}H_{40}O_3$ 400.59
Androst-4-en-3-one, 17-(1-oxoheptyl)oxy-, (17β)-.
Testosterone heptanoate [315-37-7].

» Testosterone Enanthate contains not less than 97.0 percent and not more than 103.0 percent of $C_{26}H_{40}O_3$.

Packaging and storage—Preserve in well-closed containers, and store in a cool place.

USP Reference standards ⟨11⟩—
USP Testosterone Enanthate RS

Identification—

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 10 µg per mL.
Medium: alcohol.
Absorptivities at 240 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

C: Reflux 25 mg with 2 mL of a 1 in 100 solution of potassium hydroxide in methanol for 1 hour. Cool the mixture, add 10 mL of water, filter, and wash the precipitate with water until the last washing is neutral to litmus. Dry the precipitate in vacuum at 60° for 3 hours: the testosterone so obtained melts between 151° and 157°.

Melting range ⟨741⟩: between 34° and 39°, the initial temperature of the bath not exceeding 20°.

Specific rotation ⟨781S⟩: between +77° and +82°.
Test solution: 20 mg per mL, in dioxane.

Water Determination, *Method I* ⟨921⟩: not more than 0.5%.

Free heptanoic acid—Dissolve 500 mg in 10 mL of alcohol that previously has been neutralized to a faint blue color following the addition of 2 or 3 drops of bromothymol blue TS, and promptly titrate with 0.01 N sodium hydroxide VS: not more than 0.6 mL of 0.01 N sodium hydroxide is required (0.16% of heptanoic acid).

Ordinary impurities ⟨466⟩—
Test solution: methanol.
Standard solution: methanol.
Eluant: a mixture of cyclohexane and ethyl acetate (2:1).
Visualization: 19.

USP Monographs

www.webofpharma.com

Limits—No individual impurity exceeds 1.0%, and the total of observed impurities does not exceed 2.0%.

Assay—Dissolve about 40 mg of Testosterone Enanthate, accurately weighed, in chloroform to make 100 mL, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, add chloroform to volume, and mix. Dissolve a suitable quantity of USP Testosterone Enanthate RS, accurately weighed, in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a Standard solution having a known concentration of about 40 µg per mL. Pipet 5 mL each of the solution of Testosterone Enanthate and the Standard solution into separate, glass-stoppered, 50-mL conical flasks, and place 5.0 mL of chloroform in a similar flask to provide a blank. Treat each flask as follows. Add 10.0 mL of a solution of 375 mg of isoniazid and 0.47 mL of hydrochloric acid in 500 mL of methanol, mix, and allow to stand for 45 minutes. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 380 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of $C_{26}H_{40}O_3$ in the Testosterone Enanthate taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Testosterone Enanthate RS in the Standard solution; and A_U and A_S are the absorbances of the solution of Testosterone Enanthate and the Standard solution, respectively.

Testosterone Enanthate Injection

» Testosterone Enanthate Injection is a sterile solution of Testosterone Enanthate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{26}H_{40}O_3$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

USP Reference standards ⟨11⟩—
USP Testosterone Enanthate RS

Identification—Dilute a suitable volume of Injection with chloroform to obtain a solution having a concentration of about 400 µg of testosterone enanthate per mL. Proceed as directed in the *Identification* test under *Testosterone Cypionate Injection*, beginning with "Prepare a 20- × 20-cm thin-layer chromatographic plate," but using USP Testosterone Enanthate RS. The R_F value of the principal spot obtained from the solution under test corresponds to that obtained from the Reference Standard solution.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Chromatographic solvent—Equilibrate, by shaking in a separator, 95 mL of alcohol, 5 mL of water, and 50 mL of chromatographic *n*-heptane. Allow the layers to separate.

Isoniazid reagent—Dissolve 375 mg of isoniazid and 0.47 mL of hydrochloric acid in 500 mL of methanol.

Standard preparation—Dissolve a suitable quantity of USP Testosterone Enanthate RS, accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a known concentration of about 40 µg per mL.

Assay preparation—Transfer to a 10-mL volumetric flask an accurately measured volume of Injection, equivalent to about 100 mg of testosterone enanthate, add chromatographic *n*-heptane to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, add chromatographic *n*-heptane to volume, and mix.

Procedure—Mix in a beaker 3 g of silanized chromatographic siliceous earth and 3 mL of the upper layer of the *Chromatographic solvent*. Pack the mixture into a 250- × 25-mm chromatographic tube that contains a small pledget of glass wool above the stem constriction. Mix in a beaker 3 g of silanized chromatographic siliceous earth and 2.0 mL of *Assay preparation*, transfer the mixture to the tube, and pack. Dry-wash the beaker with 1 g of silanized chromatographic siliceous earth, and transfer to the tube. Place a small pad of glass wool above the column packing. Pass 35 mL of the lower layer of the *Chromatographic solvent* through the column, and collect the eluate in a 50-mL volumetric flask. Add alcohol to volume, and mix. Pipet 10 mL of the resulting solution into a glass-stoppered, 50-mL conical flask, and evaporate on a water bath to dryness. Pipet 5 mL of methanol into the flask, and swirl to dissolve the residue. Pipet 5 mL of *Standard preparation* into a similar flask. To each flask add 10.0 mL of *Isoniazid reagent*, mix, and allow to stand for about 45 minutes. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 380 nm, with a suitable spectrophotometer, using as a blank 5 mL of methanol that has been treated similarly with *Isoniazid reagent*. Calculate the quantity, in mg, of $C_{26}H_{40}O_3$ in each mL of the Injection taken by the formula:

$$2.5(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Testosterone Enanthate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Testosterone Propionate

$C_{22}H_{32}O_3$ 344.49
Androst-4-en-3-one, 17-(1-oxopropoxy)-, (17β)-.
Testosterone propionate [57-85-2].

» Testosterone Propionate contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{32}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

Loss on drying ⟨731⟩—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.5% of its weight.
Assay—Proceed with Testosterone Propionate as directed in the *Assay* under *Testosterone Enanthate,* except to use USP Testosterone Propionate RS and otherwise substitute Testosterone Propionate throughout. Calculate the quantity, in mg, of $C_{22}H_{32}O_3$ in the Testosterone Propionate taken by the formula given therein.

Testosterone Propionate Injection

» Testosterone Propionate Injection is a sterile solution of Testosterone Propionate in a suitable vegetable oil. It contains not less than 88.0 percent and not more than 112.0 percent of the labeled amount of $C_{22}H_{32}O_3$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
USP Reference standards ⟨11⟩—
USP Testosterone Propionate RS
Identification—Dilute a suitable volume of Injection with chloroform to obtain a solution having a concentration of about 400 µg of testosterone propionate per mL. Proceed as directed in the *Identification* test under *Testosterone Cypionate Injection,* beginning with "Prepare a 20- × 20-cm thin-layer chromatographic plate," except to use USP Testosterone Propionate RS. The R_F value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Chromatographic solvent and *Isoniazid reagent*—Prepare as directed in the *Assay* under *Testosterone Enanthate Injection.*
Standard preparation—Prepare as directed in the *Assay* under *Testosterone Enanthate Injection,* using USP Testosterone Propionate RS.
Assay preparation—Transfer to a 10-mL volumetric flask an accurately measured volume of Injection, equivalent to about 100 mg of testosterone propionate, add chromatographic *n*-heptane to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, add chromatographic *n*-heptane to volume, and mix.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Testosterone Enanthate Injection.* Calculate the quantity, in mg, of $C_{22}H_{32}O_3$ in each mL of the Injection taken by the formula:

$$2.5(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Testosterone Propionate RS in the *Standard preparation,* V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

Add the following:

▲Testosterone Topical Solution

DEFINITION
Testosterone Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of testosterone ($C_{19}H_{28}O_2$).

IDENTIFICATION
- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY
- **PROCEDURE**

Solution A: Acetonitrile, water, and trifluoroacetic acid (10: 90: 0.05)
Solution B: Acetonitrile and trifluoroacetic acid (100: 0.05)
Mobile phase: See *Table 1.*

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
12	10	90
13	0	100
15	0	100
16	80	20
21	80	20

[NOTE—Post time of the gradient may be extended to more than 21 min to allow system to properly re-equilibrate.]
Diluent: Absolute alcohol and *Solution A* (50:50)
Standard stock solution: 0.8 mg/mL of USP Testosterone RS in absolute alcohol
Standard solution: 80 µg/mL of USP Testosterone RS from the *Standard stock solution* in *Diluent*
Sample solution: Nominally 80 µg/mL of testosterone from Topical Solution prepared as follows. Dispense a suitable amount of Topical Solution to a screw-cap glass container, seal the container, and sonicate briefly to disperse bubbles. [NOTE—Do not store sample in an open container.] Transfer a suitable volume of the solution to an appropriate volumetric flask and dilute with *Diluent* to volume. Sonicate the resulting solution. [NOTE—Sonication for 30–60 s may be suitable.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 240 nm. For *Identification B,* use a diode array detector in the range of 210–400 nm.
Column: 3.9-mm × 15-cm; 5-µm packing L7. [NOTE—A guard column with a similar packing may be used.]
Flow rate: 0.7 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.3
Relative standard deviation: NMT 1.0%

USP Monographs

www.webofpharma.com

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of testosterone ($C_{19}H_{28}O_2$) in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of testosterone from the *Sample solution*
r_S = peak response of testosterone from the *Standard solution*
C_S = concentration of USP Testosterone RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of testosterone in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES
• **ORGANIC IMPURITIES**
Solution A, Solution B, Mobile phase, Diluent, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability
Samples: *Standard solution* and *Sensitivity solution*
Suitability requirements
Tailing factor: NMT 1.3 for the testosterone peak, *Standard solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*
Analysis
Sample: *Sample solution*
Calculate the percentage of each individual degradation product in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_T) \times 100$$

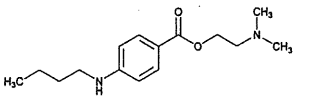
r_U = peak response of each individual degradation product from the *Sample solution*
r_T = peak response of testosterone from the *Sample solution*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Any individual unspecified degradation product	—	0.3
Total degradation products	—	5.0

SPECIFIC TESTS
• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^2 cfu/mL. The total combined molds and yeasts count does not exceed 10^1 cfu/mL. It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.



ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Testosterone RS▲ 2S (USP41)

Tetanus Immune Globulin

» Tetanus Immune Globulin conforms to the regulations of the FDA concerning biologics (see *Biologics* ⟨1041⟩). It is a sterile, nonpyrogenic solution of globulins derived from the blood plasma of adult human donors who have been immunized with tetanus toxoid. It has a potency of not less than 50 antitoxin units per mL based on the U.S. Standard Tetanus Antitoxin and the U.S. Control Tetanus Test Toxin, tested in guinea pigs. It contains not less than 10 g and not more than 18 g of protein per 100 mL, of which not less than 90 percent is gamma globulin. It contains 0.3 M glycine as a stabilizing agent, and it contains a suitable preservative.

Packaging and storage—Preserve at a temperature between 2° and 8°.
Expiration date—The expiration date for Tetanus Immune Globulin containing a 10% excess of potency is not later than 3 years after date of issue from manufacturer's cold storage (5°, 1 year).
Labeling—Label it to state that it is not for intravenous injection.

Tetracaine

$C_{15}H_{24}N_2O_2$ 264.36
Benzoic acid, 4-(butylamino)-, 2-(dimethylamino)ethyl ester; 2-(Dimethylamino)ethyl *p*-(butylamino)benzoate [94-24-6].

DEFINITION
Tetracaine contains NLT 98.0% and NMT 102.0% of tetracaine ($C_{15}H_{24}N_2O_2$), calculated on the dried basis.

IDENTIFICATION

Change to read:

Relative standard deviation: NMT 0.73%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tetracaine ($C_{15}H_{24}N_2O_2$) in the portion of Tetracaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Tetracaine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tetracaine, 264.36
M_{r2} = molecular weight of tetracaine hydrochloride, 300.82

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** ⟨281⟩: NMT 0.1%
- **Organic Impurities**

Solution A, Solution B, Solution C, Mobile phase, Diluent, and **Chromatographic system:** Proceed as directed in the *Assay*.
Standard solution: 4.6 µg/mL of USP Tetracaine Hydrochloride RS and 4 µg/mL each of USP Tetracaine Related Compound B RS, USP Tetracaine Related Compound C RS, and USP Aminobenzoic Acid RS in *Diluent*
Sample solution: 1 mg/mL of Tetracaine in *Diluent*
System suitability
Sample: *Standard solution*
[Note—See *Table 2* for the relative retention times.]
Suitability requirements
Resolution: NLT 5.0 between tetracaine and tetracaine related compound B
Relative standard deviation: NMT 5.0% for tetracaine
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of aminobenzoic acid, tetracaine related compound B, and tetracaine related compound C in the portion of Tetracaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of corresponding tetracaine related compound from the *Sample solution*
r_S = peak response of corresponding tetracaine related compound from the *Standard solution*
C_S = concentration of corresponding tetracaine related compound in the *Standard solution* (mg/mL)
C_U = concentration of Tetracaine in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Tetracaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each unspecified impurity from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Tetracaine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tetracaine, 264.36
M_{r2} = molecular weight of tetracaine hydrochloride, 300.82

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

  $C_{12}H_{17}NO_2$ 207.35
  USP Tetracaine Hydrochloride RS

Tetracaine Ointment

» Tetracaine Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{24}N_2O_2$ in a suitable ointment base.

Packaging and storage—Preserve in collapsible ointment tubes.
USP Reference standards ⟨11⟩—
USP Tetracaine Hydrochloride RS

Identification—
A: The solution employed for measurement of absorbance in the *Assay* exhibits a maximum at 310 ± 2 nm.
B: Dissolve 5 g in 50 mL of ether, extract the ether solution with 5 mL of 3 N hydrochloric acid, and filter the acid extract. Add 2 mL of potassium thiocyanate solution (1 in 2) to the filtrate: a crystalline precipitate is formed, and when recrystallized from water and dried at 80° for 2 hours, it melts between 130° and 132° (see *Melting Range or Temperature* ⟨741⟩).
Microbial enumeration tests ⟨61⟩ **and *Tests for specified microorganisms*** ⟨62⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
Minimum fill ⟨755⟩: meets the requirements.

Assay—
Standard preparation—Transfer about 20 mg of USP Tetracaine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, dissolve in water, add water to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, add 5 mL of dilute hydrochloric acid (1 in 240) and 10 mL of *Buffer B.6* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers*) dilute with water to volume, and mix. The concentration of USP Tetracaine Hydrochloride RS in the *Standard preparation* is about 10 µg per mL.
Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 9 mg of tetracaine, to a separator, and dissolve in 15 mL of ether. Extract with one 20-mL portion and two 10-mL portions of dilute hydrochloric acid (1 in 240), collecting the acid extracts in a second separator. Render the aqueous solution alkaline by the addition of 5 mL of sodium carbonate TS, and extract immediately with two 50-mL portions of ether, collecting the ether extracts in another separator. Wash the ether solution with 20 mL of water, discard the washing, and extract the ether solution with two 20-mL portions and one 5-mL portion of dilute hydrochloric acid (1 in 240), collecting the acid extracts in a 50-mL volumetric flask. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 10 mL of *Buffer B.6* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers*) dilute with water to volume, and mix.
Procedure—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 310 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{15}H_{24}N_2O_2$ in the portion of Ointment taken by the formula:

$$(264.36/300.82)(C)(A_U/A_S)$$

in which 264.36 and 300.82 are the molecular weights of tetracaine and tetracaine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation;* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Tetracaine and Menthol Ointment

» Tetracaine and Menthol Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of tetracaine ($C_{15}H_{24}N_2O_2$) and menthol ($C_{10}H_{20}O$) in a suitable ointment base.

Packaging and storage—Preserve in collapsible ointment tubes.
USP Reference standards ⟨11⟩—
USP Menthol RS
USP Tetracaine Hydrochloride RS

Identification—
A: The solution employed for measurement of absorbance in the *Assay for tetracaine* exhibits a maximum at 310 ± 2 nm (*presence of tetracaine*).
B: Dissolve 5 g in 50 mL of ether, extract the ether solution with 5 mL of 3 N hydrochloric acid, and filter the acid extract. Add 2 mL of potassium thiocyanate solution (1 in 2) to the filtrate: a crystalline precipitate is formed, and when recrystallized from water and dried at 80° for 2 hours, it melts between 130° and 132° (see *Melting Range or Temperature* ⟨741⟩) (*presence of tetracaine*).
C: When chromatographed as directed in the *Assay for menthol*, the *Assay preparation* exhibits a major peak for menthol, the retention time of which corresponds to that exhibited by menthol in the *Standard preparation.*
Minimum fill ⟨755⟩: meets the requirements.

Assay for tetracaine—
Standard preparation—Prepare as directed in the *Assay* under *Tetracaine Ointment.*
Assay preparation—Using Ointment, proceed as directed in the *Assay* under *Tetracaine Ointment.*
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tetracaine Ointment.*

Assay for menthol—
Internal standard solution—Dissolve decanol in *n*-hexane to obtain a solution having a concentration of about 1 mg per mL.
Standard preparation—Dissolve an accurately weighed quantity of USP Menthol RS in *n*-hexane to obtain a solution having a known concentration of about 1 mg per mL. Transfer

www.webofpharma.com

5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with ether to volume, and mix. Combine 2.0 mL of this solution and 2.0 mL of ether in a suitable container, and mix. This *Standard preparation* has a known concentration of about 0.05 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of Ointment, equivalent to about 5 mg of menthol, to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *n*-hexane to volume, mix, and sonicate. Using a suitable syringe attached firmly to a 25- × 12.5-mm chromatographic cartridge containing packing L4, force 2.0 mL of the solution through the cartridge at a rate of 1 mL per 12 seconds. Wash the cartridge at the same rate with two 5-mL portions of *n*-hexane, and discard the washings. Force two 2.0-mL portions of ether through the cartridge, combine the ether eluates in a suitable container, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 2-mm × 1.8-m column packed with 10% phase G16 on support S1AB. The column temperature is maintained isothermally at about 170°, the injection port temperature is maintained at about 260°, and the detector block temperature is maintained at about 240°. Dry helium is used as the carrier gas at a flow rate of about 50 mL per minute.

System suitability—Chromatograph three injections of the *Standard preparation*, and record the peak responses as directed for *Procedure:* the retention time of menthol is about 0.7 relative to decanol; the resolution, *R*, between the 2 peaks is not less than 2.5; and the relative standard deviation of the ratio of the peak response obtained with menthol to that obtained with decanol is not more than 2%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Assay preparation* and the *Standard preparation* into the gas chromatograph, and measure the peak responses for menthol and decanol in each chromatogram. Calculate the quantity, in mg, of $C_{10}H_{20}O$ in the portion of Ointment taken by the formula:

$$100C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Menthol RS in the *Standard preparation;* and R_U and R_S are the peak response ratios of menthol to decanol obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Tetracaine Hydrochloride

$C_{15}H_{24}N_2O_2 \cdot HCl$ 300.82

Benzoic acid, 4-(butylamino)-, 2-(dimethylamino)ethyl ester, monohydrochloride;
2-(Dimethylamino)ethyl *p*-(butylamino)benzoate monohydrochloride [136-47-0].

DEFINITION

Tetracaine Hydrochloride contains NLT 98.0% and NMT 102.0% of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$), calculated on the anhydrous basis.

Assay—

pH 6 Acetate buffer—Dissolve 250 g of sodium acetate in about 500 mL of water in a 1000-mL volumetric flask, add 5.0 mL of glacial acetic acid, dilute with water to volume, and mix.

Standard preparation—Transfer about 25 mg of USP Tetracaine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, dissolve in isopropyl alcohol, add isopropyl alcohol to volume, and mix. Transfer 2.0 mL of this solution to another 100-mL volumetric flask, add 2.0 mL of *pH 6 Acetate buffer*, dilute with isopropyl alcohol to volume, and mix. The concentration of USP Tetracaine Hydrochloride RS in the *Standard preparation* is about 5 µg per mL.

Assay preparation—Transfer an accurately weighed portion of Cream, equivalent to about 4.5 mg of tetracaine, to a 50-mL beaker, add 25 mL of isopropyl alcohol, and warm on a steam bath to dissolve the specimen completely. Transfer the solution with the aid of isopropyl alcohol to a 100-mL volumetric flask, dilute with isopropyl alcohol to volume, and mix. Transfer 10.0 mL of this solution to another 100-mL volumetric flask, add 2.0 mL of *pH 6 Acetate buffer*, dilute with isopropyl alcohol to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 310 nm, with a suitable spectrophotometer, using a 1 in 50 solution of *pH 6 Acetate buffer* in isopropyl alcohol as the blank. Calculate the quantity, in mg, of $C_{15}H_{24}N_2O_2$ in the portion of Cream taken by the formula:

$$(264.36/300.82)(C)(A_U/A_S)$$

in which 264.36 and 300.82 are the molecular weights of tetracaine and tetracaine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation;* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Tetracaine Hydrochloride Injection

DEFINITION

Tetracaine Hydrochloride Injection is a sterile solution of Tetracaine Hydrochloride in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$).

IDENTIFICATION

- **A.**

Sample solution: 100 mg in 10 mL of water

Analysis: To the *Sample solution* add 1 mL of potassium thiocyanate solution (1 in 4). A crystalline precipitate is formed. Recrystallize the precipitate from water, and dry at 80° for 2 h.

Acceptance criteria: The crystalline precipitate melts between 130° and 132°.

- **B.** The retention time of the major peak of tetracaine in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile, methanol, and water (20:20:60) containing 0.06% of sulfuric acid, 0.5% of sodium sulfate, and 0.02% of sodium 1-heptanesulfonate. The pH is about 2.6.

Diluent: Methanol and water (1:1)

Standard solution: 1 mg/mL of USP Tetracaine Hydrochloride RS in *Diluent*

System suitability solution: 4 mg/mL of salicylic acid and 1 mg/mL of tetracaine hydrochloride in *Standard solution*

Sample solution: Nominally 1 mg/mL of tetracaine hydrochloride in *Diluent* from Injection

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 305 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 5 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for salicylic acid and tetracaine are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2 between salicylic acid and tetracaine peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tetracaine from the *Sample solution*

r_S = peak response of tetracaine from the *Standard solution*

C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tetracaine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.7 USP Endotoxin Units/mg of tetracaine hydrochloride
- **pH** ⟨791⟩: 3.2–6.0
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, under refrigeration and protected from light. It may be packaged in 100-mL multiple-dose containers. Injection supplied as a component of spinal anesthesia trays may be stored at room temperature for 12 months.
- **LABELING:** Label it to indicate that the Injection is not to be used if it contains crystals, or if it is cloudy or discolored.
- **USP REFERENCE STANDARDS** ⟨11⟩

www.webofpharma.com

Tetracaine Hydrochloride for Injection

DEFINITION
Tetracaine Hydrochloride for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
Sample solution: The *Sample solution* from the *Assay*.
Acceptance criteria: Meets the requirements
• **B.**
Sample solution: 100 mg in 10 mL of water
Analysis: To the *Sample solution* add 1 mL of potassium thiocyanate solution (1 in 4). A crystalline precipitate is formed. Recrystallize the precipitate from water, and dry at 80° for 2 h.
Acceptance criteria: The crystalline precipitate melts between 130° and 132°.

ASSAY
• **PROCEDURE**
Buffer: *Buffer B.6* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers, Table 12*)
Diluent: Dilute hydrochloric acid (1 in 200)
Standard stock solution: 0.2 mg/mL of USP Tetracaine Hydrochloride RS in water
Standard solution: 0.01 mg/mL of USP Tetracaine Hydrochloride RS prepared as follows. Pipet 5 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5 mL of *Diluent* and 10 mL of *Buffer*, and dilute with water to volume.
Sample stock solution: Nominally 0.2 mg/mL of tetracaine hydrochloride in water prepared as follows. Transfer to a tared 20-mL beaker the contents of a sufficient number of containers of Tetracaine Hydrochloride for Injection to yield about 100 mg of tetracaine hydrochloride. Weigh immediately, and transfer with the aid of water to a 500-mL volumetric flask. Dilute with water to volume.
Sample solution: Nominally 0.01 mg/mL of tetracaine hydrochloride prepared as follows. Transfer 5.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 5 mL of *Diluent* and 10 mL of *Buffer*, then dilute with water to volume.
Instrumental conditions
Mode: UV
Analytical wavelength: Maximum absorbance at about 310 nm
Blank: Water
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in the portion of Tetracaine Hydrochloride for Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tetracaine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Buffer: *Buffer B.6* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers, Table 12*)
Diluent: Dilute hydrochloric acid (1 in 200)
Standard stock solution: 0.2 mg/mL of USP Tetracaine Hydrochloride RS in water
Standard solution: 0.01 mg/mL of USP Tetracaine Hydrochloride RS prepared as follows. Transfer 5 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5 mL of *Diluent* and 10 mL of *Buffer*, and dilute with water to volume.
Sample stock solution: Transfer the contents of one container, with the aid of water, to a 200-mL volumetric flask, and add water to volume.
Sample solution: Nominally 0.01 mg/mL of tetracaine hydrochloride from the *Sample stock solution* prepared as follows. Pipet a portion of the *Sample stock solution*, equivalent to 1 mg of tetracaine hydrochloride, to a 100-mL volumetric flask, add 5 mL of *Diluent* and 10 mL of *Buffer*, and dilute with water to volume.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in each container taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of tetracaine hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: Meets the requirements

IMPURITIES
• **RESIDUE ON IGNITION**
Sample: 500 mg
Analysis: Transfer the *Sample* to a beaker, and dissolve in 10 mL of methanol. Filter through paper previously washed with methanol, collecting the filtrate in an ignited and tared crucible, and wash the beaker and the filter paper with 25–30 mL of methanol. Evaporate with the aid of heat and a current of air to dryness, and proceed as directed in *Residue on Ignition* ⟨281⟩, beginning with "Heat gently at a temperature as low as practicable".
Acceptance criteria: NMT 0.1%
• **ORGANIC IMPURITIES**
Standard solution: 0.2 mg/mL of 4-(butylamino) benzoic acid in methanol
Sample solution: 50 mg/mL of Tetracaine Hydrochloride for Injection in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 5 µL
Developing solvent system: Chloroform, methanol, and isopropylamine (98:7:2)
Analysis
Samples: *Standard solution* and *Sample solution*
Proceed as directed in the chapter. Develop the plate in a suitable chromatographic chamber containing the *Developing solvent system* until the solvent front has

www.webofpharma.com

moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry in a current of warm air. Examine the plate under short-wavelength UV light.

Acceptance criteria: Any spot from the *Sample solution*, other than the principal spot, is not more intense than the principal spot from the *Standard solution* (0.4%), and the sum of the intensities of any such spots is not greater than 0.8%.

SPECIFIC TESTS

- **pH** ⟨791⟩: 5.0–6.0 in a solution (1 in 100)
- **Water Determination** ⟨921⟩, *Method I*: NMT 2.0%
- **Bacterial Endotoxins Test** ⟨85⟩: NMT 0.7 USP Endotoxin Units/mg of tetracaine hydrochloride
- **Completeness of Solution** ⟨641⟩
  Sample: Nominally 10 mg of tetracaine hydrochloride
  Acceptance criteria: The *Sample* dissolves in 1 mL of water in NMT 2 s to yield a colorless solution free from undissolved solid.
- **Constituted Solution:** At the time of use, it meets the requirements in *Injections and Implanted Drug Products*, ⟨1⟩, *Specific Tests, Completeness and clarity of solutions*.
- **Sterility Tests** ⟨71⟩: Meets the requirements
- **Other Requirements:** It meets the requirements in *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution*, preferably Type I glass.
- **USP Reference Standards** ⟨11⟩
  USP Tetracaine Hydrochloride RS

Tetracaine Hydrochloride Ophthalmic Solution

» Tetracaine Hydrochloride Ophthalmic Solution is a sterile, aqueous solution of Tetracaine Hydrochloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{24}N_2O_2 \cdot HCl$. It may contain suitable antimicrobial and thickening agents.

Packaging and storage—Preserve in tight, light-resistant containers.
Labeling—Label it to indicate that the Ophthalmic Solution is not to be used if it contains crystals, or if it is cloudy or discolored.
USP Reference standards ⟨11⟩—
USP Tetracaine Hydrochloride RS
Identification—Add 5 mL of Ophthalmic Solution to 5 mL of water in a test tube, then add 1 mL of potassium thiocyanate solution (1 in 4): a crystalline precipitate is formed. Recrystallize the precipitate from water, and dry at 80° for 2 hours: the crystals so obtained melt between 130° and 132°.
Sterility Tests ⟨71⟩: meets the requirements.
pH ⟨791⟩: between 3.7 and 6.0.

Assay—
Mobile phase—Prepare 0.01 *M* of dibasic ammonium phosphate in water, and adjust with phosphoric acid to a pH of 3.0. Prepare a filtered and degassed mixture of this solution and acetonitrile (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Dissolve an accurately weighed quantity of USP Tetracaine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.1 mg per mL.
Assay preparation—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 10 mg of tetracaine hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column containing packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 500 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{15}H_{24}N_2O_2 \cdot HCl$ in each mL of the Ophthalmic Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Ophthalmic Solution taken; and r_U and r_S are the tetracaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Tetracaine Hydrochloride Topical Solution

» Tetracaine Hydrochloride Topical Solution is an aqueous solution of Tetracaine Hydrochloride. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{24}N_2O_2 \cdot HCl$. It contains a suitable antimicrobial agent.

Packaging and storage—Preserve in tight, light-resistant containers.
Labeling—Label it to indicate that the Topical Solution is not to be used if it contains crystals, or if it is cloudy or discolored.
USP Reference standards ⟨11⟩—
USP Tetracaine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—*Solutions:* solutions of the Topical Solution employed for measurement of absorbance in the *Assay*.
B: It responds to the tests for *Chloride* ⟨191⟩.
pH ⟨791⟩: between 4.5 and 6.0.

Assay—
Standard preparation—Prepare as directed in the *Assay* under *Tetracaine Hydrochloride in Dextrose Injection*.

www.webofpharma.com

Assay preparation—Using an accurately measured volume of Topical Solution, prepare as directed in the *Assay* under *Tetracaine Hydrochloride in Dextrose Injection.*

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tetracaine Hydrochloride in Dextrose Injection.* Calculate the quantity, in mg, of $C_{15}H_{24}N_2O_2 \cdot HCl$ in the volume of Topical Solution taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation*, and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Tetracaine Hydrochloride in Dextrose Injection

DEFINITION

Tetracaine Hydrochloride in Dextrose Injection is a sterile solution of Tetracaine Hydrochloride and Dextrose in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amounts of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) and dextrose ($C_6H_{12}O_6$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩,** *Ultraviolet-Visible Spectroscopy*: **197U▲** (CN 1-May-2020)
- **B. IDENTIFICATION TESTS—GENERAL ⟨191⟩,** *Chloride*
  Sample solution: 100 mg in 5 mL of water
  Acceptance criteria: Meets the requirements
- **C.**
  Sample solution: Nominally 50 mg/mL of dextrose from Injection
  Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.
  Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

ASSAY

- **TETRACAINE HYDROCHLORIDE**
  Buffer: *Buffer B.6* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers, Table 12*)
  Diluent: Dilute hydrochloric acid (1 in 200)
  Standard stock solution: 0.2 mg/mL of USP Tetracaine Hydrochloride RS in water
  Standard solution: 0.01 mg/mL of USP Tetracaine Hydrochloride RS prepared as follows. Pipet 5 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5 mL of *Diluent* and 10 mL of *Buffer*, and dilute with water to volume.
  Sample stock solution: Nominally 0.2 mg/mL of tetracaine hydrochloride from Injection prepared as follows. Transfer a volume of Injection, equivalent to 10 mg of tetracaine hydrochloride, to a separator. Dilute with water to about 50 mL, and render alkaline by the addition of 5 mL of sodium carbonate TS. Extract immediately with two 50-mL portions of ether, collecting the extracts in a separator. Wash the ether extracts with 20 mL of water, discarding the wash solution, and extract the ether solution with two 20-mL portions and one 5-mL portion of *Diluent*, collecting the extracts in a 50-mL volumetric flask. Dilute with water to volume.
  Sample solution: Nominally 0.01 mg/mL of tetracaine hydrochloride from *Sample stock solution* prepared as follows. Transfer 5.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 10 mL of *Buffer*, and dilute to volume with water.
  Instrumental conditions
  Mode: UV
  Analytical wavelength: Maximum absorbance at about 310 nm
  Blank: Water
  Analysis
  Samples: *Standard solution*, *Sample solution*, and *Blank*
  Calculate the percentage of labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tetracaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tetracaine hydrochloride in the *Sample solution* (mg/mL)

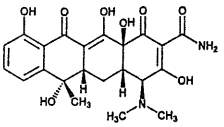
  Acceptance criteria: 95.0%–105.0%
- **DEXTROSE**
  Sample: Injection
  Analysis: Determine the angular rotation of the Injection in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩). Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times 100$$

a = observed angular rotation of the Injection (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
C_U = nominal concentration of dextrose in the *Sample* (g/100 mL)

  Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS



- **PARTICULATE MATTER IN INJECTIONS ⟨788⟩:** Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST ⟨85⟩:** It contains NMT 1.0 USP Endotoxin Unit/mg of tetracaine hydrochloride.
- **pH ⟨791⟩:** 3.5–6.0
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, under refrigeration and protected from light. It may be packaged in 100-mL multiple-dose containers. Injection supplied as a component of spinal anesthesia trays may be stored at room temperature for 12 months.
- **LABELING:** Label it to indicate that the Injection is not to be used if it contains crystals, or if it is cloudy or discolored.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Tetracaine Hydrochloride RS

www.webofpharma.com

Tetracycline

$C_{22}H_{24}N_2O_8$ 444.44
Trihydrate 498.49
2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, [4*S*-(4α,4aα,5aα,6β,12aα)]-;
(4*S*,4a*S*,5a*S*,12a*S*)-4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide [60-54-8].
Trihydrate [6416-04-2].

DEFINITION
Tetracycline has a potency equivalent to NLT 975 µg/mg of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: 197U▲** (CN 1-May-2020)
  Sample solution: 20 µg/mL in 0.25 N sodium hydroxide
  Analytical wavelength: 380 nm
  Analysis: Measure the absorptivity 6 min after preparation.
  Acceptance criteria: Absorptivity, calculated on the anhydrous basis and taking into account the potency of the Reference Standard, is between 104.5% and 111.95% of the absorptivity of USP Tetracycline Hydrochloride RS.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
  Solution A: Dilute 1 mL of phosphoric acid with water to 1 L.
  Solution B: Acetonitrile
  Mobile phase: See *Table 1*.

Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 0.73%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the potency equivalent, in µg/mg, of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) in the portion of Tetracycline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response of tetracycline from the *Sample solution*
r_S = peak response of tetracycline from the *Standard solution*
C_S = concentration of USP Tetracycline Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of Tetracycline in the *Sample solution* (µg/mL)
P = potency of USP Tetracycline Hydrochloride RS (µg/mg)

Acceptance criteria: NLT 975 µg/mg on the anhydrous basis

IMPURITIES
- **ORGANIC IMPURITIES**
  Solution A, Solution B, Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
  System suitability solution: 25 µg/mL each of USP Anhydrotetracycline Hydrochloride RS, USP Epitetracycline Hydrochloride RS, USP 4-Epianhydrotetracycline Hydrochloride RS, and USP Tetracycline Hydrochloride RS in *Solution A*
  Standard solution: 0.5 µg/mL of USP Anhydrotetracycline Hydrochloride RS, 3 µg/mL of USP Epitetracycline Hydrochloride RS, 2 µg/mL of USP 4-Epianhydrotetracycline Hydrochloride RS, and 0.1 µg/mL of USP Tetracycline Hydrochloride RS in *Solution A*
  System suitability
  Samples: *System suitability solution* and *Standard solution*
  Suitability requirements
  Resolution: NLT 2.5 between epitetracycline and tetracycline; NLT 2.5 between anhydrotetracycline and 4-epianhydrotetracycline, *System suitability solution*
  Relative standard deviation: NMT 2.8%, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of anhydrotetracycline, epitetracycline, and 4-epianhydrotetracycline in the portion of Tetracycline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

www.webofpharma.com

r_U = peak response of anhydrotetracycline, epitetracycline, or 4-epianhydrotetracycline from the *Sample solution*
r_S = peak response of the corresponding USP Reference Standard from the *Standard solution*
C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (µg/mL)
C_U = concentration of Tetracycline in the *Sample solution* (µg/mL)

Calculate the percentage of 2-acetyl analog or any unspecified impurity in the portion of Tetracycline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of 2-acetyl analog or any unspecified impurity from the *Sample solution*
r_S = peak response of tetracycline from the *Standard solution*
C_S = concentration of USP Tetracycline Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of Tetracycline in the *Sample solution* (µg/mL)
M_{r1} = molecular weight of tetracycline, 444.44
M_{r2} = molecular weight of tetracycline hydrochloride, 480.90

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
4-Epitetracycline[a]	0.9	3.0
Tetracycline	1.0	—
2-Acetyl analog[b]	1.3	2.0
4-Epianhydrotetracycline[c]	1.7	2.0
Anhydrotetracycline[d]	1.9	0.5
Any individual unspecified impurity	—	0.10

[a] (4*R*,4a*S*,5a*S*,6*S*,12a*S*)-4-(Dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide.
[b] 2-Acetyl-2-decarbamoyltetracycline; (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-Acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione.
[c] (4*R*,4a*S*,12a*S*)-4-(Dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide.
[d] (4*S*,4a*S*,12a*S*)-4-(Dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide.

SPECIFIC TESTS
- **OPTICAL ROTATION** ⟨781S⟩, *Procedures, Specific Rotation*
  Sample solution: 5 mg/mL in 0.1 N hydrochloric acid
  Acceptance criteria: −260° to −280° on the anhydrous basis
- **CRYSTALLINITY** ⟨695⟩: Meets the requirements
- **pH** ⟨791⟩
  Sample solution: In an aqueous suspension (1 in 100)
  Acceptance criteria: 3.0–7.0
- **WATER DETERMINATION** ⟨921⟩, *Method I*: NMT 13.0%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label it to indicate that it is to be used in the manufacture of nonparenteral drugs only.

- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Anhydrotetracycline Hydrochloride RS
  USP 4-Epianhydrotetracycline Hydrochloride RS
  USP Epitetracycline Hydrochloride RS
  USP Tetracycline Hydrochloride RS

Tetracycline Boluses

» Tetracycline Boluses contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

Packaging and storage—Preserve in tight containers.
Labeling—Label Boluses to indicate that they are intended for veterinary use only.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
Identification—Shake a suitable quantity of finely powdered Boluses with methanol to obtain a solution containing the equivalent of 1 mg of tetracycline hydrochloride per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed under *Identification—Tetracyclines* ⟨193⟩.
Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation*.
Loss on drying ⟨731⟩—Dry about 100 mg of finely powdered Boluses, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight, or where the Boluses have a diameter of greater than 15 mm, it loses not more than 6.0% of its weight.
Assay—Transfer not less than 2 Boluses to a high-speed blender jar containing an accurately measured volume of 0.1 N hydrochloric acid, so that the solution so obtained contains not less than 150 µg of tetracycline hydrochloride per mL, and blend for about 3 to 5 minutes. Proceed as directed for tetracycline under *Antibiotics—Microbial Assays* ⟨81⟩, using an accurately measured volume of this solution diluted quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Tetracycline Oral Suspension

» Tetracycline Oral Suspension is Tetracycline with or without one or more suitable buffers, preservatives, stabilizers, and suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP 4-Epianhydrotetracycline Hydrochloride RS
Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for tetracycline, the retention time of which corresponds to that

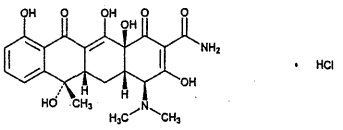
USP Monographs

www.webofpharma.com

exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Uniformity of dosage units ⟨905⟩—
F *OR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS* : meets the requirements.
Deliverable volume ⟨698⟩: meets the requirements.
pH ⟨791⟩: between 3.5 and 6.0.
Limit of 4-epianhydrotetracycline—Using the *Diluting solvent*, *Chromatographic system*, and *Procedure* set forth in the *Assay*, chromatograph a Standard solution prepared by dissolving an accurately weighed quantity of USP 4-Epianhydrotetracycline Hydrochloride RS in *Diluting solvent* to obtain a solution having a known concentration of about 10 µg per mL. Using the chromatogram so obtained and the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of 4-epianhydrotetracycline in the Oral Suspension taken by the formula:

$$(25C_E/T)(r_U/r_S)$$



in which C_E is the concentration, in µg per mL, of USP 4-Epianhydrotetracycline Hydrochloride RS in the Standard solution, T is the quantity, in mg, of tetracycline hydrochloride equivalent in the portion of Oral Suspension taken, based on the labeled quantity, and r_U and r_S are the 4-epianhydrotetracycline peak responses obtained from the *Assay preparation* and the Standard solution, respectively: not more than 5.0% is found.

Assay—
Diluting solvent, *Mobile phase*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Tetracycline Hydrochloride*.
Assay preparation—Transfer an accurately measured volume of Oral Suspension, equivalent to about 125 mg of tetracycline hydrochloride, to a 250-mL volumetric flask, add 200 mL of *Diluting solvent*, and shake. Add *Diluting solvent* to volume, mix, and filter.
Procedure—Proceed as directed in the *Assay* under *Tetracycline Hydrochloride*. Calculate the quantity, in mg per mL, of $C_{22}H_{24}N_2O_8 \cdot HCl$ equivalent in the Oral Suspension taken by the formula:

$$(CP/4V)(r_U/r_S)$$

in which V is the volume, in mL, of Oral Suspension taken, and the other terms are as defined therein.

Tetracycline Hydrochloride

$C_{22}H_{24}N_2O_8 \cdot HCl$ 480.90
2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a, 5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, monohydrochloride, [4*S*-(4α,4aα,5aα, 6β,12aα)]-;
(4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-(Dimethylamino)- 1,4,4a,5,5a, 6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [64-75-5].

DEFINITION
Tetracycline Hydrochloride has a potency of NLT 900 µg/mg of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

Tetracycline Hydrochloride Capsules

DEFINITION

Tetracycline Hydrochloride Capsules contain NLT 90.0% and NMT 125.0% of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

▲• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.▲ (USP 1-Dec-2019)

ASSAY

Change to read:

- **PROCEDURE**

Solution A: Dilute 1 mL of phosphoric acid with water to 1 L.
Solution B: Acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
7.5	60	40
7.6	85	15
10	85	15

System suitability solution: 25 µg/mL each of USP Anhydrotetracycline Hydrochloride RS, USP 4-Epianhydrotetracycline Hydrochloride RS, USP Epitetracycline Hydrochloride RS, and USP Tetracycline Hydrochloride RS in *Solution A*
Standard solution: 100 µg/mL of USP Tetracycline Hydrochloride RS in *Solution A*. ▲[NOTE—If needed, dilute the *Standard solution* concentration for *Identification B*.]▲ (USP 1-Dec-2019)
Sample solution: Nominally equivalent to 100 µg/mL of tetracycline hydrochloride in *Solution A* from NLT 20 Capsules prepared as follows. Transfer a portion of Capsule contents, equivalent to 25 mg of tetracycline hydrochloride, into a 250-mL volumetric flask. Dissolve with the aid of sonification, and dilute with *Solution A* to volume. Pass through a syringe filter of 0.22-µm pore size, discarding the first 2 mL of the filtrate. ▲[NOTE—If needed, dilute the *Sample solution* concentration for *Identification B*.]▲ (USP 1-Dec-2019)

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm. ▲For *Identification B*, use a diode array detector in the range of 220–400 nm.▲ (USP 1-Dec-2019)
Column: 4.6-mm × 15-cm; 3-µm packing L1

Flow rate: 1.0 mL/min
Injection volume: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for epitetracycline, tetracycline, 4-epianhydrotetracycline, and anhydrotetracycline are 0.9, 1.0, 1.6, and 1.8, respectively.]
Suitability requirements
Tailing factor: NMT 1.5, *Standard solution*
Resolution: NLT 2.5 between epitetracycline and tetracycline; NLT 2.5 between anhydrotetracycline and 4-epianhydrotetracycline, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of tetracycline from the *Sample solution*
r_S = peak response of tetracycline from the *Standard solution*
C_S = concentration of USP Tetracycline Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of tetracycline hydrochloride in the *Sample solution* (µg/mL)
P = potency of USP Tetracycline Hydrochloride RS (µg/mg)
F = correction factor, 0.001 mg/µg

Acceptance criteria: 90.0%–125.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨711⟩

Test 1
Medium: Water; 900 mL
Apparatus 2: 75 rpm. Maintain a distance of 45 ± 5 mm between the blade and the inside bottom of the vessel.
Times: 60 min ▲for 250-mg Capsules;▲ (USP 1-Dec-2019) 90 min for 500-mg Capsules
Detector: UV 276 nm
Standard solution: A known concentration of USP Tetracycline Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Analysis: Determine the percentage of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) dissolved by using UV absorption on portions of the *Sample solution* suitably diluted with *Medium*, if necessary, in comparison with the *Standard solution*.
Tolerances: NLT 80% (*Q*) of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) is dissolved.

www.webofpharma.com

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: Water; 900 mL, deaerated
Apparatus 2: 75 rpm. Maintain a distance of 45 ± 5 mm between the blade and the inside bottom of the vessel.
Times: For Capsules labeled to contain 250 mg: 30 and 60 min; for Capsules labeled to contain 500 mg: 30, 60, and 90 min
Detector: UV 276 nm
Standard solution: A known concentration of USP Tetracycline Hydrochloride RS in *Medium*
Sample solution: At the times specified, withdraw a known volume of the solution under test, and pass it through a suitable filter. Dilute with *Medium*, if necessary. Replace the volume withdrawn with the same amount of *Medium*, preheated at 37.0 ± 0.5°.
Blank: *Medium*
▲**Analysis:** Determine the percentage of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) dissolved by using UV absorption on portions of the *Sample solution* suitably diluted with *Medium*, if necessary, in comparison with the *Standard solution*.▲ (USP 1-Dec-2019)
Tolerances: See *Table 2* and *Table 3*.

[a] (4*R*,4a*S*,5a*S*,6*S*,12a*S*)-4-(Dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide.
[b] 2-Acetyl-2-decarbamoyltetracycline; (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione.
[c] Process impurities that are controlled in the drug substance are not to be reported. They are not to be included in total impurities. They are listed here for information only.
[d] (4*R*,4a*S*,12a*S*)-4-(Dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide.
[e] (4*S*,4a*S*,12a*S*)-4-(Dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide.

USP Monographs

www.webofpharma.com

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Anhydrotetracycline Hydrochloride RS
  USP 4-Epianhydrotetracycline Hydrochloride RS
  USP Epitetracycline Hydrochloride RS
  USP Tetracycline Hydrochloride RS

Tetracycline Hydrochloride for Injection

» Tetracycline Hydrochloride for Injection is sterile Tetracycline Hydrochloride or a sterile, dry mixture of sterile Tetracycline Hydrochloride, one form of which contains Magnesium Chloride or magnesium ascorbate and one or more suitable buffers, and may contain one or more suitable preservatives, solubilizers, stabilizers, and anesthetic agents, and the other form of which contains one or more suitable stabilizing agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$.

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution*, protected from light.
Labeling—Label Tetracycline Hydrochloride for Injection that contains an anesthetic agent to indicate that it is intended for intramuscular administration only.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP 4-Epianhydrotetracycline Hydrochloride RS
Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* ⟨1⟩, *Specific Tests, Completeness and clarity of solutions*.
Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for tetracycline, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.5 USP Endotoxin Unit per mg of tetracycline hydrochloride.
Sterility Tests ⟨71⟩ —It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined, Fluid D* being used instead of *Fluid A*.
pH ⟨791⟩: between 2.0 and 3.0, in a solution containing 10 mg per mL.
Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.
Particulate Matter in Injections ⟨788⟩: meets the requirements for small-volume injections.
Limit of 4-epianhydrotetracycline—Using the *Diluting solvent*, *Chromatographic system*, and *Procedure* set forth in the *Assay*, chromatograph a Standard solution prepared by dissolving an accurately weighed quantity of USP 4-Epianhydrotetracycline Hydrochloride RS in *Diluting solvent* to obtain a solution having a known concentration of about 15 µg per mL. Using the chromatogram so obtained and the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of 4-epianhydrotetracycline hydrochloride in the Tetracycline Hydrochloride for Injection taken by the formula:

$$(10C_E/T)(r_U/r_S)$$

in which C_E is the concentration, in µg per mL, of USP 4-Epianhydrotetracycline Hydrochloride RS in the Standard solution; T is the quantity, in mg, of tetracycline hydrochloride in the portion of Tetracycline Hydrochloride for Injection taken to prepare the *Assay preparation*, based on the labeled quantity; and r_U and r_S are the 4-epianhydrotetracycline peak responses obtained from the *Assay preparation* and the Standard solution, respectively: not more than 3.0% is found.
Other requirements—It meets the requirements for *Uniformity of Dosage Units* ⟨905⟩ and for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

Assay—
Diluting solvent, Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system* —Prepare as directed in the *Assay* under *Tetracycline Hydrochloride*.
Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Tetracycline Hydrochloride for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with *Diluting solvent* to obtain a solution containing about 0.5 mg of tetracycline hydrochloride per mL.
Assay preparation 2 (where the label states the quantity of tetracycline hydrochloride in a given volume of constituted solution)—Constitute Tetracycline Hydrochloride for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Diluting solvent* to obtain a solution containing about 0.5 mg of tetracycline hydrochloride per mL.
Procedure—Proceed as directed in the *Assay* under *Tetracycline Hydrochloride*. Calculate the quantity, in mg, of $C_{22}H_{24}N_2O_8.HCl$ withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L/D)(CP/1000)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of $C_{22}H_{24}N_2O_8.HCl$ in the container, or in the volume of constituted solution taken; D is the concentration, in mg of tetracycline hydrochloride per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; and the other terms are as defined therein.

Tetracycline Hydrochloride Ointment

» Tetracycline Hydrochloride Ointment contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$.

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP 4-Epianhydrotetracycline Hydrochloride RS

www.webofpharma.com

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for tetracycline, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.
Minimum fill ⟨755⟩: meets the requirements.
Water Determination, *Method I* ⟨921⟩: not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay—
Diluting solvent , *Mobile phase*, *Resolution solution*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Tetracycline Hydrochloride*.
Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 300 mg of tetracycline hydrochloride, to a glass-stoppered conical flask, add 20 mL of cyclohexane, and shake. Add 35 mL of methanol, and sonicate for about 20 minutes. Filter this solution into a 100-mL volumetric flask, and rinse the sides of the conical flask with 40 mL of methanol, filtering the rinsing through the filter into the volumetric flask. Dilute with methanol to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix.
Standard preparation—Dissolve an accurately weighed quantity of USP Tetracycline Hydrochloride RS quantitatively in methanol to obtain a solution having a known concentration of about 1 mg per mL. Transfer 6.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix. This solution contains about 0.12 mg of USP Tetracycline Hydrochloride RS per mL.
Procedure—Proceed as directed in the *Assay* under *Tetracycline Hydrochloride*. Calculate the quantity, in mg, of $C_{22}H_{24}N_2O_8 \cdot HCl$ in the portion of Ointment taken by the formula:

$$2.5CP(r_U/r_S)$$

in which the terms are as defined therein.

Tetracycline Hydrochloride Ophthalmic Ointment

DEFINITION
Tetracycline Hydrochloride Ophthalmic Ointment contains NLT 90.0% and NMT 125.0% of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

IDENTIFICATION
- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Solution A: 0.1 M ammonium oxalate
Solution B: 0.2 M dibasic ammonium phosphate
Diluent: Dimethylformamide and *Solution A* (270:680)
Mobile phase: Dimethylformamide, *Solution A*, and *Solution B* (270:680:50). Adjust, if necessary, with 3 N ammonium hydroxide or 3 N phosphoric acid to a pH of 7.6–7.7.
System suitability solution: 100 µg/mL of tetracycline hydrochloride and 25 µg/mL of USP 4-Epianhydrotetracycline Hydrochloride RS in *Diluent*
Standard stock solution: 1 mg/mL of USP Tetracycline Hydrochloride RS in methanol
Standard solution: 0.12 mg/mL of USP Tetracycline Hydrochloride RS from *Standard stock solution* in *Diluent*
Sample stock solution: Nominally 3 mg/mL of tetracycline hydrochloride prepared as follows. Transfer a portion of Ophthalmic Ointment, containing nominally 300 mg of tetracycline hydrochloride, to a glass-stoppered conical flask. Add 20 mL of cyclohexane, and shake. Add 35 mL of methanol, and sonicate for 20 min. Filter this solution into a 100-mL volumetric flask, and rinse the sides of the conical flask with 40 mL of methanol, filtering the rinsing into the volumetric flask. Dilute with methanol to volume.
Sample solution: Nominally 0.12 mg/mL of tetracycline hydrochloride in *Diluent* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Columns
Guard: 4.6-mm × 3-cm; 10-µm packing L7
Analytical: 4.6-mm × 25-cm; 5–10-µm packing L7
Flow rate: 2 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times of 4-epianhydrotetracycline and tetracycline are 0.9 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 1.2 between 4-epianhydrotetracycline and tetracycline, *System suitability solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of tetracycline from the *Sample solution*
r_S = peak response of tetracycline from the *Standard solution*
C_S = concentration of USP Tetracycline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tetracycline hydrochloride in the *Sample solution* (mg/mL)
P = potency of USP Tetracycline Hydrochloride RS (µg/mg)
F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–125.0%

SPECIFIC TESTS
- **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements for *Particulate and Foreign Matter* and *Container Contents* in *Ophthalmic Products—Quality Tests* ⟨771⟩, *Drug Product Quality, Universal Tests, Particulate and Foreign Matter* and *Container Contents*.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
Identification—Shake a suitable quantity of Powder with methanol to obtain a solution containing the equivalent of 1 mg of tetracycline hydrochloride per mL, and filter. Using the filtrate so obtained as the *Test Solution*, proceed as directed under *Identification—Tetracyclines* ⟨193⟩.
Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.
Assay—Transfer an accurately weighed quantity of Powder to a high-speed blender jar containing an accurately measured volume of 0.1 N hydrochloric acid, so that the solution so obtained contains not less than 150 µg of tetracycline hydrochloride per mL, and blend for about 3 to 5 minutes. Proceed as directed for tetracycline under *Antibiotics—Microbial Assays* ⟨81⟩, diluting an accurately measured volume of this solution quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Tetracycline Hydrochloride for Topical Solution

» Tetracycline Hydrochloride for Topical Solution is a dry mixture of Tetracycline Hydrochloride and Epitetracycline Hydrochloride with Sodium Metabisulfite packaged in conjunction with a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of tetracycline hydrochloride, when constituted as directed.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
Identification—Dissolve a suitable quantity in methanol to obtain a solution containing 1 mg of tetracycline hydrochloride per mL, and filter, if necessary, to obtain a clear solution. Using the clear solution as the *Test Solution*, proceed as directed under *Identification—Tetracyclines* ⟨193⟩: the specified result is obtained.
pH ⟨791⟩: between 1.9 and 3.5, in the solution constituted as directed in the labeling.
Loss on drying ⟨731⟩—Dry the contents of 1 container, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

Content of epitetracycline hydrochloride—
Standard solution—Use the *Standard preparation* prepared as directed under the *Assay*.
Test solution—Open the column stopcock of the *Chromatographic column* remaining from the *Assay preparation* in the *Assay*, and collect the eluate in a low-actinic, 50-mL volumetric flask until the column runs dry. Use this as the *Test solution*.
Procedure—Proceed as directed for *Procedure* in the *Assay*. Calculate the quantity, in mg, of epitetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) in each mL of the constituted Topical Solution taken by the formula:

$$0.002(WP/V)(A_U/A_S)$$

in which A_U is the absorbance of the solution from the *Test solution*, and the other terms are defined therein: the quantity of epitetracycline hydrochloride is between 115.0% and 140.0% of the quantity of tetracycline hydrochloride found as determined in the *Assay*.

Assay—
Edetate disodium solution—Dissolve 74.4 g of edetate disodium in about 1800 mL of water, adjust with ammonium hydroxide to a pH of 7.0, dilute with water to 2000 mL, and mix.
Stationary phase—Mix 95 mL of *Edetate disodium solution* and 5 mL of a mixture of glycerine and polyethylene glycol 400 (4:1).
Alkaline methanol solution—On the day of use, prepare a mixture of methanol and ammonium hydroxide (19:1).
Column support—Suspend 300 g of chromatographic siliceous earth in 2000 mL of 6 N hydrochloric acid in a suitable vessel, and mix for about 15 minutes. Filter, and wash the siliceous earth with water until the last washing is neutral to moistened litmus paper. Suspend the washed siliceous earth in 2000 mL of a mixture of ethyl acetate and methanol (1:1), and mix for about 15 minutes. Filter, and dry the siliceous earth in vacuum at 60° for about 16 hours. Weigh, add 0.5 mL of *Stationary phase* for each g of dried siliceous earth, and shake until the column packing is uniformly moist. Store in a tight container.
Chromatographic column—Prepare as directed under *Column Partition Chromatography* ⟨621⟩, using a 10- × 300-mm chromatographic tube equipped with a solvent reservoir on the top and a stopcock on the bottom and packed with 8 ± 0.1 g of *Column support*.
Standard preparation—Transfer about 22 mg of USP Tetracycline Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask, add 1 mL of methanol, and swirl to dissolve. Dilute with *Stationary phase* to volume, and mix. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, dilute with *Stationary phase* to volume, and mix. Pipet 2.0 mL of the resulting solution into the *Chromatographic column*, and allow it to permeate the *Column support*. Add 20 mL of benzene to the solvent reservoir, and collect the eluate at the rate of about 1 mL per minute, using a 50-mL graduated cylinder as a receiver. When the benzene level reaches the top of *Column support*, add 60 mL of chloroform to the solvent reservoir, and continue collecting the eluate until 30 mL has been collected. Discard this eluate, and continue collecting the eluate in a low-actinic, 50-mL volumetric flask. When the chloroform level reaches the top of the *Column support*, add 10 mL of a mixture of butyl alcohol and chloroform (1:1) to the solvent reservoir, and replace the low-actinic, 50-mL volumetric flask with a 10-mL graduated cylinder. Collect 8 mL of the eluate, close the column stopcock, and transfer the eluate to the low-actinic, 50-mL volumetric flask. Rinse the graduated cylinder with 2 mL of chloroform, and add the

www.webofpharma.com

rinsing to the volumetric flask. The eluate in the 50-mL volumetric flask is the *Standard preparation.*

Assay preparation—Constitute the Topical Solution as directed in the labeling. Transfer an accurately measured volume of the constituted Topical Solution, equivalent to about 4.4 mg of tetracycline hydrochloride, to a 25-mL volumetric flask, dilute with *Stationary phase* to volume, and mix. Pipet 2.0 mL of this solution into the *Chromatographic column,* and allow it to penetrate the *Column support.* Add 20 mL of benzene to the solvent reservoir, and collect the eluate at the rate of about 1 mL per minute, using a 50-mL graduated cylinder as a receiver. When the benzene level reaches the top of the *Column support,* add 60 mL of chloroform to the solvent reservoir, and continue collecting the eluate until 30 mL has been collected. Discard this eluate, and continue collecting the eluate in a low-actinic, 50-mL volumetric flask. When the chloroform level reaches the top of the *Column support,* add 50 mL of a mixture of butyl alcohol and chloroform (1:1) to the solvent reservoir, and replace the low-actinic, 50-mL volumetric flask with a 10-mL graduated cylinder. Collect 8 mL of the eluate, close the column stopcock, and transfer the eluate to the low-actinic, 50-mL volumetric flask. Rinse the graduated cylinder with 2 mL of chloroform, and add the rinsing to the volumetric flask. The eluate in the 50-mL volumetric flask is the *Assay preparation.* Retain the column for the test for *Content of epitetracycline hydrochloride.*

Procedure—Add 2.0 mL of *Alkaline methanol solution* to the *Standard preparation,* and the *Assay preparation,* dilute each with chloroform to volume, and mix. Concomitantly, within 10 minutes of preparation, determine the absorbances of these solutions at the wavelength of maximum absorbance at about 366 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of tetracycline hydrochloride in each mL of the constituted Topical Solution taken by the formula:

$$0.0002(WP/V)(A_U/A_S)$$

in which W is the weight, in mg, of USP Tetracycline Hydrochloride RS taken, P is the potency, in µg per mg, of USP Tetracycline Hydrochloride RS, V is the volume, in mL, of constituted Topical Solution taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

Tetracycline Hydrochloride Ophthalmic Suspension

» Tetracycline Hydrochloride Ophthalmic Suspension is a sterile suspension of sterile Tetracycline Hydrochloride in a suitable oil. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers of glass or plastic, containing not more than 15 mL. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP 4-Epianhydrotetracycline Hydrochloride RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for tetracycline, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay.*

Sterility Tests ⟨71⟩ : meets the requirements.

Water Determination, *Method I* ⟨921⟩: not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay—

Diluting solvent, Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Tetracycline Hydrochloride.*

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, equivalent to about 50 mg of tetracycline hydrochloride, with the aid of 30 mL of cyclohexane to a 125-mL separator, add 30 mL of *Diluting solvent,* insert the stopper, and shake. Allow to separate, and collect the lower layer in a 100-mL volumetric flask. Repeat the extraction with two additional 30-mL portions of *Diluting solvent,* combining the extracts in the 100-mL volumetric flask. Add *Diluting solvent* to volume, mix, and filter.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tetracycline Hydrochloride.* Calculate the quantity, in mg per mL, of $C_{22}H_{24}N_2O_8 \cdot HCl$ equivalent in the Ophthalmic Suspension taken by the formula:

$$(CP/10V)(r_U/r_S)$$

in which V is the volume, in mL, of Ophthalmic Suspension taken, and the other terms are as defined therein.

Tetracycline Hydrochloride Compounded Oral Suspension

DEFINITION

Tetracycline Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$).

Prepare Tetracycline Hydrochloride Compounded Oral Suspension 25 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tetracycline Hydrochloride	2.50 g
Cetylpyridinium Chloride	10 mg
Xanthan Gum	0.15 g
Dibasic Sodium Phosphate	60 mg
Monobasic Sodium Phosphate	0.65 g
Sodium Hydroxide	0.30 g
Purified Water	35 mL
Suspension Structured Vehicle or Sugar-Free Suspension Structured Vehicle, a sufficient quantity to make	100 mL

Dissolve *Dibasic Sodium Phosphate* and *Monobasic Sodium Phosphate* in 25 mL of *Purified Water.* Separately dissolve a quantity of *Cetylpyridinium Chloride* in *Purified Water* and dilute, if necessary, with *Purified Water* to obtain 5 mL of a solution containing 10 mg of *Cetylpyridinium Chloride.* Mix this solution with 5 mL of the aqueous phosphate solution and add the resulting solution, in divided portions, with

www.webofpharma.com

mixing, to the *Tetracycline Hydrochloride* in a glass mortar to completely wet the powder, and make a smooth paste. Transfer the remaining 20 mL of the aqueous phosphate solution to a beaker. Using moderate heat, stir to form a vortex, and slowly sprinkle the *Xanthan Gum* into the vortex to produce a uniform dispersion. Add this dispersion to the paste in the glass mortar, and mix until smooth, then add 20 mL of the *Suspension Structured Vehicle* or *Sugar-Free Suspension Structured Vehicle* to the mixture. Dissolve the *Sodium Hydroxide* in 5 mL of *Purified Water*, and while mixing, slowly add this solution to the prepared mixture. Complete the suspension by adding a sufficient quantity of the *Suspension Structured Vehicle* or *Sugar-Free Suspension Structured Vehicle* to make a final volume of 100 mL, and pass this final dispersion through a hand homogenizer prior to transferring it to the dispensing container.

ASSAY

- **PROCEDURE**

Diluent: Dimethylformamide and ammonium oxalate (27:68)

Mobile phase: Dimethylformamide, 0.1 M ammonium oxalate, and 0.2 M dibasic ammonium phosphate (27:68:5). Adjust, if necessary, with 3 N ammonium hydroxide or 3 N phosphoric acid to a pH of 7.6–7.7.

System suitability solution: 100 µg/mL of tetracycline hydrochloride and 25 µg/mL of USP 4-Epianhydrotetracycline Hydrochloride RS

Standard solution: 0.5 mg/mL of USP Tetracycline Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 125 mg of tetracycline hydrochloride, from Oral Suspension, to a 250-mL volumetric flask add 200 mL of *Diluent*, and shake. Add *Diluent* to volume and filter.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Columns

Pre-injection guard: 4.6-mm × 3-cm; 10-µm packing L7

Analytical: 4.6-mm × 25-cm; 5–10-µm packing L7

Flow rate: 2 mL/min

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 4-epianhydrotetracycline and tetracycline are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.2 between the 4-epianhydrotetracycline and tetracycline peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tetracycline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tetracycline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0–110.0%

SPECIFIC TESTS

- **pH** ⟨791⟩: 3.5–6.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, and protect from freezing.
- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded when stored at controlled room temperature
- **LABELING:** Label it to state the *Beyond-Use Date*. Label it to state that it should not be frozen and that it is to be well shaken before use.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP 4-Epianhydrotetracycline Hydrochloride RS

USP Tetracycline Hydrochloride RS

Tetracycline Hydrochloride Tablets

» Tetracycline Hydrochloride Tablets contain not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Tetracycline Hydrochloride RS

USP 4-Epianhydrotetracycline Hydrochloride RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for tetracycline, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 75 rpm. Maintain a distance of 45 ± 5 mm between the blade and the inside bottom of the vessel.

Time: 60 minutes.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_8 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Tetracycline Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight.

Limit of 4-epianhydrotetracycline—Using the *Diluting solvent*, *Chromatographic system*, and *Procedure* set forth in the *Assay*, chromatograph a Standard solution prepared by dissolving an accurately weighed quantity of USP 4-Epianhydrotetracycline Hydrochloride RS in *Diluting solvent* to obtain a solution having a known concentration of about 15 µg per mL. Using the chromatogram so obtained and the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of 4-epianhydrotetracycline hydrochloride in the Tablets taken by the formula:

www.webofpharma.com

$$(10C_E/T)(r_U/r_S)$$

in which C_E is the concentration, in µg per mL, of USP 4-Epianhydrotetracycline Hydrochloride RS in the Standard solution; T is the quantity, in mg, of tetracycline hydrochloride in the portion of Tablets taken to prepare the *Assay preparation*, based on the labeled quantity; and r_U and r_S are the 4-epianhydrotetracycline peak responses obtained from the *Assay preparation* and the Standard solution, respectively: not more than 3.0% is found.

Assay—

Diluting solvent, Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Tetracycline Hydrochloride.*

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of tetracycline hydrochloride, to a 100-mL volumetric flask, add 50 mL of *Diluting solvent*, mix, and sonicate for 5 minutes. Allow to cool, add *Diluting solvent* to volume, mix, and filter.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tetracycline Hydrochloride.* Calculate the quantity, in mg, of $C_{22}H_{24}N_2O_8 \cdot HCl$ in the portion of Tablets taken by the formula:

$$(CP/10)(r_U/r_S)$$

in which the terms are as defined therein.

Tetracycline Hydrochloride and Novobiocin Sodium Tablets

» Tetracycline Hydrochloride and Novobiocin Sodium Tablets contain the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) and novobiocin ($C_{31}H_{36}N_2O_{11}$).

Packaging and storage—Preserve in tight containers.
Labeling—Label the Tablets to indicate that they are intended for veterinary use only.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP Novobiocin RS
Identification—Shake a suitable quantity of finely powdered Tablets with methanol to obtain a solution containing 1 mg of tetracycline hydrochloride per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed under *Identification—Tetracyclines* ⟨193⟩.
Disintegration ⟨701⟩: 60 minutes, simulated gastric fluid TS being substituted for water in the test.
Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to tetracycline hydrochloride and to novobiocin sodium.
Loss on drying ⟨731⟩—Dry about 100 mg, accurately weighed, of finely powdered Tablets in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.
Limit of 4-epianhydrotetracycline ⟨226⟩—To an accurately weighed quantity of finely powdered Tablets, equivalent to about 250 mg of tetracycline hydrochloride, add 10 mL of 0.1 N hydrochloric acid, and adjust with 6 N ammonium hydroxide to a pH of 7.8. Transfer this solution with the aid of *EDTA Buffer* to a 50-mL volumetric flask, dilute with *EDTA Buffer* to volume, and mix. Use this solution, without delay, as the *Test Solution:* not more than 2.0% is found.
Assay for tetracycline hydrochloride—Proceed as directed for tetracycline under *Antibiotics—Microbial Assays* ⟨81⟩, except to use *Escherichia coli* ATCC 10536 as the test organism instead of *Staphylococcus aureus* ATCC 29737 and an inoculum composition of about 0.2 mL of stock suspension in each 100 mL of *Medium 3*. Transfer not less than 5 Tablets to a high-speed blender jar containing an accurately measured volume of 0.1 N hydrochloric acid, so that, after blending for about 3 to 5 minutes, the solution so obtained contains not less than 150 µg of tetracycline hydrochloride per mL. Dilute an accurately measured volume of this solution quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration of tetracycline hydrochloride assumed to be equal to the median dose level of the Standard.
Assay for novobiocin—Proceed as directed for novobiocin under *Antibiotics—Microbial Assays* ⟨81⟩, blending not less than 5 Tablets for 3 to 5 minutes in a high-speed glass blender jar containing 1.0 mL of polysorbate 80 and a sufficient accurately measured volume of *Buffer B.3* to provide a stock solution of convenient concentration. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with *Buffer B.6* to obtain a *Test Dilution* having a concentration of novobiocin assumed to be equal to the median dose level of the Standard.

Tetracycline Hydrochloride, Novobiocin Sodium, and Prednisolone Tablets

» Tetracycline Hydrochloride, Novobiocin Sodium, and Prednisolone Tablets contain not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) and novobiocin ($C_{31}H_{36}N_2O_{11}$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone ($C_{21}H_{28}O_5$).

Packaging and storage—Preserve in tight containers.
Labeling—Label the Tablets to indicate that they are intended for veterinary use only.
USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP Novobiocin RS
USP Prednisolone RS
Disintegration ⟨701⟩: 60 minutes, simulated gastric fluid TS being substituted for water in the test.
Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to tetracycline hydrochloride and to novobiocin sodium and for *Content Uniformity* with respect to prednisolone.

Procedure for content uniformity for prednisolone—Mobile phase, Internal standard solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Prednisolone.*
Standard preparation—Prepare as directed in the *Assay for prednisolone.*
Test preparation—Transfer 1 Tablet to a suitable container, add 7 mL of diluted methanol (2 in 7) for each 1.5 mg of prednisolone in the Tablet, based on the labeled amount, and allow to stand for 90 minutes, occasionally agitating gently to

www.webofpharma.com

ensure that the Tablet disintegrates. For each 1.5 mg of prednisolone, add 3.0 mL of *Internal standard solution*, 12 mL of water-saturated chloroform, and about 10 glass beads. Securely close the container, and shake by mechanical means for 30 minutes. Carefully open the container, add 0.5 mL of sodium carbonate solution (1 in 4), reclose the container, and shake by mechanical means for 5 minutes. Centrifuge, remove the upper layer by aspiration, discarding the aspirated liquid, and retain the clear chloroform layer (*Test preparation*). *Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Prednisolone*. Calculate the quantity, in mg, of prednisolone ($C_{21}H_{28}O_5$) in the Tablet taken by the formula:

$$0.015C(R_U/R_S)$$

in which the terms are as defined therein.

Limit of 4-epianhydrotetracycline ⟨226⟩—To an accurately weighed quantity of finely powdered Tablets, equivalent to about 250 mg of tetracycline hydrochloride, add 10 mL of 0.1 N hydrochloric acid, and adjust with 6 N ammonium hydroxide to a pH of 7.8. Transfer this solution with the aid of *EDTA Buffer* to a 50-mL volumetric flask, dilute with *EDTA Buffer* to volume, and mix. Use this solution, without delay, as the *Test Solution:* not more than 2.0% is found.

Other requirements—Tablets respond to the *Identification* test and meet the requirements of the test for *Loss on drying* under *Tetracycline Hydrochloride and Novobiocin Sodium Tablets*.

Assay for tetracycline hydrochloride and Assay for novobiocin—Using Tablets, proceed as directed in the *Assay for tetracycline hydrochloride* and the *Assay for novobiocin* under *Tetracycline Hydrochloride and Novobiocin Sodium Tablets*.

Assay for prednisolone—

Mobile phase, Internal standard solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Prednisolone*.

Standard preparation—Transfer about 10 mg of USP Prednisolone RS, accurately weighed, to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, and swirl to dissolve. Dilute with water-saturated chloroform to volume, and mix. Transfer 15.0 mL of this solution to a suitable container, add 7 mL of diluted methanol (2 in 7), securely close the container, and shake by mechanical means for 30 minutes. Carefully open the container, add 0.5 mL of sodium carbonate solution (1 in 4), reclose the container, and shake by mechanical means for 5 minutes. Centrifuge, remove the upper layer by aspiration, discarding the aspirated liquid, and retain the clear chloroform layer (*Standard preparation*).

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1.5 mg of prednisolone, to a suitable container containing about 10 glass beads. Add 3.0 mL of *Internal standard solution*, 12 mL of water-saturated chloroform, and 7 mL of diluted methanol (2 in 7), securely close the container, and shake by mechanical means for 30 minutes. Carefully open the container, add 0.5 mL of sodium carbonate solution (1 in 4), reclose the container, and shake by mechanical means for 5 minutes. Centrifuge, remove the upper layer by aspiration, discarding the aspirated liquid, and retain the clear chloroform layer (*Assay preparation*).

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Prednisolone*. Calculate the quantity, in mg, of prednisolone ($C_{21}H_{28}O_5$) in the portion of Tablets taken by the formula:

$$0.015C(R_U/R_S)$$

in which the terms are as defined therein.

Tetracycline Hydrochloride and Nystatin Capsules

» Tetracycline Hydrochloride and Nystatin Capsules contain not less than 90.0 percent and not more than 125.0 percent of the labeled amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$), and not less than 90.0 percent and not more than 135.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Tetracycline Hydrochloride RS
USP Nystatin RS

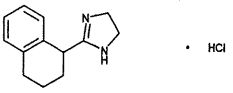
Identification—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing about 1 mg of tetracycline hydrochloride per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed under *Identification—Tetracyclines* ⟨193⟩.

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Time: 60 minutes.

Procedure—Determine the amount of tetracycline hydrochloride ($C_{22}H_{24}N_2O_8 \cdot HCl$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Tetracycline Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 70% (*Q*) of the labeled amount of $C_{22}H_{24}N_2O_8 \cdot HCl$ is dissolved in 60 minutes.

Loss on drying ⟨731⟩—Dry about 100 mg of Capsule contents, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 4.0% of its weight.



Limit of 4-epianhydrotetracycline ⟨226⟩—To a quantity of Capsule contents, equivalent to about 250 mg of tetracycline hydrochloride, add 10 mL of 0.1 N hydrochloric acid, and adjust with 6 N ammonium hydroxide to a pH of 7.8. Transfer this solution with the aid of *EDTA Buffer* to a 50-mL volumetric flask, dilute with *EDTA Buffer* to volume, and mix. Use this solution, without delay, as the *Test Solution:* not more than 3.0% is found.

Assay for tetracycline hydrochloride—Proceed with Capsules as directed in the *Assay* under *Tetracycline Hydrochloride Capsules*.

Assay for nystatin—Proceed as directed for Nystatin under *Antibiotics—Microbial Assays* ⟨81⟩, blending not less than 5 Capsules for 3 to 5 minutes in a high-speed blender with a sufficient, accurately measured, volume of dimethylformamide to obtain a solution of convenient concentration. Dilute an accurately measured portion of this solution quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Dilute this stock solution quantitatively with *Buffer B.6* to obtain a *Test Dilution* having a concentration of nystatin assumed to be equal to the median dose level of the Standard.

www.webofpharma.com

Tetrahydrozoline Hydrochloride

$C_{13}H_{16}N_2 \cdot HCl$ 236.74

1*H*-Imidazole, 4,5-dihydro-2-(1,2,3,4-tetrahydro-1-naphthalenyl)-, monohydrochloride;
2-(1,2,3,4-Tetrahydro-1-naphthyl)-2-imidazoline monohydrochloride [522-48-5].

DEFINITION

Tetrahydrozoline Hydrochloride contains NLT 98.0% and NMT 102.0% of tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

SPECIFIC TESTS
- **LOSS ON DRYING** ⟨731⟩
  Analysis: Dry at 105° for 2 h.
  Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Tetrahydrozoline Hydrochloride RS

Tetrahydrozoline Hydrochloride Nasal Solution

» Tetrahydrozoline Hydrochloride Nasal Solution is a solution of Tetrahydrozoline Hydrochloride in water adjusted to a suitable tonicity. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{13}H_{16}N_2 \cdot HCl$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Tetrahydrozoline Hydrochloride RS
Identification—The UV absorption spectrum of the Nasal Solution, diluted with water, if necessary, to a concentration of about 1 in 4000, exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Tetrahydrozoline Hydrochloride RS, concomitantly measured.
Microbial enumeration tests ⟨61⟩ **and** ***Tests for specified microorganisms*** ⟨62⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
pH ⟨791⟩: between 5.3 and 6.5.

Assay—
Oxidized nitroprusside reagent—Dissolve 1.0 g of sodium nitroferricyanide in water to make 10.0 mL (*Solution A*). Dissolve 1.0 g of potassium ferricyanide in water to make 10.0 mL (*Solution B*). Transfer 1.0 mL each of *Solution A* and *Solution B* to a 100-mL volumetric flask, add 1 mL of sodium hydroxide solution (1 in 10), and allow to stand until the solution changes to a light yellow color (about 20 to 30 minutes). Dilute with water to volume, and mix. Store in a refrigerator or keep in an ice bath, and use within 4 hours.
Standard preparation—Dissolve a suitable quantity of USP Tetrahydrozoline Hydrochloride RS, accurately weighed, in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 100 µg per mL.
Assay preparation—Transfer an accurately measured volume of Nasal Solution, equivalent to about 10 mg of tetrahydrozoline hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.
Procedure—Transfer 5.0 mL each of the *Standard preparation* and the *Assay preparation* to separate glass-stoppered test tubes. Pipet 5 mL of water into a third tube to provide a blank. To each tube add 4.0 mL of *Oxidized nitroprusside reagent*, mix, and allow to stand at 30° for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 570 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of $C_{13}H_{16}N_2 \cdot HCl$ in each mL of the Nasal Solution taken by the formula:

$$0.1(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tetrahydrozoline Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of Nasal Solution taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Tetrahydrozoline Hydrochloride Ophthalmic Solution

DEFINITION
Tetrahydrozoline Hydrochloride Ophthalmic Solution is a sterile, isotonic solution of Tetrahydrozoline Hydrochloride in water. It contains NLT 90.0% and NMT 110.0% of the labeled amount of tetrahydrozoline hydrochloride ($C_{13}H_{16}N_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers, protected from light, and store at controlled room temperature.

USP Reference standards ⟨11⟩—
USP Thalidomide RS

Change to read:

Identification, ***▲Spectroscopic Identification Tests*** ⟨197⟩, *Infrared Spectroscopy*: 197K▲ (CN 1-May-2020)

Microbial enumeration tests ⟨61⟩ **and** ***Tests for specified microorganisms*** ⟨62⟩—The total aerobic microbial count using the *Plate Method* is not more than 1000 cfu per g, and the total combined molds and yeasts count is not more than 100 cfu per g.

Water Determination, *Method Ic* ⟨921⟩ **:** not more than 0.5%.

Solvent: anhydrous dimethyl sulfoxide.

Chromatographic purity—

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (95: 5: 0.1).

Solution B—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (85: 15: 0.1).

Diluent—Prepare a mixture of water, acetonitrile, and phosphoric acid (50: 50: 0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Phthalic acid stock solution—Transfer about 100 mg of phthalic acid to a 100-mL volumetric flask, dissolve in a mixture of acetonitrile and water (80:5), and dilute with acetonitrile to volume. Mix, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.1 mg per mL.

Standard stock solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Thalidomide RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Pipet 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Phthalic acid stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.0002 mg of phthalic acid per mL.

Test solution—Transfer about 100 mg of Thalidomide, accurately weighed, to a 50-mL volumetric flask, and dissolve, with the aid of sonication, in 40 mL of a mixture of water, acetonitrile, and phosphoric acid (50: 50: 0.1). Dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–15	100→50	0→50	linear gradient
15–20	50→100	50→0	linear gradient
20–30	100	0	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.35 for phthalic acid and about 1.0 for thalidomide; the tailing factor for the phthalic acid and thalidomide peaks is not more than 2.0; and the relative standard deviation determined from the phthalic acid peak for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of each impurity in Thalidomide by the formula:

$$50{,}000(C_P/W)(r_i/r_P)$$

in which C_P is the concentration, in mg per mL, of phthalic acid in the *Standard solution; W* is the amount, in mg, of Thalidomide taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_P is the phthalic acid peak response obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

Ordinary impurities ⟨466⟩—

Test solution—Dissolve an accurately weighed quantity of Thalidomide in acetonitrile to obtain a solution having a concentration of about 2 mg per mL.

Standard solution—Dissolve an accurately weighed quantity of glutamine in a mixture of acetonitrile and water (1:1) to obtain a solution having a concentration of about 0.1 mg per mL.

Eluant: a mixture of methylene chloride, methanol, and acetic acid (75: 25: 0.05).

Application volume: 2 µL (*Standard solution*) and 100 µL (*Test solution*).

Visualization: 4.

Limit: 0.1%.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (85: 15: 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard preparation—Transfer about 150 mg of phenacetin, accurately weighed, to a 100-mL volumetric flask, dissolve in about 80 mL of acetonitrile, dilute with acetonitrile to volume, and mix.

Standard preparation—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Thalidomide RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL. Transfer 10.0 mL of this solution and 5.0 mL of *Internal standard preparation* to a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.

Assay preparation—Transfer about 100 mg of Thalidomide, accurately weighed, to a 100-mL volumetric flask, and dissolve, with the aid of sonication, in 80 mL of acetonitrile. Dilute with acetonitrile to volume, and mix. Pipet 10.0 mL of this solution and 5.0 mL of *Internal standard preparation* into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 237-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the

www.webofpharma.com

peak responses as directed for *Procedure:* the resolution, *R*, between thalidomide and phenacetin is not less than 3.0; the column efficiency determined from the thalidomide and phenacetin peaks is not less than 7000 and 9000 theoretical plates, respectively; the tailing factor is not more than 2.0; and the relative standard deviation for ▲the response ratio of thalidomide to phenacetin▲ (ERR 1-May-2019) is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{10}N_2O_4$ in the portion of Thalidomide taken by the formula:

$$1000C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Thalidomide RS in the *Standard preparation;* and R_U and R_S are the peak area ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Thalidomide Capsules

» Thalidomide Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thalidomide ($C_{13}H_{10}N_2O_4$).

Packaging and storage—Preserve in tight containers, protected from light, at controlled room temperature. Do not repackage.

USP Reference standards ⟨11⟩—
USP Thalidomide RS

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—*Test solution*—Prepare a solution of it in acetonitrile containing about 3000 µg of thalidomide per mL.
Application volume: 5 µL.
Developing solvent system: a mixture of normal butyl acetate, glacial acetic acid, and butyl alcohol (50:25:5).

B: The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial enumeration tests ⟨61⟩ **and** ***Tests for specified microorganisms*** ⟨62⟩—The total aerobic microbial count using the *Plate Method* is not more than 1000 cfu per g, and the total combined molds and yeasts count is not more than 100 cfu per g. It meets the requirements of the test for absence of *Escherichia coli.*

Dissolution ⟨711⟩—
Medium—Add 1.0 mL of polyoxyethylene (23) lauryl ether solution, prepared by dissolving 50 g in 100 mL of water, to 0.225 M hydrochloric acid; 4000 mL.
Apparatus 2: 75 rpm.
Time: 60 minutes.
Determine the amount of $C_{13}H_{10}N_2O_4$ dissolved by employing the following method.
Mobile phase—Prepare as directed in the *Assay* under *Thalidomide.*
Internal standard solution—Prepare a solution of phenacetin in acetonitrile containing about 375 µg per mL. Pipet 20.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.
Standard solution—Dissolve an accurately weighed quantity of USP Thalidomide RS in acetonitrile to obtain a solution having a known concentration of about 0.25 mg per mL. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix. Add 5.0 mL of *Internal standard solution* to 20.0 mL of this solution, and mix. This solution contains about 0.02 mg of USP Thalidomide RS per mL.
Test solution—Add 5.0 mL of *Internal standard solution* to each 20.0 mL of filtered solution under test, and mix.
Chromatographic system—Prepare as directed in the *Assay* under *Thalidomide.*
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{10}N_2O_4$ dissolved by the formula:

$$2500C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Thalidomide RS in the *Standard solution;* and R_U and R_S are the peak area ratios of thalidomide to the internal standard obtained from the *Test solution* and the *Standard solution,* respectively.
Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{13}H_{10}N_2O_4$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Mobile phase, Internal standard preparation, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Thalidomide.*
Assay preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of thalidomide, to a 100-mL volumetric flask, add 80 mL of acetonitrile to dissolve, and sonicate for about 20 minutes. Dilute with acetonitrile to volume, and mix. Transfer 20.0 mL of this solution and 5.0 mL of *Internal standard preparation* to a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of thalidomide ($C_{13}H_{10}N_2O_4$) in the portion of Capsules taken by the formula:

$$1000C(R_U/R_S)$$

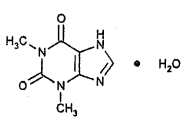
in which *C* is the concentration, in mg per mL, of USP Thalidomide RS in the *Standard preparation;* and R_U and R_S are the peak area ratios of thalidomide to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thallous Chloride Tl 201 Injection

» Thallous Chloride Tl 201 Injection is a sterile, isotonic, aqueous solution of radioactive thallium (^{201}Tl) in the form of thallous chloride suitable for

USP Monographs

www.webofpharma.com



intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{201}Tl as chloride, expressed in megabecquerels (microcuries or millicuries) per mL, at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5.0 percent of the total radioactivity. It may contain a preservative or stabilizer.

Packaging and storage—Preserve in single-dose or multiple-dose containers.
Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{201}Tl as labeled thallous chloride expressed as total megabecquerels (microcuries or millicuries) and concentration as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{201}Tl is 73.1 hours.
Radionuclide identification (see *Radioactivity* ⟨821⟩)—Its gamma-ray spectrum is identical to that of a specimen of ^{201}Tl of known purity that exhibits a major photopeak at an energy of 167 KeV and a minor photopeak of 135 KeV.
Bacterial Endotoxins Test ⟨85⟩—The limit of endotoxin content is not more than $175/V$ USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.
pH ⟨791⟩: between 4.5 and 7.5.
Radiochemical purity —Soak a 2.5- × 15.0-cm cellulose polyacetate strip in 0.05 M edetate disodium for 45 to 60 minutes. Remove the strip with forceps, taking care to handle the outer edges only. Place the strip between two absorbent pads, and blot to remove excess solution. Apply not less than 5 µL of a previously mixed solution consisting of equal volumes of Injection and 0.05 M edetate disodium to the center of the blotted strip, and mark the point of application. Attach the strip to the support bridge of an electrophoresis chamber containing equal portions of 0.05 M edetate disodium in each side of the chamber. Ensure that each end of the strip is in contact with the 0.05 M edetate disodium. Attach the chamber cover, and perform the electrophoresis at 250 volts for 30 minutes. Remove the strip from the chamber, and allow to air-dry without blotting. Using a suitable scanner and counting assembly, determine the radioactivity. Not less than 95.0% of the radioactivity on the strip migrates toward the cathode as a single peak.
Radionuclidic purity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity of each radionuclidic impurity in the Injection by use of a calibrated system. Not less than 95.0% of the total radioactivity is present as thallium 201. In addition, not more than 2.0% of thallium 200 (half-life is 26.1 hours), not more than 0.3% of lead 203 (half-life is 52.02 hours), and not more than 2.7% of thallium 202 (half-life is 12.23 days) are present.

Content of thallium—
Standard thallium solution—Transfer 235 mg of thallous chloride, accurately weighed, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with saline TS containing 0.9% benzyl alcohol to volume, and mix. This standard solution contains 2 µg of thallium per mL.
Procedure—Transfer 1.0-mL portions of the *Standard thallium solution* and the Injection to separate screw-cap test tubes. To each tube add 2 drops of a solution, prepared by carefully mixing 18 mL of nitric acid and 82 mL of hydrochloric acid, and mix. Then add to each tube 1.0 mL of sulfosalicylic acid solution (1 in 10), and mix. Add 2 drops of 12 N hydrochloric acid to each tube, and mix. To each tube add 4 drops of rhodamine B solution (50 mg of rhodamine B diluted with hydrochloric acid to 100.0 mL), and mix. Add 1.0 mL of diisopropyl ether. Screw the caps on tightly, shake the tubes by hand for 1 minute, accurately timed, releasing any pressure build-up by loosening the caps slightly. Recap the tubes and allow the phases to separate. Transfer 0.5 mL of the diisopropyl ether layer from each tube to clean tubes. Visually compare the ether layers: the color of the ether layer from the Injection is not darker than that from the *Standard thallium solution.*
Iron—Into separate cavities of a spot plate, place 0.1 mL of the Injection and 0.1 mL of *Standard Iron Solution* (see *Iron* ⟨241⟩) diluted with water to a concentration of 5 µg per mL. Add to each cavity 0.1 mL of hydroxylamine hydrochloride solution (1 in 10), 1 mL of sodium acetate solution (1 in 4), and 0.1 mL of 0.5% dipyridyl solution (0.5 g of 2,2′-dipyridyl dissolved in 100 mL of water containing 0.15 mL of hydrochloric acid), and mix. After 5 minutes, the color of the specimen of Injection is not darker than that of the *Standard Iron Solution.*

Copper—
Standard copper solution—Dissolve 0.982 g of $CuSO_4 \cdot 5H_2O$ in 1000 mL of 0.1 N hydrochloric acid. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix to obtain a Standard solution containing 5 µg of copper per mL.
Procedure—Into separate cavities of a spot plate, place 0.2 mL of the Injection and 0.2 mL of *Standard copper solution.* Add to each cavity 0.2 mL of water and 0.1 mL of iron thiocyanate solution (1.5 g ferric chloride and 2 g potassium thiocyanate dissolved in water and diluted with water to 100.0 mL). Mix, then add 0.1 mL of sodium thiosulfate solution (1 in 100), and again mix. The time required for the specimen of Thallous Chloride Tl 201 Injection to decolorize is equal to or longer than that observed for the *Standard copper solution.*
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility,* the latter test being started on the day of final manufacture, and except that it is not subject to the recommendations on *Container Content.*
Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity in MBq (µCi or mCi) per mL of Injection by use of a calibrated system.

Theophylline

$C_7H_8N_4O_2 \cdot H_2O$ 198.18
$C_7H_8N_4O_2$ 180.17
1*H*-Purine-2,6-dione, 3,7-dihydro-1,3-dimethyl-, monohydrate;
Theophylline monohydrate [5967-84-0].
Anhydrous [58-55-9].

www.webofpharma.com

DEFINITION

Theophylline contains one molecule of water of hydration or is anhydrous. It contains NLT 97.0% and NMT 102.0% of theophylline ($C_7H_8N_4O_2$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: 10 mM ammonium acetate prepared as follows. Transfer 770.8 mg of ammonium acetate to a 1-L volumetric flask, and dissolve in 80% flask volume of water. Adjust with glacial acetic acid to a pH of 5.5 and dilute with water to volume. Pass through a suitable filter of 0.2-µm pore size.

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	98	2
7	50	50
7.3	10	90
8.3	10	90
8.31	98	2
12	98	2

Impurity stock solution: 0.2 mg/mL of USP Theophylline Related Compound F RS in water

System suitability solution: 1 mg/mL of USP Theophylline RS and 1 µg/mL of USP Theophylline Related Compound F RS, from *Impurity stock solution*, in water. Sonicate as needed to aid in the dissolution.

Standard solution: 0.2 mg/mL of USP Theophylline RS in water

Sample solution: 0.2 mg/mL of Theophylline in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 2.1-mm × 10-cm; 1.7-µm packing L1

Column temperature: 40°

Flow rate: 0.4 mL/min

Injection volume: 1 µL

System suitability

Samples: *System suitability solution* and *Standard solution*. [NOTE—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between theophylline and theophylline related compound F, *System suitability solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of theophylline ($C_7H_8N_4O_2$) in the portion of Theophylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of theophylline from the *Sample solution*

r_S = peak response of theophylline from the *Standard solution*

C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)

C_U = concentration of Theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.15%
- **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Impurity stock solution, and **System suitability solution:** Proceed as directed in the *Assay*.

Standard stock solution: 50 µg/mL each of USP Caffeine RS, USP Theophylline RS, USP Theophylline Related Compound B RS, USP Theophylline Related Compound C RS, USP Theophylline Related Compound D RS, and USP Theophylline Related Compound F RS

Standard solution: 1 µg/mL each of USP Caffeine RS, USP Theophylline RS, USP Theophylline Related Compound B RS, USP Theophylline Related Compound C RS, USP Theophylline Related Compound D RS, and USP Theophylline Related Compound F RS, from *Standard stock solution*, in water

Sample solution: 1.0 mg/mL of Theophylline in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector

For unspecified impurities with absorption maxima near 220 nm: UV 220 nm

For specified impurities and unspecified impurities with absorption maxima near 270 nm: UV 270 nm

Column: 2.1-mm × 10-cm; 1.7-µm packing L1

Column temperature: 40°

Flow rate: 0.4 mL/min

Injection volume: 1 µL

System suitability

Samples: *System suitability solution* and *Standard solution* [NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between theophylline and theophylline related compound F, *System suitability solution*

Relative standard deviation: NMT 3.0% for each peak present in the *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

For impurities detected at 270 nm

Calculate the percentage of caffeine, theophylline related compound B, theophylline related compound C, and theophylline related compound D in the portion of Theophylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of caffeine, theophylline related compound B, theophylline related compound C, or theophylline related compound D from the *Sample solution*

r_S = peak response of the corresponding Reference Standard from the *Standard solution*

www.webofpharma.com

C_S = concentration of USP Caffeine RS, USP Theophylline Related Compound B RS, USP Theophylline Related Compound C RS, or USP Theophylline Related Compound D RS in the *Standard solution* (mg/mL)
C_U = concentration of Theophylline in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual unspecified impurity with absorption maxima near 270 in the portion of Theophylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual unspecified impurity from the *Sample solution*
r_S = peak response of theophylline from the *Standard solution*
C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)
C_U = concentration of Theophylline in the *Sample solution* (mg/mL)

For impurities detected at 220 nm
Calculate the percentage of any other individual unspecified impurity with absorption maxima near 220 in the portion of Theophylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual unspecified impurity from the *Sample solution*
r_S = peak response of theophylline from the *Standard solution*
C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)
C_U = concentration of Theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Theophylline related compound C	0.36	0.10
Theophylline related compound B	0.63	0.10
Theophylline related compound D	0.69	0.10
Theophylline	1.0	—
Theophylline related compound F[a]	1.09	—
Caffeine	1.20	0.10
Any other individual unspecified impurity	—	0.10
Total impurities	—	0.5

[a] Included for establishing system suitability only.

SPECIFIC TESTS
• **Loss on Drying** ⟨731⟩
Analysis: Dry at 105° for 4 h.
Acceptance criteria: The hydrous form loses 7.5%–9.5% of its weight, and the anhydrous form loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in well-closed containers.
• **Labeling:** Label it to indicate whether it is hydrous or anhydrous.
• **USP Reference Standards** ⟨11⟩
USP Caffeine RS
USP Theophylline RS
USP Theophylline Related Compound B RS
3-Methyl-1*H*-purine-2,6-dione.
$C_6H_6N_4O_2$ 166.14
USP Theophylline Related Compound C RS
N-(6-Amino-1,3-dimethyl-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl)formamide.
$C_7H_{10}N_4O_3$ 198.18
USP Theophylline Related Compound D RS
Theophyllidine;
N-Methyl-5-(methylamino)-1*H*-imidazole-4-carboxamide hydrochloride monohydrate.
$C_6H_{10}N_4O \cdot HCl \cdot H_2O$ 208.65
USP Theophylline Related Compound F RS
Etophylline;
7-(2-Hydroxyethyl)-1,3-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione.
$C_9H_{12}N_4O_3$ 224.22

Theophylline Capsules

» Theophylline Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Theophylline RS

Identification—
A: The contents of the Capsules respond to *Identification* tests *A* and *B* under *Theophylline Tablets*.
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 60 minutes.
Procedure—Determine the amount of $C_7H_8N_4O_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 268 nm of filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, if necessary, in comparison with a Standard solution having a known concentration of USP Theophylline RS in the same medium.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_7H_8N_4O_2$ is dissolved in 60 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

www.webofpharma.com

Assay—

Mobile phase—Prepare a solution containing a mixture of water, methanol, and glacial acetic acid (64:35:1).

Standard preparation—Dissolve an accurately weighed quantity of USP Theophylline RS in methanol to obtain a solution having a known concentration of about 400 µg per mL.

Assay preparation for hard Capsules—Remove, as completely as possible, the contents of not less than 20 Capsules, weigh, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of anhydrous theophylline, to a 250-mL volumetric flask, add about 150 mL of methanol, and shake to dissolve. Dilute with methanol to volume, mix, and filter, using a membrane filter.

Assay preparation for soft Capsules—Cut open 20 Capsules, and place them in a 200-mL volumetric flask. Add 50 mL of 6 N ammonium hydroxide, shake to dissolve the contents, add water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Transfer an accurately measured portion of the filtrate, equivalent to about 100 mg of anhydrous theophylline, to a 250-mL volumetric flask, add methanol to volume, mix, and filter through a membrane filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses. Calculate the quantity, in mg, of anhydrous theophylline in the portion of Capsule contents taken by the formula:

$$0.25C(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Theophylline RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Theophylline Extended-Release Capsules

DEFINITION

Theophylline Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

IDENTIFICATION

- **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: 10 mM ammonium acetate prepared as follows. Transfer 0.77 g of ammonium acetate to a 1-L volumetric flask, and dissolve in 80% of the flask volume of water. Adjust with glacial acetic acid to a pH of 5.4 and dilute with water to volume. Pass through a suitable filter of 0.2-µm pore size.

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	93.5	6.5
2.5	93.5	6.5
5.0	10	90
5.1	93.5	6.5
7.0	93.5	6.5

Diluent: Dilute 138 mL of ammonium hydroxide solution with water to 1 L.

Standard solution: 0.2 mg/mL of USP Theophylline RS

Sample stock solution: Nominally 4 mg/mL of theophylline prepared as follows. Transfer the contents of a suitable number of Capsules to a 500-mL volumetric flask. Add 150 mL of *Diluent* and heat on a hot plate to just boiling with occasional stirring. Remove from the hot plate and sonicate for 5 min while still hot. Cool to ambient temperature and dilute with water to volume.

Sample solution: Nominally 0.2 mg/mL of theophylline from *Sample stock solution*. Centrifuge and use the supernatant.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm. For *Identification A*, use a photodiode array detector in the range of 210–400 nm.

Column: 2.1-mm × 10-cm; 1.7-µm packing L7

Column temperature: 40 ± 2°

Flow rate: 0.4 mL/min

Injection volume: 1 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of theophylline from the *Sample solution*

r_S = peak response of theophylline from the *Standard solution*

C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

[NOTE—The following tests, which were assigned numbers chronologically, are placed in groups corresponding to product dosing intervals. Thus, individual tests do not necessarily appear in numerical order.]

www.webofpharma.com

For products labeled for dosing every 12 h

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*. Proceed as directed for *Dissolution* ⟨711⟩, *Procedure, Apparatus 1 and 2, Delayed-Release Dosage Forms, Method B Procedure* except to use *Acceptance Table 2*.

Medium: pH 1.2 simulated gastric fluid (without pepsin) for the first hour; pH 6.0 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 2: 50 rpm

Times: 1, 2, 4, 6, and 8 h

Standard solution: A known concentration of USP Theophylline RS in *Medium*

Sample solution: Filtered portions of the solution under test. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 271 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at each time point using the UV absorption.

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved (%)
1	3–15
2	20–40
4	50–75
6	65–100
8	NLT 80

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Solution A: 6.8 g/L of monobasic potassium phosphate. Adjust with either 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 4.5 ± 0.05.

Medium: *Solution A*; 900 mL

Apparatus 2: 75 rpm

Times: 1, 2, 4, and 8 h

Analysis: Proceed as directed in *Test 1*.

Tolerances: See *Table 3*.

Table 3

Time (h)	Amount Dissolved (%)
1	10–30
2	30–55
4	55–80
8	NLT 80

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*. Proceed as directed for *Dissolution* ⟨711⟩, *Procedure, Apparatus 1 and 2, Delayed-Release Dosage Forms, Method B Procedure* except to use *Acceptance Table 2*.

Medium: pH 1.2 simulated gastric fluid (without pepsin) for 1 h; pH 7.5 simulated intestinal fluid (without enzyme); 900 mL

Apparatus 2: 50 rpm

Times: 1, 2, 3, 4, and 7 h

Analysis: Proceed as directed in *Test 1*.

Tolerances: See *Table 4*.

Table 4

Time (h)	Amount Dissolved (%)
1	1–17
2	30–60
3	50–90
4	NLT 65
7	NLT 85

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*. Proceed as directed for *Dissolution* ⟨711⟩, *Procedure, Apparatus 1 and 2, Delayed-Release Dosage Forms, Method A Procedure* except to use *Acceptance Table 2*.

Medium: pH 3.0 phosphate buffer prepared by adjusting 0.05 M potassium phosphate buffer with phosphoric acid to a pH of 3.0 ± 0.05, for the first 3.5 h, followed by the addition of 5.3 M sodium hydroxide to adjust to a pH of 7.4 ± 0.05; 900 mL

Apparatus 2: 50 rpm

Times: 1, 2, 3.5, and 5 h

Analysis: Proceed as directed in *Test 1*.

Tolerances: See *Table 5*.

Table 5

Time (h)	Amount Dissolved (%)
1	13–38
2	25–50
3.5	37–65
5	85–115

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium, Apparatus 2, and **Analysis:** Proceed as directed in *Test 4*.

Times: 1, 3.5, 5, 7, and 10 h

Tolerances: See *Table 6*.

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

For products labeled for dosing every 24 h

Test 6: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium: 0.05 M pH 6.6 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 1000 mL

Apparatus 1: 100 rpm

Times: 1, 2, 4, 5, and 8 h

Analysis: Proceed as directed in *Test 1*.

Tolerances: See *Table 11*.

Table 11

Time (h)	Amount Dissolved (%)
1	5–15
2	12–30
4	25–50
5	30–60
8	55–75

The percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved at the times given conforms to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

Procedure for content uniformity

Standard solution: 12 µg/mL of USP Theophylline RS

Sample solution: Nominally 12 µg/mL of theophylline, prepared as follows. Using a mortar and pestle, triturate the contents of 1 Capsule with 20 mL of water. With the aid of water, transfer the mixture to a 100-mL volumetric flask. Add 25 mL of 6 N ammonium hydroxide, shake or

USP Monographs

www.webofpharma.com

sonicate for 45 min, and cool to room temperature. Dilute with water to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Dilute a portion of the filtrate with water to obtain the solution.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 270 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Concomitantly determine the absorbance of the *Sample solution* and *Standard solution*.

Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in each Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Theophylline RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (µg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Sample stock solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard stock solution: 0.1 mg/mL each of USP Theophylline RS and USP Theophylline Related Compound D RS

System suitability solution: 1 µg/mL each of USP Theophylline RS and USP Theophylline Related Compound D RS from the *Standard stock solution*

Standard solution: 2.0 µg/mL each of USP Theophylline RS and USP Theophylline Related Compound D RS from the *Standard stock solution*

Sample solution: Nominally 1.0 mg/mL of theophylline from the *Sample stock solution*. Centrifuge and use the supernatant.

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 12* for relative retention times.]

Suitability requirements

Relative standard deviation: NMT 5.0% for the theophylline and theophylline related compound D RS peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of theophylline related compound D in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of theophylline related compound D from the *Sample solution*

r_S = peak response of theophylline related compound D from the *Standard solution*

C_S = concentration of USP Theophylline Related Compound D RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual unspecified degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual unspecified degradation product from the *Sample solution*

r_S = peak response of theophylline from the *Standard solution*

C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 12*. Disregard peaks less than 0.1%.

Table 12

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Theophylline related compound D	0.45	0.2
Theophylline	1.0	—
Any other individual unspecified degradation product	—	0.2
Total degradation products	—	0.5

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

• **LABELING:** The labeling indicates whether the product is intended for dosing every 12 or 24 h, and states with which in vitro *Dissolution Test* the product complies.

• **USP REFERENCE STANDARDS** ⟨11⟩

Theophylline Compounded Oral Suspension

DEFINITION

Theophylline Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of theophylline ($C_7H_8N_4O_2$).

Prepare Theophylline Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Theophylline	500 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), *NF*, and Vehicle for Oral Suspension, *NF*, a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Calculate the amount of *Theophylline* on the anhydrous basis. If using tablets, place the required number in a suitable mortar, and comminute to a fine powder, or use *Theophylline* powder. Add about 20 mL of the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container. Add enough of the liquid *Vehicle* to bring to final volume, and mix well.

ASSAY

- **PROCEDURE**

Solution A: Dissolve 2.500 g of sodium citrate and 1.633 g of citric acid (anhydrous) in 850 mL of ASTM Type I water, add 150 mL of methanol, and pass through 0.45-µm membrane filters.

Solution B: Acetonitrile

Mobile phase: See *Table 1*. Make adjustments, if necessary.

Table 1

Time (min)	Solution A (%)	Solution B (%)

Theophylline Tablets

» Theophylline Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Theophylline RS

Identification—
A: Triturate a quantity of finely powdered Tablets, equivalent to about 500 mg of theophylline, with 10-mL and 5-mL portions of solvent hexane, and discard the solvent hexane. Triturate the residue with two 10-mL portions of a mixture of equal volumes of 6 N ammonium hydroxide and water, and filter each time. Evaporate the combined filtrates to about 5 mL, neutralize, if necessary, with 6 N acetic acid, using litmus, and then cool to about 15°, with stirring. Collect the precipitate on a filter, wash it with cold water, and dry at 105° for 2 hours: the theophylline so obtained melts between 270° and 274°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩). Retain the remaining portion of the theophylline for use in *Identification* test *B*.
B: The IR absorption spectrum of a potassium bromide dispersion of the residue obtained in *Identification* test *A* exhibits maxima only at the same wavelengths as that of a potassium bromide dispersion of USP Theophylline RS.
C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* both relative to the internal standard, as obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_7H_8N_4O_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 272 nm of filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Theophylline RS in the same medium.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_7H_8N_4O_2$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Mobile phase , *Internal standard solution*, and *Standard preparation*—Prepare as directed in the *Assay* under *Theophylline*.
Assay preparation—Place 10 Tablets in a 500-mL volumetric flask, add 50 mL of water, and when the Tablets have disintegrated add 50 mL of 6 N ammonium hydroxide. Shake until no more dissolves, dilute with water to volume, mix, and filter through a dry filter with the aid of suction, if necessary, into a dry flask, discarding the first 20 mL of the filtrate. Transfer an accurately measured aliquot portion of this concentrate, equivalent to about 10 mg of theophylline, to a 100-mL volumetric flask. Add 20.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.
Chromatographic system—Proceed as directed in the *Assay* under *Theophylline*.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Theophylline*. Calculate the quantity, in mg, of $C_7H_8N_4O_2$ per Tablet taken by the formula:

$$5000(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Theophylline RS in the *Standard preparation*, V is the volume, in mL, of concentrate taken for the *Assay preparation*, and R_U and R_S are the response ratios of the theophylline peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Theophylline in Dextrose Injection

DEFINITION
Theophylline in Dextrose Injection is a sterile solution of Theophylline and Dextrose in Water for Injection. It contains NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$) and NLT 95.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$).

IDENTIFICATION
- **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.**

Sample solution: Theophylline in Dextrose Injection
Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.
Acceptance criteria: A red-to-orange precipitate of cuprous oxide is formed.

ASSAY
- **THEOPHYLLINE**

Solution A: 10 mM ammonium acetate prepared as follows. Transfer 771 mg of ammonium acetate to a 1-L volumetric flask, and dissolve in 80% of the flask volume of water. Adjust with glacial acetic acid to a pH of 4.8 and dilute with water to volume. Pass through a suitable filter of 0.2-µm pore size.
Solution B: Methanol
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	93.5	6.5
2.5	93.5	6.5
5.0	10	90
5.1	93.5	6.5
7.0	93.5	6.5

Standard solution: 0.1 mg/mL of USP Theophylline RS
Sample solution: Nominally 0.1 mg/mL of theophylline prepared as follows. Transfer 5 mg of theophylline from a volume of Injection to a 50-mL volumetric flask. Dissolve and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 270 nm. For *Identification A*, use a photodiode array detector in the range of 210–400 nm.
Column: 2.1-mm × 10-cm; 1.7-µm packing L7

USP Monographs

www.webofpharma.com

Column temperature: 40°
Flow rate: 0.4 mL/min
Injection volume: 1 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of theophylline from the *Sample solution*
r_S = peak response of theophylline from the *Standard solution*
C_S = concentration of USP Theophylline RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

• **DEXTROSE**
Sample solution: Nominally 2–5 g of dextrose per 100 mL, prepared as follows. Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.
Analysis
Sample: *Sample solution*
Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩).
Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)
M_{r1} = molecular weight of dextrose monohydrate, 198.17
M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 95.0%–105.0%

IMPURITIES

• **ORGANIC IMPURITIES**
Solution A, Solution B, and **Mobile phase:** Prepare as directed in the *Assay*.
System suitability solution: 0.4 µg/mL each of USP Theophylline Related Compound D RS and 5-hydroxymethylfurfural
Standard solution: 0.4 µg/mL each of USP Theophylline RS and USP Theophylline Related Compound D RS
Sample solution: Nominally 400 µg/mL of theophylline in water prepared as follows. Transfer 4 mg of theophylline from a volume of Injection to a 10-mL volumetric flask. Dissolve and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 270 nm
Column: 2.1-mm × 10-cm; 1.7-µm packing L7
Column temperature: 40°
Flow rate: 0.4 mL/min
Injection volume: 2.5 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—See *Table 2* for relative retention times.]
Suitability requirements
Resolution: NLT 1.1 between theophylline related compound D and 5-hydroxymethylfurfural, *System suitability solution*
Relative standard deviation: NMT 5.0% for theophylline and theophylline related compound D, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of theophylline related compound D in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of theophylline related compound D from the *Sample solution*
r_S = peak response of theophylline related compound D from the *Standard solution*
C_S = concentration of USP Theophylline Related Compound D RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of theophylline in the *Sample solution* (µg/mL)

Calculate the percentage of any other individual unspecified degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual unspecified degradation product from the *Sample solution*
r_S = peak response of theophylline from the *Standard solution*
C_S = concentration of USP Theophylline RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of theophylline in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.1%.

Table 2

[a] 5-Hydroxymethylfurfural; the content of this impurity is controlled in the *Limit of 5-Hydroxymethylfurfural and Related Substances* test.

USP Monographs

www.webofpharma.com

• **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Cation-exchange column: Proceed as directed in *Chromatography* ⟨621⟩ using a chromatographic tube capable of providing a 0.8- × 4-cm bed volume (or 2 mL) of 100- to 200-mesh, strongly acidic styrene-divinylbenzene cation-exchange resin. Condition the column by washing with 30 mL of water, discarding the eluate.

Sample solution: Pass a volume of Injection containing 100 mg of hydrous dextrose through the resin bed in the *Cation-exchange column*, allowing the sample to flow down the wall of the column so as not to disturb the resin bed, and collect the eluate in a 50-mL volumetric flask. Wash the column with 25 mL of water, and collect the eluate in the same 50-mL volumetric flask. Dilute the eluate with water to volume.

Blank solution: Pass 27 mL of water through a freshly conditioned *Cation-exchange column*, collecting the eluate in a 50-mL volumetric flask. Fill with water to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 284 nm

Cell: 1 cm

Blank: *Blank solution*

Analysis

Samples: *Sample solution* and *Blank solution*

Determine the absorbance of the *Sample solution* and *Blank solution* with a suitable spectrophotometer.

Acceptance criteria: The absorbance is NMT 0.25.

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 1.0 USP Endotoxin Unit/mg of anhydrous theophylline

• **PH** ⟨791⟩

Sample solution: NMT 5% of dextrose from a portion of Injection in water, diluted with water if necessary

Acceptance criteria: 3.5–6.5

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I or Type II glass, or of a suitable plastic material. Store at controlled room temperature.

USP Ephedrine Sulfate RS

USP Phenobarbital RS

Identification—Place a quantity of finely powdered Tablets, equivalent to about 24 mg of ephedrine hydrochloride, in a 15-mL centrifuge tube, add 4.0 mL of a mixture of chloroform and methanol (4:1), mix by sonication for 10 minutes, and filter to obtain the test solution. Prepare separate Standard solutions containing known concentrations of about 36 mg of USP Theophylline RS per mL, about 9.6 mg of USP Ephedrine Sulfate RS per mL, and about 5 mg of USP Phenobarbital RS per mL, respectively, in the mixture of chloroform and methanol (4:1). Apply 2 µL of the test solution and of each of the three Standard solutions at equidistant points about 2.5 cm above one edge of a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a suitable chamber previously equilibrated with a solvent system consisting of a mixture of chloroform, acetone, methanol, and ammonium hydroxide (50:10:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, air-dry, and locate the spots on the plate by viewing under short-wavelength UV light: the R_F values of the spots obtained from the test solution correspond to those obtained from the Standard solutions.

Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Determine the amounts of theophylline, ephedrine hydrochloride, and phenobarbital dissolved using the following procedure.

Mobile phase—Dissolve accurately weighed quantities of monobasic potassium phosphate and sodium 1-hexanesulfonate in water, and dilute quantitatively with water to obtain a solution having concentrations of 0.953 mg per mL (0.007 M monobasic potassium phosphate) and 0.564 mg per mL (0.003 M sodium 1-hexanesulfonate), respectively. Adjust, if necessary, with 0.3 M phosphoric acid or 0.2 M monobasic potassium phosphate to a pH of 3.0 ± 0.05, to obtain a *Phosphate buffer*. The *Mobile phase* is a mixture of *Phosphate buffer* and methanol (75:25).

Standard preparation—Dissolve accurately weighed quantities of USP Theophylline RS, USP Ephedrine Sulfate RS, and USP Phenobarbital RS in water, and dilute quantitatively and stepwise with water to obtain a solution having known concentrations of about 145 µg of anhydrous theophylline per mL, 28 µg of ephedrine sulfate per mL, and 9 µg of phenobarbital per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the theophylline and phenobarbital peaks is not less than 4.0, the tailing factors for the ephedrine and phenobarbital peaks are not more than 3.0 and 2.0, respectively, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject an accurately measured volume (about 75 µL) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the responses for the major peaks. The elution order is theophylline, ephedrine, and phenobarbital (last). Calculate the quantity, in mg, of $C_7H_8N_4O_2$ dissolved by the formula:

www.webofpharma.com

$$(0.9C)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Theophylline RS in the *Standard preparation*, and r_U and r_S are the peak responses for theophylline obtained from the solution under test and the similarly chromatographed *Standard preparation*, respectively. Calculate the quantity, in mg, of $C_{10}H_{15}NO \cdot HCl$ dissolved by the formula:

$$(201.69/214.27)(0.9C')(r'_U/r'_S)$$

in which 201.69 is the molecular weight of ephedrine hydrochloride, 214.27 is one-half the molecular weight of ephedrine sulfate, C' is the concentration, in µg per mL, of USP Ephedrine Sulfate RS in the *Standard preparation*, and r'_U and r'_S are the peak responses for ephedrine obtained from the solution under test and the similarly chromatographed *Standard preparation*, respectively. Calculate the quantity, in mg, of $C_{12}H_{12}N_2O_3$ dissolved by the formula:

$$(0.9C'')(r''_U/r''_S)$$

in which C'' is the concentration, in µg per mL, of USP Phenobarbital RS in the *Standard preparation*, and r''_U and r''_S are the peak responses for phenobarbital obtained from the solution under test and the similarly chromatographed *Standard preparation*, respectively.

Tolerances—Not less than 75% *(Q)* of the labeled amounts of $C_7H_8N_4O_2$, $C_{10}H_{15}NO \cdot HCl$, and $C_{12}H_{12}N_2O_3$ are dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—

Mobile phase—Mix 240 mL of acetonitrile with 760 mL of 0.01 M, pH 7.8 phosphate buffer (see *Buffer Solutions* under *Solutions* in the section *Reagents, Indicators, and Solutions*).

Internal standard solution—Dissolve 25 mg of butabarbital sodium in 50 mL of dibasic potassium phosphate solution (17 in 1000). Mix 40 mL of this solution with 10 mL of sodium metaperiodate solution (1 in 100).

Standard preparation—Transfer about 120 mg of USP Theophylline RS, about 8 mg of USP Phenobarbital RS, and about 25 mg of USP Ephedrine Sulfate RS, each accurately weighed, to a 200-mL volumetric flask. Add 10 mL of methanol and 100 mL of chloroform, mix to dissolve, add chloroform to volume, and mix. Pipet 15 mL of this solution into a 50-mL volumetric flask, add chloroform to volume, and mix. The concentrations of anhydrous theophylline, phenobarbital, and ephedrine sulfate in the *Standard preparation* are about 180 µg per mL, 12 µg per mL, and 37.5 µg per mL, respectively.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 120 mg of anhydrous theophylline, to a 200-mL volumetric flask, and shake by mechanical means for 20 minutes with a mixture of 10 mL of methanol and 100 mL of chloroform. Add chloroform to volume, mix, and filter. Pipet 15 mL of the clear filtrate into a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Standard solution and *Assay solution*—Pipet 10-mL portions of the *Standard preparation* and the *Assay preparation* into separate glass-stoppered, 25-mL conical flasks, and treat each as follows: Evaporate in a warm-water bath with the aid of a current of air to dryness. Add by pipet 4 mL of *Internal standard solution*, insert the stopper in the flask, mix to dissolve the residue, and allow to stand at room temperature for 30 minutes. Pipet 1 mL of propylene glycol solution (1 in 100) into the flask, insert the stopper, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 241-nm detector and a 30-cm × 4-mm stainless steel column that contains packing L1. Set a flow rate of 1.0 mL per minute for the *Mobile phase*, and allow the system to equilibrate until a stable baseline is obtained on the recorder. Chromatograph a 10-µL portion of the *Standard preparation*, and record the peak responses as directed for *Procedure:* the peaks are completely resolved, and the resolution factors between each two neighboring peaks are not less than 1.5. Five replicate injections of the *Standard preparation* show a relative standard deviation of not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Assay solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. In the order of increasing elution times, the five peaks correspond to the reagent (iodate), theophylline, phenobarbital, butabarbital, and benzaldehyde (from ephedrine). Designate the peak response ratio of each component to the internal standard in the *Standard solution* as R_S, and that of each component to the internal standard in the *Assay solution* as R_U.

Calculation for theophylline—Calculate the quantity, in mg, of anhydrous theophylline ($C_7H_8N_4O_2$) in the portion of Tablets taken by the formula:

$$0.667C(R_U/R_S)$$

in which C is the concentration, in µg per mL, of USP Theophylline RS in the *Standard preparation*.

Calculation for ephedrine hydrochloride—Calculate the quantity, in mg, of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Tablets taken by the formula:

$$(201.69/214.27)(0.667C)(R_U/R_S)$$

in which 201.69 is the molecular weight of ephedrine hydrochloride, 214.27 is one-half the molecular weight of ephedrine sulfate, and C is the concentration, in µg per mL, of USP Ephedrine Sulfate RS in the *Standard preparation*.

Calculation for phenobarbital—Calculate the quantity, in mg, of phenobarbital ($C_{12}H_{12}N_2O_3$) in the portion of Tablets taken by the formula:

$$0.667C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Phenobarbital RS in the *Standard preparation*.

Theophylline and Guaifenesin Capsules

» Theophylline and Guaifenesin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of anhydrous theophylline ($C_7H_8N_4O_2$) and guaifenesin ($C_{10}H_{14}O_4$).

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—
USP Guaifenesin RS
USP Theophylline RS

Identification—Transfer a quantity of the contents of the Capsules, equivalent to about 150 mg of theophylline, to a separator, and add 15 mL of water. To a second separator

USP Monographs

www.webofpharma.com

transfer 15 mL of an aqueous Standard solution containing USP Theophylline RS and USP Guaifenesin RS corresponding, proportionately, to the amounts of theophylline and guaifenesin in the Capsules and having a known concentration of about 10 mg of theophylline per mL. Treat the contents of each separator as follows. Add 25 mL of chloroform, and shake vigorously for 0.5 minute. Allow the layers to separate, filter the lower chloroform layer through glass wool, and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of chloroform. Apply separately 10 µL of each solution so obtained to a thin-layer chromatographic cellulose sheet with fluorescent indicator (see *Chromatography* ⟨621⟩), allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methanol and water (95:5) until the solvent front has moved about 10 cm above the starting line. Remove the sheet from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the sheet to short-wavelength UV light: the R_F values of the spots obtained from the test preparation correspond to those obtained from the Standard solution.

Dissolution ⟨711⟩—
Medium: simulated gastric fluid; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—Determine the amounts of theophylline ($C_7H_8N_4O_2$) and guaifenesin ($C_{10}H_{14}O_4$) dissolved in filtered portions of the solution under test and employing the procedure set forth in the *Assay*, making any necessary volumetric adjustments, in comparison with Standard solutions having known concentrations of USP Theophylline RS and USP Guaifenesin RS in the same medium.
Tolerances—Not less than 75% *(Q)* of the labeled amounts of $C_7H_8N_4O_2$ and $C_{10}H_{14}O_4$ are dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
pH 6.5 buffer solution—Dissolve 1.36 g of monobasic potassium phosphate in water to make 1000 mL. Carefully adjust with 2.5 N sodium hydroxide to a pH of 6.5, and filter.
Mobile phase—Prepare a degassed solution of *pH 6.5 buffer solution* and methanol (70:30).
Internal standard solution—Dissolve about 400 mg of caffeine in 1000 mL of a solution of methanol and water (90:10), and mix.
Standard preparation—Dissolve an accurately weighed quantity of USP Theophylline RS in *pH 6.5 buffer solution*, and dilute quantitatively with *pH 6.5 buffer solution* to obtain a solution (*Solution T*) having a known concentration of about 900*J* µg per mL, in which *J* is the ratio of the labeled amount of theophylline to that of guaifenesin. Transfer about 90 mg of USP Guaifenesin RS, accurately weighed, to a 200-mL volumetric flask, add about 150 mL of *pH 6.5 buffer solution*, shake to dissolve, dilute with *pH 6.5 buffer solution* to volume, and mix. Pipet 10 mL of this solution, 10 mL of *Internal standard solution*, and 5 mL of *Solution T* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having known concentrations of about 90 µg of guaifenesin and about 90*J* µg of theophylline per mL.
Assay preparation—Transfer a number of Capsules, equivalent to about 900 mg of guaifenesin, to a 200-mL volumetric flask, add about 160 mL of *pH 6.5 buffer solution*, heat to dissolve completely, cool to room temperature, dilute with *pH 6.5 buffer solution* to volume, and mix. Dilute 10.0 mL of this solution with *pH 6.5 buffer solution* to 100.0 mL. Pipet 10 mL of the diluted solution and 10 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph six replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation of the ratio of peak responses (peak response of ingredient/peak response of internal standard) is not more than 2.0% for theophylline and not more than 2.5% for guaifenesin. The resolution, *R*, between theophylline and caffeine is not less than 3.0.
Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for theophylline, 1.0 for caffeine, and 1.5 for guaifenesin. Calculate the quantities, in mg, of anhydrous theophylline ($C_7H_8N_4O_2$) and guaifenesin ($C_{10}H_{14}O_4$) in the portion of Capsules taken by the formula:

$$10C(R_U/R_S)$$

in which *C* is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard preparation*, and R_U and R_S are the ratios of the peak responses of the corresponding analyte to those of caffeine in the *Assay preparation* and the *Standard preparation*, respectively.

Theophylline and Guaifenesin Oral Solution

» Theophylline and Guaifenesin Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$) and not less than 86.7 percent and not more than 113.3 percent of the labeled amount of guaifenesin ($C_{10}H_{14}O_4$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Guaifenesin RS
USP Theophylline RS
Identification—Transfer a volume of Oral Solution, equivalent to about 150 mg of theophylline, to a separator, add 15 mL of water, and proceed as directed in the *Identification* test under *Theophylline and Guaifenesin Capsules*, beginning with "To a second separator."
Alcohol Determination, *Method II* ⟨611⟩ ***(if present):*** between 90.0% and 110.0% of the labeled amount of C_2H_5OH, determined by the gas-liquid chromatographic procedure, acetone being used as the internal standard.

Assay—
pH 6.5 buffer solution and *Mobile phase*—Prepare as directed in the *Assay* under *Theophylline and Guaifenesin Capsules*.
Caffeine solution—Dissolve about 400 mg of caffeine in 1000 mL of a mixture of methanol and water (90:10), and mix.
Standard preparation—Dissolve an accurately weighed quantity of USP Theophylline RS in *pH 6.5 buffer solution*, and dilute quantitatively with *pH 6.5 buffer solution* to obtain a solution (*Solution T*) having a known concentration of about 900*J* µg per mL, in which *J* is the ratio of the labeled amount

USP Monographs

www.webofpharma.com

of theophylline to that of guaifenesin. Transfer about 90 mg of USP Guaifenesin RS, accurately weighed, to a 200-mL volumetric flask, add about 150 mL of *pH 6.5 buffer solution*, shake to dissolve, dilute with *pH 6.5 buffer solution* to volume, and mix. Pipet 10 mL of this solution and 5 mL of *Solution T* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having known concentrations of about 90 µg of guaifenesin and about 90*J* µg of theophylline per mL.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 90 mg of guaifenesin, to a 200-mL volumetric flask, dilute with *pH 6.5 buffer solution* to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph a mixture of 4 mL of *Standard preparation* and 1 mL of *Caffeine solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the theophylline and caffeine peaks is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0 for theophylline and not more than 2.5% for guaifenesin.

Procedure—Proceed as directed in the *Assay* under *Theophylline and Guaifenesin Capsules*. Calculate the quantities, in mg, of anhydrous theophylline ($C_7H_8N_4O_2$) and guaifenesin ($C_{10}H_{14}O_4$) per mL of the Oral Solution taken by the formula:

$$(C/V)(r_U/r_S)$$

in which *C* is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard preparation*, *V* is the volume, in mL, of Oral Solution taken, and r_U and r_S are the peak responses of the corresponding analyte in the *Assay preparation* and the *Standard preparation*, respectively.

Theophylline Sodium Glycinate

Glycine, mixture with 3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione, monosodium salt.
Theophylline sodium mixture with glycine [8000-10-0].

» Theophylline Sodium Glycinate is an equilibrium mixture containing Theophylline Sodium ($C_7H_7N_4NaO_2$) and Glycine ($C_2H_5NO_2$) in approximately equimolecular proportions buffered with an additional mole of Glycine. Dried at 105° for 4 hours, it contains theophylline sodium glycinate equivalent to not less than 44.5 percent and not more than 47.3 percent of anhydrous theophylline ($C_7H_8N_4O_2$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Glycine RS
USP Theophylline RS

Identification—

A: Dissolve about 1 g in 20 mL of warm water, and neutralize the solution with 6 N acetic acid: a white, crystalline precipitate of theophylline is formed. Filter, wash the precipitate with small portions of cold water, and dry it at 105° for 1 hour: the theophylline so obtained melts between 270° and 274°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩). Retain the remaining portion of the theophylline for use in *Identification* test *B*.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K.*▲ (CN 1-May-2020)Residue obtained in *Identification* test *A*.

C: Ignite it: the residue colors a nonluminous flame intensely yellow and effervesces with acids.

pH ⟨791⟩: between 8.5 and 9.5, in a saturated solution.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 2.0% of its weight.

Glycine content—

Mobile phase—Prepare a solution containing 470 mg of sodium acetate trihydrate and 1 mL of glacial acetic acid in 2 liters of water. Adjust with 10 N sodium hydroxide to a pH of 4.3. Mix 3 volumes of the resulting solution with 7 volumes of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Glycine RS in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 1.3 mg per mL.

Test preparation—Transfer about 153 mg of Theophylline Sodium Glycinate, accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 3.9-mm × 30-cm column that contains packing L8. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 2000 theoretical plates, the tailing factor for the glycine peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the glycine peaks. Calculate the quantity, in mg, of $C_2H_5NO_2$ in the portion of Theophylline Sodium Glycinate taken by the formula:

$$50C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Glycine RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not less than 42.0 percent and not more than 48.0 percent, on the dried basis, is found.

Assay—

Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Theophylline*.

Assay preparation—Transfer about 550 mg of Theophylline Sodium Glycinate, previously dried and accurately weighed, to a 250-mL volumetric flask, add about 125 mL of *Mobile phase*, shake by mechanical means until solution is complete, dilute with *Mobile phase* to volume, and mix.

www.webofpharma.com

Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Theophylline*. Calculate the quantity, in mg, of anhydrous theophylline ($C_7H_8N_4O_2$) in the portion of Theophylline Sodium Glycinate taken by the formula:

$$2500C(R_U/R_S)$$

in which the terms are as defined therein.

Theophylline Sodium Glycinate Oral Solution

» Theophylline Sodium Glycinate Oral Solution contains an amount of theophylline sodium glycinate equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Theophylline RS
Labeling—Label Oral Solution to state both the content of theophylline sodium glycinate and the content of anhydrous theophylline.
Identification—Mix a volume of Oral Solution, equivalent to about 500 mg of theophylline, with 10 mL of 6 N ammonium hydroxide, and evaporate on a steam bath to a volume of about 20 mL. Neutralize with 6 N acetic acid to litmus, and cool, with stirring, to about 15°. Collect the precipitate on a filter, wash with cold water, and dry at 105° for 4 hours: the theophylline so obtained melts between 270° and 274°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩), and meets the requirements for *Identification* test *B* under *Theophylline Sodium Glycinate*.
pH ⟨791⟩: between 8.3 and 9.1.
Alcohol Determination, *Method II* ⟨611⟩: between 17.0% and 23.0% of C_2H_5OH.

Assay—

Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Theophylline*.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 220 mg of theophylline sodium glycinate, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Theophylline*. Calculate the quantity, in mg, of anhydrous theophylline ($C_7H_8N_4O_2$) in each mL of the Oral Solution taken by the formula:

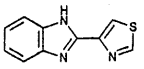
$$(1000C/V)(R_U/R_S)$$

in which V is the volume, in mL, of Oral Solution taken, and the other terms are as defined therein.

Theophylline Sodium Glycinate Tablets

» Theophylline Sodium Glycinate Tablets contain an amount of theophylline sodium glycinate equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

Packaging and storage—Preserve in well-closed containers.
Labeling—Label the Tablets to state both the content of theophylline sodium glycinate and the content of anhydrous theophylline.
USP Reference standards ⟨11⟩—
USP Theophylline RS
Identification—Triturate a quantity of finely powdered Tablets, equivalent to about 500 mg of theophylline, with 10-mL and 15-mL portions of solvent hexane, and discard the solvent hexane. Triturate the residue with two 10-mL portions of a mixture of equal volumes of 6 N ammonium hydroxide and water, and filter each time. Evaporate the combined filtrates to about 5 mL, neutralize, if necessary, with 6 N acetic acid, using litmus, and cool to about 15°, with stirring. Collect the precipitate on a filter, wash it with cold water, and dry at 105° for 1 hour: the theophylline so obtained melts between 270° and 274°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩), and responds to *Identification* test *B* under *Theophylline Sodium Glycinate*.



Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.

Procedure—Determine the amount of anhydrous theophylline ($C_7H_8N_4O_2$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 272 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Theophylline RS in the same medium.

Tolerances—Not less than 75% *(Q)* of the labeled amount of anhydrous $C_7H_8N_4O_2$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Assay—Place 20 Tablets in a 200-mL volumetric flask, add 50 mL of water, and when the tablets have disintegrated add 50 mL of 6 N ammonium hydroxide. Shake until no more dissolves, then dilute with water to volume, mix, and filter through a dry filter into a dry flask, discarding the first 20 mL of the filtrate. Transfer an accurately measured aliquot of the subsequent filtrate, equivalent to about 250 mg of theophylline, to a 250-mL conical flask, add 20.0 mL of 0.1 N silver nitrate VS, and heat on a steam bath for 15 minutes. Filter through a filter crucible under reduced pressure, and wash the precipitate with three 10-mL portions of water. Acidify the combined filtrate and washings with nitric acid, and add an excess of 3 mL of the acid. Cool, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

www.webofpharma.com

Thiabendazole

$C_{10}H_7N_3S$ 201.25
1*H*-Benzimidazole, 2-(4-thiazolyl)-.
2-(4-Thiazolyl)benzimidazole [148-79-8].

» Thiabendazole contains not less than 98.0 percent and not more than 101.0 percent of $C_{10}H_7N_3S$, calculated on the dried basis. [NOTE—Thiabendazole labeled solely for veterinary use is exempt from the requirements of the tests for *Residue on ignition*, *Selenium*, and *Chromatographic purity*.]

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Thiabendazole RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020)—Do not dry specimens.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 5 µg per mL.
Medium: 0.1 N hydrochloric acid.

C: Dissolve about 5 mg in 5 mL of 0.1 N hydrochloric acid, add 3 mg of *p*-phenylenediamine dihydrochloride, and shake to dissolve. Add about 0.1 g of zinc dust, mix, and allow to stand for 2 minutes. Add 5 mL of a solution prepared by dissolving 20 g of ferric ammonium sulfate in 75 mL of water, adding 10 mL of 1 N sulfuric acid, and diluting with water to 100 mL: a blue or blue-violet color develops.

D: The R_f value of the principal spot in the chromatogram of the *Identification test preparation* corresponds to that of *Standard preparation A*, as obtained in the test for *Chromatographic purity*.

Loss on drying ⟨731⟩ —Dry it in vacuum at 100° for 2 hours: it loses not more than 0.5% of its weight.
Melting range ⟨741⟩: between 296° and 303°.
Residue on ignition ⟨281⟩: not more than 0.1%.
Selenium ⟨291⟩: 0.003%, a 200-mg test specimen being used.

Chromatographic purity—
Standard preparations—Dissolve USP Thiabendazole RS in glacial acetic acid, and mix to obtain a solution having a known concentration of 1.0 mg per mL. Dilute quantitatively with glacial acetic acid to obtain *Standard preparations A*, *B*, and *C* having the following compositions:

Standard preparation	Dilution	Concentration (µg RS per mL)	Percentage (%, for comparison with test specimen)
A	(1 in 4)	250	0.5
B	(3 in 20)	150	0.3
C	(1 in 20)	50	0.1

Test preparation—Dissolve an accurately weighed quantity of Thiabendazole in glacial acetic acid to obtain a solution containing 50 mg per mL.
Identification preparation—Dilute a portion of the *Test preparation* quantitatively with glacial acetic acid to obtain a solution containing 0.25 mg per mL.
Procedure—Apply separately 10 µL of the *Test preparation*, 10 µL of the *Identification preparation*, and 10 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of toluene, glacial acetic acid, acetone, and water (60:20:8:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*. No secondary spot from the chromatogram of the *Test preparation* is larger or more intense than the principal spot obtained from *Standard preparation* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Test preparation* corresponds to not more than 1.0%.
Assay—Dissolve about 160 mg of Thiabendazole, accurately weighed, in 10 mL of glacial acetic acid. Add 50 mL of acetic anhydride, 1 mL of mercuric acetate TS, and 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS (the color change at the endpoint is from blue to blue-green). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.13 mg of $C_{10}H_7N_3S$.

Thiabendazole Oral Suspension

» Thiabendazole Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thiabendazole ($C_{10}H_7N_3S$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Thiabendazole RS

Identification—
A: Mix a portion of Oral Suspension, equivalent to about 0.5 g of thiabendazole, with about 20 mL of water, and filter. Wash the residue with 20 mL of water, discard the washing, dissolve the residue in 30 mL of 0.1 N hydrochloric acid, and filter. Collect the filtrate in a separator, render it alkaline with 1 N sodium hydroxide, and extract with 10 mL of carbon disulfide. Pass the carbon disulfide layer through a dry filter, collecting the filtrate in an evaporating dish. Evaporate the solvent with the aid of gentle heat and a stream of nitrogen. [CAUTION—Do not overheat the residue.] The residue so

www.webofpharma.com

obtained responds to *Identification* test *A* under *Thiabendazole*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay*.

Uniformity of dosage units ⟨905⟩—
FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume ⟨698⟩—
FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH ⟨791⟩: between 3.4 and 4.2.

Assay—

pH 3.1 Phosphate buffer—Dissolve 13.8 g of monobasic sodium phosphate in water to obtain 2000 mL of solution. Adjust this solution with phosphoric acid to a pH of 3.1 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.1 Phosphate buffer* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Thiabendazole RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution containing about 2 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.2 mg of USP Thiabendazole RS per mL.

Assay preparation—Transfer an accurately measured volume of Oral Suspension, equivalent to about 0.5 g of thiabendazole, to a 250-mL volumetric flask; dilute with 0.1 N hydrochloric acid to volume; and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 960 theoretical plates, the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in g, of thiabendazole ($C_{10}H_7N_3S$) in each mL of the Oral Suspension taken by the formula:

$$2.5(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiabendazole RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiabendazole Chewable Tablets

Former Title: Thiabendazole Tablets

» Thiabendazole Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thiabendazole ($C_{10}H_7N_3S$).

Packaging and storage—Preserve in tight containers.
Labeling—Label the Chewable Tablets to indicate that they are to be chewed before swallowing.
USP Reference standards ⟨11⟩—
USP Thiabendazole RS

Identification—

A: Triturate a quantity of powdered Chewable Tablets, equivalent to about 0.5 g of thiabendazole, with about 20 mL of water, and filter. Wash the residue with 20 mL of water, discard the washing, dissolve the residue in 30 mL of 0.1 N hydrochloric acid, and filter. Collect the filtrate in a separator, render it alkaline with 1 N sodium hydroxide, and extract with 10 mL of carbon disulfide. Pass the carbon disulfide layer through a dry filter, collecting the filtrate in an evaporating dish. Evaporate the solvent with the aid of gentle heat and a stream of nitrogen. *[Caution—Do not overheat the residue.]* The residue so obtained meets the requirements for *Identification* test *A* under *Thiabendazole*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay*.

Uniformity of dosage units ⟨905⟩: meet the requirements.
PROCEDURE FOR CONTENT UNIFORMITY—
Standard preparation—Dissolve an accurately weighed quantity of USP Thiabendazole RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 5 µg per mL.

Test preparation—Transfer 1 Chewable Tablet to a 1000-mL volumetric flask, add about 75 mL of 0.1 N hydrochloric acid, and heat on a steam bath for about 1 hour. Cool to room temperature, dilute with 0.1 N hydrochloric acid to volume, mix, and filter a portion of the solution, discarding the first 20 mL of the filtrate. Pipet 5 mL of the filtrate into a 500-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Test preparation* at the wavelength of maximum absorbance at about 302 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{10}H_7N_3S$ in the Chewable Tablet taken by the formula:

$$(TC/D)(A_U/A_S)$$

in which T is the labeled quantity, in mg, of thiabendazole in the Chewable Tablet; C is the concentration, in µg per mL, of USP Thiabendazole RS in the *Standard preparation; D* is the concentration, in µg per mL, of thiabendazole in the *Test preparation,* based upon the labeled quantity per Chewable Tablet and the extent of dilution; and A_U and A_S are the absorbances of the *Test preparation* and the *Standard preparation,* respectively.

Assay—

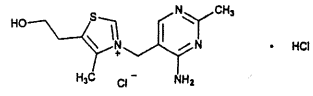
Standard preparation and *Chromatographic system*—Prepare as directed in the *Assay* under *Thiabendazole Oral Suspension*.

pH 3.5 Phosphate buffer—Dissolve 13.8 g of monobasic sodium phosphate in water to obtain 2000 mL of solution. Adjust this solution with phosphoric acid to a pH of 3.5 ± 0.05.

USP Monographs

www.webofpharma.com

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.5 Phosphate buffer* and methanol (54:46). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).



Assay preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of thiabendazole, to a 1000-mL volumetric flask, add 100 mL of 0.1 N hydrochloric acid, mix, and warm the solution for a minimum of 30 minutes. Allow to cool to room temperature, dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiabendazole Oral Suspension*. Calculate the quantity, in mg, of thiabendazole ($C_{10}H_7N_3S$) in the portion of Chewable Tablets taken by the formula:

$$1000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiabendazole RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiamine Hydrochloride

$C_{12}H_{17}ClN_4OS \cdot HCl$ 337.27

Thiazolium, 3-[(4-amino-2-methyl-5-pyrimidinyl)methyl]-5-(2-hydroxyethyl)-4-methyl-, chloride, monohydrochloride; Thiamine monohydrochloride [67-03-8].

DEFINITION

Thiamine Hydrochloride contains NLT 98.0% and NMT 102.0% of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **USP Reference Standards** ⟨11⟩
  USP Thiamine Hydrochloride RS

Thiamine Hydrochloride Injection

» Thiamine Hydrochloride Injection is a sterile solution of Thiamine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.
USP Reference standards ⟨11⟩**—**
USP Thiamine Hydrochloride RS

Identification—
A: It yields a white precipitate with mercuric chloride TS, and a red-brown precipitate with iodine TS. It also yields a precipitate with mercuric-potassium iodide TS, and with trinitrophenol TS.
B: Dilute a portion of Injection with water to a concentration of about 10 mg of thiamine hydrochloride per mL. To 0.5 mL of this solution add 5 mL of 0.5 N sodium hydroxide, then add 0.5 mL of potassium ferricyanide TS and 5 mL of isobutyl alcohol, shake the mixture vigorously for 2 minutes, and allow the liquid layers to separate: when illuminated from above by a vertical beam of UV light and viewed at a right angle to this beam, the air-liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.
C: It responds to the tests for *Chloride* ⟨191⟩.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 3.5 USP Endotoxin Units per mg of thiamine hydrochloride.
pH ⟨791⟩: between 2.5 and 4.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Mobile phase, Internal standard solution, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Thiamine Hydrochloride Oral Solution.*
Assay preparation—Quantitatively dilute an accurately measured volume of Injection with *Mobile phase* to obtain a solution containing about 500 µg of thiamine hydrochloride per mL. Pipet 10 mL of the resulting solution and 10 mL of *Internal standard solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiamine Hydrochloride Oral Solution.* Calculate the quantity, in mg, of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in each mL of the Injection taken by the formula:

$$C(L/D)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Thiamine Hydrochloride RS in the *Standard preparation; L* is the labeled quantity, in mg per mL, of thiamine hydrochloride in the Injection; *D* is the concentration, in mg per mL, of thisamine hydrochloride in the *Assay preparation* on the basis of the labeled quantity and the extent of dilution; and R_U and R_S are the ratios of the peak responses of thiamine to methylparaben obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiamine Hydrochloride Oral Solution

DEFINITION
Thiamine Hydrochloride Oral Solution contains NLT 95.0% and NMT 135.0% of the labeled quantity of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$).

IDENTIFICATION
- **A.**
  Sample solution: Dilute a portion of Oral Solution with water to a concentration of 10 mg/mL of thiamine hydrochloride.
  Analysis: To 0.5 mL of the *Sample solution* add 5 mL of 0.5 N sodium hydroxide, then add 0.5 mL of potassium ferricyanide TS and 5 mL of isobutyl alcohol. Shake the mixture vigorously for 2 min, and allow the liquid layers to separate. Illuminate from above by a vertical beam of UV light, and observe the air–liquid meniscus at a right angle to this beam.
  Acceptance criteria: The air–liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.

ASSAY
- **Procedure**
  Mobile phase: Methanol and 0.04 M aqueous monobasic potassium phosphate (45:55)
  Internal standard solution: 100 µg/mL of methylparaben in *Mobile phase*
  Standard stock solution: 500 µg/mL of USP Thiamine Hydrochloride RS in *Mobile phase*
  Standard solution: Dilute a mixture of equal volumes of the *Standard stock solution* and *Internal standard solution* with

USP Monographs

www.webofpharma.com

Mobile phase to obtain a concentration of USP Thiamine Hydrochloride RS of about 50 µg/mL.
Sample stock solution: Equivalent to 500 µg/mL of thiamine hydrochloride in *Mobile phase* from an accurately measured volume of Oral Solution
Sample solution: Dilute a mixture of equal volumes of the *Sample stock solution* and *Internal standard solution* with *Mobile phase* to obtain a concentration of thiamine hydrochloride of about 50 µg/mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 1 mL/min
Injection size: 25 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for thiamine and methylparaben are about 0.35 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 6.0 between thiamine and methylparaben
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of thiamine to methylparaben from the *Sample solution*
R_S = peak area ratio of thiamine to methylparaben from the *Standard solution*
C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard stock solution* (µg/mL)
C_U = nominal concentration of thiamine hydrochloride in the *Sample stock solution* (µg/mL)

Acceptance criteria: 95.0%–135.0%

OTHER COMPONENTS
• **ALCOHOL DETERMINATION,** *Method II* ⟨611⟩**:** 90.0%–110.0% of the labeled quantity of C_2H_5OH, using acetone as the internal standard

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Thiamine Hydrochloride RS

Thiamine Hydrochloride Tablets

DEFINITION
Thiamine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$).

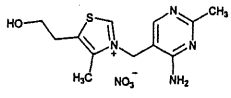
IDENTIFICATION
• **A.**
Sample solution: Triturate a quantity of powdered Tablets, equivalent to 10 mg of thiamine hydrochloride, with 10 mL of 0.5 N sodium hydroxide, and filter.
Analysis: To 5 mL of the *Sample solution* add 0.5 mL of potassium ferricyanide TS and 5 mL of isobutyl alcohol, shake the mixture vigorously for 2 min, and allow the liquid layers to separate. Illuminate from above by a vertical beam of UV light, and observe the air–liquid meniscus at a right angle to this beam.
Acceptance criteria: The air–liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.
• **B.**
Sample solution: Triturate a quantity of powdered Tablets, equivalent to 10 mg of thiamine hydrochloride, with 10 mL of water, and filter.
Analysis 1: To 2 mL of the *Sample solution* add iodine TS.
Acceptance criteria 1: A red-brown precipitate is formed.
Analysis 2: To 2 mL of the *Sample solution* add mercuric chloride TS.
Acceptance criteria 2: A white precipitate is formed.
Analysis 3: *Identification Tests—General* ⟨191⟩, *Chloride*
Acceptance criteria 3: Meet the requirements
• **C.**
Sample solution: Use the remainder of the *Sample solution* from *IdentificationB.*
Analysis: Add 1 mL of lead acetate TS and 1 mL of 2.5 N sodium hydroxide.
Acceptance criteria: A yellow color is produced. Heat the mixture for several minutes on a steam bath: the color changes to brown, and, on standing, a precipitate of lead sulfide separates.

ASSAY
• **THIAMINE ASSAY** ⟨531⟩, *Chemical Methods, Procedure 1*
Sample solution: Place NLT 20 Tablets in a flask of suitable size, half fill the flask with 0.2 N hydrochloric acid, and heat on a steam bath, with frequent agitation, until the Tablets have dissolved or have disintegrated so that a uniform dispersion is obtained. Cool, transfer the contents of the flask to a volumetric flask, and dilute with 0.2 N hydrochloric acid to volume. If the mixture is not clear, either centrifuge it or filter it through paper known not to adsorb thiamine. Dilute a portion of the clear solution with 0.2 N hydrochloric acid to obtain a 0.2-µg/mL solution of thiamine hydrochloride.
Analysis: Proceed as directed in the chapter.
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩, *Procedure, Apparatus 1 and 2, Immediate-Release Dosage Forms, Procedure for a pooled sample for immediate-release dosage forms*
Medium: Water; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: A known concentration of USP Thiamine Hydrochloride RS in *Medium*
Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary
Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 1.40 mg/mL of sodium 1-hexanesulfonate
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 3.0%

www.webofpharma.com

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) dissolved:



$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak area of thiamine from the *Sample solution*
r_S = peak area of thiamine from the *Standard solution*
C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*
V = volume of *Medium*, 900 mL
L = labeled claim of thiamine hydrochloride (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Thiamine Hydrochloride RS

Thiamine Mononitrate

$C_{12}H_{17}N_5O_4S$ 327.36
Thiazolium, 3-[(4-amino-2-methyl-5-pyrimidinyl)methyl]-5-(2-hydroxyethyl)-4-methyl-, nitrate (salt);
Thiamine nitrate (salt) [532-43-4].

DEFINITION
Thiamine Mononitrate contains NLT 98.0% and NMT 102.0% of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$), calculated on the dried basis.

IDENTIFICATION
• **A.**
Sample solution: 20 mg/mL of Thiamine Mononitrate
Analysis: To 2 mL of the *Sample solution* add 2 mL of sulfuric acid. Cool, and superimpose 2 mL of ferrous sulfate TS.
Acceptance criteria: A brown ring is produced at the junction of the two liquids.
• **B.**
Sample: 5 mg
Analysis: Dissolve the *Sample* in a mixture of 1 mL of lead acetate TS and 1 mL of 2.5 N sodium hydroxide. Heat for several min on a steam bath.
Acceptance criteria: After dissolution of the *Sample*, a yellow color is produced. After heating the solution, the color changes to brown and on standing, a precipitate of lead sulfide separates.
• **C.** A solution of Thiamine Mononitrate yields a white precipitate with mercuric chloride TS, and a red-brown precipitate with iodine TS. It also yields a precipitate with mercuric–potassium iodide TS, and with trinitrophenol TS.
• **D.**
Sample solution: Dissolve 5 mg in 5 mL of 0.5 N sodium hydroxide.
Analysis: To the *Sample solution* add 0.5 mL of potassium ferricyanide TS and 5 mL of isobutyl alcohol. Shake the mixture vigorously for 2 min, and allow the liquid layers to separate.
Acceptance criteria: When illuminated from above by a vertical beam of UV light and viewed at a right angle to this beam, the air–liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.

ASSAY
• **PROCEDURE**
Solution A: 0.005 M sodium 1-octanesulfonate in dilute glacial acetic acid (1 in 100)
Solution B: Methanol and acetonitrile (3:2)
Mobile phase: *Solution A* and *Solution B* (60:40)
Internal standard solution: 2.0% (v/v) of methylbenzoate in methanol
Standard solution: Prepare a 1-mg/mL solution of USP Thiamine Hydrochloride RS in *Mobile phase*. Transfer 20.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. The *Standard solution* contains 400 µg/mL of thiamine hydrochloride.
Sample solution: Prepare a 2-mg/mL solution of Thiamine Mononitrate in *Mobile phase*. Transfer 10.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4-mm × 30-cm; packing L1
Flow rate: 1 mL/min. [NOTE—The flow rate may be adjusted as needed to obtain a retention time of about 12 min for thiamine hydrochloride.]
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 4.0 between the thiamine and methylbenzoate peaks
Tailing factor: NMT 2.0 for the thiamine peak
Column efficiency: NLT 1500 theoretical plates for the thiamine peak
Relative standard deviation: NMT 2.0% for the ratios of the thiamine peak area to the internal standard peak area
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Thiamine Mononitrate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = internal standard ratio (peak area of thiamine/peak area of the internal standard) from the *Sample solution*
R_S = internal standard ratio (peak area of thiamine/peak area of the internal standard) from the *Standard solution*
C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Thiamine Mononitrate in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of thiamine mononitrate, 327.36
M_{r2} = molecular weight of thiamine hydrochloride, 337.27

www.webofpharma.com

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.2%
- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
  Standard: 0.40 mL of 0.020 N hydrochloric acid

Thiamine Mononitrate Oral Solution

DEFINITION

Thiamine Mononitrate Oral Solution contains NLT 95.0% and NMT 115.0% of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$).

IDENTIFICATION

- **A.**
  Sample solution: Dilute a portion of Oral Solution with water to a concentration of 10 mg/mL of thiamine mononitrate.
  Analysis: To 0.5 mL of the *Sample solution* add 5 mL of 0.5 N sodium hydroxide, then add 0.5 mL of potassium ferricyanide TS and 5 mL of isobutyl alcohol. Shake the mixture vigorously for 2 min, and allow the liquid layers to separate. Illuminate from above by a vertical beam of UV light and observe the air–liquid meniscus at a right angle to this beam.
  Acceptance criteria: The air–liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.
- **B.**
  Sample: 5 mL of Oral Solution
  Analysis: Add 2 mL of sulfuric acid to the *Sample*, cool, and superimpose 2 mL of ferrous sulfate TS.
  Acceptance criteria: A brown ring is produced at the junction of the two liquids.

ASSAY

- **PROCEDURE**
  Mobile phase: Methanol and 0.04 M aqueous monobasic potassium phosphate (45:55)
  Internal standard solution: 100 µg/mL of methylparaben in *Mobile phase*
  Standard stock solution: 500 µg/mL of USP Thiamine Hydrochloride RS in *Mobile phase*
  Standard solution: Dilute a mixture of equal volumes of the *Standard stock solution* and *Internal standard solution* with *Mobile phase* to obtain a concentration of USP Thiamine Hydrochloride RS of 50 µg/mL.
  Sample stock solution: Equivalent to 500 µg/mL of thiamine mononitrate in *Mobile phase* from an accurately measured volume of Oral Solution
  Sample solution: Dilute a mixture of equal volumes of the *Sample stock solution* and *Internal standard solution* with *Mobile phase* to obtain a concentration of thiamine mononitrate of 50 µg/mL.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 3.9-mm × 30-cm; packing L1
  Flow rate: 1 mL/min
  Injection size: 25 µL
  System suitability
  Sample: *Standard solution*
  [NOTE—The relative retention times for thiamine and methylparaben are about 0.35 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 6.0 between the thiamine and methylparaben
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = peak area ratio of thiamine to methylparaben from the *Sample solution*
R_S = peak area ratio of thiamine to methylparaben from the *Standard solution*
C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard stock solution* (µg/mL)
C_U = nominal concentration of thiamine mononitrate in the *Sample stock solution* (µg/mL)
M_{r1} = molecular weight of thiamine mononitrate, 327.36
M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 95.0%–115.0%

- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Thiamine Hydrochloride RS

Thiethylperazine Maleate

$C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$ 631.76

10*H*-Phenothiazine, 2-(ethylthio)-10-[3-(4-methyl-1-piperazinyl)propyl]-, (*Z*)-2-butenedioate (1:2); 2-(Ethylthio)-10-[3-(4-methyl-1-piperazinyl)propyl] phenothiazine maleate (1:2) [1179-69-7].

DEFINITION

Thiethylperazine Maleate contains NLT 98.0% and NMT 101.5% of thiethylperazine maleate ($C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$), calculated on the dried basis.

[NOTE—Throughout the following procedures, protect test or assay samples, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

ASSAY

- **PROCEDURE**

Sample solution: Dissolve 250 mg of Thiethylperazine Maleate in 30 mL of glacial acetic acid. Warm on a steam bath to dissolve.

Analysis: To the *Sample solution* add 1 drop of crystal violet TS. Titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.59 mg of thiethylperazine maleate ($C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$).

Acceptance criteria: 98.0%–101.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
- **SELENIUM** ⟨291⟩

Test solution: 100 mg of Thiethylperazine Maleate, mixed with 100 mg of magnesium oxide

Acceptance criteria: NMT 30 ppm; the absorbance of the solution from the *Test solution* is NMT one-half that from the *Standard Solution.*

- **ORGANIC IMPURITIES**

[NOTE—Conduct this test promptly without exposure to daylight and with minimum exposure to artificial light.]

Diluent: Methanol and ammonium hydroxide (49:1)

Sample solution: 20 mg/mL of Thiethylperazine Maleate in *Diluent*

Standard solution A: 20.0 mg/mL of USP Thiethylperazine Maleate RS in *Diluent*

Standard solutions B–F: Solutions containing 0.2, 0.1, 0.06, 0.04, and 0.02 mg/mL, respectively, from *Standard solution A* in *Diluent.* The final concentrations of *Standard solutions B–F* represent 1%, 0.5%, 0.3%, 0.2%, and 0.1% concentrations of *Standard solution A.*

Chromatographic system

Application volume: 5 µL

Developing solvent system: Ether, cyclohexane, methanol, and ammonium hydroxide (25:10:5:1)

Analysis: Apply equal spots of the *Sample solution* and *Standard solutions A–F* as directed in *Ordinary Impurities* ⟨466⟩. Examine the plate under short- and long-wavelength UV light, then spray the plate with Dragendorff's TS, dry the plate with a stream of nitrogen, and then spray with hydrogen peroxide TS.

Acceptance criteria: Any secondary spot in the *Sample solution* is NMT 0.5%, and the sum of all secondary spots is NMT 2.0%.

SPECIFIC TESTS

- **PH** ⟨791⟩

Sample solution: 1 mg/mL in water, warming, if necessary, to dissolve

Acceptance criteria: 2.8–3.8

- **LOSS ON DRYING** ⟨731⟩

Analysis: Dry a sample at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Thiethylperazine Maleate RS

Thiethylperazine Maleate Suppositories

DEFINITION

Thiethylperazine Maleate Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of thiethylperazine maleate ($C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$).

[NOTE—Throughout the following procedures, protect test or assay samples, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*
- **B.** The R_F value of the principal spot and its color, as visualized by the spray reagents in the chromatogram of the *Sample solution,* corresponds to that of *Standard solution A,* as obtained in *Organic Impurities.*

ASSAY

- **PROCEDURE**

Mobile phase: Methanol and 10% ammonium carbonate (9:1)

Diluent: Methanol, chloroform, and ammonium hydroxide (55:45:1)

Standard solution: 0.1 mg/mL of USP Thiethylperazine Maleate RS in *Diluent*

USP Monographs

www.webofpharma.com

Sample solution: Weigh not fewer than 20 Suppositories, and freeze them at 0° for about 30 min. Grind the Suppositories into small particles, and transfer a portion of the mass, equivalent to about 10 mg of thiethylperazine maleate, to a 100-mL volumetric flask. Add about 30 mL of *Diluent*, and gently shake for about 10 min or until the mass dissolves. Dilute with *Diluent* to volume, and filter through about 2 g of anhydrous sodium sulfate, discarding the first portion of the filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 265 nm
Column: 4.6-mm × 25-cm; 5-µm, base-deactivated packing L1
Column temperature: 45°
Flow rate: 2 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 1.0 between the thiethylperazine peak and adjacent peaks
Column efficiency: NLT 1000 theoretical plates
Tailing factor: NMT 2.5
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of thiethylperazine maleate ($C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$) in the portion of Suppositories taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Thiethylperazine Maleate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of thiethylperazine maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES
• **Organic Impurities**
Diluent: Methanol, chloroform (stabilized with 0.75% alcohol), and ammonium hydroxide (55:45:1)
Standard stock solution: 10 mg/mL of USP Thiethylperazine Maleate RS in *Diluent*
Standard solutions: Dilute the *Standard stock solution* quantitatively with *Diluent* to obtain the *Standard solution* shown in *Table 1*.

Table 1

Standard solution	Dilution	Concentration (µg/mL)	Percentage (%, for comparison with Sample solution)
A	(1 in 20)	500	5
B	(1 in 33)	300	3
C	(1 in 50)	200	2
D	(1 in 100)	100	1
E	(1 in 200)	50	0.5

Sample solution: Transfer a number of Suppositories, equivalent to about 20 mg of thiethylperazine maleate, to a funnel having a fritted disk of a fine pore size. Add 50 mL of *n*-pentane, macerate, and mix with a glass stirring rod, collecting the filtrate in a filter flask under reduced pressure. Rinse the stirring rod and funnel with five 10-mL portions of *n*-pentane, and discard the filtrate. Transfer the funnel to a separate filter flask, add three 10-mL portions of *Diluent*, and collect the filtrate under reduced pressure. Evaporate the filtrate to dryness, add 2.0 mL of *Diluent*, and mix. Filter the resulting solution through a filter of 0.45-µm pore size, discarding the initial portion of the filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Absorbent: 0.25-mm layer of chromatographic silica gel mixture. Equilibrate for 3 h in the *Developing solvent system*. Remove and allow solvent to evaporate.
Application volume: 10 µL
Developing solvent system: Methylene chloride, isopropyl alcohol, methanol, and ammonium hydroxide (85:15:2:1)

Analysis
Samples: *Standard solutions A–E* and *Sample solution*
Develop the chromatogram in a separate lined chamber in the *Developing solvent system*, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow to evaporate in a stream of nitrogen for about 10 min. Examine the plate under short- and long-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Sample solution* with those of the principal spots in the chromatograms of the *Standard solutions*. Spray the plate with Dragendorff's reagent, followed by a 9% solution of hydrogen peroxide in water, and cover with a glass plate for 5 min. Remove the glass plate, and observe under white light. Record the R_F values and estimate the concentration of the secondary spots observed in the *Sample solution*.

Acceptance criteria: No secondary spot from the chromatogram of the *Sample solution* observed, using the visualization methods above, is larger or more intense than the principal spot of *Standard solution E* (NMT 0.5%), and the sum of the intensities of the secondary spots of the *Sample solution* corresponds to NMT 5%.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight containers at temperatures below 25°. Do not expose unwrapped Suppositories to sunlight.
• **USP Reference Standards** ⟨11⟩
USP Thiethylperazine Maleate RS

Thiethylperazine Maleate Tablets

DEFINITION
Thiethylperazine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of thiethylperazine maleate ($C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4$).
[Note—Throughout the following procedures, protect test or assay samples, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

USP Monographs

Injection volume: 2.5 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times of thimerosal and thimerosal related compound A are 1.0 and 1.3, respectively.]
Suitability requirements
Resolution: NLT 3.5 between the thimerosal and thimerosal related compound A peaks, *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 0.73%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of thimerosal ($C_9H_9HgNaO_2S$) in the portion of Thimerosal taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Thimerosal RS in the *Standard solution* (µg/mL)
C_U = concentration of Thimerosal in the *Sample solution* (µg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

• **MERCURY IONS**
Iodide reagent: 332 mg/mL of potassium iodide. Prepare fresh daily. Keep the stopper in the flask, and protect from light.
Standard solution: 95 µg/mL of mercuric chloride
Sample stock solution: 5 mg/mL of Thimerosal
Sample solution A: 1 mg/mL of Thimerosal from *Sample stock solution*
Sample solution B: 1 mg/mL of Thimerosal from *Sample stock solution* and 9.5 µg/mL of mercuric chloride from *Standard solution*
Instrumental conditions
Mode: UV
Analytical wavelength: Determine the wavelength of maximum absorbance for the tetraiodomercurate ion at about 323 nm using the solution prepared by mixing 1.0 mL of the *Standard solution* and 5.0 mL of the *Iodide reagent*, and diluting with water to 10.0 mL.
Cell: 1 cm
Blank: Water
Analysis
Protect all solutions from light before determining their absorbances.
Samples: Label five 10-mL volumetric flasks C, D, E, F, and R. Transfer 5.0 mL of *Sample solution A* to flasks C and D, 5.0 mL of *Sample solution B* to flasks E and F, and 5.0 mL of water to flask R. Dilute flasks C and E with water to volume. Dilute flasks D, F, and R with *Iodide reagent* to volume.
Determine the absorbances of the solutions in flasks C, D, E, F, and R as A_C, A_D, A_E, A_F, and A_R, respectively.
Calculate the percentage of mercury ions in the portion of Thimerosal taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (A_r/M_r) \times 100$$

A_U = absorbance of the *Sample solution* obtained by: $A_U = A_D - A_R - A_C$
A_S = absorbance of the *Standard solution* obtained by: $A_S = A_F - A_R - A_E - A_U$
C_S = concentration of mercuric chloride in *Sample solution B* (mg/mL)
C_U = concentration of Thimerosal in *Sample solution B* (mg/mL)
A_r = atomic weight of mercury, 200.59
M_r = molecular weight of mercuric chloride, 271.50

Acceptance criteria: NMT 0.70%

• **ORGANIC IMPURITIES**

Thimerosal Topical Aerosol

DEFINITION

Thimerosal Topical Aerosol is an alcoholic solution of Thimerosal mixed with suitable propellants in a pressurized container. It contains NLT 85.0% and NMT 115.0% of the labeled quantity of thimerosal ($C_9H_9HgNaO_2S$).

[Note—Thimerosal Topical Aerosol is sensitive to some metals.]

IDENTIFICATION

• **A.**

Sample: 10 mL of Topical Aerosol

Analysis: Spray the *Sample* into a suitable container, add 10 mL of water, and heat on a steam bath until the odor of alcohol is no longer perceptible. Cool, and pass hydrogen sulfide through the solution.

Acceptance criteria: No black discoloration or black precipitate is formed.

• **B.**

Sample: 15 mL of Topical Aerosol

Analysis: Spray the *Sample* into a suitable container, add 15 mL of water, heat on a steam bath until the odor of alcohol is no longer perceptible, and add 2 drops of bromine. Mix with 1.5 mL of 3 N hydrochloric acid, filter, evaporate the excess bromine with a current of air, and pass hydrogen sulfide through the filtrate.

Acceptance criteria: A black precipitate is formed.

ASSAY

• **Procedure**

The *Standard solutions* and *Sample solution* may be diluted with water, if necessary, to yield solutions of suitable concentration, adaptable to the linear or working range of the instrument.

Solution A: Dissolve 50 g of stannous chloride in 100 mL of hydrochloric acid on a steam bath, cool, dilute with water to 500 mL, and mix. Use within 3 months.

Standard stock solution A: 1.8 µg/mL of USP Thimerosal RS

Standard stock solution B: 2.0 µg/mL of USP Thimerosal RS

Standard stock solution C: 2.2 µg/mL of USP Thimerosal RS

Standard solution A: Pipet 20 mL of *Standard stock solution A* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Standard solution B: Pipet 20 mL of *Standard stock solution B* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Standard solution C: Pipet 20 mL of *Standard stock solution C* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Sample stock solution: Weigh a filled Topical Aerosol container, and record the weight. Place the container in a dry ice–alcohol bath, and cool for 60 min. Remove the container from the bath, and carefully remove the spray cap with wire cutters, taking precautions to save all pieces of the spray head and cap. With the aid of three 5-mL portions of water, transfer the contents of the container to a beaker previously chilled in the bath. Dry the rinsed empty container and all of its parts in an oven at 105° for 2 h, cool, and weigh. Calculate the weight of the container contents. Add a few boiling chips to the beaker, and carefully stir to help evaporate the propellant. After the bulk of the propellant has evaporated, place the beaker on a steam bath, evaporate the volatile solvents, and cool. Transfer the residual liquid with the aid of 35.0 mL of alcohol to a 50-mL volumetric flask, and dilute with water to volume. Dilute a portion of this solution quantitatively with water to obtain nominally 2 µg/mL of thimerosal.

Sample solution: Pipet 20 mL of *Sample stock solution* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Instrumental conditions

Mode: Flameless atomic absorption spectroscopy

Lamp: Mercury hollow-cathode

Blank solution: Pipet 20 mL of water into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Analysis

Samples: *Standard solutions A, B,* and *C, Sample solution,* and *Blank solution*

Proceed with each of the *Samples* as follows. Separately pipet 3 mL into the scrubbing chamber of a suitable system designed for determination of mercury. Dilute with water to 150 mL, and add hydroxylamine hydrochloride solution (1 in 10) to reduce the excess permanganate. Add 5 mL of *Solution A,* and immediately attach the scrubbing chamber to the system. Concomitantly determine the absorbance of the vapor from each solution at an integration time of 15 s. Use the absorbance of the *Blank solution* to correct the

USP Monographs

www.webofpharma.com

absorbances of *Standard solutions A, B,* and *C,* and the *Sample solution.* Plot the corrected absorbances of the standards versus the respective concentrations of the *Standard stock solutions,* in µg/mL, and from the curve so obtained determine the concentration, *C,* in µg/mL, of the *Sample solution.*

Calculate the percentage of thimerosal ($C_9H_9HgNaO_2S$) in the Topical Aerosol taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of thimerosal in the *Sample solution* (µg/mL)

C_U = nominal concentration of thimerosal in the *Sample solution* (µg/mL)

Acceptance criteria: 85.0%–115.0%

SPECIFIC TESTS

• **ALCOHOL DETERMINATION,** *Method II* ⟨611⟩

Analysis: Weigh, chill, and open 1 Topical Aerosol container, and remove the propellant as directed for the *Sample solution* in the *Assay,* continuing until the bulk of the propellant has evaporated. Determine the alcohol content of the sample thus prepared by the *Gas Chromatographic Method* (see *Method II* in *Alcohol Determination* ⟨611⟩), using methyl ethyl ketone as the internal standard in place of acetonitrile.

Acceptance criteria: 18.7%–25.3% (w/w) of C_2H_5OH

• **OTHER REQUIREMENTS:** Meets the requirements for *Topical Aerosols* ⟨603⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, pressurized containers, and avoid exposure to excessive heat.

Thimerosal Topical Solution

DEFINITION

Thimerosal Topical Solution contains, in each 100 mL, NLT 95 mg and NMT 105 mg of thimerosal ($C_9H_9HgNaO_2S$).

[NOTE—Thimerosal Topical Solution is sensitive to some metals.]

IDENTIFICATION

• **A.**

Sample: 50 mL of Topical Solution

Analysis 1: Pass hydrogen sulfide through the *Sample.*

Acceptance criteria 1: No black discoloration or black precipitate is formed.

Analysis 2: Add 3 or 4 drops of bromine to the *Sample,* mix, and warm on a steam bath to expel the excess bromine. Add 5 mL of 3 N hydrochloric acid, filter, and pass hydrogen sulfide through the filtrate.

Acceptance criteria 2: A black precipitate is formed.

• **B.**

Sample: 1 mL of Topical Solution

Analysis: To the *Sample* add 9 mL of water, mix, and add 1 mL of cupric sulfate TS.

Acceptance criteria: A green color is produced immediately and is followed by the gradual precipitation of flocculent, greenish brown particles.

ASSAY

• **PROCEDURE**

The *Standard solutions* and *Sample solution* may be diluted with water, if necessary, to yield solutions of suitable concentration, adaptable to the linear or working range of the instrument.

Solution A: Dissolve 50 g of stannous chloride in 100 mL of hydrochloric acid on a steam bath, cool, and dilute with water to 500 mL. Use within 3 months.

Standard stock solution A: 1.8 µg/mL of USP Thimerosal RS

Standard stock solution B: 2.0 µg/mL of USP Thimerosal RS

Standard stock solution C: 2.2 µg/mL of USP Thimerosal RS

Standard solution A: Pipet 20 mL of *Standard stock solution A* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Standard solution B: Pipet 20 mL of *Standard stock solution B* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Standard solution C: Pipet 20 mL of *Standard stock solution C* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Sample stock solution: Pipet 2 mL of Topical Solution into a 1000-mL volumetric flask, and dilute with water to volume.

Sample solution: Pipet 20 mL of *Sample stock solution* into a 100-mL volumetric flask. Add 5 mL of sulfuric acid, cool, add 3 mL of nitric acid, and mix. Add potassium permanganate crystals, while mixing, until the purple color persists for NLT 15 min. Add 200 mg of potassium persulfate, mix, and heat on a steam bath for 2 h. Cool, and dilute with water to volume.

Sample solution: Transfer 100 mg of Thioguanine, previously dried, to a 100-mL volumetric flask. Dissolve in a mixture of 15 mL of water and 1.5 mL of 1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, add 1% hydrochloric acid to volume, and mix. Finally, transfer 5.0 mL of the last solution to a third 100-mL volumetric flask, then add 1% hydrochloric acid to volume, and mix.
Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Thioguanine RS.

ASSAY
• **PROCEDURE**
Phosphoric acid solution: Add 1 mL of phosphoric acid to 99 mL of water.
Mobile phase: 0.05 M monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 3.0.
Standard stock solution: 0.4 mg/mL of USP Thioguanine RS in 0.01 N sodium hydroxide
Standard solution: 0.04 mg/mL of USP Thioguanine RS in *Phosphoric acid solution* from *Standard stock solution*
Sample stock solution: 0.4 mg/mL of Thioguanine in 0.01 N sodium hydroxide
Sample solution: 0.04 mg/mL of Thioguanine in *Phosphoric acid solution* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 248 nm
Column: 4.6-mm × 5-cm; packing L1
Flow rate: 2.0 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of thioguanine ($C_5H_5N_5S$) in the portion of Thioguanine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Thioguanine RS in the *Standard solution* (mg/mL)
C_U = concentration of Thioguanine in the *Sample solution* (mg/mL)

Acceptance criteria: 96.0%–100.5% on the dried basis

OTHER COMPONENTS
• **NITROGEN DETERMINATION,** *Method II* ⟨461⟩
Sample: 100 mg
Analysis: Each mL of 0.1 N sulfuric acid is equivalent to 1.401 mg of N.
Acceptance criteria: 40.2%–43.1% on the dried basis

IMPURITIES
• **SELENIUM** ⟨291⟩
Sample: 200 mg
Acceptance criteria: NMT 30 ppm
• **FREE SULFUR**
Sample solution: Dissolve 50 mg of Thioguanine in 5 mL of 1 N sodium hydroxide.
Acceptance criteria: The *Sample solution* is clear.
• **PHOSPHOROUS-CONTAINING SUBSTANCES**
Solution A: Dissolve 8.3 g of ammonium molybdate in 40 mL of water, add 33 mL of dilute sulfuric acid (2 in 7), and dilute with water to 100.0 mL. [NOTE—This solution is stable for about 2 weeks.]
Analysis: Transfer 50.0 mg of Thioguanine to a large test tube, add 1 mL of dilute sulfuric acid (2 in 7), and heat in a boiling water bath for 5 min. Cautiously add nitric acid, dropwise, continue heating until the mixture becomes colorless, and then heat for 1 min longer. Cool, dilute with water to about 10 mL, and transfer the solution to a 25-mL volumetric flask with the aid of a few mL of water. To the flask add 0.75 mL of *Solution A* and 1.0 mL of aminonaphtholsulfonic acid TS, dilute with water to volume, and mix. Determine the absorbance of this solution in a 1-cm cell, with a suitable spectrophotometer, at a wavelength of about 620 nm, using a reagent blank to set the instrument.
Acceptance criteria: NMT 0.03% as phosphate; the absorbance is not greater than that produced by 1.5 mL of a similar solution of monobasic potassium phosphate in water having a known concentration of 10 µg/mL of phosphate (PO_4), concomitantly measured.
• **ORGANIC IMPURITIES**
Mobile phase, Sample stock solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Thiopental Sodium

$C_{11}H_{17}N_2NaO_2S$ 264.32

4,6(1*H*,5*H*)-Pyrimidinedione, 5-ethyldihydro-5-(1-methylbutyl)-2-thioxo-, monosodium salt, (±)-;
Sodium (±)-5-ethyl-5-(1-methylbutyl)-2-thiobarbiturate [71-73-8].

DEFINITION

Thiopental Sodium contains NLT 97.0% and NMT 102.0% of thiopental sodium ($C_{11}H_{17}N_2NaO_2S$), calculated on the dried basis.

IDENTIFICATION

• **A.**

Sample: 500 mg of Thiopental Sodium

Analysis: Dissolve the *Sample* in 10 mL of water in a separator, add 10 mL of 3 N hydrochloric acid, and extract the liberated thiopental with two 25-mL portions of chloroform. Evaporate the combined chloroform extracts to dryness. Add 10 mL of ether, evaporate again, and dry at 105° for 2 h.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Thiopental RS.

• **B. Identification Tests—General,** *Sodium* ⟨191⟩

Analysis: Ignite 500 mg.

Acceptance criteria: The residue meets the requirements.

• **C.**

Sample: 200 mg of Thiopental Sodium

Analysis 1: Dissolve the *Sample* in 5 mL of 1 N sodium hydroxide, and add 2 mL of lead acetate TS.

Acceptance criteria 1: A white precipitate is formed, and it gradually darkens when the mixture is boiled.

Analysis 2: Acidify the darkened mixture obtained from *Analysis 1* with hydrochloric acid.

USP Monographs

www.webofpharma.com

Acceptance criteria 2: Hydrogen sulfide is evolved, and it is recognizable by its darkening of moistened lead acetate test paper held in the vapor.

Buffer: 13.6 g/L of monobasic potassium phosphate in water. Adjust with 35 g/L of dibasic sodium phosphate to a pH of 7.0.
Mobile phase: Acetonitrile and *Buffer* (13:87)
System suitability solution: Transfer 10 mg of USP Thiotepa RS to a 4-mL vial, add 2 mL of methanol, and mix. Add 50 µL of 0.1% phosphoric acid solution. Place a cap on the vial, and heat at 65° for 50 s. Cool the solution, add 1 mL of methanol, and mix. [NOTE—The preparation generates methoxythiotepa.]
Standard solution: 1.5 mg/mL of USP Thiotepa RS in water
Sample solution: 1.5 mg/mL of Thiotepa in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for thiotepa and methoxythiotepa are about 1.0 and 1.3, respectively.]
Suitability requirements
Resolution: NLT 3 between methoxythiotepa and thiotepa, *System suitability solution*
Relative standard deviation: NMT 0.73%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of thiotepa ($C_6H_{12}N_3PS$) in the portion of Thiotepa taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of thiotepa from the *Sample solution*
r_S = peak response of thiotepa from the *Standard solution*
C_S = concentration of USP Thiotepa RS in the *Standard solution* (mg/mL)
C_U = concentration of Thiotepa in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES
- **ORGANIC IMPURITIES**

Buffer, Mobile phase, and System suitability solution: Proceed as directed in the *Assay*.
Peak identification solution: Dissolve 15 mg of USP Thiotepa RS in 10 mL of water, add 1 g of sodium chloride, boil in a water bath for 10 min, and cool. [NOTE—The preparation generates thiotepa chloroethyl analog.]
Standard solution: 3.5 µg/mL of USP Thiotepa RS in water
Sample solution: 3.5 mg/mL of Thiotepa in water
Chromatographic system: Proceed as directed in the *Assay*, with a run time NLT 4 times the retention time of the thiotepa peak.
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for thiotepa and methoxythiotepa are about 1.0 and 1.3, respectively.]
Suitability requirements
Resolution: NLT 3 between methoxythiotepa and thiotepa, *System suitability solution*
Analysis
Samples: *Peak identification solution*, *Standard solution*, and *Sample solution*
Calculate the percentage of each impurity in the portion of Thiotepa taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of thiotepa from the *Standard solution*
C_S = concentration of USP Thiotepa RS in the *Standard solution* (mg/mL)
C_U = concentration of Thiotepa in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. Disregard any impurity peaks less than 0.05%.

USP Thiothixene RS
USP (*E*)-Thiothixene RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197S*▲ (CN 1-May-2020)—
Solution: 1 in 20.
Medium: chloroform.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 10 µg per mL.
Medium: methanol.
Absorptivities at about 230 nm and 307 nm, calculated on the dried basis, do not differ by more than 4.0%.
Melting range, *Class I* ⟨741⟩: between 147° and 153.5°.
Loss on drying ⟨731⟩—Dry it in vacuum at 100° for 3 hours: it loses not more than 2.0% of its weight.
Residue on ignition ⟨281⟩: not more than 0.2%.
Selenium ⟨291⟩: 0.003%.
Limit of (*E*)-thiothixene— [Note—Prepare all solutions in low-actinic glassware.]
Mobile phase—Transfer 6.9 g of monobasic sodium phosphate to a 1-liter volumetric flask, dissolve in and dilute with deionized water to volume, and mix. Filter through a suitable membrane filter. Mix 4 volumes of this solution with 6 volumes of methanol. The concentration of methanol may be adjusted to meet the system suitability requirements.
Standard preparations—
A—Using accurately weighed quantities of USP (*E*)-Thiothixene RS and USP Thiothixene RS, prepare a solution in methanol containing, in each mL, 0.4 mg and 1.2 mg, respectively.
B—Transfer 5.0 mL of *Standard preparation A* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.
C—Transfer about 200 mg of Thiothixene, accurately weighed, to a 100-mL volumetric flask. Transfer 5.0 mL of *Standard preparation A* to the same flask, dissolve in and dilute with methanol to volume, and mix.
Test preparation—Transfer about 200 mg of Thiothixene, accurately weighed, to a 100-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix.
Procedure—Concomitantly introduce equal volumes (about 20 µL) of *Standard preparation C* and *Test preparation* into a high-pressure liquid chromatograph operated at room temperature and equipped with a suitable microsyringe or sampling valve, a column containing packing L9 (typically 25 cm × 4.6 mm), an UV detector capable of monitoring absorption at 254 nm, and a suitable recorder. The *Mobile phase* is maintained at a flow rate of about 1 to 1.5 mL per minute. In a suitable chromatographic system, three replicate injections of *Standard preparation B* show a resolution factor of not less than 2.2 between the thiothixene and (*E*)-thiothixene peaks, their retention times being 13 and 15 minutes, and between 16 and 18 minutes, respectively. Calculate the quantity, in mg, of (*E*)-thiothixene in the portion of Thiothixene taken by the formula:

$$5CH_U/(H_C - H_U)$$

in which *C* is the concentration of USP (*E*)-Thiothixene RS, in mg per mL, in *Standard preparation A;* and H_C and H_U are the peak responses of the (*E*)-thiothixene peaks corrected for the tailing of the main peak, obtained from *Standard preparation C* and the *Test preparation*, respectively: the limit of (*E*)-thiothixene is 1.0%.

USP Monographs

www.webofpharma.com

Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase—Mix 0.5 mL of ethanolamine with 3780 mL of methanol, mix 1400 mL of this solution with 200 mL of water, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Using an accurately weighed quantity of USP Thiothixene RS, prepare a solution in methanol having a known concentration of about 0.02 mg per mL.

Assay preparation—Transfer about 100 mg of Thiothixene, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 2 mL of the resulting solution into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L3. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{23}H_{29}N_3O_2S_2$ in the portion of Thiothixene taken by the formula:

$$5000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Thiothixene Capsules

» Thiothixene Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{29}N_3O_2S_2$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Thiothixene RS

Identification—Dissolve a portion of the contents of Capsules in a solvent consisting of equal volumes of chloroform and methanol to obtain a solution containing 1 mg of thiothixene per mL. Shake by mechanical means for 10 minutes, clarify a portion of the mixture by centrifugation, filter, if necessary, and use the clear supernatant or filtrate for the test. Apply 10 µL of this test solution, 10 µL of a Standard solution containing 1 mg of USP Thiothixene RS per mL in the same medium, and 10 µL of a mixture of equal volumes of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methanol, and diethylamine (65:35:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and locate the spots on the plate by viewing under short- and long-wavelength UV light. Spray the plate lightly with acidified iodoplatinate spray reagent (prepared by mixing 1 volume of hydrochloric acid with 50 volumes of potassium iodoplatinate TS): the R_F value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution and the mixed test-Standard solution.

Dissolution ⟨711⟩—

Medium—Dissolve 2.0 g of sodium chloride and 7 mL of hydrochloric acid in water to make 1000 mL, and mix; 900 mL.

Apparatus 1: 100 rpm.

Time: 20 minutes.

Buffer solution—On the day of use, prepare a mixture of 55 volumes of dibasic potassium phosphate solution (87 in 1000), 20 volumes of citric acid monohydrate solution (21 in 200), and 40 volumes of sodium hydroxide solution (1 in 25).

Methyl orange solution—Transfer 15.5 g of boric acid and 2.0 g of methyl orange to a glass-stoppered, 1000-mL flask. Add 500 mL of water, insert the stopper, and shake by mechanical means for not less than 3 hours. Filter through retentive filter paper, and wash the filtrate with two 100-mL portions of chloroform, discarding the chloroform washings. Store the *Methyl orange solution* over 50 mL of chloroform in a glass-stoppered bottle.

Procedure—Prepare a *Test preparation* by passing a 60-mL portion of the dissolution solution through a suitable filter, discarding the first 5 mL of the filtrate, and diluting the subsequent filtrate quantitatively, if necessary, to obtain a concentration of about 1 µg of thiothixene per mL. Prepare a *Standard preparation* of USP Thiothixene RS in *Dissolution Medium* having a known concentration of about 1 µg per mL. Transfer 40.0 mL each of the *Test preparation*, the *Standard preparation*, and *Dissolution Medium* to provide the blank, to individual separators, each containing 8.0 mL of *Buffer solution*, 10.0 mL of *Methyl orange solution*, and 50.0 mL of chloroform. Shake for 3 minutes, allow the layers to separate, transfer 40.0 mL of the chloroform layer, clarified by centrifugation, to a 60-mL separator containing 8.0 mL of dilute hydrochloric acid (1 in 120), shake for 1 minute, and allow the layers to separate. Concomitantly determine the absorbances of the aqueous layers in 1-cm cells, at the wavelength of maximum absorbance at about 508 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in µg per mL, of $C_{23}H_{29}N_3O_2S_2$ in the *Test preparation* taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Thiothixene RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively, and, from the known extent of dilution, determine the amount of it in the dissolution solution.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{23}H_{29}N_3O_2S_2$ is dissolved in 20 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase , *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Thiothixene.*

Assay preparation—Transfer, as completely as possible, the contents of not less than 20 Capsules to a tared beaker, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 10 mg of thiothixene, to a 500-mL volumetric flask. Add about 400 mL of methanol, shake by mechanical means for 10 minutes, place in an

USP Monographs

www.webofpharma.com

ultrasonic bath for 5 minutes, dilute with methanol to volume, and filter the suspension through a 5-µm polytef membrane filter.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiothixene.* Calculate the quantity, in mg, of $C_{23}H_{29}N_3O_2S_2$ in the portion of Capsules taken by the formula:

$$500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation,* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiothixene Hydrochloride

$C_{23}H_{29}N_3O_2S_2 \cdot 2HCl \cdot 2H_2O$ 552.58

Standard preparations and *Test preparation*—Prepare as directed in the test for *Limit of (E)-thiothixene* under *Thiothixene,* except to use 250 mg of Thiothixene Hydrochloride instead of 200 mg of Thiothixene.

Procedure—Proceed as directed for *Procedure* in the test for *Limit of (E)-thiothixene* under *Thiothixene.* Calculate the quantity, in mg, of (*E*)-thiothixene hydrochloride in the portion of Thiothixene Hydrochloride taken by the formula:

$$5CH_U(516.56/443.63)/(H_C - H_U)$$

in which 516.56 and 443.63 are the molecular weights of anhydrous thiothixene hydrochloride and thiothixene, respectively; and the other terms are as previously defined. The limit of (*E*)-thiothixene, as the hydrochloride, is 1.0%.
Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay* under *Thiothixene.*

Assay preparation—Transfer about 116 mg of Thiothixene Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 2 mL of this solution into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiothixene.* Calculate the quantity, in mg, of $C_{23}H_{29}N_3O_2S_2 \cdot 2HCl$ in the portion of Thiothixene Hydrochloride taken by the formula:

$$(516.56/443.64)(5000C)(r_U/r_S)$$

in which 516.56 and 443.64 are the molecular weights of anhydrous thiothixene hydrochloride and thiothixene, respectively; C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiothixene Hydrochloride Injection

» Thiothixene Hydrochloride Injection is a sterile solution of Thiothixene Hydrochloride in Water for Injection. It contains an amount of thiothixene hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thiothixene ($C_{23}H_{29}N_3O_2S_2$).

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light.
USP Reference standards ⟨11⟩—
USP Thiothixene RS
Identification—Transfer a volume of Injection, equivalent to about 20 mg of thiothixene hydrochloride, to a separator containing 20.0 mL of chloroform. Render the aqueous layer just basic with ammonium hydroxide, shake for 1 minute, and allow the layers to separate. Pass a portion of the chloroform layer through filter paper, previously washed with chloroform, and use the clear filtrate for the test. Proceed as directed in the *Identification* test under *Thiothixene Capsules,* beginning with "Apply 10 µL of this test solution."
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 88.0 USP Endotoxin Units per mg of thiothixene.
pH ⟨791⟩: between 2.5 and 3.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

www.webofpharma.com

Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay* under *Thiothixene.*

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 2 mg of thiothixene, to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiothixene.* Calculate the quantity, in mg, of $C_{23}H_{29}N_3O_2S_2$ in each mL of the Injection taken by the formula:

$$(100C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation,* V is the volume, in mL, of Injection taken, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiothixene Hydrochloride for Injection

» Thiothixene Hydrochloride for Injection is a sterile, dry mixture of Thiothixene Hydrochloride and Mannitol. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{29}N_3O_2S_2$.

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution;* protect from light.

USP Reference standards ⟨11⟩—
USP Thiothixene RS

Identification—Constitute a vial of Thiothixene Hydrochloride for Injection with 2.2 mL of water. Further dilute one volume of the constituted solution with 4 volumes of methanol to obtain a test solution containing 1 mg of thiothixene per mL. Apply 10 µL of this test solution and 10 µL of a Standard solution containing 1 mg of USP Thiothixene RS per mL in the same medium to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of isopropyl alcohol and diethylamine (25:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, air-dry for 30 minutes, and then oven-dry at 110° for 30 minutes. Locate the spots on the plate by viewing under short-wavelength UV light. Spray the plate with alkaline permanganate spray reagent (prepared by dissolving 0.5 g of potassium permanganate and 2.0 g of sodium carbonate in 100 mL of water): the R_F value of the principal spot obtained from the test solution, under both detection conditions, corresponds to that obtained from the Standard solution.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 88.0 USP Endotoxin Units per mg of thiothixene.

pH ⟨791⟩: between 2.3 and 3.7, in the solution constituted as directed in the labeling.

Water Determination, *Method I* ⟨921⟩: not more than 4.0%.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay* under *Thiothixene.*

Assay preparation—Constitute a vial of Thiothixene Hydrochloride for Injection with an accurately measured volume (V_L mL) of water as directed in the labeling. Transfer an accurately measured volume (V_F mL) of the constituted solution, equivalent to about 5 mg of thiothixene, to a 250-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiothixene.* Calculate the quantity, in mg, of $C_{23}H_{29}N_3O_2S_2$ in each mL of the constituted solution taken by the formula:

$$(250CV_L/V_P)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation,* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Thiothixene Hydrochloride Oral Solution

» Thiothixene Hydrochloride Oral Solution contains an amount of thiothixene hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of thiothixene ($C_{23}H_{29}N_3O_2S_2$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Thiothixene RS

Identification—Transfer a portion of Oral Solution, equivalent to about 20 mg of thiothixene hydrochloride, to a separator containing 20.0 mL of chloroform. Render the aqueous layer just basic with ammonium hydroxide, shake for 1 minute, and allow the layers to separate. Pass a portion of the chloroform layer through filter paper, previously washed with chloroform; and use the clear filtrate for the test. Proceed as directed in the *Identification* test under *Thiothixene Capsules,* beginning with "Apply 10 µL of this test solution."

Uniformity of dosage units ⟨905⟩—
FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume ⟨698⟩—
FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH ⟨791⟩: between 2.0 and 3.0.

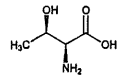
Alcohol Determination, *Method II* ⟨611⟩: if present, between 90.0% and 110.0% of the labeled amount, the labeled amount being not more than 7.0% of C_2H_5OH, determined by the gas-liquid chromatographic procedure, acetonitrile being used as the internal standard.

Assay— [NOTE—Perform the dilution operations in low-actinic glassware.]

Mobile phase, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Thiothixene.*

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 25 mg of thiothixene, to a 25-mL volumetric flask; dissolve in and dilute with methanol to volume; and mix. Pipet 2 mL of this solution

www.webofpharma.com



into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiothixene.* Calculate the quantity, in mg, of thiothixene ($C_{23}H_{29}N_3O_2S_2$) in each mL of the Oral Solution taken by the formula:

$$(1250C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Thiothixene RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Threonine

$C_4H_9NO_3$ 119.12

L-Threonine [72-19-5].

DEFINITION

Threonine contains NLT 98.5% and NMT 101.5% of L-threonine ($C_4H_9NO_3$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩,** *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)

ASSAY

- **PROCEDURE**

Sample: 110 mg of Threonine

Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant.* Perform the *Blank* determination.

Calculate the percentage of threonine ($C_4H_9NO_3$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 119.1 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

USP L-Proline RS

USP L-Threonine RS

Thyroid

DEFINITION

Thyroid is the cleaned, dried, and powdered thyroid gland previously deprived of connective tissue and fat. It is obtained from domesticated animals that are used for food by humans.

On hydrolysis it yields NLT 90.0% and NMT 110.0% each of the labeled amounts of levothyroxine ($C_{15}H_{11}I_4NO_4$) and liothyronine ($C_{15}H_{12}I_3NO_4$), calculated on the dried basis. It

USP Monographs

www.webofpharma.com

is free from iodine in inorganic or any form of combination other than that peculiar to the thyroid gland. It may contain a suitable diluent such as lactose, sodium chloride, starch, sucrose, or dextrose.

IDENTIFICATION

• **A.** The retention times of the peaks for liothyronine and levothyroxine of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile, water, and phosphoric acid (350:650:5), filtered and degassed

Reducing buffer solution: Freshly prepare 0.04 M tris(hydroxymethyl)aminomethane and 0.05 M methimazole in 0.11 M sodium chloride. Adjust, if necessary, with 6 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 8.4 ± 0.05.

Proteolytic enzyme: Freshly prepare a solution containing 3 mg/mL of bacterial protease in *Reducing buffer solution*.[1]

Enzyme deactivating solution: Phosphoric acid in acetonitrile (1:99)

Standard stock solution: Transfer accurately weighed quantities of about 9 mg of USP Liothyronine RS and about 38 mg of USP Levothyroxine RS to a 100-mL volumetric flask, add 50 mL of a mixture of acetonitrile, water, and ammonium hydroxide (500:500:1) and swirl to dissolve. Dilute with a mixture of acetonitrile and water (1:1) to volume, and mix. [NOTE—Protect solutions from light.]

Standard solution: Pipet 5 mL of the freshly prepared *Standard stock solution* into a 250-mL volumetric flask, dilute with *Reducing buffer solution* to volume, and mix to obtain a solution having known concentrations of about 1.8 µg/mL of liothyronine and 7.6 µg/mL of levothyroxine. Pipet 5 mL of this solution into a screw-capped 16- × 125-mm culture tube. Pipet 2 mL of *Enzyme deactivating solution* into the tube, place the cap on the tube, and shake the mixture vigorously. [NOTE—Prepare on the day of use.]

Sample solution: Transfer an accurately weighed portion of finely powdered Thyroid, equivalent to about 38 µg of levothyroxine, to a screw-capped 16- × 125-mm culture tube that has been flushed previously with nitrogen. Taking precautions to avoid unnecessary exposure to air, pipet 5 mL of *Proteolytic enzyme* into the tube. Allow nitrogen to flow gently over the mixture for 5 min. Place the cap on the tube, mix to disperse the contents, and place in a covered water bath maintained at a temperature of 37 ± 1° for 28 h. [NOTE—Protect the contents of the tubes from light.] Examine occasionally, and mix as necessary to ensure dispersion. At the end of the incubation period, pipet 2 mL of *Enzyme deactivating solution* into the tube, place the cap on the tube, mix vigorously, and centrifuge at about 2000 rpm for 5 min. Pass the supernatant through a filter of 0.45-µm pore size, discarding the first 1 mL of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-cm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 200 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8 for liothyronine and levothyroxine peaks

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of levothyroxine ($C_{15}H_{11}I_4NO_4$) and liothyronine ($C_{15}H_{12}I_3NO_4$) in the portion of Thyroid taken:

$$\text{Result} = (V \times C) \times (r_U/r_S)$$

V = volume of *Sample solution*, 7 mL

C = concentration of the corresponding Reference Standard in the *Standard solution* (µg/mL)

r_U = peak response of the corresponding analytes from the *Sample solution*

r_S = peak response of the corresponding analytes from the *Standard solution*

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of levothyroxine ($C_{15}H_{11}I_4NO_4$) and liothyronine ($C_{15}H_{12}I_3NO_4$) on the dried basis

IMPURITIES

• **LIMIT OF INORGANIC IODIDES**

Extracting solution: Sulfuric acid and water (1:99)

Standard solution: Dissolve an accurately weighed quantity of potassium iodide in water to obtain a stock solution containing 0.131 mg, equivalent to 0.100 mg of iodide, per mL. Transfer 1.0 mL of this stock solution into a 100-mL volumetric flask, dilute with *Extracting solution* to volume, and mix. Each mL of the *Standard solution* contains 1.0 µg of iodide. [NOTE—Prepare this solution on the day of use.]

Sample solution: Transfer 1.00 g, or proportionately less if the dry basis levothyroxine content is greater than 38 µg per grain, of Thyroid to a beaker. Add 100.0 mL of *Extracting solution*, and sonicate for 5 min.

Electrode system: Use an iodide-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±1 mV (see *pH* ⟨791⟩).

Analysis: Transfer the *Standard solution* to a beaker containing a magnetic stirring bar. Rinse and dry the electrodes, insert in the solution, stir for 5 min or until the reading stabilizes, and read the potential in mV. Repeat this process using the *Sample solution*.

Acceptance criteria: The requirements of the test are met if the *Sample solution* has a higher potential, in mV, than the *Standard solution*, the limit is 0.01%.

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.

• **LOSS ON DRYING** ⟨731⟩

Analysis: Dry under vacuum at 60° for 4 h.

Acceptance criteria: NMT 6.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Levothyroxine RS

USP Liothyronine RS

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8 for liothyronine and levothyroxine

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of liothyronine ($C_{15}H_{12}I_3NO_4$) and levothyroxine ($C_{15}H_{11}I_4NO_4$) in the portion of Tablets taken:

$$\text{Result} = (V \times C) \times (r_U/r_S)$$

V = volume of *Sample solution*, 7 mL

C = concentration of the corresponding Reference Standards in the *Standard solution* (µg/mL)

r_U = peak response of the corresponding analytes from the *Sample solution*

r_S = peak response of the corresponding analytes from the *Standard solution*

Acceptance criteria: 90.0%–110.0% of the labeled amounts of liothyronine ($C_{15}H_{12}I_3NO_4$) and levothyroxine ($C_{15}H_{11}I_4NO_4$)

PERFORMANCE TESTS

• **DISINTEGRATION** ⟨701⟩

Time: 15 min, with disks

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

Standard stock solution: Accurately weigh 1.69 g of potassium iodate and transfer to a 1-L volumetric flask. Dissolve in about 200 mL of water, dilute with water to volume, and mix. This is a stock solution having a concentration of about 1 mg/mL with respect to iodine.

Standard solution: Pipet 8 mL of the *Standard stock solution* into a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer an appropriate aliquot, based on the dosage being analyzed (i.e., ¼ grain, 1 mL; ½ grain, 2 mL; 1 grain, 4 mL; 1½ grains, 6 mL; 2 grains, 8 mL; 2½ grains, 10 mL; 3 grains, 12 mL; 4 grains, 16 mL; 5 grains, 20 mL), to a 100-mL volumetric flask containing 8 g of anhydrous potassium carbonate dissolved in 70 mL of water. Add 1 mL of bromine TS, mix, add sufficient sodium sulfite (about 20 mg) until the solution becomes colorless, and dilute with water to volume, and mix.

Sample solution: Crush 1 Tablet in a porcelain crucible with a glass rod. Remove any sample adhering to the glass rod with a spatula, and add it to the crucible. Add 4 g of anhydrous potassium carbonate, mix carefully, and gently tap the crucible several times to compact the mixture. Overlay with 4 g more of anhydrous potassium carbonate, and again compact the material thoroughly by tapping. Place the crucible in a preheated muffle furnace, and ignite at 675°–700° for 25 min. Cool, add 30 mL of water, carefully heat on a hot plate to dissolve the residue, and pass through a funnel with a glass wool plug into a 100-mL volumetric flask. Repeat the heating and filtration with two additional 30-mL portions of water, and add these filtrates to the volumetric flask. Add 1 mL of bromine TS, mix, add sufficient sodium sulfite (about 20 mg) until the solution becomes colorless, and mix. Dilute with water to volume, and mix.

Blank solution: Add 8 g of anhydrous potassium carbonate into a 100-mL volumetric flask, and dissolve it in 70 mL of water. Add 1 mL of freshly prepared bromine TS, mix, add sufficient sodium sulfite (about 20 mg) until the solution

[1] A suitable grade is available as "Pronase" (Catalog number 53702) from Calbiochem-Behring, P.O. Box 12087, San Diego, CA 92112.

www.webofpharma.com

becomes colorless, and dilute with water to volume, and mix.

Analysis: Transfer 10 mL of the *Sample solution* to a dry polarographic cell. Bubble nitrogen through the solution for 5 min, then direct the stream of nitrogen above the solution. Use a suitable differential pulse polarograph equipped with a saturated calomel reference electrode and a dropping mercury electrode with a 1-s drop time. Scan from –0.8 V to –1.5 V at the rate of 5 mV/s, and 50-mV pulses. Record the polarogram of the *Sample solution*, the *Standard solution*, and the *Blank solution*. At the peaks near –1.18 V in the polarograms from the *Standard solution* and the *Sample solution*, measure the heights from the baseline, as established by the *Blank solution*.

Calculate the amount of iodine, in µg, in the Tablet taken:

$$\text{Result} = (A_{r1}/A_{r2}) \times (r_U/r_S) \times (C \times V)$$

A_{r1} = atomic weight of iodine (I), 126.90
A_{r2} = atomic weight of potassium iodate (KIO_3), 214.00
r_U = peak height from the *Sample solution*
r_S = peak height from the *Standard solution*
C = concentration of the aliquot portion of potassium iodate solution used to prepare the *Standard solution*, 54.08 µg/mL
V = volume of the aliquot portion of potassium iodate solution used to prepare the *Standard solution* (mL)

Proceed as directed for *Uniformity of Dosage Units* ⟨905⟩, *Content Uniformity*, using the results obtained by this procedure to determine the total iodine content of individual Tablets, and use the *Sample solution* from the *Assay* to perform the composite determination for iodine.

Acceptance criteria: The amount of iodine in each Tablet is within 85.0%–115% of the composite assay for iodine, with a relative standard deviation of NMT 6.0%.

SPECIFIC TESTS

Mobile phase: Hexane, isopropyl alcohol, alcohol, and trifluoroacetic acid (80: 14: 6: 0.5). [NOTE—Increase or decrease the percentage of hexane or alcohol, but keep the percentage of isopropyl alcohol constant. Make other adjustments, if necessary (see *Chromatography* ⟨621⟩, *System Suitability*).]

Standard solution: 0.1 mg/mL of USP Racemic Tiagabine Hydrochloride Mixture RS prepared as follows. Transfer a suitable quantity of USP Racemic Tiagabine Hydrochloride Mixture RS into a suitable volumetric flask, dissolve in a few drops of methanol, and dilute with isopropyl alcohol to volume.

Sample solution: 2 mg/mL of Tiagabine Hydrochloride prepared as follows. Transfer a suitable quantity of Tiagabine Hydrochloride in a suitable volumetric flask, dissolve in a few drops of methanol, and dilute with isopropyl alcohol to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 25-cm; ${}^{\blacktriangle}$10-µm${}^{\blacktriangle}_{\text{(USP 1-Aug-2019)}}$ packing L40

Flow rate: 0.8 mL/min

Injection volume: 10 µL

${}^{\blacktriangle}$Run time: NLT 1.5 times the retention of the (*R*)-(–) isomer${}^{\blacktriangle}_{\text{(USP 1-Aug-2019)}}$

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times of the (*S*)-(+) isomer and the (*R*)-(–) isomer are about 0.76 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the (*S*)-(+) and (*R*)-(–) isomers

Analysis

Sample: *Sample solution*

Calculate the percentage of the (*S*)-(+) isomer in the portion of Tiagabine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of the (*S*)-(+) isomer from the *Sample solution*

r_T = sum of the peak responses of the (*S*)-(+) isomer and (*R*)-(–) isomer from the *Sample solution*

Acceptance criteria: NMT 0.5%

Tiagabine Hydrochloride Compounded Oral Suspension

DEFINITION

Tiagabine Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tiagabine hydrochloride ($C_{20}H_{25}NO_2S_2 \cdot HCl$). Prepare Tiagabine Hydrochloride Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tiagabine Hydrochloride	100 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, *NF*, and Vehicle for Oral Suspension, *NF*, a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder or add *Tiagabine Hydrochloride* powder. Add the *Vehicle* in small portions and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tiagabine hydrochloride suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and 5 mM octanesulfonic acid (50:50). Pass through a suitable filter of 0.45-µm pore size and degas.

Standard stock solution: 1.0 mg/mL of USP Tiagabine Hydrochloride RS in methanol

Standard solution: Transfer 0.2 mL of *Standard stock solution* to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing 20 µg/mL of tiagabine hydrochloride. Centrifuge, and pass through a suitable filter of 0.22-µm pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Centrifuge, and pass through a suitable filter of 0.22-µm pore size. Accurately pipet 0.2 mL of the Oral Suspension to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a nominal concentration of 20 µg/mL of tiagabine hydrochloride.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Flow rate: 0.4 mL/min
Column: 3.0-mm × 15-cm; 5-µm packing L10
Injection volume: 10 µL

System suitability
Sample: *Standard solution*
[NOTE—The retention time of the tiagabine hydrochloride peak is 3.2 min.]
Suitability requirements
Relative standard deviation: NMT 1.7%

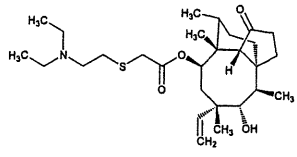
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tiagabine hydrochloride ($C_{20}H_{25}NO_2S_2 \cdot HCl$) in the volume of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

USP Monographs

www.webofpharma.com



C_S = concentration of USP Tiagabine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of tiagabine hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
- **pH** ⟨791⟩: 4.0–4.5

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a refrigerator.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored in a refrigerator; NMT 60 days after the date it was compounded, when stored at controlled room temperature
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Tiagabine Hydrochloride RS

Tiamulin

$C_{28}H_{47}NO_4S$ 493.74

Acetic acid, [[2-(diethylamino)ethyl]thio]-, 6-ethenyldecahydro-5-hydroxy-4,6,9,10-tetramethyl-1-oxo-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl ester [3a*S*-(3aα,4β,5α,6α,8β,9α,9aβ,10*S**)]-;
[[2-(Diethylamino)ethyl]thio]acetic acid 8-ester with (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-octahydro-5,8-dihydroxy-4,6,9,10-tetramethyl-6-vinyl-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one [55297-95-5].

DEFINITION
Tiamulin contains NLT 96.5% and NMT 102.0% of tiamulin ($C_{28}H_{47}NO_4S$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A or 197K.▲ (CN 1-May-2020)

ASSAY
- **PROCEDURE**

Buffer: Dissolve 10.0 g of ammonium carbonate in water, add 22 mL of perchloric acid TS, and dilute with water to 1000 mL. Adjust with ammonium hydroxide to a pH of 10.0.
Mobile phase: Methanol, acetonitrile, and *Buffer* (490:210:300)
Diluent: Acetonitrile and *Buffer* (1:1)
Standard solution: 5.0 mg/mL of USP Tiamulin Fumarate RS in *Diluent*
Sample solution: 4.0 mg/mL of Tiamulin in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 212 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2 between tiamulin and its subsequent peak
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tiamulin ($C_{28}H_{47}NO_4S$) in the portion of Tiamulin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Tiamulin Fumarate RS in the *Standard solution* (mg/mL)
C_U = concentration Tiamulin in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tiamulin, 493.74
M_{r2} = molecular weight of tiamulin fumarate, 609.82

Acceptance criteria: 96.5%–102.0% on the dried basis

IMPURITIES
- **LIMIT OF ALCOHOL AND TOLUENE**

Proceed as directed in *Residual Solvents* ⟨467⟩.
Acceptance criteria
Alcohol: NMT 1.0%
Toluene: NMT 0.08%
Sum of alcohol and toluene: NMT 1.0%
- **ORGANIC IMPURITIES**

Buffer, Mobile phase, Diluent, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.
Toluene solution: Transfer 0.1 mL of toluene to a 100-mL volumetric flask, and dilute with acetonitrile to volume. Transfer 0.1 mL of this solution to another 100-mL volumetric flask, and dilute with *Diluent* to volume.
Diluted sample solution: 0.04 mg/mL of Tiamulin from the *Sample solution* in *Diluent*
Analysis
Samples: *Standard solution, Sample solution, Toluene solution*, and *Diluted sample solution*
Calculate the area percentage of each impurity, relative to tiamulin, in the portion of Tiamulin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual impurity from the *Sample solution*
r_T = peak area of tiamulin from the *Diluted sample solution*

Acceptance criteria: See *Table 1*. Disregard the toluene peak and any peak from the *Sample solution* less than 0.1 times the area of the principal peak from the *Diluted sample solution*.

SPECIFIC TESTS

- **OPTICAL ROTATION** ⟨781S⟩, *Procedures, Specific Rotation*

Sample solution: 5.0 mg/mL in dioxane

Acceptance criteria: +24° to +28°, on the dried basis, measured at 20°

- **pH** ⟨791⟩

Sample solution: 10 mg/mL

Acceptance criteria: 3.1–4.1

- **LOSS ON DRYING** ⟨731⟩

Analysis: Dry under vacuum at 105° for 3 h.

Acceptance criteria: NMT 0.5%

- **CLARITY AND COLOR OF SOLUTION**

Sample: 5 g

Analysis: Transfer the *Sample* to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Acceptance criteria: The solution is clear and colorless, and its absorbances determined in a 1-cm cell at 400 and 650 nm are NMT 0.150 and 0.030 absorbance units, respectively.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Tiamulin Fumarate RS

USP Tiamulin Related Compound A RS

Tosyl pleuromutilin.

Ticarcillin for Injection

DEFINITION

Ticarcillin for Injection contains an amount of Ticarcillin Disodium equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$).

ASSAY

- **PROCEDURE**

Buffer A: 13.8 g/L of monobasic sodium phosphate in water adjusted with phosphoric acid or 10 N sodium hydroxide to a pH of 4.3 ± 0.1 before final dilution

Buffer B: 6.9 g/L of monobasic sodium phosphate adjusted with 10 N sodium hydroxide to a pH of 6.4 ± 0.1 before final dilution

Mobile phase: Acetonitrile and *Buffer A* (5:95)

System suitability stock solution: 0.15 mg/mL of clavulanic acid from USP Clavulanate Lithium RS in *Buffer B*

System suitability solution: 30 µg/mL of clavulanic acid from *System suitability stock solution* and 1 mg/mL of USP Ticarcillin Monosodium Monohydrate RS in *Buffer B*. Use this solution on the day prepared.

Standard solution: 1 mg/mL of USP Ticarcillin Monosodium Monohydrate RS in *Buffer B*

Sample solution 1 (where the article is represented as being in a single-dose container): Nominally 0.9 mg/mL of ticarcillin prepared as follows. Constitute Ticarcillin for Injection as directed in the labeling. Withdraw all of the withdrawable contents, and dilute with *Buffer B*.

Sample solution 2 (where the label states the quantity of ticarcillin in a given volume of constituted solution): Nominally 0.9 mg/mL of ticarcillin prepared as follows. Constitute Ticarcillin for Injection as directed in the labeling. Dilute a suitable aliquot of the constituted solution with *Buffer B*.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4-mm × 30-cm; 3- to 10-µm packing L1

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clavulanic acid and ticarcillin are 0.2 and 1.0, respectively.]

USP Monographs

www.webofpharma.com

Suitability requirements
Resolution: NLT 5.0 between clavulanic acid and ticarcillin, *System suitability solution*
Column efficiency: NLT 1000 theoretical plates, *Standard solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution 1* or *Sample solution 2*
Calculate the percentage of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$) in the portion of Ticarcillin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of ticarcillin from *Sample solution 1* or *Sample solution 2*
r_S = peak response of ticarcillin from the *Standard solution*
C_S = concentration of USP Ticarcillin Monosodium Monohydrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ticarcillin in *Sample solution 1* or *Sample solution 2* (mg/mL)
P = potency of ticarcillin in USP Ticarcillin Monosodium Monohydrate RS (µg/mg)
F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS

Ticarcillin and Clavulanic Acid Injection

DEFINITION
Ticarcillin and Clavulanic Acid Injection is a sterile isoosmotic solution of Ticarcillin Monosodium and Clavulanate Potassium in Water for Injection. It contains one or more suitable buffering agents and a tonicity-adjusting agent. It contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$) and the equivalent of NLT 85.0% and NMT 120.0% of the labeled amount of clavulanic acid ($C_8H_9NO_5$).

IDENTIFICATION
• **A.** The retention time of the major peak for ticarcillin of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY
• **Procedure**
Buffer A: 13.8 g/L of monobasic sodium phosphate in water adjusted with phosphoric acid or 10 N sodium hydroxide to a pH of 4.3 ± 0.1 before final dilution
Buffer B: 6.9 g/L of monobasic sodium phosphate in water adjusted with 10 N sodium hydroxide to a pH of 6.4 ± 0.1 before final dilution
Mobile phase: Acetonitrile and *Buffer A* (5:95)

www.webofpharma.com

Standard stock solution: 0.6 mg/mL of USP Clavulanate Lithium RS in *Buffer B*
Standard solution: Transfer 100 mg of USP Ticarcillin Monosodium Monohydrate RS to a 100-mL volumetric flask. Add 150/*J* mL of *Standard stock solution*. Dilute with *Buffer B* to volume.

$$J = L_1/L_2$$

L_1 = labeled amount of ticarcillin (mg)
L_2 = labeled amount of clavulanic acid (mg)

Sample solution: Nominally 0.9 mg/mL of ticarcillin in *Buffer B* prepared as follows. Allow a container of Injection to thaw, and mix the solution. Dilute a suitable aliquot of Injection with *Buffer B*, stepwise if necessary.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4-mm × 30-cm; 3- to 10-µm packing L1
Flow rate: 2 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for clavulanic acid and ticarcillin are 0.2 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 5.0 between ticarcillin and clavulanic acid
Column efficiency: NLT 1000 theoretical plates for ticarcillin and clavulanic acid
Tailing factor: NMT 2.0 for ticarcillin and clavulanic acid
Relative standard deviation: NMT 2.0% for ticarcillin and clavulanic acid
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of ticarcillin from the *Sample solution*
r_S = peak response of ticarcillin from the *Standard solution*
C_S = concentration of USP Ticarcillin Monosodium Monohydrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ticarcillin in the *Sample solution* (mg/mL)
P = potency of ticarcillin in USP Ticarcillin Monosodium Monohydrate RS (µg/mg)
F = conversion factor, 0.001 mg/µg

Calculate the percentage of the labeled amount of clavulanic acid ($C_8H_9NO_5$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of clavulanic acid from the *Sample solution*
r_S = peak response of clavulanic acid from the *Standard solution*
C_S = concentration of USP Clavulanate Lithium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of clavulanic acid in the *Sample solution* (mg/mL)
P = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

Acceptance criteria: 90.0%–115.0% of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$) and 85.0%–120.0% of the labeled amount of clavulanic acid ($C_8H_9NO_5$)

PERFORMANCE TESTS
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meets the requirements

SPECIFIC TESTS
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: It contains NMT 0.07 USP Endotoxin Unit/mg of ticarcillin.
- **STERILITY TESTS** ⟨71⟩: It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **PH** ⟨791⟩: 5.5–7.5
- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements in *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging*. Maintain in the frozen state.
- **LABELING:** It meets the requirements in *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*. The label states that it is to be thawed just before use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

Ticarcillin and Clavulanic Acid for Injection

DEFINITION
Ticarcillin and Clavulanic Acid for Injection is a sterile, dry mixture of Ticarcillin Disodium and Clavulanate Potassium. It contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of ticarcillin ($C_{15}H_{16}N_2O_6S_2$) and the equivalent of NLT 85.0% and NMT 120.0% of the labeled amount of clavulanic acid ($C_8H_9NO_5$). The labeled amounts represent proportions of ticarcillin to clavulanic acid of 15:1 or 30:1.

IDENTIFICATION
A. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
Buffer A: 13.8 g/L of monobasic sodium phosphate in water adjusted with phosphoric acid or 10 N sodium hydroxide to a pH of 4.3 ± 0.1 before final dilution
Buffer B: 6.9 g/L of monobasic sodium phosphate in water adjusted with 10 N sodium hydroxide to a pH of 6.4 ± 0.1 before final dilution
Mobile phase: Acetonitrile and *Buffer A* (5:95)
Standard stock solution: 0.6 mg/mL of USP Clavulanate Lithium RS in *Buffer B*
Standard solution: Transfer 100 mg of USP Ticarcillin Monosodium Monohydrate RS to a 100-mL volumetric

USP Monographs

www.webofpharma.com

flask. Add 150/*J* mL of *Standard stock solution*. Dilute with *Buffer B* to volume.

$$J = L_1/L_2$$

L_1 = labeled amount of ticarcillin (mg)
L_2 = labeled amount of clavulanic acid (mg)

Sample solution: Nominally 0.9 mg/mL of ticarcillin prepared as follows. Dissolve the contents of one container of Ticarcillin and Clavulanic Acid for Injection in a volume of water corresponding to the volume of solvent specified in the labeling. Using a suitable hypodermic needle and syringe, withdraw all of the withdrawable contents from the container, and dilute stepwise with *Buffer B*.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4-mm × 30-cm; 3- to 10-µm packing L1
Flow rate: 2 mL/min
Injection volume: 20 µL

System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for clavulanic acid and ticarcillin are 0.2 and 1.0, respectively.]

Acceptance criteria: 2.5–4.0

- **WATER DETERMINATION,** *Method I* ⟨921⟩**:** 4.0%–6.0%
- **STERILITY TESTS** ⟨71⟩**:** Where the label states that Ticarcillin Monosodium is sterile, it meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration.*
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** Where the label states that Ticarcillin Monosodium is sterile, or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.05 USP Endotoxin Units/mg of ticarcillin.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers and store in a refrigerator.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Ticarcillin Monosodium Monohydrate RS

Ticlopidine Hydrochloride

$C_{14}H_{14}ClNS \cdot HCl$ 300.25

Thieno[3,2-*c*]pyridine, 5-[(2-chlorophenyl)methyl]-4,5,6,7-tetrahydro-, hydrochloride;

5-(*o*-Chlorobenzyl)-4,5,6,7-tetrahydrothieno-[3,2-*c*]pyridine hydrochloride [53885-35-1].

DEFINITION

Ticlopidine Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{14}H_{14}ClNS \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A.** ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M**▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩**:** Meets the requirements

ASSAY

- **PROCEDURE**

Buffer: 1.1 g of monobasic sodium phosphate and 0.28 g of dibasic sodium phosphate in 1000 mL of water. The pH of solution is between 6.1 and 6.6. If necessary, adjust to the required pH using phosphoric acid or sodium hydroxide.

Mobile phase: Acetonitrile, methanol, and *Buffer* (6:7:7)

System suitability solution: 0.2 mg/mL of USP Ticlopidine Hydrochloride RS and 0.2 mg/mL of USP Sulconazole Nitrate RS in *Mobile phase*. [NOTE—Sonication may be necessary for complete dissolution.]

Standard solution: 0.4 mg/mL of USP Ticlopidine Hydrochloride RS in *Mobile phase*

Sample solution: 0.4 mg/mL of Ticlopidine Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 10-µm packing L7

Flow rate: 2 mL/min

Column temperature: 40°

Run time: 1.5 times the retention time of the ticlopidine peak

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.6 between ticlopidine hydrochloride and sulconazole nitrate, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{14}H_{14}ClNS \cdot HCl$ in the portion of Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ticlopidine from the *Sample solution*

USP Monographs

www.webofpharma.com

r_S = peak response of ticlopidine from the *Standard solution*
C_S = concentration of ticlopidine in the *Standard solution*
C_U = concentration of ticlopidine in the *Sample solution*

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

INORGANIC IMPURITIES

• **Residue on Ignition** ⟨281⟩: NMT 0.1% on a 1-g sample

ORGANIC IMPURITIES

• **Procedure 1**

Adsorbent: 0.25-mm thickness of silica

Developing solvent: Butanol, water, and glacial acetic acid (4:5:1). Shake well in a separatory funnel, allow it to settle, discard the lower aqueous layer, and use the upper organic layer.

Diluent: Methylene chloride and methanol (1:2)

Iodine–methanol reagent: Iodine TS and methanol (1:1)

Standard solution A: 15 mg/mL of USP Ticlopidine Hydrochloride RS in *Diluent*

Standard solution B: 2.5 mg/mL of each of USP Ticlopidine Related Compound A RS and USP Ticlopidine Related Compound B RS in *Diluent*

Sample solution: 15 mg/mL of Ticlopidine Hydrochloride in *Diluent*

Combined standard solution: Transfer 1.5 mL of *Standard solution B* and 250 µL of the *Sample solution* to a 25-mL volumetric flask and dilute to volume with *Diluent*.

Application size: 2, 5, and 10 µL of the *Combined standard solution* and 20 µL of the *Sample solution*

Analysis

Samples: *Sample solution* and *Combined standard solution*

Develop the plate to a distance of at least 15 cm from the origin, and remove the plate and air dry for at least 1 h. Analyze visually under UV light. Estimate the amounts of ticlopidine related compound A and ticlopidine related compound B. Spray the plate with the *Iodine–methanol reagent*, and estimate any other impurities by comparing to the ticlopidine hydrochloride spots in the *Combined standard solution*.

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Retardation Factor (R_f)	Acceptance Criteria, NMT (%)
Ticlopidine hydrochloride	1.00	—
Ticlopidine hydrochloride related compound A[a]	1.26	0.5
Ticlopidine hydrochloride related compound B[b]	1.41	0.5

[a] (4-Oxo-4,5,6,7-tetrahydrothieno-[3,2-*c*]pyridine.
[b] (5-(2-Chlorobenzyl)-4-oxo-4,5,6,7-tetrahydrothieno-[3,2-*c*]pyridine).

• **Procedure 2**

Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of *N*-methyl ticlopidine in the portion of Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of *N*-methyl ticlopidine in the *Sample solution*
r_T = sum of all the peak responses from in the *Sample solution*

Calculate the percentage of any individual impurity in the portion of the Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = peak response of any impurity in the *Sample solution*
r_S = peak response of ticlopidine in the *Standard solution*

Acceptance criteria

Individual impurities: See *Impurity Table 2*.

Total impurities: See *Impurity Table 2*.

Impurity Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Ticlopidine hydrochloride	1	—
N-Methyl ticlopidine[a]	1.18	0.5
Any other individual impurity	—	0.10
Total impurities[b]	—	1.0

[a] 2-[*N*-Methyl-*N*-(2-chlorobenzyl)aminoethyl] thiophene hydrochloride.
[b] Total of *N*-methyl ticlopidine and sum of % individual impurities from *Procedure 1*.

SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩: Dry a 1.0-g sample at 80° for 5 h: it loses NMT 1.0% of its weight.

• **LIMIT OF FORMALDEHYDE**

Mobile phase: Acetonitrile, water, and hydrochloric acid (3: 2: 0.004)

2,4 Dintirophenyl hydrazine solution: 1.65 mg/mL of 2,4-dinitrophenylhydrazine in acetonitrile

Standard stock solution: Transfer a known amount of formaldehyde solution, equivalent to 37 mg of formaldehyde, into a 100-mL volumetric flask. Dilute with methanol to volume.

Standard solution: Dilute the *Standard stock solution* with methanol to prepare a 1.85-µg/mL solution.

Sample solution: 0.50 g of Ticlopidine Hydrochloride in 10 mL methanol (sonication may be necessary for complete dissolution)

Derivatized standard and **sample solutions:** Transfer 2.0 mL of *2,4-Dinitrophenyl hydrazine solution* to five different 10-mL volumetric flasks: 50 µL of 2 N hydrochloric acid and 150, 250, and 500 µL of the *Standard solution* to the first three flasks; 500 µL of the *Sample solution* to the fourth; and 500 µL of methanol to the fifth flask. Mix each solution well and allow the solutions to react for at least 30 min at ambient temperature. Dilute each flask with *Mobile phase* to volume and mix well. The solutions should be analyzed within 4 h.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 365 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

www.webofpharma.com

System suitability
Sample: *Derivatized standard solution* prepared from 500 µL
Suitability requirements
Relative standard deviation: NMT 10.0%
Analysis
Samples: *Derivatized standard solutions* and *Derivatized sample solution*
[NOTE—The approximate retention time for 2,4 dinitrophenylhydrazine is about 3.5 min and for the formaldehyde and 2,4 dinitrophenylhydrazine derivative is about 3.8 min.]
Calculate the formaldehyde concentration in ppm in the *Derivatized sample solution* as the concentration in the Ticlopidine Hydrochloride taken:

$$\text{Result} = (C \times D)/W$$

C = concentration of formaldehyde from the calibration curve generated from the peak areas of the derivatized methanol and the three *Derivatized standard solutions* (µg/mL)
D = dilution factor, 200
W = sample weight (g)

Acceptance criteria
Formaldehyde: NMT 20 ppm

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature below 30°.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Sulconazole Nitrate RS
USP Ticlopidine Hydrochloride RS
USP Ticlopidine Hydrochloride Related Compound A RS
4-Oxo-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine.
USP Ticlopidine Hydrochloride Related Compound B RS
5-(2-Chlorobenzyl)-4-oxo-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine.

Ticlopidine Hydrochloride Tablets

DEFINITION
Ticlopidine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ticlopidine hydrochloride $C_{14}H_{14}ClNS \cdot HCl$.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U.**▲ (CN 1-May-2020) Place a portion of powdered Tablets, equivalent to 100 mg of ticlopidine hydrochloride, in a suitable flask. Add 1 mL of water, and allow to stand for 15 min with occasional shaking. Add about 60 mL of *Mobile phase*, sonicate for 15 min, and shake by mechanical means for an additional 15 min. Dilute with *Mobile phaseMobile phase* to prepare 0.1 mg/mL of ticlopidine hydrochloride.
Acceptance criteria: The UV absorption spectra of the solution exhibits maxima at the same wavelength (232 nm) as that of a similar solution prepared from USP Ticlopidine Hydrochloride RS, concomitantly measured.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
Buffer: 3.55 g/L of dibasic sodium phosphate
Mobile phase: Acetonitrile and *Buffer* (3:2). Adjust with phosphoric acid to a pH of 7.0 ± 0.1.
Standard solution: 0.1 mg/mL of USP Ticlopidine Hydrochloride RS in *Mobile phase*
Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to about 250 mg of ticlopidine hydrochloride to a 250-mL volumetric flask, add 150 mL of *Mobile phase*, sonicate for about 5 min, and shake mechanically for 10 additional min. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 0.45-µm filter, and use the filtrate after discarding the first few mL. Transfer 5 mL of the filtrate into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 228 nm
Column: 3.9-mm × 30-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 15 µL
Run time: Twice the retention time of the ticlopidine peak
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{14}ClNS \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ticlopidine from the *Sample solution*
r_S = peak response of ticlopidine from the *Standard solution*
C_S = concentration of USP Ticlopidine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ticlopidine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION**
Medium: Water; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: 0.278 mg/mL of USP Ticlopidine Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Detection: UV 232 nm
Path length: 0.1 cm
Blank: *Medium*
Calculate the percentage of $C_{14}H_{14}ClNS \cdot HCl$ dissolved:

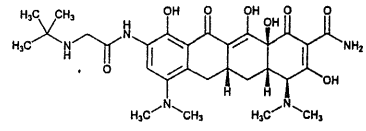
$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = Tablet label claim (mg)

www.webofpharma.com

V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of $C_{14}H_{14}ClNS \cdot HCl$ is dissolved.



• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers and stored at controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Ticlopidine Hydrochloride RS

Tigecycline

$C_{29}H_{39}N_5O_8$ 585.65

2-Naphthacenecarboxamide, 4,7-bis(dimethylamino)-9-[[[(1,1-dimethylethyl)amino]acetyl]amino]-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-, (4*S*,4a*S*,5a*R*,12a*S*)-;
(4*S*,4a*S*,5a*R*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-2-naphthacenecarboxamide [220620-09-7].

DEFINITION

Tigecycline contains NLT 97.0% and NMT 102.0% of tigecycline ($C_{29}H_{39}N_5O_8$), calculated on the anhydrous and solvent-free basis.

[NOTE—Handle Standards and samples under moisture-controlled conditions to prevent degradation in quantitative applications where degradation could impact results.]

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Protect solutions containing tigecycline from light using low-actinic glassware. Store these solutions at 10° immediately after preparation and during analysis.

Buffer: 4.35 g/L of dibasic potassium phosphate and 0.93 g/L of edetate disodium, adjusted with phosphoric acid to a pH of 6.2

Mobile phase: Acetonitrile and *Buffer* (140:860)

Diluent: 4.35 g/L of dibasic potassium phosphate and 0.5 g/L of sodium bisulfite, adjusted with 1 N potassium hydroxide to a pH of 8.0

System suitability stock solution: Dissolve 10 mg of USP Tigecycline RS in 10.0 mL of water. Add 1 or 2 drops of trifluoroacetic acid, heat at about 65° for 15 min, and cool.

System suitability solution: Dilute 5.0 mL of the *System suitability stock solution* with water to 50.0 mL.

Standard solution: 0.1 mg/mL of USP Tigecycline RS in *Diluent*

Sample solution: 0.1 mg/mL of Tigecycline in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 248 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Temperatures

Column: 30°

Autosampler: 10°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for the tigecycline epimer and tigecycline are about 0.67 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the tigecycline epimer and tigecycline, *System suitability solution*

Tailing factor: 0.7–1.5, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tigecycline ($C_{29}H_{39}N_5O_8$) in the portion of Tigecycline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tigecycline RS in the *Standard solution* (mg/mL)

C_U = concentration of Tigecycline in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%

• **ORGANIC IMPURITIES**

Protect solutions containing tigecycline from light using low-actinic glassware. Store these solutions at 10° immediately after preparation and during analysis.

Solution A: Dissolve 4.35 g of dibasic potassium phosphate and 0.93 g of edetate disodium in 950 mL of water. Adjust with phosphoric acid to a pH of 6.4 ± 0.05, and add 50 mL of acetonitrile.

Solution B: Dissolve 4.35 g of dibasic potassium phosphate and 0.93 g of edetate disodium in 500 mL of water. Adjust with phosphoric acid to a pH of 6.4 ± 0.05, and add 500 mL of acetonitrile.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
40	57	43
55	0	100
58	0	100
59	85	15

www.webofpharma.com

Table 1 *(continued)*

Time (min)	Solution A (%)	Solution B (%)
66	85	15

Diluent: 4.35 g/L of dibasic potassium phosphate and 0.5 g/L of sodium bisulfite, adjusted with 1 N potassium hydroxide to a pH of 8.0

System suitability solution: 0.5 mg/mL of USP Tigecycline RS and 2.4 µg/mL of USP Tigecycline Related Compound B RS in *Diluent*

Standard solution: 0.005 mg/mL of USP Tigecycline RS in *Diluent*

Sensitivity solution: 0.25 µg/mL of USP Tigecycline RS in *Diluent*

Sample solution: 0.5 mg/mL of Tigecycline in *Diluent*

Chromatographic system

$C_{23}H_{28}N_4O_7 \cdot HCl$ 508.95

Tigecycline for Injection

DEFINITION

Tigecycline for Injection contains NLT 96.0% and NMT 116.0% of the labeled amount of tigecycline ($C_{29}H_{39}N_5O_8$). It may contain suitable stabilizers and buffers.
[NOTE—Handle standards and samples under moisture-controlled conditions to prevent degradation in quantitative applications where degradation could impact results.]

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**
Protect solutions containing tigecycline from light using low-actinic glassware. Store these solutions at 10° immediately after preparation and during analysis.
Buffer: 4.35 g/L of dibasic potassium phosphate and 0.93 g/L of edetate disodium, adjusted with phosphoric acid to a pH of 6.2
Mobile phase: Acetonitrile and *Buffer* (140:860)
Diluent: 4.35 g/L of dibasic potassium phosphate and 0.5 g/L of sodium bisulfite, adjusted with 1 N potassium hydroxide to a pH of 8.0
System suitability stock solution: Dissolve 10 mg of USP Tigecycline RS in 10.0 mL of water. Add 1 or 2 drops of trifluoroacetic acid, heat at about 65° for 15 min, and cool.
System suitability solution: Dilute 5.0 mL of the *System suitability stock solution* with water to 50.0 mL.
Standard solution: 0.1 mg/mL of USP Tigecycline RS in *Diluent*
Sample solution: Nominally 0.1 mg/mL of tigecycline from Tigecycline for Injection in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 248 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Temperatures
Column: 30°
Autosampler: 10°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for the tigecycline epimer and tigecycline are about 0.67 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 3.0 between the tigecycline epimer and tigecycline, *System suitability solution*
Tailing factor: 0.7–1.5, *Standard solution*
Relative standard deviation: NMT 1.1%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tigecycline ($C_{29}H_{39}N_5O_8$) in the portion of Tigecycline for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tigecycline RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tigecycline in the *Sample solution* (mg/mL)

Acceptance criteria: 96.0%–116.0%

PERFORMANCE TESTS

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meets the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Protect solutions containing tigecycline from light using low-actinic glassware. Store these solutions at 10° immediately after preparation and during analysis.
Solution A: Dissolve 4.35 g of dibasic potassium phosphate and 0.93 g of edetate disodium in 950 mL of water. Adjust with phosphoric acid to a pH of 6.4 ± 0.05, and add 50 mL of acetonitrile.
Solution B: Dissolve 4.35 g of dibasic potassium phosphate and 0.93 g of edetate disodium in 500 mL of water. Adjust with phosphoric acid to a pH of 6.4 ± 0.05, and add 500 mL of acetonitrile.
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
40	57	43
55	0	100
58	0	100
59	85	15
66	85	15

Diluent: 4.35 g/L of dibasic potassium phosphate and 0.5 g/L of sodium bisulfite, adjusted with 1 N potassium hydroxide to a pH of 8.0
System suitability solution: 0.5 mg/mL of USP Tigecycline RS and 2.4 µg/mL of USP Tigecycline Related Compound B RS in *Diluent*
Standard solution: 0.005 mg/mL of USP Tigecycline RS in *Diluent*
Sensitivity solution: 0.25 µg/mL of USP Tigecycline RS in *Diluent*
Sample solution: Nominally 0.5 mg/mL of tigecycline in *Diluent* from the combined contents of NLT 5 vials
Chromatographic system

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tigecycline for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

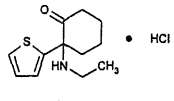
r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of tigecycline from the *Standard solution*
C_S = concentration of USP Tigecycline RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tigecycline in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tigecycline open ring[a, b]	0.36	0.15
Tigecycline 12-oxo-11-hydroxy[c]	0.55	0.5
Tigecycline related compound B[d]	0.64	0.7
Tigecycline epimer[e]	0.74	2.0
Tigecycline	1.0	—
Tigecycline quinone analog[f]	1.3	0.3
Minocycline[g]	1.6	—
Tigecycline tricyclic analog[h]	1.7	0.5
Any individual unspecified degradation product	—	0.2
Total degradation products	—	6.0

[a] To be reported if there is a peak with maximum absorbance at either 390 or 640 nm. The impurity is quantitated at 248 nm. The system may resolve two peaks. The limit is for the sum of the two peaks.
[b] (3*S*,4*R*)-7-[2-(*tert*-Butylamino)acetamido]-3-[4-carbamoyl-2-(dimethylamino)-3,5,6-trihydroxybenzyl]-5-(dimethylimino)-1,4,8-trihydroxy-3,4,5,8-tetrahydronaphthalene-2-carboxylate.
[c] (4*S*,4a*S*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)-3,10,11,12a-tetrahydroxy-1,12-dioxo-1,4,4a,5,12,12a-hexahydro-2-naphthacenecarboxamide.
[d] (4*S*,4a*S*,5a*R*,12a*S*)-9-Amino-4,7-bis(dimethylamino)-3,10,12,12a-tetrahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride.
[e] (4*R*,4a*S*,5a*R*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-2-naphthacenecarboxamide.
[f] (*S*)-4-({6-[2-(*tert*-Butylamino)acetamido]-8-(dimethylamino)-5-hydroxy-4-oxo-1,2,3,4-tetrahydronaphthalen-2-yl}methyl)-2,5-dihydroxy-3,6-dioxocyclohexa-1,4-dienecarboxamide.
[g] Process impurities are controlled in the drug substance and are not to be reported here. They are not included in total impurities.
[h] (1*S*,4a*R*,4b*R*,10a*R*,11a*S*)-7-[2-(*tert*-Butylamino)acetamido]-9-(dimethylamino)-1,4,4a,6-tetrahydroxy-2,5,12-trioxo-1,2,4a,5,10,10a,11,11a-octahydro-1,4b-methanobenzo[*b*]fluorene-3-carboxamide.



SPECIFIC TESTS

- **pH** ⟨791⟩
  Sample solution: Use the solution constituted as directed in the labeling.
  Acceptance criteria: 4.5–5.5
- **Particulate Matter in Injections** ⟨788⟩
  Sample solution: Use the solution constituted as directed in the labeling.
  Acceptance criteria: Meets the requirements
- **Bacterial Endotoxins Test** ⟨85⟩**:** NMT 1.75 USP Endotoxin Units/mg
- **Sterility Tests** ⟨71⟩**:** Meets the requirements
- **Other Requirements:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution*. Store at controlled room temperature.
- **USP Reference Standards** ⟨11⟩
  USP Tigecycline RS
  USP Tigecycline Related Compound B RS
  (4*S*,4a*S*,5a*R*,12a*S*)-9-Amino-4,7-bis(dimethylamino)-3,10,12,12a-tetrahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride.
  $C_{23}H_{28}N_4O_7 \cdot HCl$ 508.95

Tiletamine Hydrochloride

$C_{12}H_{17}NOS \cdot HCl$ 259.80
Cyclohexanone, 2-(ethylamino)-2-(2-thienyl)-.

USP Monographs

www.webofpharma.com

2-(Ethylamino)-2-(2-thienyl)cyclohexanone hydrochloride [14176-50-2].

» Tiletamine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{12}H_{17}NOS \cdot HCl$.

Packaging and storage—Preserve in tight containers.
Labeling—Label it to indicate that it is for veterinary use only. Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
USP Reference standards ⟨11⟩—
USP Tiletamine Hydrochloride RS
Clarity of solution—Dissolve 1.0 g of it in 10 mL of water: the solution is clear.

Change to read:

Identification—
A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).
B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: ▲0.03▲ (ERR 1-Jun-2019) mg per mL.
Medium: 0.1 N hydrochloric acid.
Absorptivities at 234 nm do not differ by more than 3.0%.
C: It meets the requirements of the tests for *Chloride* ⟨191⟩.
Melting range ⟨741⟩: between 190° and 195°, within a 2° range.
Bacterial Endotoxins Test ⟨85⟩ —Where the label states that Tiletamine Hydrochloride is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains not more than 0.07 USP Endotoxin Unit per mg of tiletamine.
Sterility Tests ⟨71⟩ —Where the label states that Tiletamine Hydrochloride is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*
pH ⟨791⟩: between 3.0 and 5.0, in a solution (1 in 10).
Water Determination, *Method I* ⟨921⟩: not more than 1.0%.
Residue on ignition ⟨281⟩: not more than 0.5%.
Chromatographic purity—Prepare a test solution of Tiletamine Hydrochloride in methanol containing 50.0 mg per mL. Prepare a Standard solution in methanol containing 1.0 mg of USP Tiletamine Hydrochloride RS per mL. Prepare a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture as follows. Prewash the plate by developing it in a mixture of methanol and ether (8:2) to the top of the plate, and allow the plate to dry. Separately apply 5 µL of the test solution and the Standard solution to the plate, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, allow the plate to air-dry, and examine under short- and long-wavelength UV light: no individual secondary spot observed in the chromatogram obtained from the test solution is greater in size or intensity than the principal spot observed in the chromatogram obtained from the Standard solution, corresponding to 2%, and the total of any such spots observed does not exceed 3%.
Chloride content—Transfer about 250 mg of it, accurately weighed, to a conical flask, add 5 mL of water, 5 mL of glacial acetic acid, and 50 mL of methanol, and swirl to dissolve. Add 1 drop of eosin Y TS, and titrate with 0.1 N silver nitrate VS to the endpoint when the granular precipitate first turns to a permanent pink color. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride: between 13.24% and 14.06% is found.
Assay—Transfer about 300 mg of Tiletamine Hydrochloride, accurately weighed, to a conical flask, add 70 mL of glacial acetic acid and 10 mL of mercuric acetate TS, and swirl to dissolve. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 25.98 mg of $C_{12}H_{17}NOS \cdot HCl$.

Tiletamine and Zolazepam for Injection

» Tiletamine and Zolazepam for Injection is a sterile dry mixture of Tiletamine Hydrochloride and Zolazepam Hydrochloride. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of tiletamine ($C_{12}H_{17}NOS$) and zolazepam ($C_{15}H_{15}FN_4O$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution.*
Labeling—Label it to indicate that it is for veterinary use only.
USP Reference standards ⟨11⟩—
USP Tiletamine Hydrochloride RS
USP Zolazepam Hydrochloride RS
Identification—Constitute a container of Tiletamine and Zolazepam for Injection with a volume of water sufficient to yield a test solution containing the equivalent of about 10 mg of tiletamine and 10 mg of zolazepam per mL. Prepare two Standard solutions containing in each mL 10 mg of USP Tiletamine Hydrochloride RS and 10 mg of USP Zolazepam Hydrochloride RS, respectively. Separately apply 2 µL of the test solution and the Standard solutions to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow the spots to dry. Place the plate in a saturated chamber containing ethyl acetate as the solvent system and lined with filter paper. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, allow the plate to air-dry, and examine under short-wavelength UV light: the R_F values of the principal spots obtained from the test solution correspond to those obtained from the Standard solutions.
Bacterial Endotoxins Test ⟨85⟩—It contains not more than 0.07 USP Endotoxin Unit per mg of combined tiletamine and zolazepam equivalents.
Sterility Tests ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*
pH ⟨791⟩: between 2.0 and 3.5, when constituted as directed in the labeling.
Water Determination, *Method I* ⟨921⟩: not more than 20 mg in a container containing the equivalent of 250 mg of tiletamine and 250 mg of zolazepam.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩ and for *Uniformity of Dosage Units* ⟨905⟩.

www.webofpharma.com

Assay—

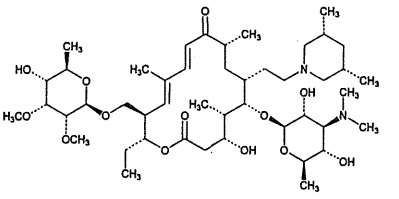
Internal standard solution—Prepare a solution of tetraphenylethylene in chloroform containing 10 mg per mL.

Standard preparation—Transfer accurately weighed quantities of about 116 mg of USP Tiletamine Hydrochloride RS and 113 mg of USP Zolazepam Hydrochloride RS to a 250-mL flask, add 2 mL of water, and swirl to dissolve. Add 30 mL of *Alkaline borate buffer, pH 10.0* (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and swirl. Add 5.0 mL of *Internal standard solution* and 95.0 mL of chloroform, and shake by mechanical means for 30 minutes. Allow the phases to separate, and use the chloroform layer as the *Standard preparation.*

Assay preparation—Constitute a container of Tiletamine and Zolazepam for Injection with the volume of water specified in the labeling. Transfer an accurately measured volume of the resultant solution, equivalent to about 100 mg of tiletamine and 100 mg of zolazepam, to a 250-mL flask. Add 30.0 mL of *Alkaline borate buffer, pH 10.0* (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and swirl. Add 5.0 mL of *Internal standard solution* and 95.0 mL of chloroform, and shake by mechanical means for 30 minutes. Allow the phases to separate, and use the chloroform layer as the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.24-m column that contains 3% phase G2 on 100- to 120-mesh support S1AB. Helium is used as the carrier gas flowing at a rate of about 40 mL per minute. The column temperature is maintained at about 150° for 0.5 minute after injection and is programmed to rise to 230° at a rate of 10° per minute. The injector port is maintained at 160° and the detector at 250°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.4 for tiletamine, 0.8 for zolazepam, and 1.0 for tetraphenylethylene.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of tiletamine ($C_{12}H_{17}NOS$) in each mL of the constituted solution taken by the formula:



$$(223.33/259.79)(W/V)(R_U/R_S)$$

in which 223.33 and 259.79 are the molecular weights of tiletamine base and tiletamine hydrochloride, respectively; W is the weight, in mg, of USP Tiletamine Hydrochloride RS taken to prepare the *Standard preparation;* V is the volume, in mL, of the constituted solution taken to prepare the *Assay preparation;* and R_U and R_S are the peak area response ratios of the tiletamine peak to the tetraphenylethylene peak obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the quantity, in mg, of zolazepam ($C_{15}H_{15}FN_4O$) in each mL of the constituted solution taken by the formula:

$$(286.31/322.77)(W/V)(R_U/R_S)$$

in which 286.31 and 322.77 are the molecular weights of zolazepam base and zolazepam hydrochloride, respectively; W is the weight, in mg, of USP Zolazepam Hydrochloride RS taken to prepare the *Standard preparation;* V is the volume, in mL, of the constituted solution taken to prepare the *Assay preparation;* and R_U and R_S are the peak area response ratios of the zolazepam peak to the tetraphenylethylene peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Tilmicosin

$C_{46}H_{80}N_2O_{13}$ 869.13

Tylosin, 4^A-*O*-de(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-20-deoxo-20-(3,5-dimethyl-1-piperidinyl)-, 20(*cis*)-.

4^A-*O*-de(2,6-Dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-20-deoxo-20-(*cis*-3,5-dimethylpiperidino)-tylosin [108050-54-0].

» Tilmicosin contains not less than 85.0 percent of $C_{46}H_{80}N_2O_{13}$, calculated on the anhydrous basis. The content of tilmicosin *cis*-isomers is between 82.0 percent and 88.0 percent, and the content of tilmicosin *trans*-isomers is between 12.0 percent and 18.0 percent of total $C_{46}H_{80}N_2O_{13}$. [**CAUTION**—Tilmicosin is irritating to the eyes and may cause allergic reaction. Avoid contact.]

Packaging and storage—Preserve in well-closed, light-resistant containers. Avoid excessive heat.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—

USP Tilmicosin RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits peaks for the tilmicosin *trans*-isomer and the tilmicosin *cis*-isomer, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay.*

Water Determination, *Method I* ⟨921⟩: not more than 5.0%, 20 mL of a mixture of methanol and pyridine (4:1) containing 10% of imidazole being used in place of methanol in the titration vessel.

Related compounds—

Dibutylammonium phosphate buffer and *Diluent*—Prepare as directed in the *Assay.*

Solution A—To 700 mL of water add 25 mL of *Dibutylammonium phosphate buffer,* dilute quantitatively with water to 1 L, and mix. Degas before use.

Solution B—Use degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Tilmicosin RS in acetonitrile to obtain a solution having a known concentration of about 0.25 mg per mL, sonicating if necessary to dissolve. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

www.webofpharma.com

Test solution—Transfer about 200 mg of Tilmicosin, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile, and sonicate briefly to dissolve. Dilute with *Diluent* to volume, and mix. [NOTE—Use this solution within 24 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1 and is programmed for gradient elution by delivering a mixture of *Solution A* and *Solution B* in a ratio of 82:18 initially, and by continuously varying the mixture linearly over a period of 30 minutes until the final ratio is 60:40. The flow rate is about 1.1 mL per minute. Chromatograph the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.9 for the tilmicosin *trans*-isomers (two incompletely resolved peaks), 1.0 for the tilmicosin *cis*-isomer, and 1.1 for the tilmicosin *cis*-8-epimer.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage of each related compound in the portion of Tilmicosin taken by the formula:

$$5(CP/W)(r_c/r_s)$$

in which C is the concentration, in mg per mL, of USP Tilmicosin RS in the *Standard solution; P* is the designated potency, in µg per mg, of tilmicosin in the USP Tilmicosin RS; *W* is the weight, in mg, of Tilmicosin taken to prepare the *Test solution;* r_c is the area response of the individual related compound peak, other than those obtained for tilmicosin *trans*-isomers, tilmicosin *cis*-isomer, and tilmicosin *cis*-8-epimer; and r_s is the sum of the peak area responses for the tilmicosin *trans*-isomers, the tilmicosin *cis*-isomer, and the tilmicosin *cis*-8-epimer obtained from the *Standard solution.* Not more than 3% of any individual related compound, calculated on the anhydrous basis, is found, and the sum of all the related compounds is not more than 10%, calculated on the anhydrous basis.

Assay—

Dibutylammonium phosphate buffer—Add, with stirring, 70 mL of dilute phosphoric acid (1 in 10) to 16.8 mL of dibutylamine. Allow to cool, and adjust with phosphoric acid to a pH of 2.5 ± 0.1. Dilute with water to 100 mL, and mix.

Mobile phase—To 700 mL of water, add 115 mL of acetonitrile, 55 mL of tetrahydrofuran, and 25 mL of *Dibutylammonium phosphate buffer.* Dilute with water to 1000 mL, and mix. Each component may be degassed before use, or the *Mobile phase* may be sparged with helium for 2 minutes before use. Store the *Mobile phase* in a sealed container when not in use. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Decreasing the proportion of acetonitrile or tetrahydrofuran increases resolution.]

Diluent—To 900 mL of water, add 5.71 g of phosphoric acid, adjust with 12.5 N sodium hydroxide to a pH of 2.5 ± 0.1, dilute with water to 1000 mL, and mix.

Standard preparation—Transfer about 25 mg of USP Tilmicosin RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile, and sonicate to dissolve. Dilute with *Diluent* to volume, and mix. [NOTE—Use this solution on the day prepared.]

Assay preparation—Transfer about 25 mg of Tilmicosin, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile, and sonicate to dissolve. Dilute with *Diluent* to volume, and mix. [NOTE—Use this solution on the day prepared.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the relative retention times are about 0.8 for the tilmicosin *trans*-isomers and 1.0 for the tilmicosin *cis*-isomers [NOTE—Tilmicosin *cis*-isomer and tilmicosin *cis*-8-epimer co-elute in this chromatographic system] ; the resolution, *R,* between the tilmicosin *trans*-isomers peak and the tilmicosin *cis*-isomers peak is not less than 1.25; the tailing factors for the peaks are not less than 0.7 and not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in µg, of tilmicosin *trans*- and *cis*-isomers in the portion of Tilmicosin taken by the formula:

$$50(CP/W)(r_i/r_s)$$

in which C is the concentration, in mg per mL, of USP Tilmicosin RS in the *Standard preparation; P* is the designated potency, in µg per mg, of the relevant (*trans* or *cis*) tilmicosin isomers in the USP Tilmicosin RS; *W* is the weight, in mg, of Tilmicosin taken to prepare the *Assay preparation;* r_i is the peak area response for the relevant (*trans* or *cis*) tilmicosin isomers obtained from the *Assay preparation;* and r_s is the peak area response for the relevant (*trans* or *cis*) tilmicosin isomers obtained from the *Standard preparation.* Calculate the percentage of tilmicosin ($C_{46}H_{80}N_2O_{13}$) in the portion of Tilmicosin taken by the formula:

$$0.1(trans + cis)$$

in which *trans* and *cis* are the quantities, in µg per mg, of tilmicosin *trans*-isomers and tilmicosin *cis*-isomers in the Tilmicosin, as determined above. Calculate the percentages of tilmicosin *trans*-isomers and tilmicosin *cis*-isomers taken by the formula:

$$100\ isomer/(trans + cis)$$

in which *isomer* is the quantity, in µg per mg, of either the tilmicosin *trans*-isomers or the tilmicosin *cis*-isomers in the Tilmicosin, as determined above.

Tilmicosin Injection

» Tilmicosin Injection is a sterile solution of Tilmicosin in a mixture of Propylene Glycol and Water for Injection, and is solubilized with the aid of Phosphoric Acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tilmicosin ($C_{46}H_{80}N_2O_{13}$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging;* protect from light. Store at or below 30°.

Labeling—Label the Injection to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—
USP Tilmicosin RS

www.webofpharma.com

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits major peaks for the tilmicosin *trans*-isomers and the tilmicosin *cis*-isomers, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mg of tilmicosin.

Sterility Tests ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except that the test mixture is prepared as follows. Transfer aseptically 1 mL from each of 20 containers to a vessel containing 200 mL of a mixture containing 2 mL of polysorbate 20 in *Buffer B.16* (see *Antibiotics—Microbial Assays* ⟨81⟩, *Media and Solutions, Solutions, Buffers*). After that solution has been filtered, wash the filter with three 100-mL portions of the same solution, instead of *Diluting Fluid A*.

pH ⟨791⟩: between 5.5 and 6.5.

Particulate Matter in Injections ⟨788⟩—Use the procedure under *Microscopic Particle Count Test:* not more than 50 particles per mL that are equal to or greater than 10 µm in effective spherical diameter, and not more than 5 particles per mL that are equal to or greater than 25 µm in effective spherical diameter are found.

Content of propylene glycol—

Internal standard solution—Prepare a solution of pentadecane in acetone containing about 0.5 mg per mL.

Standard solution—Transfer about 125 mg of propylene glycol, accurately weighed, to a 100-mL volumetric flask, dilute with acetone to volume, and mix. Mix equal, accurately measured volumes of this solution and the *Internal standard solution*. This solution contains about 0.625 mg of propylene glycol per mL.

Test solution—Transfer an accurately measured volume of Injection, equivalent to about 250 mg of propylene glycol, to a 200-mL volumetric flask, dilute with acetone to volume, and mix. Mix equal, accurately measured volumes of this solution and the *Internal standard solution*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 15-m fused silica column that has liquid phase G16 bonded to the inner surface at a thickness of 1 µm. The injection port and the detector block are maintained at about 250°, and the column is maintained at a temperature of about 100°. Helium is used as the carrier gas at a flow rate of about 15 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.6 for pentadecane and 1.0 for propylene glycol, the resolution, *R*, between the pentadecane peak and the propylene glycol peak is not less than 7.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of propylene glycol in each mL of the Injection taken by the formula:

$$400(C/V)(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of propylene glycol in the *Standard solution*, *V* is the volume, in mL, of Injection taken, and R_U and R_S are the ratios of the propylene glycol peak area response to the pentadecane peak area response obtained from the *Test solution* and the *Standard solution*, respectively. Between 80.0% and 120.0% of the labeled amount of propylene glycol is found.

Assay—

Dibutylammonium phosphate buffer—To 700 mL of water, add 168 mL of dibutylamine. Add phosphoric acid slowly until the dibutylamine is just dissolved, stirring vigorously during the addition. Allow to cool, and adjust with phosphoric acid to a pH of 2.55 ± 0.05. Dilute with water to 1000 mL, mix, and filter under vacuum.

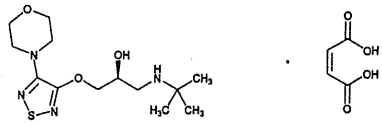
Mobile phase—To 700 mL of water, add 115 mL of acetonitrile, 55 mL of tetrahydrofuran, and 25 mL of *Dibutylammonium phosphate buffer*. Dilute with water to 1000 mL, and mix. Each component may be filtered before mixing, or the *Mobile phase* may be filtered, minimizing solvent evaporation. Store the *Mobile phase* in a sealed container when not in use. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—To 700 mL of water add 200 mL of acetonitrile and 25 mL of *Dibutylammonium phosphate buffer*, dilute with water to 1000 mL, and mix.

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Tilmicosin RS in acetonitrile to obtain a solution having a known concentration of about 2.5 mg per mL. Transfer 4.0 mL of this solution to a 20-mL volumetric flask, add 10 mL of water, and 0.5 mL of *Dibutylammonium phosphate buffer*, dilute with water to volume, and mix.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of tilmicosin, to a 30-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure:* the relative retention times are about 0.8 for the tilmicosin *trans*-isomers and 1.0 for the tilmicosin *cis*-isomers, the resolution, *R*, between the tilmicosin *trans*-isomers peak and the tilmicosin *cis*-isomers peak is not less than 1.25, the tailing factors for the peaks are not less than 0.7 and not more than 2, and the relative standard deviation for replicate injections is not more than 1.5%.



Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of each of the tilmicosin isomers in each mL of the Injection taken by the formula:

$$0.6(CP/V)(r_I/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Tilmicosin RS in the *Standard preparation*, *P* is the potency, in µg per mg, of the relevant (*trans* or *cis*) tilmicosin isomers in the USP Tilmicosin RS, *V* is the volume of Injection taken to prepare the *Assay preparation*, r_I is the peak response of the relevant tilmicosin isomers obtained from the *Assay preparation*, and r_S is the peak area response for the relevant (*trans* or *cis*) tilmicosin isomers obtained from the *Standard preparation*. Calculate the quantity, in mg, of $C_{46}H_{80}N_2O_{13}$ in each mL of the Injection taken by adding the quantities, in mg per mL, of *cis*- and *trans*-isomers found.

Timolol Maleate

$C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$ 432.49

2-Propanol, 1-[(1,1-dimethylethyl)amino]-3- [[4-(4-morpholinyl)-1,2,5-thiadiazol-3-yl]oxy]-, (*S*)-, (*Z*)-2-butenedioate (1:1) (salt);
(–)-1-(*tert*-Butylamino)-3-[(4-morpholino-1,2,5-thiadiazol-3-yl)oxy]-2-propanol maleate (1:1) (salt) [26921-17-5].

DEFINITION

Timolol Maleate contains NLT 98.0% and NMT 102.0% of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$), calculated on the dried basis.

IDENTIFICATION

Timolol Maleate Ophthalmic Solution

» Timolol Maleate Ophthalmic Solution is a sterile, aqueous solution of Timolol Maleate. It contains an amount of $C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$ equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of timolol ($C_{13}H_{24}N_4O_3S$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Timolol Maleate RS

Identification—Dilute a suitable quantity of Ophthalmic Solution with water to obtain a solution having a concentration of about 20 µg of timolol per mL: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar preparation of USP Timolol Maleate RS, concomitantly measured.

Sterility Tests ⟨71⟩ **:** meets the requirements.

pH ⟨791⟩: between 6.5 and 7.5.

Assay—

pH 2.8 phosphate buffer—Dissolve 11.1 g of monobasic sodium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 2.8 ± 0.05, filter, and degas.

Diluent—Prepare a mixture of acetonitrile and *pH 2.8 phosphate buffer* (2:1).

Mobile phase—Prepare a mixture of *pH 2.8 phosphate buffer* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [Note—Minimize the time the Reference Standard, the Ophthalmic Solution, the standard stock solution, the *Standard preparation,* and the *Assay preparation* are exposed to direct light.]

Standard preparation—Transfer about 34 mg of USP Timolol Maleate RS, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 5.0 mL of this stock solution to a 50-mL volumetric flask, add 15 mL of *Diluent*, dilute with water to volume, and mix.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 5 mg of timolol, to a 50-mL volumetric flask, add 15 mL of *Diluent*, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°, and the flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, the column efficiency is not less than 3600 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the quantity, in mg, of timolol ($C_{13}H_{24}N_4O_3S$) in each mL of Ophthalmic Solution taken by the formula:

$$(316.43/432.49)(50C/V)(r_U/r_S)$$

in which 316.43 and 432.49 are the molecular weights of timolol and timolol maleate, respectively, C is the concentration, in mg per mL, of USP Timolol Maleate RS in the *Standard preparation*, V is the volume, in mL, of Ophthalmic Solution taken, and r_U and r_S are the peak area responses of the timolol peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Timolol Maleate Tablets

DEFINITION

Timolol Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

www.webofpharma.com

• **B.** The UV (or UV-Vis) spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: Transfer 0.5 mL of trifluoroacetic acid to a 1-L volumetric flask and dilute with water to volume.

Solution B: Transfer 0.5 mL of trifluoroacetic acid to a 1-L volumetric flask and dilute with acetonitrile to volume.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	84	16
2.4	84	16
8	20	80
8.1	84	16
11	84	16

Buffer: Transfer 11.04 g of monobasic sodium phosphate to a 1-L volumetric flask and dilute with water to volume. Adjust with phosphoric acid to a pH of 2.8 ± 0.05.

Diluent: Methanol and *Buffer* (20:80)

System suitability solution: 0.1 mg/mL of USP Timolol Maleate RS and 10.0 µg/mL of USP Timolol Related Compound D RS in *Diluent* with sonication if necessary

Standard solution: 0.1 mg/mL of USP Timolol Maleate RS in *Diluent* with sonication if necessary

Sample solution: 0.1 mg/mL of timolol maleate from NLT 20 finely ground Tablets (ground with a mortar and pestle) in *Diluent* with sonication if necessary, and filtration with 0.2-µm syringe filters, discarding the first 2 mL

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 295 nm. For *Identification* test *B*, use a diode array detector in the range of 210–400 nm.

Column: 2.1-mm × 10-cm; 2.6-µm packing L1

Flow rate: 0.4 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are listed in *Table 2*.]

Suitability requirements

Resolution: NLT 2.5 between timolol and timolol related compound D, *System suitability solution*

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Timolol Maleate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of timolol maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 1: 100 rpm

Time: 20 min

Standard solution: USP Timolol Maleate RS in *Medium*

Sample solution: Sample per the chapter. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Analysis: Determine the amount of timolol maleate in solution in filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the procedure in the *Assay*.

Tolerances: NLT 80% (*Q*) of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Mobile phase, Buffer, Diluent, and **Chromatographic system:** Proceed as directed in the *Assay*.

System suitability solution: 0.1 mg/mL of USP Timolol Maleate RS and 10 µg/mL of USP Timolol Related Compound D RS in *Diluent* with sonication if necessary

Standard solution: 2.0 µg/mL each of USP Timolol Maleate RS, USP Timolol Related Compound B RS, and USP Timolol Related Compound D RS in *Diluent*

Sample solution: 1.0 mg/mL of timolol maleate from NLT 20 finely ground Tablets (ground with a mortar and pestle) in *Diluent* with sonication if necessary, and filtration with 0.2-µm syringe filters, discarding the first 2 mL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are listed in *Table 2*.]

Suitability requirements

Resolution: NLT 3 between timolol and timolol related compound D, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of timolol maleate related compound B and timolol maleate related compound D the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of each impurity from the *Standard solution*

C_S = concentration of each impurity in the *Standard solution* (mg/mL)

C_U = nominal concentration of timolol maleate in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any impurity from the *Sample solution*

r_S = peak response of timolol from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of USP Timolol Maleate RS in the *Standard solution*
C_U = nominal concentration of timolol maleate in the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Timolol Maleate and Hydrochlorothiazide Tablets

DEFINITION

Timolol Maleate and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

Standard solution A: 10 mg/mL of USP Timolol Maleate RS in methanol
Standard solution B: 10 mg/mL of USP Hydrochlorothiazide RS in methanol
Sample solution: Norminally equivalent to 4 mg/mL of timolol maleate in methanol prepared as follows. Transfer a portion of powdered Tablets, equivalent to about 20 mg of timolol maleate, to a suitable centrifuge tube containing about 5 mL of methanol.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 3 µL
Developing solvent system: Chloroform, methanol, and ammonium hydroxide (80:20:1)
Analysis
Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*
Separately apply *Standard solution A*, *Standard solution B*, and the *Sample solution* to a thin-layer chromatographic plate, and develop the chromatogram until the solvent front has moved three-fourths of the length of the plate. Air-dry, and examine under short-wavelength UV light.
Acceptance criteria: The R_F values of the principal spots of the *Sample solution* correspond to the principal spots of *Standard solution A* and *Standard solution B*.

ASSAY

- **PROCEDURE**

Buffer: Dissolve 13.6 g of monobasic potassium phosphate in 100 mL of water. Adjust with phosphoric acid to a pH of 3.0 ± 0.05, and filter.
Mobile phase: Acetonitrile, methanol, *Buffer*, and water (160:40:40:760)
Standard stock solution: 0.1 mg/mL of USP Timolol Maleate RS and (0.1*J*) mg/mL of USP Hydrochlorothiazide RS, *J* being the ratio of the labeled amount, in mg, of hydrochlorothiazide to the labeled amount, in mg, of timolol maleate per Tablet prepared as follows. To a suitable amount of each reference material in a suitable volumetric flask add 0.05 M monobasic sodium phosphate to 10% of the final volume, followed by 25% of the final volume of acetonitrile. Sonicate for 4 min, and dilute with water to volume.
Standard solution: 0.02 mg/mL of USP Timolol Maleate RS and (0.02*J*) mg/mL of USP Hydrochlorothiazide RS, *J* being the ratio of the labeled amount, in mg, of hydrochlorothiazide to the labeled amount, in mg, of timolol maleate per Tablet in acetonitrile solution (1 in 10), from the *Standard stock solution*
Sample solution: Nominally equivalent to 0.02 mg/mL of timolol maleate from NLT 20 finely powdered Tablets prepared as follows. Transfer a portion of the powder, equivalent to about 20 mg of timolol maleate, to a 1-L volumetric flask, add about 100 mL of 0.05 M monobasic sodium phosphate, 125 mL of acetonitrile, and 100 mL of water, and mix by mechanical means. Allow to stand for 16 h, dilute with water to volume, mix, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 295 nm
Column: 4-mm × 30-cm; packing L1
Flow rate: 1.5 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzothiadiazine related compound A, hydrochlorothiazide, and timolol maleate are about 0.5, 0.6, and 1.0, respectively.]
Suitability requirements
Resolution: NLT 4.0 between hydrochlorothiazide and timolol maleate
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of hydrochlorothiazide from the *Sample solution*
r_S = peak response of hydrochlorothiazide from the *Standard solution*
C_S = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

www.webofpharma.com

Calculate the percentage of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of Timolol from the *Sample solution*
r_S = peak response of Timolol from the *Standard solution*
C_S = concentration of USP Timolol Maleate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of timolol maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of timolol maleate and hydrochlorothiazide

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 20 min
Standard solution A: 11 µg/mL of USP Timolol Maleate RS in 0.1 N hydrochloric acid
Standard solution B: A suitable concentration of USP Hydrochlorothiazide RS in ethyl acetate
Sample solution: Filter a portion of the solution under test.
Blank: 0.1 N hydrochloric acid
Detector: UV 293 nm for timolol maleate; 270 nm for hydrochlorothiazide
Analysis
Samples: *Standard solution A*, *Sample solution*, and *Blank*
Transfer 10.0 mL each of *Blank*, *Standard solution A*, and *Sample solution* to three separators, respectively, and treat each of the solutions as follows. Add 20.0 mL of ethyl acetate, mix for 1 min, allow the phases to separate, filter the aqueous layer into a suitable vessel for the timolol maleate analysis, and retain the ethyl acetate layer for the hydrochlorothiazide determination. Determine the amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) by comparison of the UV absorbances of the aqueous layer from the *Sample solution* with that of the aqueous layer from *Standard solution A*. Filter the ethyl acetate layer through filter paper. Determine the amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) by comparison of the UV absobances of the ethyl acetate layer from the *Sample solution* with that of *Standard solution B*.
Tolerances: NLT 80% (*Q*) of each of the labeled amounts of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements for *Content Uniformity* for timolol maleate and hydrochlorothiazide

IMPURITIES

• **ORGANIC IMPURITIES**
Buffer, Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
Standard stock solution: 0.5 mg/mL of USP Benzothiadiazine Related Compound A RS in methanol
Standard solution: 0.5 µg/mL of USP Benzothiadiazine Related Compound A RS in *Mobile phase* from the *Standard stock solution*
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 4.0 between hydrochlorothiazide and timolol
Relative standard deviation: NMT 5.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzothiadiazine related compound A from the *Sample solution*

Tioconazole

$C_{16}H_{13}Cl_3N_2OS$ 387.71

www.webofpharma.com

1*H*-Imidazole, 1-[2-[(2-chloro-3-thienyl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-;
1-[2,4-Dichloro-[β-(2-chloro-3-thenyl)-oxy]phen ethyl] imidazole [65899-73-2].

DEFINITION

Tioconazole contains NLT 97.0% and NMT 103.0% of $C_{16}H_{13}Cl_3N_2OS$.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M**▲ (CN 1-May-2020)
- **B. PROCEDURE**

Standard solution: 50 mg/mL of USP Tioconazole RS in methanol
Sample solution: 50 mg/mL of Tioconazole in methanol
Developing solvent system: Chloroform, methanol, and glacial acetic acid (40:5:1)
Visualizing solution: Dissolve 0.85 g of bismuth subnitrate in 10 mL of glacial acetic acid, and dilute with water to 50 mL. Mix 10 mL of this solution, 50 mL of potassium iodide solution (2 in 25), and 20 mL of glacial acetic acid, and dilute to 100 mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Analysis
Samples: *Standard solution* and *Sample solution*
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber and locate the spots on the plate by viewing under short- and long-wavelength UV light after drying the plate at 80° for 5 min. Spray the plate with *Visualizing solution*, air-dry for 2 min, and overspray with sodium nitrite solution (1 in 20). Air-dry the plate for 5 min, and examine it for brown spots on a pale yellow background.
Acceptance criteria: The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.

- **C.** The retention time of the major peak for tioconazole of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile, methanol, and water (44:40:28). Degas the solution, and add 2.0 mL of ammonium hydroxide to 1120 mL of *Mobile phase*. [NOTE—Prepare the *Mobile phase* fresh daily.]
Standard solution: 200 µg/mL of USP Tioconazole RS in methanol
Sample solution: 200 µg/mL of Tioconazole in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 219 nm
Column: 5-mm × 25-cm; packing L1 with a precolumn containing packing L4 installed between the pump and the injector. [NOTE—Replace the precolumn daily.]
Flow rate: Adjust to obtain a retention time of between 12 and 17 min for tioconazole.
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 1000 theoretical plates, determined from the analyte peak
Tailing factor: NMT 2.0 for the analyte peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{16}H_{13}Cl_3N_2OS$ in the Tioconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tioconazole RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0%

IMPURITIES

INORGANIC IMPURITIES

- **Residue on Ignition** ⟨281⟩: NMT 0.2%
- **Chloride and Sulfate,** *Chloride* ⟨221⟩: A 0.7-g portion dissolved in methanol shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.05%).

ORGANIC IMPURITIES

- **Procedure**

Mobile phase and **Chromatographic system:** Proceed as directed in the *Assay*.
Standard solution: Dissolve 1 mg each of USP Tioconazole Related Compound A RS, USP Tioconazole Related Compound B RS, and USP Tioconazole Related Compound C RS in 15.0 mL of methanol, and shake until the contents are completely dissolved.
Sample solution: Dissolve 100 mg of Tioconazole in 15.0 mL of methanol, and shake until the substance is completely dissolved.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate, in turn, the percentages of 1-[2,4-dichloro-β-[(3-thenyl)-oxy]phenethyl]imidazole hydrochloride (tioconazole related compound A), 1-[2,4-dichloro-β-[(2,5-dichloro-3-thenyl)-oxy] phenethyl]imidazole hydrochloride (tioconazole related compound B), and 1-[2,4-dichloro-β-[(5-bromo-2-chloro-3-thenyl)-oxy]phenethyl]imidazole hydrochloride (tioconazole related compound C) in the portion of Tioconazole taken:

$$\text{Result} = (r_U/r_S) \times (W_I/W_U) \times 100$$

r_U = peak response of the related compound from the *Sample solution*
r_S = peak response of the related compound from the *Standard solution*
W_I = weight of the respective USP Reference Standard taken to prepare the *Standard solution* (mg)
W_U = weight of Tioconazole taken to prepare the *Sample solution* (mg)

Acceptance criteria: The limit of each related compound is NMT 1.0%.

Tissue Human Amnion Chorion Membrane Dehydrated

DEFINITION

Tissue Human Amnion Chorion Membrane Dehydrated is a dried bi-layer allograft containing amnion and chorion, derived from donated human placental tissues obtained from scheduled Caesarian sections. Using sterile solutions and aseptic techniques, the amniotic membrane is dissected from the placenta, the amnion and chorion layers are separated and then washed, layered, and dried. The product is provided in a sterile sheet form. Placentas used to produce Tissue Human Amnion Chorion Membrane Dehydrated are obtained from donors that have passed all applicable donor eligibility requirements and relevant communicable disease testing.

SPECIFIC TESTS

- **HISTOLOGICAL EVALUATION**

Hydration solution: 0.9% (w/v) sodium chloride (NaCl)

Cryopreservation matrix: Optimum cutting temperature (OCT) formulation of water-soluble glycols and resins[1]

Tissue preparation: Cut a sample of Tissue Human Amnion Chorion Membrane Dehydrated NLT 0.5 cm × 0.5 cm and NMT 1.0 cm × 1.0 cm. Hydrate the sample in 5 mL of *Hydration solution* for 10–30 min. Add a thin layer of the *Cryopreservation matrix* into the bottom of a suitable embedding mold,[2] and freeze on dry ice for 5–10 min until the *Cryopreservation matrix* appears white. Add more *Cryopreservation matrix* on top of the frozen layer, and place the tissue sample into the *Cryopreservation matrix*. Use forceps to arrange the tissue in the *Cryopreservation matrix* in the desired orientation for sectioning. Place the tissue sample and embedding mold onto dry ice for 10–20 min until the *Cryopreservation matrix* is completely solid and appears white. Immediately place the frozen block in a –80° freezer until ready for sectioning.

Cryosectioning: Add a layer of liquid *Cryopreservation matrix* onto the cryostat sample holder of a suitable cryostat,[3] and then place the frozen tissue block onto the holder in the desired orientation for sectioning. Freeze the tissue block onto the holder in the cryostat sectioning chamber before trimming the frozen block. Using the cryostat, trim the frozen block as necessary in 50–100 µm sections until the tissue sample is accessed. Subsequently, cut 5-µm section(s) of the tissue sample. Press each section onto the positively charged side of a microscope slide,[4] allowing the section to freeze onto the slide. Store the sections at –80° until use.

Staining preparation: When ready to stain, thaw the frozen slides at room temperature for NLT 30 min. Fix the tissue slides in ice cold acetone for 10 min. Allow the slides to dry at room temperature for NLT 30 min.

- **VERHOEFF STAINING**

Verhoeff staining solution: Prepare fresh Verhoeff stain containing 60 mL of 5% alcoholic hematoxylin, 24 mL of 10% aqueous ferric chloride, and 24 mL of Lugol's iodine working solution.[5]

Analysis: Place the slides in 100 mL of deionized water twice for 5 min each. Submerge the slides in *Verhoeff staining solution* for 15 min. Place the slides in five changes of deionized water until the water appears clear, then perform two additional changes in 100 mL of deionized water for 5 min each. Dip the slides in 100 mL of 2% aqueous ferric chloride 10 times, and then allow the stain to differentiate for 60 s until the amnion begins to appear gray. Place the slides in two changes of 100 mL of deionized water for 5 min each. Submerge the slides in 100 mL of 5% aqueous sodium thiosulfate for 1 min, then submerge the slides in two exchanges of 100 mL of deionized water for 5 min each.

Add 3–4 drops of a mounting solution[6] to each slide and incubate for 5 min. Carefully place a coverslip over the tissue section, taking care not to trap any bubbles under the coverslip. Seal the edges of the coverslip with clear nail polish, and store the slides at 4° protected from light.

Image the tissue sections using a suitable microscope at 40× magnification with brightfield.

Acceptance criteria: The product must show the presence of both the amnion layer and the chorion layer. The amnion layer contains a thin, dark staining layer followed by light staining throughout the rest of the amnion. The chorion layer must show a thin layer of light staining followed by dark staining throughout the rest of the chorion.

- **HUMAN TYPE IV COLLAGEN IMMUNOSTAINING**

Phosphate buffered saline (PBS): 0.01 M phosphate buffer, 0.0027 M potassium chloride (KCl), and 0.137 M sodium chloride (NaCl), pH 7.4

1% Bovine serum albumin (BSA): 500 mg of BSA in 50 mL of *PBS*

Blocking buffer diluent: Add 50 µL of *t*-octylphenoxypolyethoxyethanol to 48.95 mL of *1% BSA*.

Blocking buffer: 2% (v/v) normal goat serum in *Blocking buffer diluent*

Human type IV collagen antibody solution: Dilute a suitable mouse anti-human type IV collagen antibody[7] (1:100) in *1% BSA*.

Secondary antibody solution: Dilute a suitable fluorescent labeled, goat anti-mouse antibody[8] 1:100 in *PBS*.

Sample: A sample of Tissue Human Amnion Chorion Membrane Dehydrated cut to NLT 0.5 cm × 0.5 cm and

NMT 1.0 cm × 1.0 cm and prepared as directed in *Histological Evaluation* (see *Tissue preparation, Cryosectioning,* and *Staining preparation*).

Analysis: Place the slides in two exchanges of 100 mL of *PBS* for 5 min each. Circle each tissue section with a hydrophobic pen to make a hydrophobic ring surrounding the *Sample*. Place the slides into a humidity chamber for the following incubation steps. Add 50–100 µL of *Blocking buffer* to completely cover each tissue section within the hydrophobic ring, and incubate for 20 min. Blot off the excess *Blocking buffer*, but do not rinse the slides. Add 50–100 µL of *Human type IV collagen antibody solution* to completely cover each tissue section and incubate overnight for 12–24 h at 4°.

In parallel, prepare a negative control by incubating a *Sample* with 50–100 µL of *1% BSA* alone without primary antibody for the same amount of time followed by the same steps described below. Blot off the primary antibody or *1% BSA*, and rinse the slides by immersing in two exchanges of 100 mL of *PBS* for 5 min each. Add 50–100 µL of *Secondary antibody solution* to completely cover each tissue section, and incubate for 30 min. Blot off the *Secondary antibody solution* and place the slides in two exchanges of 100 mL of *PBS* for 5 min each, followed by 100 mL of deionized water for 5 min.

Add 3–4 drops of a mounting solution[9] to each slide and incubate for 5 min. Carefully place a coverslip over the tissue on each microscope slide, taking care not to trap any bubbles under the coverslip. Seal the edges of the coverslip with clear nail polish, and store the slides at 4° protected from light.

Image the tissue sections using a suitable fluorescent microscope at 40× magnification with an excitation wavelength of 628 nm and an emission wavelength of 692 nm. Other optical filters can also be used to image tissue autofluorescence relative to that seen with the specific fluorescence of the collagen type IV stain.

Acceptance criteria: Tissue Human Amnion Chorion Membrane Dehydrated must show positive staining for human type IV collagen in the amnion layer and throughout the chorion layer.

• **BALL-BURST TESTING**

Normal saline: 0.9% (w/v) sodium chloride (NaCl)

Sample: Tissue Human Amnion Chorion Membrane Dehydrated with dimensions of NLT 25 mm × 25 mm. [NOTE—At least five *Samples* should be tested for each lot.] Hydrate the *Samples* in *Normal saline* for NLT 30 min. [NOTE—Complete the *Analysis* rapidly so the *Sample* does not dry before testing.]

Analysis: Center the *Sample* between the ball-burst specimen clamp plates. Ensure that the test article is flat over the hole of the ball-burst fixture. Trim the *Sample* if it extends beyond the fixation screws so that the *Sample* rests flat between the screws. Tighten the screws on the ball-burst fixture on either side of the *Sample* to secure the *Sample* in place. Place the ball-burst attachment in the hole of the ball-burst clamp, with the ball of the attachment resting on the *Sample*. The polished steel ball is 6.35 mm in diameter, and the diameter of the test area is 10.7 mm. Place the ball-burst specimen clamp with the *Sample* and the ball-burst attachment approximately centered on the lower compression plate of a suitable materials testing system.[10] Test the *Sample* by lowering the upper compression piston until the *Sample* fails, at a rate of 305 ± 13 mm/min. Record the load, in Newtons (N), at failure.

Acceptance criteria: NLT 0.25 N per *Sample*

• **WATER DETERMINATION** ⟨921⟩

Sample: Weigh a sample of Tissue Human Amnion Chorion Membrane Dehydrated. The test sample should be NLT 40 and NMT 100 mg. [NOTE—Multiple grafts may be used when needed to create a sample size of 40 mg.]

Acceptance criteria: NMT 15%

• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Tissue Human Amnion Chorion Membrane Dehydrated is packaged and supplied sterile in a double pouch configuration. Tissue Human Amnion Chorion Membrane Dehydrated can be stored between 0° and 38°.

• **LABELING:** The label shows the tissue identification number, expiration date, and size of Tissue Human Amnion Chorion Membrane Dehydrated contained in the pouch.

Titanium Dioxide

TiO_2 79.87

Titanium oxide (TiO_2) [13463-67-7].

DEFINITION

Titanium Dioxide contains NLT 99.0% and NMT 100.5% of titanium dioxide (TiO_2), calculated on the dried basis. If labeled as attenuation grade, then Titanium Dioxide contains NLT 99.0% and NMT 100.5% of TiO_2, calculated on the ignited basis. Attenuation grade material may contain suitable coatings, stabilizers, and treatments to assist formulation.

[NOTE—If labeled as attenuation grade, then all tests and assays are conducted on uncoated, untreated material. For UV attenuation grade, the test for *Loss on Drying* does not apply. The FDA requires the content of lead to be NMT 10 ppm (µg/g), that of antimony to be NMT 2 ppm (µg/g), and that of mercury to be NMT 1 ppm (µg/g) (21 CFR 73.1575).]

IDENTIFICATION

• **A.**

Sample: 500 mg

Analysis: Add 5 mL of sulfuric acid to the *Sample*, and heat gently. After fumes of sulfur trioxide appear, continue heating for a minimum of 10 s. Cool the suspension, and cautiously dilute with water to 100 mL. Filter, and to 5 mL of the clear filtrate, add a few drops of hydrogen peroxide TS.

Acceptance criteria: A yellow-red to orange-red color develops immediately.

ASSAY

• **PROCEDURE**

Sample solution: Transfer 300 mg of Titanium Dioxide to a 250-mL beaker. Add 20 mL of sulfuric acid and 7–8 g of ammonium sulfate. Mix, heat on a hot plate until fumes of sulfur trioxide appear, and continue heating over a strong flame until the solution is complete, or until it is apparent that the undissolved residue is siliceous matter. Cool, cautiously dilute with 100 mL of water, stir, heat carefully to boiling while stirring, and allow the insoluble matter to settle. Filter, transfer the entire residue to the filter, and wash thoroughly with cold 2 N sulfuric acid. Dilute the filtrate with water to 200 mL, and cautiously add about 10 mL of ammonium hydroxide.

Blank: 200 mL of 2 N sulfuric acid

[9] A suitable reagent can be obtained from Electron Microscopy Sciences/ Diatome, product #17985-10 or a suitable equivalent.

[10] A suitable materials system is the INSTRON Series 5500 Load Frames with a Series 2525 Load Cell or a suitable equivalent.

USP Monographs

www.webofpharma.com

Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Direct titration
Titrant: 0.1 N potassium permanganate VS
Endpoint detection: Visual
Analysis: Prepare a zinc amalgam column in a 25-cm Jones reductor tube, placing a pledget of glass wool in the bottom of the tube, and filling the constricted portion of the tube with zinc amalgam prepared as follows. Add 20- to 30-mesh zinc to mercuric–chloride solution (1 in 50), using about 100 mL of the solution for each 100 g of zinc, and after about 10 min, decant the solution from the zinc, then wash the zinc by decantation. Wash the zinc amalgam column with 100-mL portions of 2 N sulfuric acid until 100 mL of the washing does not decolorize 1 drop of 0.1 N potassium permanganate.
Place 50 mL of ferric ammonium sulfate TS in a 1000-mL suction flask, and add 0.1 N potassium permanganate until a faint pink color persists for 5 min. Attach the Jones reductor tube to the neck of the flask, and pass 50 mL of 2 N sulfuric acid through the reductor at a rate of about 30 mL/min. Pass the *Sample solution* through the reductor at the same rate, and follow with 100 mL each of 2 N sulfuric acid and of water. During these operations, keep the reductor filled with a solution or water above the upper level of the amalgam. Taking precautions against the admission of atmospheric oxygen, gradually release the suction, wash down the outlet tube of the reductor and the sides of the receiver, and titrate immediately with *Titrant*. Perform a blank determination, and make any necessary correction.
Calculate the percentage of titanium dioxide (TiO_2) in the sample taken:

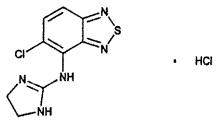
$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 79.88 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 99.0%–100.5% on the dried basis; if labeled as attenuation grade, 99.0%–100.5% on the ignited basis

IMPURITIES

• **ARSENIC,** *Method I* ⟨211⟩
Test preparation: Add 3.0 g of Titanium Dioxide to a 250-mL conical flask fitted with a thermometer and a vapor outlet. Add 50 mL of water, 500 mg of hydrazine sulfate, 500 mg of potassium bromide, 20 g of sodium chloride, and 25 mL of sulfuric acid. Arrange to collect the evolved vapors in 52 mL of water contained in the arsine generator flask, heat the test specimen to 90°, and maintain the temperature at 90°–100° for 15 min. Add 3 mL of hydrochloric acid to the solution in the generator flask.
Analysis: Follow the *Procedure* in the chapter, omitting the addition of 20 mL of 7 N sulfuric acid.
Acceptance criteria: Any red color produced by the *Test preparation* does not exceed that produced by the *Standard Preparation* (NMT 1 µg/g).



SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 105° for 3 h
Acceptance criteria: NMT 0.5%
• **LOSS ON IGNITION** ⟨733⟩
Sample: 2 g (previously dried sample). If labeled as attenuation grade, 4 g
Analysis: Ignite the *Sample* at 800 ± 25° to constant weight.
Acceptance criteria: NMT 0.5%; if labeled as attenuation grade, NMT 13%
• **WATER-SOLUBLE SUBSTANCES**
Sample suspension: Suspend 4.0 g in 50 mL of water, mix, and allow to stand overnight.
Analysis: Transfer the *Sample suspension* to a 200-mL volumetric flask, add 2 mL of ammonium chloride TS, and mix. If the Titanium Dioxide does not settle, add another 2-mL portion of ammonium chloride TS. Allow the suspension to settle, dilute with water to volume, mix, and pass through a double thickness of fine-porosity filter paper, discarding the first 10 mL of the filtrate. Collect 100 mL of the clear filtrate, transfer to a tared platinum dish, evaporate on a hot plate to dryness, and ignite at a dull red heat to constant weight.
Acceptance criteria: The residue weighs NMT 5 mg (NMT 0.25%).
• **ACID-SOLUBLE SUBSTANCES**
Sample suspension: Suspend 5.0 g in 100 mL of 0.5 N hydrochloric acid, and heat on a steam bath for 30 min, with occasional stirring.
Analysis: Pass the *Sample suspension* through an appropriate filter medium until clear. Wash with three 10-mL portions of 0.5 N hydrochloric acid. Evaporate the combined filtrate and washings to dryness, and ignite at a dull red heat to constant weight.
Acceptance criteria: The residue weighs NMT 25 mg (NMT 0.5%).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.
• **LABELING:** If intended for UV-attenuation, the material is labeled as attenuation grade. If intended for UV-attenuation, and any added coatings, stabilizers, or treatments are used, label it to indicate the name and amount of the additives.

Tizanidine Hydrochloride

$C_9H_8ClN_5S \cdot HCl$ 290.17
2,1,3-Benzothiadiazol-4-amine, 5-chloro-*N*-(4,5-dihydro-1*H*-imidazol-2-yl)-, monohydrochloride;
5-Chloro-4-(2-imidazolin-2-ylamino)-2,1,3-benzothiadiazole monohydrochloride [64461-82-1].

DEFINITION

Tizanidine Hydrochloride contains NLT 98.0% and NMT 102.0% of tizanidine hydrochloride ($C_9H_8ClN_5S \cdot HCl$), calculated on the dried basis.

Tizanidine Tablets

DEFINITION
Tizanidine Tablets contain Tizanidine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of tizanidine ($C_9H_8ClN_5S$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Solution A: Water and phosphoric acid (44:6)
Buffer: 3.5 g/L of sodium 1-pentanesulfonate. Adjust with *Solution A* or 1 N sodium hydroxide to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer* (20:80)
Tizanidine related compound A solution: 0.1 mg/mL of USP Tizanidine Related Compound A RS in methanol
Tizanidine related compound B solution: 0.1 mg/mL of USP Tizanidine Related Compound B RS in methanol
Tizanidine related compound C solution: 0.1 mg/mL of USP Tizanidine Related Compound C RS in methanol
System suitability solution: Transfer 23 mg of USP Tizanidine Hydrochloride RS to a 100-mL volumetric flask, and add 20 mL of *Mobile phase* and 10 mL each of *Tizanidine related compound A solution*, *Tizanidine related compound B solution*, and *Tizanidine related compound C solution*. Sonicate to dissolve the USP Tizanidine Hydrochloride RS, and dilute with *Mobile phase* to volume.
Standard solution: 0.046 mg/mL of USP Tizanidine Hydrochloride RS in *Mobile phase*
Sample solution: Transfer a weighed portion of finely powdered Tablets (NLT 20), equivalent to 20 mg of tizanidine, to a 500-mL volumetric flask. Add 250 mL of *Buffer* solution, sonicate for 15 min with occasional shaking, and shake by mechanical means for 15 min. Add 100 mL of acetonitrile, and mix. Allow to cool, and dilute with *Buffer* solution to volume. Centrifuge a portion of this solution at 2000 rpm or higher for 10 min. Pass a portion of this solution through a filter with a 0.45-µm or finer pore size, and use the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm. For *Identification B*, use a diode array detector in the range of 210–400 nm.
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 50°
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[Note—The relative retention times are listed in *Table 1*.]
Suitability requirements
Resolution: NLT 4.0 between tizanidine and tizanidine related compound C; NLT 4.0 between tizanidine and tizanidine related compound B, *System suitability solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tizanidine ($C_9H_8ClN_5S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tizanidine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tizanidine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tizanidine, 253.71
M_{r2} = molecular weight of tizanidine hydrochloride, 290.17

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **Dissolution** ⟨711⟩
Test 1
Medium: 0.1 N hydrochloric acid; 500 mL
Apparatus 1: 100 rpm
Time: 15 min
Solution A, Buffer, and **Mobile phase:** Prepare as directed in the *Assay*.
Standard solution: (*L*/500) mg/mL of USP Tizanidine Hydrochloride RS in *Medium*, where *L* is the label claim, in mg
Sample solution: Sample per *Dissolution* ⟨711⟩. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 50°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*

www.webofpharma.com

Calculate the percentage of the labeled amount of tizanidine ($C_9H_8ClN_5S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of tizanidine from the *Sample solution*
r_S = peak response of tizanidine from the *Standard solution*
C_S = concentration of USP Tizanidine Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of dissolution *Medium*, 500 mL
L = label claim, in mg
M_{r1} = molecular weight of tizanidine, 253.71
M_{r2} = molecular weight of tizanidine hydrochloride, 290.17

Tolerances: NLT 80% (Q) of the labeled amount of tizanidine ($C_9H_8ClN_5S$) is dissolved.

Test 2

[NOTE—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.]

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated
Apparatus 1: 100 rpm
Time: 30 min
Standard solution: (L/500) mg/mL of USP Tizanidine Hydrochloride RS in *Medium*, where L is the label claim, in mg
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: 228 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tizanidine ($C_9H_8ClN_5S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tizanidine Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of dissolution *Medium*, 500 mL
L = label claim, in mg
M_{r1} = molecular weight of tizanidine, 253.71
M_{r2} = molecular weight of tizanidine hydrochloride, 290.17

Tolerances: NLT 80% (Q) of the labeled amount of tizanidine ($C_9H_8ClN_5S$) is dissolved.

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Buffer, Mobile phase, System suitability solution, Standard solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.

Sample solution: Transfer a weighed portion of finely powdered Tablets (NLT 20), equivalent to 20 mg of tizanidine, to a 100-mL volumetric flask. Add about 50 mL of *Buffer* solution, sonicate for about 15 min with occasional shaking, and shake by mechanical means for 15 min. Add 20 mL of acetonitrile, and mix. Allow to cool, dilute with *Buffer* solution to volume, and mix. Centrifuge a portion of this solution at 2000 rpm or higher for 10 min. Pass a portion of this solution through a filter with a 0.45-µm or finer pore size, and use the filtrate.

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

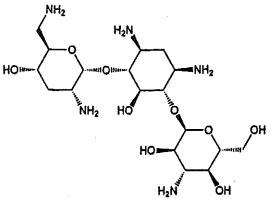
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of tizanidine from the *Standard solution*
C_S = concentration of USP Tizanidine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tizanidine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tizanidine, 253.71
M_{r2} = molecular weight of tizanidine hydrochloride, 290.17
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tizanidine related compound C[a]	0.8	—	—
Tizanidine	1.0	—	—
Tizanidine related compound B[a]	1.4	—	—
Tizanidine related compound A	10.2	1.1	0.2
Any unspecified degradation product	—	1.0	0.2
Total impurities	—	—	0.5



[a] Process impurity included for peak identification purposes only. Controlled in the drug substance.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

Tobramycin

$C_{18}H_{37}N_5O_9$ 467.51

D-Streptamine, *O*-3-amino-3-deoxy-α-D-glucopyranosyl-(1→6)-*O*-[2,6-diamino-2,3,6-trideoxy-α-D-*ribo*-hexopyranosyl-(1→4)]-2-deoxy-;
O-3-Amino-3-deoxy-α-D-glucopyranosyl-(1→4)-*O*-[2,6-diamino-2,3,6-trideoxy-α-D-*ribo*-hexopyranosyl-(1→6)]-2-deoxy-L-streptamine [32986-56-4].

DEFINITION

Tobramycin has a potency of NLT 900 µg/mg of tobramycin ($C_{18}H_{37}N_5O_9$), calculated on the anhydrous basis.

IDENTIFICATION

• **A.**

Standard solution: 6 mg/mL of USP Tobramycin RS in water

Sample solution: 6 mg/mL of Tobramycin in water

Solution A: *Standard solution* and *Sample solution* (1:1)

Chromatographic system

(See *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 3 µL

Developing solvent system: Methanol, chloroform, and ammonium hydroxide (60:25:30)

Diluent: Butyl alcohol and pyridine (100:1)

Spray reagent: 10 mg/mL of ninhydrin in *Diluent*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Solution A*

Apply the *Samples* to the plate. Place the plate in a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and heat the plate at 110° for 15 min. Immediately locate the spots on the plate by spraying with *Spray reagent*.

Acceptance criteria: Tobramycin appears as a pink spot, and the R_F values of the spots from the *Sample solution* and from *Solution A*, respectively, correspond to those obtained from the *Standard solution*.

• **B.** The retention time of the major peak of the *Derivatized sample solution* corresponds to that of the *Derivatized standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl) aminomethane in 800 mL of water. Add 20 mL of 1 N sulfuric acid, and dilute with acetonitrile to obtain 2000 mL of solution. Cool, and pass through a filter of 0.2-µm or finer pore size.

Solution A: 10 mg/mL of 2,4-dinitrofluorobenzene in alcohol. This solution may be used for 5 days if refrigerated when not in use.

Solution B: 15 mg/mL of tris(hydroxymethyl) aminomethane in water. This solution may be used for 1 month if refrigerated when not in use.

Solution C: 3 mg/mL of tris(hydroxymethyl)aminomethane prepared as follows. Transfer 40 mL of *Solution B* to a 200-mL volumetric flask. Add dimethyl sulfoxide with mixing, and dilute with dimethyl sulfoxide to volume. Use this reagent within 4 h. If kept immersed in an ice-water bath below 10°, the reagent may be used for up to 8 h.

Standard stock solution: 1.1 mg of USP Tobramycin RS prepared as follows. Transfer 55 mg of USP Tobramycin RS to a 50-mL volumetric flask. Add 1 mL of 1 N sulfuric acid and enough water to dissolve it, and dilute with water to volume.

Standard solution: 0.22 mg/mL of USP Tobramycin RS from *Standard stock solution* in water

Sample stock solution: 1.1 mg of Tobramycin prepared as follows. Transfer 55 mg of Tobramycin to a 50-mL volumetric flask. Add 1 mL of 1 N sulfuric acid and enough water to dissolve it, and dilute with water to volume.

Sample solution: 0.22 mg/mL of Tobramycin from *Sample stock solution* in water

Derivatized standard solution, Derivatized sample solution, and Blank solution: Proceed as follows. Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60° constant temperature bath at the same time.

To separate 50-mL volumetric flasks transfer 4.0 mL of the *Standard solution*, 4.0 mL of the *Sample solution*, and 4.0 mL of water. To each flask add 10 mL of *Solution A* and 10 mL of *Solution C*, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, then dilute with acetonitrile to volume. The solutions thus obtained are the *Derivatized standard solution*, the *Derivatized sample solution*, and the *Blank solution*, respectively.

System suitability stock solution: 0.24 mg/mL of *p*-naphtholbenzein in acetonitrile

System suitability solution: Transfer 2 mL of the *System suitability stock solution* to a 10-mL volumetric flask, dilute with *Derivatized standard solution* to volume, and use promptly.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 365 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Samples: *Derivatized standard solution* and *System suitability solution*

[NOTE—The relative retention times for *p*-naphtholbenzein and tobramycin are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between *p*-naphtholbenzein and tobramycin, *System suitability solution*

Relative standard deviation: NMT 2.0% for tobramycin, *Derivatized standard solution*

Analysis

Samples: *Derivatized standard solution*, *Derivatized sample solution*, and *Blank solution*

Use the *Blank solution* to identify the solvent and reagent peaks.

USP Monographs

www.webofpharma.com

Calculate the quantity, in µg/mg, of tobramycin ($C_{18}H_{37}N_5O_9$) in the portion of Tobramycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area of tobramycin from the *Derivatized sample solution*
r_S = peak area of tobramycin from the *Derivatized standard solution*
C_S = concentration of USP Tobramycin RS in the *Standard solution* (mg/mL)
C_U = concentration of Tobramycin in the *Sample solution* (mg/mL)
P = potency of tobramycin in USP Tobramycin RS (µg/mg)

Acceptance criteria: NLT 900 µg/mg of tobramycin ($C_{18}H_{37}N_5O_9$) on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩
Analysis: Moisten the charred residue with 2 mL of nitric acid and 5 drops of sulfuric acid.
Acceptance criteria: NMT 1.0%

• **ORGANIC IMPURITIES**
Solution A: Dilute 20 mL of sodium hypochlorite solution with water to 100 mL.
Solution B: Dissolve 1.1 g of potassium iodide in 60 mL of water, boil for 15 min, and slowly add a suspension of 1.5 g of soluble starch in 10 mL of water. Add 25 mL of water, and boil for 10 min. Allow to cool, and dilute with water to 100 mL.
Solution C: 29.2 g of sodium chloride in 100 mL of water
Sample solution: Transfer 50 mg of Tobramycin to a 10-mL volumetric flask. Dissolve in 7 mL of water, and adjust with 1 N sulfuric acid to a pH of 5.5 ± 0.4. Dilute with water to volume.
Standard solution: 0.05 mg/mL of Tobramycin from *Sample solution* in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography.*)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 1 µL
Developing solvent system: Alcohol, *Solution C*, and water (30:50:20)
Analysis
Samples: *Sample solution* and *Standard solution*
Apply the *Samples* to the plate. Develop the chromatogram in a saturated chromatographic chamber containing the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, evaporate the solvent in a current of hot air, then heat the plate at 110° for 10 min. Lightly spray the hot plate with *Solution A*. Dry the plate in a current of cold air until a sprayed area of the plate below the origin gives at most a faint blue color with a drop of *Solution B*. Then spray the plate with *Solution B*.
Acceptance criteria: Bluish-purple spots are immediately visible. Other than the principal tobramycin spot, no spot observed in the *Sample solution* is more intense than the principal spot from the *Standard solution* (1.0%).

SPECIFIC TESTS

• **PH** ⟨791⟩
Sample solution: 100 mg/mL
Acceptance criteria: 9.0–11.0

• **WATER DETERMINATION** ⟨921⟩, *Method I*
Analysis: Use a mixture of formamide and methanol (1:3) as the solvent.
Acceptance criteria: NMT 8.0%

• **STERILITY TESTS** ⟨71⟩**:** Where the label states that Tobramycin is sterile, it meets the requirements.

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** Where the label states that Tobramycin is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 2.00 USP Endotoxin Units/mg of tobramycin. Where it is intended for use in preparing ophthalmic dosage forms, it is exempt from the requirements for *Bacterial Endotoxins Test.*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** Where it is intended for use in preparing injectable or ophthalmic dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or ophthalmic dosage forms.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tobramycin RS

Tobramycin Injection

DEFINITION

Tobramycin Injection is a sterile solution of Tobramycin Sulfate in Water for Injection, or of Tobramycin in Water for Injection prepared with the aid of Sulfuric Acid. It contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$).

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHY**
Diluent: Butyl alcohol and pyridine (100:1)
Standard solution: 6 mg/mL of USP Tobramycin RS in water
Sample solution: 6 mg/mL in water, from Injection diluted with water
Solution A: *Standard solution* and *Sample solution* (1:1)
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography.*)
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 3 µL

Tobramycin Ophthalmic Ointment

DEFINITION

Tobramycin Ophthalmic Ointment contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

  Diluent: Butyl alcohol and pyridine (100:1)

  Standard solution: 6 mg/mL of USP Tobramycin RS in water

  Sample solution: Vigorously shake by mechanical means a quantity of Ophthalmic Ointment, containing nominally 3 mg of tobramycin with 2 mL of chloroform. Add 1 mL of water, shake vigorously by mechanical means for 1 min, and centrifuge for 15 min. Use the clear upper, aqueous layer.

  Solution A: *Standard solution* and *Sample solution* (1:1)

  Chromatographic system

  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography.*)

  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

  Application volume: 3 µL

  Developing solvent system: Methanol, chloroform, and ammonium hydroxide (60:25:30)

  Spray reagent: 10 mg/mL of ninhydrin in *Diluent*

  Analysis

  Samples: *Standard solution, Sample solution,* and *Solution A*

  Apply the *Standard solution*, the *Sample solution*, and *Solution A* to the plate. Place the plate in a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and heat the plate at 110° for 15 min. Immediately locate the spots on the plate by spraying it with *Spray reagent.*

  Acceptance criteria: Tobramycin appears as a pink spot, and the R_F values of the spots of the *Sample solution* and of *Solution A*, respectively, correspond to those of the *Standard solution.*

ASSAY

- **PROCEDURE**

  Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl) aminomethane in 800 mL of water. Add 20 mL of 1 N sulfuric acid, and dilute with acetonitrile to obtain 2000 mL of solution. Cool, and pass through a filter of 0.2-µm or finer pore size.

  Solution A: 10 mg/mL of 2,4-dinitrofluorobenzene in alcohol. This solution may be used for 5 days if refrigerated when not in use.

  Solution B: 15 mg/mL of tris(hydroxymethyl) aminomethane in water. This solution may be used for 1 month if refrigerated when not in use.

  Solution C: 3 mg/mL of tris(hydroxymethyl)aminomethane prepared as follows. Transfer 40 mL of *Solution B* to a 200-mL volumetric flask. Add dimethyl sulfoxide while mixing, and dilute with dimethyl sulfoxide to volume. Use this reagent within 4 h. If kept immersed in an ice-water bath below 10°, the reagent may be used for up to 8 h.

  Standard stock solution: 1.1 mg of USP Tobramycin RS prepared as follows. Transfer 55 mg of USP Tobramycin RS into a 50-mL volumetric flask. Add 1 mL of 1 N sulfuric acid and enough water to dissolve it, and dilute with water to volume.

  Standard solution: 0.22 mg/mL of USP Tobramycin RS from *Standard stock solution* in water

  Sample solution: Nominally 0.045 mg/mL of tobramycin from Ophthalmic Ointment in water prepared as follows. Transfer a portion of Ophthalmic Ointment, containing nominally 4.5 mg of tobramycin, to a separator. Add 50 mL of ether, and extract with four 20- to 25-mL portions of water. Combine the water extracts in a 100-mL volumetric flask, and dilute with water to volume.

  Derivatized standard solution, Derivatized sample solution, and **Blank solution:** Proceed as follows. Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60° constant temperature bath at the same time.

  To separate 50-mL volumetric flasks transfer 4.0 mL of the *Standard solution*, 15.0 mL of the *Sample solution*, and 4.0 mL of water. To each flask add 10 mL of *Solution A* and 10 mL of *Solution C*, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, then dilute with acetonitrile to volume. The solutions thus obtained are the *Derivatized standard solution*, the *Derivatized sample solution*, and the *Blank solution*, respectively.

  System suitability stock solution: 0.24 mg/mL of *p*-naphtholbenzein in acetonitrile. Prepare freshly.

  System suitability solution: Transfer 2 mL of the *System suitability stock solution* to a 10-mL volumetric flask, dilute with *Derivatized standard solution* to volume, and use promptly.

Suitability requirements

Resolution: NLT 4.0 between *p*-naphtholbenzein and tobramycin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Derivatized standard solution*

Analysis

Samples: *Derivatized standard solution*, *Derivatized sample solution*, and *Blank solution*

Use the *Blank solution* to identify the solvent and reagent peaks.

Calculate the percentage of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area of tobramycin from the *Derivatized sample solution*

r_S = peak area of tobramycin from the *Derivatized standard solution*

C_S = concentration of USP Tobramycin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tobramycin in the *Sample solution* (mg/mL)

P = potency of tobramycin in USP Tobramycin RS (µg/mg)

F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–120.0%

SPECIFIC TESTS

- **STERILITY TESTS** ⟨71⟩: Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements for *Particulate and Foreign Matter* and *Container Contents* in *Ophthalmic Products—Quality Tests* ⟨771⟩, *Drug Product Quality, Universal Tests, Particulate and Foreign Matter* and *Container Contents*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Tobramycin RS

Tobramycin Inhalation Solution

DEFINITION

Tobramycin Inhalation Solution is a sterile, nonpyrogenic, preservative-free solution of Tobramycin in Water for Injection containing Sodium Chloride. It is prepared with the aid of Sulfuric Acid or Sodium Hydroxide and contains, in each mL, NLT 90.0% and NMT 110.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Derivatized sample solution* corresponds to that of the *Derivatized standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl) aminomethane in about 800 mL of water. To this solution add 20 mL of 1 N sulfuric acid, and dilute with acetonitrile to obtain 2000 mL of solution. Allow to cool, and pass through a filter of 0.2-µm or finer pore size.

Blank: Water

2,4-Dinitrofluorobenzene reagent: 10 mg/mL of 2,4-dinitrofluorobenzene in alcohol. This solution may be used for 5 days if refrigerated when not in use.

Tris(hydroxymethyl)aminomethane stock reagent: 15 mg/mL of tris(hydroxymethyl)aminomethane in water. This reagent may be used for 1 month if refrigerated when not in use.

Tris(hydroxymethyl)aminomethane reagent: 3 mg/mL of tris(hydroxymethyl)aminomethane prepared as follows. Transfer 40 mL of *Tris(hydroxymethyl)aminomethane stock reagent* to a 200-mL volumetric flask, add dimethyl sulfoxide with mixing, and dilute with dimethyl sulfoxide to volume. Use this reagent within 4 h. If kept immersed in an ice-water bath below 10°, the reagent may be used for up to 8 h.

Standard stock solution: 1.1 mg/mL of USP Tobramycin RS prepared as follows. Weigh a suitable amount of USP Tobramycin RS into a suitable volumetric flask. Add 1 N sulfuric acid, using 2% of the final volume, and enough water to dissolve the tobramycin, and dilute with water to volume.

Standard solution: 0.22 mg/mL of USP Tobramycin RS from the *Standard stock solution* in water

Sample solution: Nominally 0.192 mg/mL of tobramycin from the Inhalation Solution in water

Derivatization procedure: Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60° constant temperature bath at the same time.

To separate 50-mL volumetric flasks transfer 4.0 mL of the *Standard solution*, 4.0 mL of the *Sample solution*, and 4.0 mL of the *Blank*. To each flask add 10 mL of *2,4-Dinitrofluorobenzene reagent* and 10 mL of *Tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, then dilute with acetonitrile to volume. The solutions thus obtained are the *Derivatized standard solution*, *Derivatized sample solution*, and *Derivatized blank solution*, respectively.

System suitability solution: 0.24 mg/mL of *p*-naphtholbenzein in acetonitrile. Transfer 2 mL of this solution to a 10-mL volumetric flask, dilute with *Derivatized standard solution* to volume, and use promptly.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 365 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Samples: *Derivatized standard solution*, *Derivatized blank solution*, and *System suitability solution*

[NOTE—The relative retention times for *p*-naphtholbenzein and tobramycin are about 0.6 and 1.0, respectively.]

Identify the solvent and reagent peaks using the *Derivatized blank solution*.

Suitability requirements

Resolution: NLT 4.0 between *p*-naphtholbenzein and tobramycin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Derivatized standard solution*

USP Monographs

www.webofpharma.com

Analysis
Samples: *Derivatized standard solution* and *Derivatized sample solution*
Calculate the percentage of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$) in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from the *Derivatized sample solution*
r_S = peak response from the *Derivatized standard solution*
C_S = concentration of USP Tobramycin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tobramycin in the *Sample solution* (mg/mL)
P = potency of tobramycin in USP Tobramycin RS (µg/mg)
F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• **CONTENT OF SODIUM CHLORIDE**
Solution A: 2 g of gelatin and 50 mL of nitric acid in 1000 mL of water
Sample solution: Pipet 25 mL of Inhalation Solution into a suitable container. Add 70–100 mL of water and 10 mL of *Solution A*.
Analysis: Titrate potentiometrically with 0.1 N silver nitrate VS using a suitable silver electrode.
Acceptance criteria: 90.0%–110.0% of the labeled amount of sodium chloride

PERFORMANCE TESTS

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meets the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Solution A: Acetonitrile, water, and phosphoric acid (5: 95: 0.08)
Solution B: Acetonitrile, water, and phosphoric acid (75: 25: 0.08)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	79	21
14	66	34
25	30	70
35	30	70
40	20	80
50	5	95

Blank: Water
2,4-Dinitrofluorobenzene reagent and **Tris(hydroxymethyl)aminomethane reagent:** Prepare as directed in the *Assay*.
System suitability stock solution: Dissolve USP Tobramycin RS in water, and adjust with 1 N sulfuric acid to a pH of 6.0. Dilute with water to obtain a solution having a known concentration of 1.1 mg/mL.
System suitability solution 1: 0.22 mg/mL of tobramycin from the *System suitability stock solution* in water
System suitability solution 2: Heat a portion of the *System suitability stock solution* in a suitable sealed glass container at 100° for 8–9 h. Cool to room temperature, and dilute with water to obtain a solution containing nominally 0.22 mg/mL of tobramycin.
Standard stock solution: Prepare as directed in the *Assay*.
Standard solution: 1.10 µg/mL of tobramycin from the *Standard stock solution* in water
Sample solution: Prepare as directed in the *Assay*.
Derivatization procedure: Heat all solutions at the same temperature and for the same duration as indicated. Move all flasks to and from the 60° constant-temperature bath at the same time.
To separate 50-mL flasks transfer 15.0 mL of *System suitability solution 1*, 15.0 mL of *System suitability solution 2*, 15.0 mL of *Standard solution*, 15.0 mL of *Sample solution*, and 15.0 mL of *Blank*. To each flask add 10 mL of *2,4-Dinitrofluorobenzene reagent* and 10 mL of *Tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flasks in a constant-temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, and dilute with acetonitrile to volume. Allow the solutions to stand for 16 h. The solutions thus obtained are *Derivatized system suitability solution 1*, *Derivatized system suitability solution 2*, *Derivatized standard solution*, *Derivatized sample solution*, and *Derivatized blank solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

System suitability
Samples: *Derivatized system suitability solution 1*, *Derivatized system suitability solution 2*, and *Derivatized standard solution*
[NOTE—See *Table 2* for relative retention times.]
Compare *Derivatized system suitability solutions 1* and *2* chromatograms to identify degradation peaks. Deoxystreptamine kanosaminide and nebramine will increase in response in *Derivatized system suitability solution 2*.
Suitability requirements
Capacity factor (*k'*): NLT 15.5 for tobramycin, *Derivatized system suitability solution 2*
Resolution: NLT 1.0 between the nebramine and kanamycin peaks, *Derivatized system suitability solution 2*
Relative standard deviation: NMT 2.0%, *Derivatized standard solution*
Analysis
Samples: *Derivatized system suitability solution 1*, *Derivatized standard solution*, *Derivatized sample solution*, and *Derivatized blank solution*
Disregard any peak corresponding to those from the *Derivatized blank solution*, and subtract the quantities of any such peaks found at the relative retention times of 0.36, 0.66, and 0.94 from those found in the *Derivatized sample solution*. For unknown peak determinations, disregard any peaks found in the chromatogram of the *Derivatized sample solution* that correspond to those in the chromatogram of *Derivatized system suitability solution 1*.
Calculate the percentage of each impurity in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

www.webofpharma.com

r_U = peak area of each impurity from the *Derivatized sample solution*
r_S = peak area of tobramycin from the *Derivatized standard solution*
C_S = concentration of USP Tobramycin RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of tobramycin in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Specified unidentified impurity	0.36	0.25
Deoxystreptamine kanosaminide	0.66	0.3
Nebramine	0.94	0.4
Kanamycin B	0.96	—
Tobramycin	1.0	—
Any individual unspecified impurity	—	0.1
Total unspecified impurities	—	0.2
Total impurities	—	1.0

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: It contains NMT 60 USP Endotoxin Units/mL.
- **STERILITY TESTS** ⟨71⟩: It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration.*
- **ABSORBANCE**
  Sample: Inhalation Solution
  Analysis: Determine the absorbance of the *Sample* at 410 nm in a 1-cm cell.
  Acceptance criteria: NMT 0.30
- **pH** ⟨791⟩: 4.5–6.5
- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections
- **OSMOLALITY AND OSMOLARITY** ⟨785⟩: The osmolality is 135–285 mOsmol/kg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in low-density, polyethylene, single-use ampules stored in light-resistant foil over-wrapped packaging, in a refrigerator.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Tobramycin RS

Tobramycin Ophthalmic Solution

DEFINITION

Tobramycin Ophthalmic Solution contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$). It may contain one or more suitable buffers, dispersants, preservatives, and tonicity agents.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**
  Diluent: Butyl alcohol and pyridine (100:1)
  Standard solution: 3 mg/mL of USP Tobramycin RS in water
  Sample solution: Ophthalmic Solution
  Solution A: *Standard solution* and *Sample solution* (1:1)
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography.*)
  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
  Application volume: 6 µL
  Developing solvent system: Methanol, chloroform, and ammonium hydroxide (60:25:30)
  Spray reagent: 10 mg/mL of ninhydrin in *Diluent*
  Analysis
  Samples: *Standard solution, Sample solution,* and *Solution A*
  Apply the *Standard solution,* the *Sample solution,* and *Solution A* to the plate. Place the plate in a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and heat the plate at 110° for 15 min. Immediately locate the spots on the plate by spraying it with *Spray reagent.*
  Acceptance criteria: Tobramycin appears as a pink spot, and the R_F values of the spots of the *Sample solution* and of *Solution A,* respectively, correspond to those of the *Standard solution.*
- **B.** The retention time of the major peak of the *Derivatized sample solution* corresponds to that of the *Derivatized standard solution* obtained as directed in the *Assay.*

ASSAY

- **PROCEDURE**
  Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl) aminomethane in 800 mL of water. Add 20 mL of 1 N sulfuric acid, and dilute with acetonitrile to obtain 2000 mL of solution. Cool, and pass through a filter of 0.2-µm or finer pore size.
  Solution A: 10 mg/mL of 2,4-dinitrofluorobenzene in alcohol. This solution may be used for 5 days if refrigerated when not in use.
  Solution B: 15 mg/mL of tris(hydroxymethyl) aminomethane in water. This solution may be used for 1 month if refrigerated when not in use.
  Solution C: 3 mg/mL of tris(hydroxymethyl)aminomethane prepared as follows. Transfer 40 mL of *Solution B* to a 200-mL volumetric flask. Add dimethyl sulfoxide while mixing, and dilute with dimethyl sulfoxide to volume. Use this reagent within 4 h. If kept immersed in an ice-water bath below 10°, the reagent may be used for up to 8 h.
  Standard stock solution: 0.66 mg of USP Tobramycin RS prepared as follows. Transfer 33 mg of USP Tobramycin RS into a 50-mL volumetric flask. Add 20 mL of water, 1 mL of 1 N sulfuric acid, and mix. Dilute with water to volume.
  Standard solution: 0.132 mg/mL of USP Tobramycin RS from *Standard stock solution* in water
  Sample solution: Nominally 0.12 mg/mL of tobramycin from Ophthalmic Solution in water
  Derivatized standard solution, Derivatized sample solution, and **Blank solution:** Proceed as follows. Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60° constant temperature bath at the same time.
  To separate 50-mL volumetric flasks transfer 5.0 mL of the *Standard solution,* 5.0 mL of the *Sample solution,* and 5.0 mL of water. To each flask add 10 mL of *Solution A* and 10 mL of *Solution C,* shake, and insert the stopper. Place the flasks in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, then dilute with acetonitrile to volume. The

  USP Tobramycin RS

Tobramycin and Dexamethasone Ophthalmic Suspension

DEFINITION
Tobramycin and Dexamethasone Ophthalmic Suspension is a sterile aqueous suspension containing Tobramycin and Dexamethasone. It contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$), and NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$).

IDENTIFICATION
- **A. THIN-LAYER CHROMATOGRAPHY**
  Diluent: Butyl alcohol and pyridine (100:1)
  Standard solution: 6 mg/mL of USP Tobramycin RS in water
  Sample solution: To 1 mL of Ophthalmic Suspension in a test tube add 100 mg of sodium sulfate, disperse by shaking, and centrifuge. Use the clear supernatant.
  Solution A: *Standard solution* and *Sample solution* (1:1)
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
  Application volume: 3 µL
  Developing solvent system: Methanol, chloroform, and ammonium hydroxide (60:25:30)
  Spray reagent: 10 mg/mL of ninhydrin in *Diluent*
  Analysis
  Samples: *Standard solution*, *Sample solution*, and *Solution A*
  Apply the *Standard solution*, the *Sample solution*, and *Solution A* to the plate. Place the plate in a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and heat the plate at 110° for 15 min. Immediately locate the spots on the plate by spraying it with *Spray reagent*.
  Acceptance criteria: Tobramycin appears as a pink spot, and the R_F values of the spots of the *Sample solution* and of *Solution A*, respectively, correspond to those of the *Standard solution*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Dexamethasone*.

ASSAY
- **TOBRAMYCIN**
  Mobile phase: Dissolve 2.0 g of tris(hydroxymethyl) aminomethane in 800 mL of water. Add 20 mL of 1 N sulfuric acid, and dilute with acetonitrile to obtain 2000 mL of solution. Cool, and pass through a filter of 0.2-µm or finer pore size.
  Solution A: 10 mg/mL of 2,4-dinitrofluorobenzene in alcohol. This solution may be used for 5 days if refrigerated when not in use.
  Solution B: 15 mg/mL of tris(hydroxymethyl) aminomethane in water. This solution may be used for 1 month if refrigerated when not in use.
  Solution C: 3 mg/mL of tris(hydroxymethyl)aminomethane prepared as follows. Transfer 40 mL of *Solution B* to a 200-mL volumetric flask. Add dimethyl sulfoxide while mixing, and dilute with dimethyl sulfoxide to volume. Use this reagent within 4 h. If kept immersed in an ice-water bath below 10°, the reagent may be used for up to 8 h.
  Standard stock solution: 1.1 mg of USP Tobramycin RS prepared as follows. Transfer 55 mg of USP Tobramycin RS into a 50-mL volumetric flask. Add 1 mL of 1 N sulfuric acid and enough water to dissolve it, and dilute with water to volume.
  Standard solution: 0.22 mg/mL of USP Tobramycin RS from *Standard stock solution* in water
  Sample solution: Nominally 0.09 mg/mL of tobramycin from Ophthalmic Suspension in water
  Derivatized standard solution, Derivatized sample solution, and **Blank solution:** Proceed as follows. Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60° constant temperature bath at the same time.
  To separate 50-mL volumetric flasks transfer 4.0 mL of the *Standard solution*, 10.0 mL of the *Sample solution*, and 4.0 mL of water. To each flask add 10 mL of *Solution A* and 10 mL of *Solution C*, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 min. Remove the flasks from the bath, and allow to stand for 10 min. Add acetonitrile to about 2 mL below the 50-mL mark, allow to cool to room temperature, then dilute with acetonitrile to volume. The solutions thus obtained are the *Derivatized standard solution*, the *Derivatized sample solution*, and the *Blank solution*, respectively.
  System suitability stock solution: 0.24 mg/mL of *p*-naphtholbenzein in acetonitrile. Prepare freshly.
  System suitability solution: Transfer 2 mL of the *System suitability stock solution* to a 10-mL volumetric flask, dilute with *Derivatized standard solution* to volume, and use promptly.
  Chromatographic system

Tobramycin and Fluorometholone Acetate Ophthalmic Suspension

DEFINITION
Tobramycin and Fluorometholone Acetate Ophthalmic Suspension is a sterile aqueous suspension of Tobramycin and Fluorometholone Acetate. It contains NLT 90.0% and NMT 120.0% of the labeled amount of tobramycin ($C_{18}H_{37}N_5O_9$) and NLT 90.0% and NMT 115.0% of the labeled amount of fluorometholone acetate ($C_{24}H_{31}FO_5$). It may contain suitable buffers, dispersants, tonicity-adjusting agents, and preservatives.

IDENTIFICATION
• **A.** The relative retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Fluorometholone Acetate*.
• **B. THIN-LAYER CHROMATOGRAPHY**
Diluent: Butyl alcohol and pyridine (100:1)
Standard solution: 6 mg/mL of USP Tobramycin RS in water
Sample solution: Allow the Ophthalmic Suspension to settle, and decant 1 mL of the supernatant into a test tube. Add 0.1 g of sodium sulfate and centrifuge. Use the clear supernatant.
Solution A: *Standard solution* and *Sample solution* (1:1)
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 3 µL

Relative standard deviation: NMT 2.0%, *Derivatized standard solution*

Analysis
Samples: *Derivatized standard solution*, *Derivatized sample solution*, and *Blank solution*
Use the *Blank solution* to identify the solvent and reagent peaks.
Calculate the quantity, in µg/mg, of tobramycin ($C_{18}H_{37}N_5O_9$) in the portion of Tobramycin Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area of tobramycin from the *Derivatized sample solution*
r_S = peak area of tobramycin from the *Derivatized standard solution*
C_S = concentration of USP Tobramycin RS in the *Standard solution* (mg/mL)
C_U = concentration of Tobramycin Sulfate in the *Sample solution* (mg/mL)
P = potency of tobramycin in USP Tobramycin RS (µg/mg)

Acceptance criteria: 634–739 µg/mg

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩
Analysis: Moisten the charred residue with 2 mL of nitric acid and 5 drops of sulfuric acid.
Acceptance criteria: NMT 1.0%

• **ORGANIC IMPURITIES**
Solution A: Dilute 20 mL of sodium hypochlorite solution with water to 100 mL.
Solution B: Dissolve 1.1 g of potassium iodide in 60 mL of water, boil for 15 min, and slowly add a suspension of 1.5 g of soluble starch in 10 mL of water. Add 25 mL of water, and boil for 10 min. Allow to cool, and dilute with water to 100 mL.
Solution C: 29.2 g of sodium chloride in 100 mL of water
Sample solution: Transfer 50 mg of Tobramycin Sulfate to a 10-mL volumetric flask, add 7 mL of water to dissolve it, and adjust with 1 N sulfuric acid to a pH of 5.5 ± 0.4. Dilute with water to volume.
Standard solution: 0.05 mg/mL of tobramycin from *Sample solution* in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 1 µL
Developing solvent system: Alcohol, *Solution C*, and water (30:50:20)
Analysis
Samples: *Sample solution* and *Standard solution*
Apply the *Sample solution* and the *Standard solution* to the plate. Develop the chromatogram in a saturated chromatographic chamber containing the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, evaporate the solvent in a current of hot air, then heat the plate at 110° for 10 min. Lightly spray the hot plate with *Solution A*. Dry the plate in a current of cold air until a sprayed area of the plate below the origin gives at most a faint blue color with a drop of *Solution B*. Then spray the plate with *Solution B*.
Acceptance criteria: Bluish-purple spots are immediately visible. Other than the principal tobramycin spot, no spot observed in the *Sample solution* is more intense than the principal spot from the *Standard solution* (1.0%).

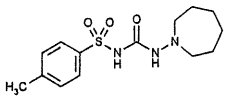
SPECIFIC TESTS

• **pH** ⟨791⟩
Sample solution: 40 mg/mL
Acceptance criteria: 6.0–8.0

• **WATER DETERMINATION,** *Method I* ⟨921⟩**:** NMT 2.0%

• **STERILITY TESTS** ⟨71⟩**:** Where the label states that Tobramycin Sulfate is sterile, it meets the requirements in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** Where the label states that Tobramycin Sulfate is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 2.00 USP Endotoxin Units/mg of tobramycin.



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** Where Tobramycin Sulfate is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

• **USP REFERENCE STANDARDS** ⟨11⟩

Tolazamide

$C_{14}H_{21}N_3O_3S$ 311.40
Benzenesulfonamide, *N*-[[(hexahydro-1*H*-azepin-1-yl)amino] carbonyl]-4-methyl-.
1-(Hexahydro-1*H*-azepin-1-yl)-3-(*p*-tolylsulfonyl)urea [1156-19-0].

» Tolazamide contains not less than 97.5 percent and not more than 102.5 percent of $C_{14}H_{21}N_3O_3S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

www.webofpharma.com

USP Reference standards ⟨11⟩—
USP Tolazamide RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The relative retention time of the major peak for tolazamide in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Loss on drying ⟨731⟩—Dry it at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%.

Selenium ⟨291⟩: 0.003%, a 200-mg specimen being used.

Limit of N-aminohexamethyleneimine—

Trisodium pentacyanoaminoferroate solution—Mix 1.0 g of sodium nitroferricyanide and 3.2 mL of ammonium hydroxide in a glass-stoppered flask, insert the stopper in the flask, and refrigerate the mixture overnight. Pour the solution into 10 mL of dehydrated alcohol, and collect the yellow precipitate that is formed on coarse filter paper in a Buchner-type funnel by filtration under reduced pressure. Wash the residue on the filter with anhydrous ether, and store the dry solid in a desiccator. Dissolve a portion of the dry solid in water to obtain a solution containing 1.0 mg per mL, store in a refrigerator, and use within 7 days.

Buffer solution—Dissolve 0.96 g of anhydrous citric acid and 2.92 g of dibasic sodium phosphate in 200 mL of water. Adjust by adding phosphoric acid or 1 N sodium hydroxide, if necessary, to a pH of 5.4 ± 0.1.

Standard solution—Transfer, with the aid of a syringe, 100 mg of N-aminohexamethyleneimine to a 200-mL volumetric flask, dilute with acetone to volume, and mix. Dilute the resulting solution quantitatively with acetone to obtain a solution containing 12.5 µg per mL. Pipet 2 mL of this solution into a 25-mL glass-stoppered flask, add 8.0 mL of *Buffer solution*, shake the mixture, allow to stand for 15 minutes, and filter. Collect the filtrate in a suitable glass-stoppered tube, and use the filtrate as the *Standard solution*.

Test solution—Transfer 0.50 g of Tolazamide to a glass-stoppered, 25-mL flask, add 2.0 mL of acetone, insert the stopper in the flask, and shake the mixture vigorously for 15 minutes. Add 8.0 mL of *Buffer solution*, shake the mixture, allow to stand for 15 minutes, and filter. Collect the filtrate in a suitable glass-stoppered tube, and use the filtrate as the *Test solution*.

Procedure—Add 1.0 mL of *Trisodium pentacyanoaminoferroate solution* to the *Standard solution* and to the *Test solution*, and mix both solutions: the intensity of any pink color that may develop in the *Test solution* within 30 minutes does not exceed that produced in the *Standard solution* within 30 minutes (0.005%).

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (100:100:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Tolazamide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.014 mg per mL.

Test solution— [NOTE—Make solution fresh before each injection.] Transfer about 140 mg of Tolazamide, accurately weighed, to a 100-mL volumetric flask, dissolve in *Mobile phase*, sonicating if necessary, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 3.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Tolazamide taken by the formula:

$$100(1/F)(r_i/r_s)$$

in which F is the relative response factor, which is equal to 0.52 for the *p*-toluenesulfonic acid peak eluting at a relative retention time of 0.23 and equal to 1.0 for all other peaks; r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.5% of any individual impurity is found; and not more than 1.5% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of hexane, water-saturated hexane, tetrahydrofuran, alcohol, and glacial acetic acid (475:475:20:15:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve a suitable quantity of Tolbutamide in alcohol-free chloroform to obtain a solution having a known concentration of about 1.5 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Tolazamide RS in *Internal standard solution* to obtain a solution having a known concentration of about 3 mg per mL.

Assay preparation—Transfer about 30 mg of Tolazamide, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 10-µm packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the analyte and internal standard peaks is not less than 2.0; and the relative standard deviation for four replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for the internal standard and 1.0 for tolazamide. Calculate the quantity, in mg, of $C_{14}H_{21}N_3O_3S$ in the portion of Tolazamide taken by the formula:

$$10C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Tolazamide RS in the *Standard preparation*; and R_U and R_S are the ratios of the analyte peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

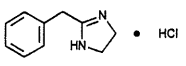
USP Monographs

www.webofpharma.com

Tolazamide Tablets

» Tolazamide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{14}H_{21}N_3O_3S$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Tolazamide RS
Identification—Triturate a quantity of Tablets, equivalent to about 250 mg of tolazamide, with 50 mL of chloroform, and filter. Evaporate the filtrate to dryness, and dry in vacuum at 60° for 3 hours: the residue so obtained responds to *Identification* test *A* under *Tolazamide*.



Dissolution ⟨711⟩—
Medium: 0.05 M Tris(hydroxymethyl)aminomethane, pH 7.6, adjusted, if necessary, with hydrochloric acid to a pH of 7.6; 900 mL.
Apparatus 2: 75 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{14}H_{21}N_3O_3S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 224 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Tolazamide RS in the same medium. [NOTE—Sonicate the Standard solution until the Reference Standard is dissolved.]
Tolerances—Not less than 70% (*Q*) of the labeled amount of $C_{14}H_{21}N_3O_3S$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Internal standard preparation , *Mobile phase*, and *Standard preparation*—Prepare as directed in the *Assay* under *Tolazamide*.
Assay preparation—Weigh and finely powder not less than 10 Tablets. Weigh accurately a portion of the powder, equivalent to about 300 mg of tolazamide, and transfer to a suitable container. Add 100.0 mL of *Internal standard solution* and about 20 glass beads. Securely close the container, and shake vigorously for approximately 30 minutes. Centrifuge, and use the clear liquid as the *Assay preparation*.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tolazamide*. Calculate the quantity, in mg, of $C_{14}H_{21}N_3O_3S$ in the portion of Tablets taken by the formula:

$$100C(R_U/R_S)$$

in which the terms are as defined therein.

Tolazoline Hydrochloride

$C_{10}H_{12}N_2 \cdot HCl$ 196.68
1*H*-Imidazole, 4,5-dihydro-2-(phenylmethyl)-, monohydrochloride.
2-Benzyl-2-imidazoline monohydrochloride [59-97-2].

» Tolazoline Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{10}H_{12}N_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.
USP Reference standards ⟨11⟩—
USP Tolazoline Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).
B: The R_F value of the principal spot in the chromatogram of the *Identification* corresponds to that of *Standard solution A*, as obtained in the test for *Chromatographic purity*.
Melting range ⟨741⟩: between 172.0° and 176.0°.
Loss on drying ⟨731⟩—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.2% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.

Chromatographic purity—
Standard solutions—Dissolve USP Tolazoline Hydrochloride RS in methanol, and mix to obtain *Standard solution A* having a known concentration of 100 µg per mL. Quantitatively dilute with methanol to obtain *Standard solutions*, designated below by letter, having the following compositions:

Standard solution	Dilution	Concentration (µg RS per mL)	Percentage (%, for comparison with test specimen)
A	undiluted	100	0.5
B	4 in 5	80	0.4
C	3 in 5	60	0.3
D	2 in 5	40	0.2
E	1 in 5	20	0.1

Test solution—Dissolve an accurately weighed quantity of Tolazoline Hydrochloride in methanol to obtain a solution containing 20 mg per mL.
Identification solution—Quantitatively dilute a portion of the *Test solution* with methanol to obtain a solution containing 100 µg per mL.
Detection reagent—Prepare (1) a solution of 0.5 g of potassium iodide in 50 mL of water, and (2) a solution of 1.5 g of soluble starch in 50 mL of boiling water. Just prior to use, mix 10 mL of each solution with 3 mL of alcohol.
Procedure—Apply separately 5 µL of the *Test solution*, 5 µL of the *Identification solution*, and 5 µL of each *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol and ammonium hydroxide (95:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to dry under a current of warm air for at least 30 minutes. Expose the plate to chlorine gas for not more than 5 minutes, and air-dry until the chlorine has dissipated (about 15 minutes). Spray the plate with *Detection reagent*,

www.webofpharma.com

and immediately compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* the sum of the intensities of all secondary spots obtained from the *Test solution* corresponds to not more than 1.0%.

Assay—Dissolve about 300 mg of Tolazoline Hydrochloride, accurately weighed, in 100 mL of glacial acetic acid; add 25 mL of mercuric acetate TS; and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩), using a calomel–glass electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.67 mg of $C_{10}H_{12}N_2 \cdot HCl$.

Tolazoline Hydrochloride Injection

» Tolazoline Hydrochloride Injection is a sterile solution of Tolazoline Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{10}H_{12}N_2 \cdot HCl$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.
USP Reference standards ⟨11⟩**—**
USP Tolazoline Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020)—Obtain the test specimen as follows. Steam-distill a volume of Injection, equivalent to about 250 mg of tolazoline hydrochloride, for 5 to 10 minutes, and discard the distillate. Transfer the remaining solution to a separator, add about 2 mL of 1 N sodium hydroxide, and extract with 20 mL of ether. Filter the ether extract through cotton into a beaker, evaporate to dryness, and dry the residue in vacuum over silica gel for 4 hours.

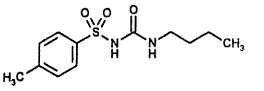
B: It responds to *Identification* test *B* under *Tolazoline Hydrochloride.*

C: To 1 mL of Injection add 1 mL of ammonium reineckate TS: a pink precipitate is formed.

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.8 USP Endotoxin Unit per mg of tolazoline hydrochloride.
pH ⟨791⟩: between 3.0 and 4.0.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Standard preparation—Transfer about 30 mg of USP Tolazoline Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.



Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 150 mg of tolazoline hydrochloride, to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 20.0 mL of this solution to a second 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Transfer 3.0 mL each of the *Standard preparation*, the *Assay preparation*, and methanol to provide the blank, to separate 25-mL volumetric flasks. To each flask add 1 mL of 0.5 N sodium hydroxide and 1 mL of dilute sodium nitroferricyanide TS (1 in 2), mix, and allow to stand for 10 minutes. Add 3 mL of sodium bicarbonate solution (1 in 12) to each flask, dilute with water to volume, mix, and allow to stand for 10 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 565 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{10}H_{12}N_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(0.5C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tolazoline Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Tolbutamide

$C_{12}H_{18}N_2O_3S$ 270.35
Benzenesulfonamide, *N*-[(butylamino)carbonyl]-4-methyl-.
1-Butyl-3-(*p*-tolylsulfonyl)urea [64-77-7].

» Tolbutamide contains not less than 97.0 percent and not more than 103.0 percent of $C_{12}H_{18}N_2O_3S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.
Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
USP Reference standards ⟨11⟩**—**
USP Tolbutamide RS

Change to read:

Identification, ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).
Melting range ⟨741⟩: between 126° and 130°.
Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.
Selenium ⟨291⟩: 0.003%, a 100-mg specimen, mixed with 100 mg of magnesium oxide, being used.
Limit of non-sulfonyl urea—Dissolve 500 mg in 10 mL of 0.5 N ammonium hydroxide: not more than a faint opalescence occurs.
Other requirements—Where the label states that Tolbutamide is sterile, it meets the requirements for *Sterility Tests* ⟨71⟩ and for *Bacterial endotoxins* under *Tolbutamide for Injection.* Where the label states that Tolbutamide must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Tolbutamide for Injection.*

Assay—

Mobile phase—Prepare a filtered and degassed mixture of hexane, water-saturated-hexane, tetrahydrofuran, alcohol,

USP Monographs

www.webofpharma.com

and glacial acetic acid (475:475:20:15:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve a suitable quantity of tolazamide in alcohol-free chloroform to obtain a solution containing about 3 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Tolbutamide RS in *Internal standard solution* to obtain a solution having a known concentration of about 1.5 mg per mL.

Assay preparation—Transfer about 15 mg of Tolbutamide, accurately weighed, to a 10-mL volumetric flask. Dissolve in and dilute with *Internal standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 30-cm column that contains packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%, and the resolution, *R*, between tolbutamide and tolazamide is not less than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for tolbutamide and 1.0 for tolazamide. Calculate the quantity, in mg, of $C_{12}H_{18}N_2O_3S$ in the portion of Tolbutamide taken by the formula:

$$10C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Tolbutamide RS in the *Standard preparation*, and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Tolbutamide for Injection

» Tolbutamide for Injection is prepared from Tolbutamide with the aid of Sodium Hydroxide. It contains an amount of tolbutamide sodium equivalent to not less than 95.0 percent and not more than 105.0 percent of the labeled amount of tolbutamide ($C_{12}H_{18}N_2O_3S$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution.*

USP Reference standards ⟨11⟩—
USP Tolbutamide RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* ⟨1⟩, *Specific Tests, Completeness and clarity of solutions.*

Change to read:

▲ ***Spectroscopic Identification Tests*** ⟨197⟩, *Infrared Spectroscopy:* ***197M***▲ (CN 1-May-2020)—Obtain the test specimen as follows. Place about 200 mg in a suitable container, dissolve in about 20 mL of water, add 2 mL of 2 N sulfuric acid, and extract with 10 mL of chloroform. Filter, and evaporate an aliquot of the chloroform layer. Dry the residue at 105° for 3 hours. Use USP Tolbutamide RS

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 0.35 USP Endotoxin Unit per mg of tolbutamide sodium.

pH ⟨791⟩: between 8.0 and 9.8, in a solution containing 50 mg per mL.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

Other requirements—It meets the requirements for *Sterility Tests* ⟨71⟩, *Uniformity of Dosage Units* ⟨905⟩, and *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products.*

Assay—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay* under *Tolbutamide.*

Internal standard solution—Prepare a solution of tolazamide in alcohol-free chloroform containing about 15 mg per mL.

Diluting solution—Prepare an alcohol-free chloroform solution containing 3% (v/v) of glacial acetic acid.

Standard preparation—Dissolve an accurately weighed quantity of USP Tolbutamide RS in *Internal standard solution* to obtain a known concentration of about 7.5 mg per mL. Add *Diluting solution* to obtain a *Standard preparation* having a final known concentration of about 1.5 mg of tolbutamide per mL.

Assay preparation—Add about 15 mL of water to 1 container of Tolbutamide for Injection, and shake vigorously to dissolve the contents. Transfer the contents, using adequate rinsing with water, to a 50-mL volumetric flask. Dilute with water to volume, and mix. Transfer an accurately measured portion of this solution, equivalent to about 75 mg of tolbutamide, to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, and dilute with *Diluting solution* to volume. Shake vigorously for about 15 minutes, and centrifuge or allow to stand for about 15 minutes. Use the lower, clear layer, as the *Assay preparation.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for tolbutamide and 1.0 for tolazamide. Calculate the quantity, in mg, of $C_{12}H_{18}N_2O_3S$ in the portion of solution taken for the *Assay preparation* by the formula:

$$50C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Tolbutamide RS in the *Standard preparation*, and R_U and R_S are the peak response ratios of the tolbutamide and internal standard peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Tolbutamide Tablets

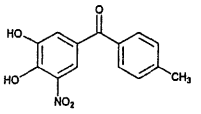
» Tolbutamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{18}N_2O_3S$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—
USP Tolbutamide RS

Identification—Triturate a quantity of finely powdered Tablets, equivalent to about 500 mg of tolbutamide, with 50 mL of chloroform, and filter. Evaporate the clear filtrate on a steam bath to dryness: the residue so obtained responds to *Identification* test *A* under *Tolbutamide.*

www.webofpharma.com



Dissolution ⟨711⟩—
Medium: pH 7.4 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.
Apparatus 2: 75 rpm.
Time: 30 minutes.
Procedure—Measure the amount in solution in filtered portions of the *Dissolution Medium*, suitably diluted with water, if necessary, at the wavelength of maximum absorbance at about 226 nm, with a suitable spectrophotometer, in comparison with a solution having a known concentration of USP Tolbutamide RS. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Dissolution Medium.*
Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{12}H_{18}N_2O_3S$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Mobile phase , Internal standard solution, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay* under *Tolbutamide.*
Assay preparation—Weigh and finely powder not less than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 150 mg of tolbutamide, to a suitable container. Add 100.0 mL of *Internal standard solution* and about 20 glass beads. Securely close the container, and shake vigorously by mechanical means for approximately 30 minutes. Centrifuge and use the clear supernatant.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Tolbutamide.* Calculate the quantity, in mg, of $C_{12}H_{18}N_2O_3S$ in the portion of Tablets taken by the formula:

$$100C(R_U/R_S)$$

in which the terms are as defined therein.

Tolcapone

$C_{14}H_{11}NO_5$ 273.24
Methanone, (3,4-dihydroxy-5-nitrophenyl)(4-methylphenyl)-;
3,4-Dihydroxy-4′-methyl-5-nitrobenzophenone [134308-13-7].

DEFINITION
Tolcapone contains NLT 98.5% and NMT 101.5% of tolcapone ($C_{14}H_{11}NO_5$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY
- **PROCEDURE**

Diluent: Methanol and acetonitrile (24:15)
Buffer: Transfer 6.8 g of monobasic potassium phosphate into a 1-L volumetric flask. Dissolve in about 980 mL of water. Adjust with phosphoric acid to a pH of 2.0. Dilute with water to volume.
Mobile phase: Acetonitrile, methanol, and *Buffer* (25:40:35)
System suitability stock solution: 5 µg/mL of USP Tolcapone Related Compound A RS, 5 µg/mL of USP Tolcapone RS, and 10 µg/mL of USP Tolcapone Related Compound B RS in *Diluent*
System suitability solution: 0.1 µg/mL of USP Tolcapone Related Compound A RS, 0.1 µg/mL of USP Tolcapone RS, and 0.2 µg/mL of USP Tolcapone Related Compound B RS from *System suitability stock solution* prepared as follows. Transfer a suitable volume of *System suitability stock solution* to a suitable volumetric flask. Add 63% of the flask volume of *Diluent* and dilute with water to volume.
Standard stock solution: 1.0 mg/mL of USP Tolcapone RS in *Diluent*
Standard solution: 0.1 mg/mL of USP Tolcapone RS from *Standard stock solution* prepared as follows. Transfer a suitable volume of *Standard stock solution* to a suitable volumetric flask. Add 55% of the flask volume of *Diluent* and dilute with water to volume.
Sample stock solution: 1.0 mg/mL of Tolcapone in *Diluent*
Sample solution: 0.1 mg/mL of Tolcapone from *Sample stock solution* prepared as follows. Transfer a suitable volume of *Sample stock solution* to a suitable volumetric flask. Add 55% of the flask volume of *Diluent* and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 230 nm
Column: 4.0-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times are given in *Table 1.*]
Suitability requirements
Resolution: NLT 4.0 between tolcapone related compound B and tolcapone, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tolcapone ($C_{14}H_{11}NO_5$) in the portion of Tolcapone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Tolcapone RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.5% on the anhydrous and solvent-free basis

IMPURITIES

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tolcapone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of any impurity from the *Sample solution*
r_S = peak area of tolcapone from the *Standard solution*
C_S = concentration of USP Tolcapone RS in the *Standard solution* (mg/mL)
C_U = concentration of Tolcapone in the *Sample solution* (mg/mL)
F = relative response factor of the impurity (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tolcapone related compound A	0.6	0.87	0.1
Tolcapone	1.0	—	—
Tolcapone related compound B	1.4	1.0	0.2
Any individual unspecified impurity	—	1.0	0.1
Total impurities	—	—	0.5

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method I* ⟨921⟩: NMT 0.1%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tolcapone RS
USP Tolcapone Related Compound A RS
4′-Methyl-3,4-dihydroxybenzophenone.
$C_{14}H_{12}O_3$ 228.24

$C_{15}H_{13}NO_5$ 287.27

Tolcapone Tablets

DEFINITION
Tolcapone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tolcapone ($C_{14}H_{11}NO_5$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197D**▲ (CN 1-May-2020)
Wavelength range: Between 2200 and 1090 cm^{-1}
Sample: Grind 10 Tablets to a fine powder.
Analysis: Transfer an amount of powder equivalent to 3 mg of tolcapone into a polystyrene vial containing 2 mixing beads. Add 300 mg of IR-grade potassium bromide, and disperse the material in the matrix by agitating the capped vial in a grinding mill for 2 min. Transfer a portion of the material to a sample cup. Record the diffuse reflectance IR spectrum.
Acceptance criteria: The spectrum thus obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Tolcapone RS, concomitantly measured.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Diluent 1: Methanol and acetonitrile (24:15)
Diluent 2: Acetonitrile, methanol, and water (25:40:35)
Buffer: Transfer 6.8 g of monobasic potassium phosphate into a 1-L volumetric flask. Dissolve in about 980 mL of water. Adjust with phosphoric acid to a pH of 2.0. Dilute with water to volume.
Mobile phase: Acetonitrile, methanol, and *Buffer* (25:40:35)
System suitability solution: 100 µg/mL of USP Tolcapone RS, 10 µg/mL of USP Tolcapone Related Compound A RS, and 10 µg/mL of USP Tolcapone Related Compound B RS in *Diluent 2*
Standard stock solution: 1.0 mg/mL of USP Tolcapone RS in *Diluent 1*
Standard solution: 0.1 mg/mL of USP Tolcapone RS from *Standard stock solution* prepared as follows. Transfer a suitable volume of *Standard stock solution* to a suitable volumetric flask. Add 55% of the flask volume of *Diluent 1* and dilute with water to volume.
Sample stock solution: Nominally 1.0 mg/mL of tolcapone from NLT 20 Tablets prepared as follows. Finely powder the Tablets and transfer a portion of the powder equivalent to NLT 100 mg of tolcapone to a suitable volumetric flask, add 10% of the flask volume of water, and sonicate for 10 min. Add 65% of the flask volume of *Diluent 1*, and sonicate for 15 min. Allow the sample to settle. If the material is still undispersed, sonicate for an additional 5 min. Dilute with water to volume, and mix. Centrifuge a portion of this solution.
Sample solution: Nominally 0.1 mg/mL of tolcapone from the centrifuged *Sample stock solution* prepared as follows. Transfer a suitable volume of the *Sample stock solution* to a suitable volumetric flask. Dilute with *Diluent 2* to volume. Pass a portion of the solution through a filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.0-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times are given in *Table 1*.]
Suitability requirements
Resolution: NLT 4.0 between tolcapone related compound B and tolcapone, *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tolcapone ($C_{14}H_{11}NO_5$) in the portion of Tablets taken:

www.webofpharma.com

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tolcapone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tolcapone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩
Medium: pH 6.8 phosphate buffer containing 1% of sodium lauryl sulfate; 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Standard stock solution: 1 mg/mL of USP Tolcapone RS prepared as follows. Transfer a suitable quantity of USP Tolcapone RS to a suitable volumetric flask. Add 10% of the flask volume of methanol. Dissolve and dilute with *Medium* to volume.
Standard solution: (L/1000) mg/mL of USP Tolcapone RS from a suitable volume of *Standard stock solution* in *Medium*, where L is the label claim, in mg/Tablet
Sample solution: Filter portions of the solution under test, suitably diluted with *Medium* if necessary.
Instrumental conditions
Mode: UV
Analytical wavelength: 271 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tolcapone ($C_{14}H_{11}NO_5$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tolcapone RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
D = dilution factor if dilution was necessary
L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of tolcapone ($C_{14}H_{11}NO_5$) is dissolved.
• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES

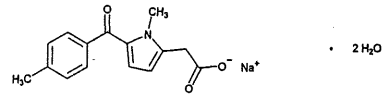
• **Organic Impurities**
Diluent 1, Diluent 2, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of any degradation product in the *Sample solution*
r_S = peak area of tolcapone in the *Standard solution*
C_S = concentration of USP Tolcapone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1



Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tolcapone related compound A[a]	0.6	—
Tolcapone	1.0	—
Tolcapone related compound B[a]	1.4	—
Any individual unspecified degradation product	—	0.1
Total degradation products	—	0.5

[a] Process impurity, controlled in the drug substance, and included for information only. Not to be included in total degradation products.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in tight containers, and store at controlled room temperature.
• **USP Reference Standards** ⟨11⟩
USP Tolcapone RS
USP Tolcapone Related Compound A RS
4′-Methyl-3,4-dihydroxybenzophenone.
$C_{14}H_{12}O_3$ 228.24
USP Tolcapone Related Compound B RS
4-Hydroxy-3-methoxy-4′-methyl-5-nitrobenzophenone.
$C_{15}H_{13}NO_5$ 287.27

Tolmetin Sodium

$C_{15}H_{14}NNaO_3 \cdot 2H_2O$ 315.30
$C_{15}H_{14}NNaO_3$ 279.27
1*H*-Pyrrole-2-acetic acid, 1-methyl-5-(4-methylbenzoyl)-, sodium salt, dihydrate;
Sodium 1-methyl-5-*p*-toluoylpyrrole-2-acetate dihydrate [64490-92-2].
Anhydrous [35711-34-3].

DEFINITION

Tolmetin Sodium contains NLT 98.0% and NMT 102.0% of tolmetin sodium ($C_{15}H_{14}NNaO_3$), calculated on the dried basis.

IDENTIFICATION

• **A. ▲Spectroscopic Identification Tests** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Change to read:

• **B. ▲Spectroscopic Identification Tests** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
Sample solution: 10 µg/mL in pH 7 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*)

www.webofpharma.com

Medium: pH 7 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*)
Acceptance criteria: Meets the requirements
• **C. Identification Tests—General,** *Sodium* ⟨191⟩
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements of the test for sodium

ASSAY
• **Procedure**
Sample: 300 mg
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Endpoint detection: Potentiometric
Analysis: Dissolve the *Sample* by warming in 150 mL of glacial acetic acid. Cool to room temperature, and titrate with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 27.93 mg of tolmetin sodium ($C_{15}H_{14}NNaO_3$).
Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
• **Organic Impurities**
Standard stock solution: 12.5 mg/mL of USP Tolmetin Sodium RS in methanol
Standard solution: 62.5 µg/mL of USP Tolmetin Sodium RS in methanol from *Standard stock solution*
Sample solution: 12.5 mg/mL of Tolmetin Sodium in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Absorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 20 µL
Developing solvent system: Chloroform and glacial acetic acid (95:5)
Analysis
Samples: *Standard stock solution*, *Standard solution*, and *Sample solution*
Develop the chromatogram in the solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, air-dry, and view under short-wavelength UV light.
Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard stock solution*. Any other spot of the *Sample solution* does not exceed in size or intensity of the principal spot of the *Standard solution* (0.5%), and the sum of the total impurities, based on a comparison of the intensities of all such other spots with the *Standard solution*, does not exceed 2.0%.

SPECIFIC TESTS
• **Loss on Drying** ⟨731⟩
Analysis: Dry a sample under vacuum at 60° for 4 h.
Acceptance criteria: 10.4%–12.4%

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in well-closed containers.
• **USP Reference Standards** ⟨11⟩
USP Tolmetin Sodium RS

Tolmetin Sodium Capsules

DEFINITION
Tolmetin Sodium Capsules contain an amount of tolmetin sodium equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of tolmetin ($C_{15}H_{15}NO_3$).

IDENTIFICATION
• **A. Ultraviolet Absorption**
Standard stock solution: 0.1 mg/mL of USP Tolmetin Sodium RS in methanol
Standard solution: 0.01 mg/mL of USP Tolmetin Sodium RS from the *Standard stock solution* diluted with 0.1 N sodium hydroxide
Sample solution: Transfer a quantity of Capsule contents, equivalent to 10 mg of tolmetin, to a 100-mL volumetric flask. Add 50 mL of methanol, shake for 2 min, and dilute with methanol to volume. Filter a portion of this solution, transfer 10.0 mL of the filtrate to a second 100-mL volumetric flask, and dilute with 0.1 N sodium hydroxide to volume.
Analysis
Samples: *Standard solution* and *Sample solution*
Concomitantly measure the UV absorption.
Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Buffer: 1.7 g/L of tetrabutylammonium phosphate. Adjust with phosphoric acid to a pH of 2.7 ± 0.1.
Mobile phase: Acetonitrile and *Buffer* (36:64)
Diluent: Acetonitrile and 0.01 N sodium hydroxide (40:60)
System suitability solution: 200 µg/mL of *p*-toluic acid and 500 µg/mL of USP Tolmetin Sodium RS in *Diluent*
Standard solution: 0.65 mg/mL of anhydrous tolmetin sodium from USP Tolmetin Sodium RS in *Diluent*
Sample solution: Transfer the equivalent of 60 mg of tolmetin from the powdered contents of NLT 20 Capsules to a 100-mL volumetric flask. Add 75 mL of *Diluent*, and shake by mechanical means for 30 min. Dilute with *Diluent* to volume, and pass through a filter of 0.45-µm or finer pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 40 ± 1.0°
Flow rate: 3 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 1.2 between the *p*-toluic acid and tolmetin sodium peaks, *System suitability solution*
Relative standard deviation: NMT 3.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tolmetin ($C_{15}H_{15}NO_3$) in the portion of Capsule contents taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the USP Tolmetin Sodium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tolmetin in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tolmetin, 257.29
M_{r2} = molecular weight of anhydrous tolmetin sodium, 279.27

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Solution A: Dissolve 2.0 g of sodium chloride in 7.0 mL of hydrochloric acid, and add water to 1000 mL.
Solution B: Dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water, and add 190 mL of 0.2 N sodium hydroxide and 400 mL of water. Adjust with 0.2 N sodium hydroxide to a pH of 7.4–7.6. Dilute with water to 1000 mL.
Medium: *Solution A* and *Solution B* (336:664). Adjust the solution with small amounts of either solution to a pH of 4.5; 900 mL.
Apparatus 2: 50 rpm
Time: 30 min
Standard solution: USP Tolmetin Sodium RS in *Medium* at a known concentration
Sample solutions: Sample per *Dissolution* ⟨711⟩. Dilute with 0.1 N sodium hydroxide, as needed, and filter.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Solution A: Dissolve 2.0 g of sodium chloride in 7.0 mL of hydrochloric acid, and add water to 1000 mL.

Solution B: Dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water, and add 190 mL of 0.2 N sodium hydroxide and 400 mL of water. Adjust the solution with 0.2 N sodium hydroxide to a pH of 7.4–7.6. Dilute with water to 1000 mL.

Medium: *Solution A* and *Solution B* (336:664). Adjust the solution with small amounts of either solution to a pH of 4.5; 900 mL.

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: USP Tolmetin Sodium RS in *Medium* at a known concentration

Sample solutions: Sample per *Dissolution* ⟨711⟩. Dilute with 0.1 N sodium hydroxide, as needed, and filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: UV

Analytical wavelength: 322 nm

Analysis

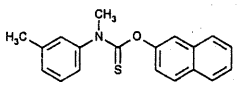
Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tolmetin ($C_{15}H_{15}NO_3$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tolmetin Sodium RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
D = dilution factor of the *Sample solution*

Tolerances: NLT 75% (Q) of the labeled amount of tolmetin ($C_{15}H_{15}NO_3$) is dissolved.



• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tolmetin Sodium RS

Tolnaftate

$C_{19}H_{17}NOS$ 307.41

Carbamothioic acid, methyl(3-methylphenyl)-, *O*-2-naphthalenyl ester.

O-2-Naphthyl *m*,*N*-dimethylthiocarbanilate [2398-96-1].

» Tolnaftate contains not less than 98.0 percent and not more than 102.0 percent of $C_{19}H_{17}NOS$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—
USP Tolnaftate RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The UV absorption spectrum of the solution employed for measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Tolnaftate RS, concomitantly measured.

C: Prepare a test solution by dissolving 10 mg in 10 mL of alcohol. Apply 10 µL of this test solution and 10 µL of a Standard solution of USP Tolnaftate RS in alcohol having a concentration of 1.0 mg per mL to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram, using toluene as the solvent system, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, allow the solvent to evaporate, and view under short-wavelength UV light: the R_F value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Melting range ⟨741⟩: between 110° and 113°.

Loss on drying ⟨731⟩—Dry it in vacuum at 65° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Assay—Dissolve about 50 mg of Tolnaftate, accurately weighed, in methanol, and dilute the solution quantitatively and stepwise with methanol to obtain a concentration of about 10 µg per mL. Dissolve an accurately weighed quantity of USP Tolnaftate RS in methanol, and dilute quantitatively and stepwise with methanol to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 258 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of $C_{19}H_{17}NOS$ in the portion of Tolnaftate taken by the formula:

$$5C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tolnaftate RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Tolnaftate and the Standard solution, respectively.

Tolnaftate Topical Aerosol

» Tolnaftate Topical Aerosol is a suspension of powder in suitable propellants in a pressurized container. The powder contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tolnaftate ($C_{19}H_{17}NOS$).

Packaging and storage—Preserve in tight, pressurized containers. Store at controlled room temperature, and avoid exposure to excessive heat.

USP Reference standards ⟨11⟩—
USP Tolnaftate RS

Identification—It meets the requirements of the *Identification* test under *Tolnaftate Topical Powder*.

Other requirements—It meets the requirements for *Pressure Test*, *Minimum Fill*, and *Leakage Test* under *Aerosols*,

www.webofpharma.com

Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers ⟨601⟩.

Assay—

Mobile phase, Internal standard solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Tolnaftate Topical Powder.*

Assay preparation—Remove the actuator button, and replace it with an actuator button that has a small-diameter, stiff polyethylene tube about 15 cm in length fitted tightly into the orifice. Deliver the entire contents of the Topical Aerosol into a conical flask, and heat the flask gently to expel the liquid phase. Cool, mix, and transfer an accurately weighed portion of the powder, equivalent to about 5 mg of tolnaftate, to a screw-capped, 50-mL centrifuge tube. Proceed as directed in the *Assay* under *Tolnaftate Topical Powder,* beginning with "Add 25.0 mL of methanol."

Procedure—Proceed as directed in the *Assay* under *Tolnaftate Topical Powder.*

Tolnaftate Cream

» Tolnaftate Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{17}NOS$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Tolnaftate RS
Identification—Evaporate 10 mL of the next-to-final chloroform solution prepared in the *Assay* on a steam bath just to dryness, and dissolve the residue in 1 mL of alcohol. Using this as the test solution, proceed as directed in *Identification* test *C* under *Tolnaftate:* the specified result is observed.
Minimum fill ⟨755⟩: meets the requirements.
Assay—Transfer a portion of Cream, equivalent to about 10 mg of tolnaftate and accurately weighed, to a 250-mL separator containing about 75 mL of chloroform. Wash the chloroform solution successively with two 25-mL portions of 0.1 N sodium hydroxide, two 25-mL portions of 0.1 N hydrochloric acid, and 25 mL of water. Filter the chloroform layer through a chloroform-washed cotton pledget into a 100-mL volumetric flask. Add chloroform to volume, and mix. [NOTE—Reserve a 10-mL portion of this solution for the *Identification* test.] Dilute 5.0 mL of the solution with chloroform to 50.0 mL, and mix. Dissolve an accurately weighed quantity of USP Tolnaftate RS in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 258 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of $C_{19}H_{17}NOS$ in the portion of Cream taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tolnaftate RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Cream and the Standard solution, respectively.

Tolnaftate Gel

» Tolnaftate Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{17}NOS$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Tolnaftate RS
Identification—It responds to the *Identification* test under *Tolnaftate Cream.*
Minimum fill ⟨755⟩: meets the requirements.
Assay—Proceed with Gel as directed in the *Assay* under *Tolnaftate Cream,* except to omit the filtration of the chloroform layer through a chloroform-washed cotton pledget.

Tolnaftate Topical Powder

» Tolnaftate Topical Powder contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{17}NOS$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Tolnaftate RS
Identification—Evaporate the 5-mL portion of the methanol solution, reserved from the *Assay preparation,* on a steam bath just to dryness, and dissolve the residue in 1 mL of alcohol. Using this as the test solution, proceed as directed in *Identification* test *C* under *Tolnaftate:* the specified result is observed.
Minimum fill ⟨755⟩: meets the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve progesterone in methanol to obtain a solution containing about 1 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Tolnaftate RS in methanol to obtain a solution having a known concentration of about 0.22 mg per mL. Transfer 20.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution,* dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.088 mg of USP Tolnaftate RS per mL.

Assay preparation—Transfer an accurately weighed quantity of Topical Powder, equivalent to about 5 mg of tolnaftate, to a screw-capped, 50-mL centrifuge tube. Add 25.0 mL of methanol, place the cap on the tube, rotate on a rotating device for 10 minutes, and centrifuge at about 2000 rpm for 5 minutes. Pass the supernatant through a 0.45-µm porosity filter, and transfer 20.0 mL of the filtrate to a 50-mL volumetric flask, retaining the remaining portion of the filtrate (about 5 mL) for the *Identification* test. Add 5.0 mL of *Internal standard solution* to the volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,*

www.webofpharma.com

between the analyte and internal standard peaks is not less than 3.0, and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for progesterone and 1.0 for tolnaftate. Calculate the quantity, in mg, of $C_{19}H_{17}NOS$ in the portion of Powder taken by the formula:

$$62.5C(R_U/R_S)$$

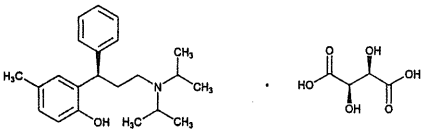
in which C is the concentration, in mg per mL, of USP Tolnaftate RS in the *Standard preparation*, and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Tolnaftate Topical Solution

» Tolnaftate Topical Solution contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{19}H_{17}NOS$.

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—
USP Tolnaftate RS



Identification—Evaporate 25 mL of the next-to-final chloroform solution prepared in the *Assay* on a steam bath just to dryness, and dissolve the residue in 1 mL of alcohol. Using this as the test solution, proceed as directed in *Identification* test C under *Tolnaftate:* the specified result is observed.

Assay—Pipet into a separator a volume of Topical Solution, equivalent to about 10 mg of tolnaftate, add 50 mL of chloroform, and extract with 50 mL of 0.1 N sodium hydroxide. Filter the chloroform layer through a chloroform-washed cotton pledget into a 250-mL volumetric flask, and extract the aqueous layer with two 45-mL portions of chloroform, filtering each portion into the flask. Add chloroform to volume, and mix. [NOTE—Reserve a 25-mL portion of this solution for the *Identification* test.] Dilute 25.0 mL of the solution with chloroform to 100.0 mL, and mix. Dissolve an accurately weighed quantity of USP Tolnaftate RS in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 258 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of $C_{19}H_{17}NOS$ in each mL of Topical Solution taken by the formula:

$$(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Tolnaftate RS in the Standard solution, V is the volume, in mL, of Topical Solution taken, and A_U and A_S are the absorbances of the solution from the Topical Solution and the Standard solution, respectively.

Tolterodine Tartrate

$C_{22}H_{31}NO \cdot C_4H_6O_6$ 475.57

(*R*)-2-[3-[Bis(1-methylethyl)amino]-1-phenylpropyl]-4-methylphenol (2*R*,3*R*)-2,3-dihydroxybutanedioate (1:1) (salt);
(+)-(*R*)-2-[α-[2-(Diisopropylamino)ethyl]benzyl]-*p*-cresol L-tartrate (1:1) (salt);
(*R*)-2-[3-(Diisopropylamino)-1-phenylpropyl]-4-methylphenol tartrate [124937-52-6].

DEFINITION

Tolterodine Tartrate contains NLT 97.0% and NMT 103.0% of tolterodine tartrate ($C_{22}H_{31}NO \cdot C_4H_6O_6$), calculated on the as-is basis.

IDENTIFICATION

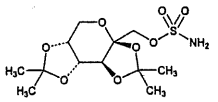
$C_{18}H_{20}O_3$ 284.35
6-Methyl-4-phenylchroman-2-one.
$C_{16}H_{14}O_2$ 238.29
USP Tolterodine Tartrate RS



Tolu Balsam

DEFINITION
Tolu Balsam is a balsam obtained from *Myroxylon balsamum* (L.) Harms (Fam. Leguminosae).

SPECIFIC TESTS
• **Rosin, Rosin Oil, and Copaiba**
Sample: 1 g, powdered or crushed, if necessary
Analysis: Place the *Sample* in a small mortar, and add 10 mL of petroleum benzin. Triturate well for 1–2 min, filter into a test tube, and to the filtrate so obtained, add 10 mL of freshly prepared cupric acetate solution (5 mg/mL). Shake, and allow the phases to separate.
Acceptance criteria: The petroleum benzin layer does not show a green color.
• **Fats and Fixed Oils,** *Acid Value* ⟨401⟩
Sample solution: 1 g in 50 mL of neutralized alcohol
Analysis: Add phenolphthalein TS, and titrate with 0.5 N alcoholic potassium hydroxide VS.
Acceptance criteria: 112–168
• **Fats and Fixed Oils,** *Saponification Value* ⟨401⟩
Sample solution: Add sufficient 0.5 N alcoholic potassium hydroxide VS to the neutralized liquid obtained in the test for *Acid Value* to make the total volume of the alkali solution added 20.0 mL, heat the liquid on a steam bath for 30 min under a reflux condenser, and cool. Add 200 mL of water, or more if necessary.
Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Residual titration
Titrant: 0.5 N alcoholic potassium hydroxide VS
Back-titrant: 0.5 N hydrochloric acid VS
Endpoint detection: Visual
Analysis: Titrate the excess potassium hydroxide in the *Sample solution* with *Back-titrant*. Perform a blank determination.
Acceptance criteria: The total volume of *Titrant* consumed, including that required to neutralize the free acid in the determination of the *Acid Value*, is equivalent to a saponification value between 154 and 220.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight containers, and avoid exposure to excessive heat.

Topiramate

$C_{12}H_{21}NO_8S$ 339.36
β-D-Fructopyranose, 2,3:4,5-bis-*O*-(1-methylethylidene)-, sulfamate;
2,3:4,5-Di-*O*-isopropylidene-β-D-fructopyranose sulfamate [97240-79-4].

DEFINITION
Topiramate contains NLT 98.0% and NMT 102.0% of topiramate ($C_{12}H_{21}NO_8S$), calculated on the anhydrous basis.
[**Caution**—Great care must be exercised in handling topiramate because it is a suspected teratogen.]

• **ORGANIC IMPURITIES, PROCEDURE 3**
Mobile phase: Methanol and water(32:68)
Standard solution: 10 mg/mL of USP Topiramate RS and 0.04 mg/mL of USP Topiramate Related Compound A RS in *Mobile phase*
Sample solution: 10 mg/mL of Topiramate in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Refractive index
Column: 4.6-mm × 15-cm; 5-µm packing L15
Column temperature: 35°
Flow rate: 1.5 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 1.0 between topiramate related compound A and topiramate
Relative standard deviation: NMT 2.0% for topiramate from six replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Topiramate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each impurity from the *Sample solution*
r_S = peak area of topiramate from the *Standard solution*
C_S = concentration of USP Topiramate RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Response Factor	Acceptance Criteria, NMT (%)
Topiramate related compound A	1.1	0.3
Any individual unspecified impurity	1.0	0.10
Total impurities	1.0	0.5

USP Monographs

Topiramate Capsules

DEFINITION
Topiramate Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197F**▲ (CN 1-May-2020)
  Wavenumber range: 4000 to 650 cm^{-1}
  Standard solution: 20 mg/mL of USP Topiramate RS in acetone
  Sample solution: Open an appropriate number of Capsules to prepare a 20-mg/mL topiramate solution in acetone. Shake the solution for 30 min, and centrifuge for 10 min. Then pass an aliquot of the clear supernatant through a suitable nylon filter of 0.2-µm pore size, and use the filtrate for analysis.
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Apply 50 µL to an NaCl plate, allow the solution to dry, then obtain the IR spectrum.
  Acceptance criteria: Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
  Buffer: 1.5 g/L of ammonium acetate in water. Adjust with glacial acetic acid to a pH of 4.0.
  Diluent: Acetonitrile and water (20:80)
  Mobile phase: Methanol and *Buffer* (20:80)
  Standard solution: 6 mg/mL of USP Topiramate RS in *Diluent*
  Sample solution: Nominally 6 mg/mL of topiramate in *Diluent* from NLT 20 Capsules. [NOTE—Shake vigorously for at least 60 min, and pass a portion through a PTFE chemical-resistant filter of 0.45-µm pore size.]
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: Refractive index
  Column: 4.6-mm × 25-cm; 5-µm packing L1
  Flow rate: 1.5 mL/min
  Injection volume: 100 µL
  Temperatures
  Column: 35°
  Detector: 35°
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Topiramate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of topiramate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION** ⟨711⟩
  Test 1
  Medium: Water; 900 mL
  Apparatus 2: 50 rpm. Use an appropriate sinker as necessary.
  Time: 45 min
  Standard stock solution: 0.56 mg/mL of USP Topiramate RS in *Medium* prepared as follows. Transfer a suitable amount to a suitable volumetric flask. Add 2% of the flask volume of acetone to dissolve the solid. Dilute with *Medium* to volume.
  Standard solution: (*L*/900) mg/mL of USP Topiramate RS in *Medium*, where *L* is the label claim, in mg of topiramate per Capsule from the *Standard stock solution*
  Sample solution: Pass a portion of the solution under test through a suitable filter of 1-µm pore size.
  Mobile phase: Methanol and water (32:68)
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: Refractive index
  Column: 4.6-mm × 15-cm; 5-µm packing L7
  Flow rate: 2 mL/min
  Injection volume: 200 µL
  Temperatures
  Column: 35°
  Detector: 35°
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Relative standard deviation: NMT 2.0% for Capsules labeled to contain more than 15 mg of topiramate; NMT 3.0% for Capsules labeled to contain less than or equal to 15 mg of topiramate
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Capsule)

Tolerances: NLT 80% (Q) of the labeled amount of topiramate is dissolved.

Test 2

If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Water; 900 mL

Apparatus 2: 50 rpm. Use an appropriate sinker as necessary.

Time: 60 min

Standard solution: (L/900) mg/mL of USP Topiramate RS in *Medium*, where L is the label claim, in mg of topiramate per Capsule

Sample solution: Pass a portion of the solution under test through a suitable filter.

Mobile phase: Methanol and water (40:60)

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 100 µL

Temperatures

Column: 35°

Detector: 35°

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Capsule)

Tolerances: NLT 75% (Q) of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **Limit of Sulfamate and Sulfate:** Use water with a resistivity of NLT 18 megohm-cm for the preparation of the *Mobile phase*, *Standard solution*, and *Sample solution*.

Buffer: 0.8 g/L of *p*-hydroxybenzoic acid in water

Mobile phase: Methanol and *Buffer* (2.5: 97.5). Adjust with sodium hydroxide solution to a pH of 9.4 ± 0.5.

Standard solution: 0.015 mg/mL each of sodium sulfate and sulfamic acid in *Mobile phase* from anhydrous sodium sulfate and sulfamic acid, respectively

Sample solution: Grind the contents of NLT 20 Capsules. Transfer an amount of powder equivalent to 300 mg of topiramate to a 50-mL volumetric flask. Add about 40 mL of *Mobile phase*, and stir for 30 min. Sonicate for 10 min, and dilute with *Mobile phase* to volume. Centrifuge, and pass through a polyethersulfone membrane filter of 0.45-µm pore size, discarding the first 3 mL of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: Conductivity

Column: 4.6-mm × 15-cm; 5-µm packing L47

Flow rate: 1.5 mL/min. [Note—A suitable background suppression unit may be used.]

Detector temperature: 30°

Injection volume: 70 µL

System suitability

Sample: *Standard solution*

[Note—The relative retention time of the sulfamate peak is 0.44 relative to the sulfate peak.]

Suitability requirements

Relative standard deviation: NMT 15.0% for the sulfamate and sulfate peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulfate in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of sulfate from the *Sample solution*
r_S = peak response of sulfate from the *Standard solution*
C_S = concentration of sodium sulfate in the *Standard solution* (mg/mL)
C_U = nominal concentration of topiramate in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sulfate anion, 96.04
M_{r2} = molecular weight of anhydrous sodium sulfate, 142.04

Calculate the percentage of sulfamate in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of sulfamate from the *Sample solution*
r_S = peak response of sulfamate from the *Standard solution*
C_S = concentration of sulfamic acid in the *Standard solution* (mg/mL)
C_U = nominal concentration of topiramate in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sulfamate anion, 96.09
M_{r2} = molecular weight of sulfamic acid, 97.09

Acceptance criteria: NMT 0.25% (w/w) of sulfate and NMT 0.25% (w/w) of sulfamate

• **Organic Impurities**

Diluent, Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard solution: 1.2 mg/mL of USP Topiramate RS and 0.6 mg/mL of USP Topiramate Related Compound A RS in *Diluent*

System suitability

Sample: *Standard solution*

[Note—Identify the peaks due to topiramate related compound A and topiramate using the relative retention times given in *Table 1*.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Sample solution* and *Standard solution*

www.webofpharma.com

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the individual impurity from the *Sample solution*
r_S = peak response of topiramate from the *Standard solution*
C_S = concentration of USP Topiramate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of topiramate in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Topiramate related compound A	0.66	1.1	0.5
Topiramate	1.0	—	—
Individual unspecified degradation product	—	—	0.2
Total impurities	—	—	0.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in tightly closed containers at controlled room temperature, protected from moisture.
- **LABELING:** Topiramate Capsules may be swallowed whole or may be administered by carefully opening the Capsule and sprinkling the entire contents on a teaspoon of soft food. This drug-food mixture should be swallowed immediately and not chewed. It should not be stored for future use. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩

Topiramate Compounded Oral Suspension

DEFINITION

Topiramate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$).

Prepare Topiramate Compounded Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Topiramate tablets[a] or powder, equivalent to	2 g
Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Topiramate 200-mg tablets, Torrent Pharmaceuticals LTD, Kalamazoo, MI.
[b] Perrigo, Minneapolis, MN.

USP Monographs

www.webofpharma.com

If using tablets, comminute the tablets to a fine powder in a suitable mortar or other mechanical means, or add *Topiramate powder* to the mortar. Wet the powder with a small amount of *Vehicle*, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make the mortar contents pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container using the remainder of the *Vehicle*. Add sufficient *Vehicle* to bring to final volume. Shake to mix well.

ASSAY

• **PROCEDURE**

Solution A: Weigh 6.24 g of monobasic sodium phosphate dihydrate, and transfer to a 1-L volumetric flask. Dissolve in 800 mL of water, add 30 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.8. Dilute with water to volume, and mix thoroughly.

Solution B: Weigh 6.25 g of boric acid and 7.5 g of potassium chloride, and transfer to a 1-L volumetric flask. Dissolve in 900 mL of water, and adjust with potassium hydroxide to a pH of 7.8. Dilute with water to volume, and mix thoroughly.

Solution C: Transfer 50 mg of 9-fluorenylmethyl chloroformate to a 10-mL volumetric flask, and dilute with acetonitrile to volume. Store at 4°, and protect from light.

Solution D: Transfer 100 mg of glycine to a 10-mL volumetric flask, and dilute with water to volume.

Mobile phase: Acetonitrile and *Solution A* (48:52). Filter, and degas.

Standard stock solution: 1 mg/mL of USP Topiramate RS in acetonitrile

Standard solution: Transfer 1 mL of *Standard stock solution* into a 10-mL volumetric flask, dilute with *Solution B* to volume, and mix well.

Sample solution: Shake thoroughly each bottle of Oral Suspension. Transfer 0.5 mL of the Oral Suspension into a 10-mL volumetric flask, add 2 mL of water and 5 mL of acetonitrile, and sonicate for 10 min. Dilute with water to volume, and mix well. Pass through a PVDF filter of 0.45-µm pore size, discarding the first 3 mL of filtrate. Mix 1 mL of the filtrate with 9 mL of *Solution B*. Transfer 100 µL of the resulting solution into a HPLC vial, add 50 µL of *Solution C*, and mix on a vortex mixer for 20 s. Incubate at 50° for 15 min. Immediately add 100 µL of *Solution D* to the vial to terminate the reaction. Mix on a vortex mixer for 10 s, and allow to stand for at least 1 min prior to analysis.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 264 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 52°

Flow rate: 1.0 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for topiramate is about 8.8 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of topiramate ($C_{12}H_{21}NO_8S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of topiramate from the *Sample solution*

r_S = peak response of topiramate from the *Standard solution*

C_S = concentration of topiramate in the *Standard solution* (mg/mL)

C_U = nominal concentration of topiramate in the *Sample solution* (mg/mL)

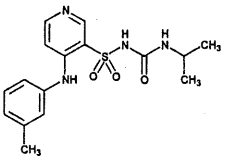
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩**:** 3.9–4.9

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.



• **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.

• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water Determination, *Method I* ⟨921⟩: not more than 1.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Related compounds—

0.02 M Potassium phosphate buffer and *Mobile phase*—Prepare as directed in the *Assay.*

Resolution solution—Transfer about 3 mg each of USP Torsemide RS and USP Torsemide Related Compound A RS to a 10-mL volumetric flask, add 3 mL of methanol, mix, and sonicate for not less than 8 minutes. Add 4.5 mL of *0.02 M Potassium phosphate buffer,* cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Standard solution—Transfer about 8 mg each of USP Torsemide Related Compound A RS, USP Torsemide Related Compound B RS, and USP Torsemide Related Compound C RS, accurately weighed, to a 100-mL volumetric flask, add 30 mL of methanol, mix, and sonicate for not less than 8 minutes. Add 45 mL of *0.02 M Potassium phosphate buffer,* cool to room temperature, dilute with *Mobile phase* to volume, and mix. Quantitatively dilute a portion of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.0019 mg per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution* and the *Standard solution,* and record the peak responses over a period three times the retention time of torsemide as directed for *Procedure:* the resolution, *R,* between torsemide and torsemide related compound A is not less than 1.0; the tailing factors are not more than 2.0; and the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for torsemide related compound A, torsemide related compound B, and torsemide related compound C. Calculate the percentage of each related compound, if present, in the portion of Torsemide taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_U is the concentration of Torsemide, in mg per mL, in the *Test solution;* and r_U and r_S are the peak areas for the relevant torsemide related compound obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.2% of torsemide related compound C, not more than 0.3% of torsemide related compound B, and not more than 0.5% of torsemide related compound A are found. Calculate the percentage of any other impurity in the portion of Torsemide taken by the formula:

$$100(r_i/r_S)$$

in which r_i is the peak response for each other impurity obtained from the *Test solution;* and r_S is the sum of the responses of all the peaks obtained from the *Test solution:* not more than 0.1% of any other impurity is found, not more than 0.2% of total other impurities is found, and not more than 1.0% of total impurities (including torsemide related compounds A, B, and C) is found.

Assay—

0.02 M Potassium phosphate buffer—Dissolve 2.7 g of monobasic potassium phosphate in about 900 mL of water. Adjust with phosphoric acid to a pH of 3.5, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.02 M Potassium phosphate buffer* and methanol (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 19 mg of USP Torsemide RS, accurately weighed, to a 50-mL volumetric flask, add 15 mL of methanol, mix, and sonicate for not less than 8 minutes. Add 22.5 mL of *0.02 M Potassium phosphate buffer,* cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 38 mg of Torsemide, accurately weighed, to a 100-mL volumetric flask, add 30 mL of methanol, mix, and sonicate for not less than 8 minutes. Add 45 mL of *0.02 M Potassium phosphate buffer,* cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 288-nm detector and a 4.6-mm × 15-cm column that contains 7-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in mg, of $C_{16}H_{20}N_4O_3S$ in the portion of Torsemide taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Torsemide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Add the following:

▲Torsemide Compounded Oral Suspension

DEFINITION

Torsemide Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of torsemide ($C_{16}H_{20}N_4O_3S$).

Prepare Torsemide Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Torsemide Tablets, equivalent to[a]	500 mg of torsemide
Sodium Hydroxide (2 N)	Adjust to pH of 8.3

www.webofpharma.com

Vehicle: 1:1 mixture of Ora-Sweet SF[b] and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Torsemide 10-mg tablets, Camber, Piscataway, NJ.
[b] Perrigo, Allegan, MI.

Place the *Torsemide Tablets* in a suitable container and triturate to a fine powder. Add a small amount of *Vehicle* and mix well to form a smooth paste. Add a sufficient amount of *Vehicle* to make the container contents pourable. Transfer the contents stepwise and quantitatively to a calibrated container. Add sufficient *Vehicle* to bring to final volume. Shake to mix well. Add *Sodium Hydroxide (2 N)* dropwise to adjust the pH to 8.3.

ASSAY

• **PROCEDURE**

Solution A: 10 mM of monobasic potassium phosphate adjusted with phosphoric acid to a pH of 4

Mobile phase: Methanol and *Solution A* (45:55)

Diluent: 50% methanol in water

Standard solution: Transfer 20 mg of USP Torsemide RS into a 200-mL volumetric flask. Add approximately 150 mL of *Diluent* and sonicate for 15 min, then dilute with *Diluent* to volume.

Sample solution: Transfer 1 mL of Oral Suspension into a 50-mL volumetric flask. Add approximately 40 mL of *Diluent* and sonicate for 15 min, then dilute with *Diluent* to volume. Filter 1 mL of this solution, discard the first 3 drops, then transfer into an HPLC vial.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*)

Mode: LC

(±)-*cis*-2-[(Dimethylamino)methyl]-1-(*m*-methoxyphenyl) cyclohexanol hydrochloride [36282-47-0].

www.webofpharma.com

DEFINITION

Tramadol Hydrochloride contains NLT 98.0% and NMT 102.0% of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩,** *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)
- **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩: An aqueous solution (1 in 100) meets the requirements.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: Dissolve 2 mL of trifluoroacetic acid in 1000 mL of water.

Mobile phase: Acetonitrile and *Solution A* (30:70)

System suitability solution: 0.05 mg/mL each of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Mobile phase*

Standard solution: 1.5 mg/mL of USP Tramadol Hydrochloride RS in *Mobile phase*

Sample solution: 1.5 mg/mL of Tramadol Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for tramadol related compound A and tramadol are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between tramadol related compound A and tramadol

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Tramadol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tramadol from the *Sample solution*

r_S = peak response of tramadol from the *Standard solution*

C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Tramadol Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **CONTENT OF CHLORIDE**

Sample solution: 150 mg of Tramadol Hydrochloride in 40 mL of water

Analysis: To the *Sample solution* add, with stirring, 7.5 mL of 4 N nitric acid and 15.0 mL of 0.1 N silver nitrate, and titrate with 0.1 N ammonium thiocyanate VS, determining the endpoint potentiometrically, and using a silver–glass electrode system. Each mL of 0.1 N ammonium thiocyanate is equivalent to 3.545 mg of chloride.

Acceptance criteria: 11.6%–12.1% of chloride is found.

- **LIMIT OF TRAMADOL RELATED COMPOUND B**

(2-[(Dimethylamino)methyl]cyclohexanone hydrochloride)

Standard solution: 0.1 mg/mL of USP Tramadol Related Compound B RS in methanol

Sample solution: 50 mg/mL of Tramadol Hydrochloride in methanol

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Developing solvent system: Toluene, isopropyl alcohol, and 25% ammonia water (80:19:1)

Sodium nitrite solution: 50 mg/mL of sodium nitrite in water

Analysis: Place the plate in a chromatographic chamber saturated with ammonia vapor from stronger ammonia water, and allow to stand for NLT 20 min. Separately apply about 10 µL each of the *Sample solution* and the *Standard solution* to the plate, and develop the plate until the solvent front is NLT 10 cm above the line of application. Remove the plate, spray with Dragendorff's TS, and air-dry for 5 min. Spray the dried plate with *Sodium nitrite solution* until the spot from tramadol related compound B in the *Standard solution* is visible. Any secondary spot from the *Sample solution* corresponding to tramadol related compound B is not more intense than a corresponding spot from the *Standard solution*.

Acceptance criteria: NMT 0.2%

- **ORGANIC IMPURITIES**

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tramadol Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria

Tramadol related compound A: NMT 0.2%

Individual impurities: NMT 0.1%

Total impurities: NMT 0.4%

SPECIFIC TESTS

- **WATER DETERMINATION,** *Method Ia* ⟨921⟩: NMT 0.5%
- **ACIDITY**

Sample solution: 500 mg of Tramadol Hydrochloride in 10 mL of water

Analysis: To the *Sample solution* add 0.2 mL of methyl red TS and 0.2 mL of 0.01 N hydrochloric acid VS, and titrate with 0.01 N sodium hydroxide VS.

Acceptance criteria: NMT 0.4 mL of 0.01 N sodium hydroxide VS is required to produce a yellow color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

Tramadol Hydrochloride Compounded Oral Suspension

DEFINITION

Tramadol Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

Prepare Tramadol Hydrochloride Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tramadol Hydrochloride tablets[a] equivalent to	500 mg of tramadol hydrochloride
Vehicle: a 1:1 mixture of Ora-Sweet[b] (sugar-free) and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Ultram 50-mg tablets, Ortho-McNeil Pharmaceutical, Inc., Raritan, NJ.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Tramadol Hydrochloride tablets* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tramadol hydrochloride liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**
Solution A: 20 mM of phosphoric acid and 4 g/L of sodium 1-hexane sulfonate
Mobile phase: Acetonitrile and *Solution A* (50:50). Filter and degas.
Diluent: Acetonitrile and water (50:50)
Standard solution: 0.25 mg/mL of USP Tramadol Hydrochloride RS in *Diluent*
Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.25 mg/mL of tramadol hydrochloride from Oral Suspension and *Diluent*, and centrifuge.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1.0 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for tramadol hydrochloride is about 6 min.]
Suitability requirements
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩**:** 3.8–4.8

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored in a refrigerator or controlled room temperature
• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tramadol Hydrochloride RS

Tramadol Hydrochloride Compounded Oral Suspension, Veterinary

DEFINITION

Tramadol Hydrochloride Compounded Oral Suspension, Veterinary contains NLT 90.0% and NMT 110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

Prepare Tramadol Hydrochloride Compounded Oral Suspension, Veterinary 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tramadol Hydrochloride	2.0 g
Sodium Chloride	0.5 g
Ora-Blend[a], a sufficient quantity to make	100 mL

[a] Perrigo Pharmaceuticals, Allegan, MI.

Add *Tramadol Hydrochloride* and *Sodium Chloride* to a suitable mortar, and triturate to a fine powder. Add a small amount of *Ora-Blend*, and triturate to make a smooth paste. Add increasing volumes of *Ora-Blend* to make a tramadol hydrochloride liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Ora-Blend* to bring to final volume, and mix well. [NOTE—*Sodium Chloride* is used to mask bitterness.]

www.webofpharma.com

ASSAY

• **PROCEDURE**

Solution A: Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water. Add 2.0 g of sodium 1-octanesulfonate, and stir until dissolved. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase: Methanol, acetonitrile, tetrahydrofuran, and *Solution A* (5:5:15:75)

Standard solution: 0.4 mg/mL of tramadol hydrochloride prepared from USP Tramadol Hydrochloride RS in *Solution A*

Sample solution: Transfer 1 mL of Oral Suspension, Veterinary into a 50-mL volumetric flask, dilute with *Solution A* to volume, and mix well.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for tramadol hydrochloride is about 13.4 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Oral Suspension, Veterinary taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tramadol hydrochloride from the *Sample solution*

r_S = peak response of tramadol hydrochloride from the *Standard solution*

C_S = concentration of tramadol hydrochloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **PH** ⟨791⟩: 3.4–4.4

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.

• **BEYOND-USE DATE:** NMT 180 days after the day on which it was compounded when stored at controlled room temperature

• **LABELING:** Label it to indicate that it is for veterinary use only. Label it to state that it is to be well-shaken before use, and to state the *Beyond-Use Date*.

USP Tramadol Hydrochloride RS

Tramadol Hydrochloride Tablets

DEFINITION

Tramadol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Sample solution: Transfer powdered Tablets, equivalent to 200 mg of tramadol hydrochloride, into a 50-mL volumetric flask, add 20 mL of dichloromethane, and sonicate. Filter, and transfer the clear supernatant to a separating funnel. Extract the dichloromethane layer with two 10-mL portions of 2 N sodium hydroxide, and discard the aqueous layer. Dry the dichloromethane layer over anhydrous sodium sulfate, and filter. Evaporate this solution to dryness under a stream of nitrogen.

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: Dissolve 5 mL of perchloric acid in 950 mL of water in a 1-L volumetric flask. Add 4 mL of 25% ammonia water, dilute with water to volume, and mix. Adjust with 25% ammonia water to a pH of 2.2 ± 0.2.

Mobile phase: Acetonitrile and *Solution A* (23:77)

Standard solution: 0.1 mg/mL of USP Tramadol Hydrochloride RS in 0.1 N hydrochloric acid

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 50 mg of tramadol hydrochloride, into a 100-mL volumetric flask. Add 70 mL of 0.1 N hydrochloric acid, sonicate for 5 min, and shake for 10 min. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter, discarding the first 20 mL of the filtrate. Transfer 10 mL of the clear filtrate into a 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 273 nm

Column: 3.9-mm × 15-cm; packing L7

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

www.webofpharma.com

C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Solution A, Mobile phase, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Standard solution: 0.055 mg/mL of USP Tramadol Hydrochloride RS in *Medium*
Sample solution: Withdraw 9 mL from the dissolution vessel, and pass through a suitable filter. Discard the first 3 mL of the filtrate.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

Procedure for content uniformity
Solution A, Mobile phase, Standard solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Sample solution: Transfer 1 whole Tablet to a 100-mL volumetric flask, add 70 mL of 0.1 N hydrochloric acid, sonicate until the Tablet is completely disintegrated, and shake for 10 min. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter, discarding the first 20 mL of the filtrate. Transfer 10 mL of the clear filtrate into a 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (mg/mL)

IMPURITIES

ORGANIC IMPURITIES

• **Procedure**

Solution A and **Mobile phase:** Prepare as directed in the *Assay*.
System suitability solution: 0.2 mg/mL each of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Mobile phase*
Standard solution: 6 µg/mL of USP Tramadol Hydrochloride RS in *Mobile phase*
System sensitivity solution: Transfer 5 mL of the *Standard solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.
Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 200 mg of tramadol hydrochloride, into a 50-mL volumetric flask. Add about 35 mL of *Mobile phase*, sonicate for 5 min, and shake for 10 min. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable filter, and use the filtrate.
Chromatographic system

Tramadol Hydrochloride Extended-Release Tablets

DEFINITION

Tramadol Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Change to read:

- **B. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
  Sample solution: Use the *Sample solution* from the *Assay*.
  Analysis: Using separate 1-cm cells, record the UV spectrum of the *Sample solution* and *Standard solution*.
  Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelength as that of a similar solution of the *Standard solution*.

ASSAY

- **PROCEDURE**
  Mobile phase: Tetrahydrofuran, trifluoroacetic acid, triethylamine, and water (10: 0.1: 0.1: 90). [NOTE—Maintain at a pH range of 2.2–2.4.]
  Standard stock solution: 1 mg/mL of USP Tramadol Hydrochloride RS prepared by dissolving in 20% of the flask volume of methanol. Sonicate if necessary, and dilute with water to volume.
  Standard solution: 0.13 mg/mL of USP Tramadol Hydrochloride RS in *Mobile phase*, from the *Standard stock solution*
  Sample solution: Nominally 0.13 mg/mL of tramadol hydrochloride in *Mobile phase*. Prepare by dissolving 10 Tablets in 20% of the flask volume of methanol, in a water bath for 60 min, at about 60° with intermittent shaking. Sonicate for 10 min. Add 40% of the flask volume of water, and sonicate for 30 min. If all Tablets are not fully disintegrated, then continue to sonicate until disintegration is completed. Shake the flask vigorously for 10 min using a mechanical shaker, and dilute with water to volume. Centrifuge a portion of the solution, pass through a suitable nylon filter, and collect the filtrate after discarding the first 2 mL. Pipet 5.0 mL of the filtrate into a 200-mL volumetric flask, and dilute with *Mobile phase* to volume.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)

  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the concentration (C_i), in mg/mL, of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the sample withdrawn from the vessel at each time point (*i*):

$$\text{Result}_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

USP Monographs

www.webofpharma.com

Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) dissolved at each time point (i):

$$Result_1 = C_1 \times V \times (1/L) \times 100$$

$$Result_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$Result_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$Result_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$Result_5 = \{(C_5 \times V) + [(C_4 + C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of tramadol hydrochloride in the portion of the sample withdrawn at the specified time point (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (i)	Time (h)	Amount Dissolved (%)
1	2	NMT 15
2	4	10–40
3	8	50–85
4	10	65–95
5	16	NLT 80

The percentages of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) released at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 75 rpm
Times: 2, 4, 8, 10, and 16 h
Standard stock solution: 5 mg/mL of USP Tramadol Hydrochloride RS in *Medium*. Sonicate if necessary.
Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a concentration of USP Tramadol Hydrochloride RS (see *Table 2*).

Table 2

Label Claim (mg/Tablet)	Concentration of USP Tramadol Hydrochloride RS (mg/mL)
100	0.075
200	0.100
300	0.200

Sample solution: Pass a portion of the solution under test through a suitable filter.

For Tablets labeled to contain 100 mg: 1 cm
For Tablets labeled to contain 200 and 300 mg: 0.5 cm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) dissolved at each time point (i):

$$Result_i = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: See *Table 3*.

Table 3

Time Point (i)	Time (h)	Amount Dissolved (%)
1	2	NMT 15
2	4	10–30
3	8	47–72
4	10	60–85
5	16	NLT 80

The percentages of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) released at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 75 rpm
Times: 2, 4, 8, and 16 h
Buffer: Trifluoroacetic acid and water (2:1000)
Mobile phase: Acetonitrile and *Buffer* (30:70)
Standard stock solution: 0.55 mg/mL of USP Tramadol Hydrochloride RS in water
Standard solution: (L/900) mg/mL of USP Tramadol Hydrochloride RS in *Medium* from the *Standard stock solution*, where L is the label claim of tramadol hydrochloride, in mg/Tablet. Pass the solution through a suitable filter of 0.45-µm pore size. Discard the first 5 mL of filtrate.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Replace the portion of solution withdrawn with an equal volume of *Medium*. Discard the first 5 mL of filtrate.
Chromatographic system

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i), in mg/mL, of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of tramadol from the *Sample solution*

r_S = peak response of tramadol from the *Standard solution*

C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of tramadol hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of medium, 900 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (h)	Amount Dissolved (%)	
		100 mg/Tablet and 300 mg/Tablet	200 mg/Tablet
1	2	NMT 40	NMT 35
2	4	45–75	32–62
3	8	NLT 70	NLT 70
4	16	NLT 85	NLT 85

The percentages of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) released at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 75 rpm

Times: 2, 4, 8, 10, and 16 h

Buffer: Dissolve 6.8 g of monobasic potassium phosphate in 1 L of water and adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (20:80)

Standard solution: 0.22 mg/mL of USP Tramadol Hydrochloride RS in *Medium*. Sonication may be necessary for complete dissolution.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 5-cm; 3-µm packing L1

Tramadol Hydrochloride and Acetaminophen Tablets

DEFINITION

Tramadol Hydrochloride and Acetaminophen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) and acetaminophen ($C_8H_9NO_2$).

IDENTIFICATION

- **A.** The retention times of the *Tramadol sample solution* and the *Acetaminophen sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Tetrahydrofuran, triethylamine, water, and trifluoroacetic acid (8: 0.1: 92: 0.1). The apparent pH of the final solvent mixture should be between 2.2 and 2.4.
Diluent: Methanol and water (1:9)
Standard solution: 0.065 mg/mL of USP Acetaminophen RS and 0.075 mg/mL of USP Tramadol Hydrochloride RS in *Diluent*. Sonication may be used to aid dissolution.
Sample stock solution: Weigh NLT 20 Tablets, and determine the average Tablet weight. Grind the Tablets into a fine powder, and transfer an amount equivalent to one Tablet to a 50-mL volumetric flask. Add 30 mL of *Diluent* with continuous shaking to disperse the powder. Sonicate for 15 min with intermittent shaking, and shake the flask on a mechanical shaker for 30 min. Dilute with *Diluent* to volume, and mix well. Centrifuge the suspension, and use the supernatant for subsequent dilutions.
Tramadol sample solution: Nominally 75 µg/mL of tramadol hydrochloride in *Diluent* from the *Sample stock solution*
Acetaminophen sample solution: Nominally 65 µg/mL of acetaminophen in *Diluent* from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 216 nm for tramadol hydrochloride and UV 249 nm for acetaminophen
Column: 4.6-mm × 15-cm; 5-µm packing L11
Column temperature: 50°
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: 4 times the retention time of acetaminophen
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 10.0 between acetaminophen and tramadol
Tailing factor: NMT 2.0 for each analyte
Relative standard deviation: NMT 2.0% for each analyte
Analysis
Samples: *Standard solution*, *Tramadol sample solution*, and *Acetaminophen sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tramadol from the *Tramadol sample solution*
r_S = peak response of tramadol from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tramadol hydrochloride in the *Tramadol sample solution* (mg/mL)

Calculate the percentage of the labeled amount of acetaminophen ($C_8H_9NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of acetaminophen from the *Acetaminophen sample solution*
r_S = peak response of acetaminophen from the *Standard solution*
C_S = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of acetaminophen in the *Acetaminophen sample solution* (mg/mL)

Acceptance criteria
Tramadol hydrochloride: 90.0%–110.0% of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$)
Acetaminophen: 90.0%–110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$)

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩
Test 1
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Buffer solution: 6.8 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.50.
Mobile phase: Acetonitrile and *Buffer solution* (1:4)
Standard solution: 0.36 mg/mL of USP Acetaminophen RS and 0.04 mg/mL of USP Tramadol Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 272 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 25°
Flow rate: 1 mL/min
Injection volume: 25 µL
Run time: 2 times the retention time of tramadol
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for acetaminophen and tramadol are about 0.5 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 5.0 between the acetaminophen and tramadol peaks
Relative standard deviation: NMT 2.0% for both the acetaminophen and tramadol peaks
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of acetaminophen ($C_8H_9NO_2$) and tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of acetaminophen or tramadol from the *Sample solution*
r_S = peak response of acetaminophen or tramadol from the *Standard solution*
C_S = concentration of USP Acetaminophen RS or USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim for acetaminophen or tramadol hydrochloride (mg/Tablet)

Tolerances: NLT 80% (*Q*) of the labeled amount of acetaminophen ($C_8H_9NO_2$) and tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) is dissolved.
Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 20 min
Buffer solution, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and **Analysis:** Proceed as directed in *Dissolution Test 1*.
Tolerances: NLT 80% (*Q*) of the labeled amount of acetaminophen ($C_8H_9NO_2$) and tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) is dissolved.
• **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **4-Aminophenol in Acetaminophen-Containing Drug Products** ⟨227⟩**:** Meet the requirements
• **Organic Impurities**
Mobile phase, Diluent, and **Sample stock solution:** Proceed as directed in the *Assay*.
Standard solution: 0.75 µg/mL each of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Diluent*
Sample solution: Pass a suitable volume of *Sample stock solution* through a nylon membrane filter of 0.45-µm pore size. Use the filtrate after discarding the first 4 mL of filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: 216 nm
Column: 4.6-mm × 15-cm; 5-µm packing L11
Column temperature: 50°
Flow rate: 1 mL/min
Injection volume: 30 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between tramadol related compound A and tramadol hydrochloride
Relative standard deviation: NMT 6.0% for tramadol hydrochloride
Analysis
Samples: *Diluent*, *Standard solution*, and *Sample solution*.
Disregard the peaks due to the *Diluent*.
Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*
r_S = peak response of tramadol from the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (µg/mL)

www.webofpharma.com

C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
O-Desmethyl-tramadol[a]	0.60	0.2
Tramadol related compound A	0.80	0.2
Tramadol	1.0	—
Acetaminophen	0.38	—
Any individual, unspecified degradation product	—	0.2
Total degradation products	—	0.8

[a] 3-[(1*RS*,2*RS*)-2-[(Dimethylamino)methyl]-1-hydroxycyclohexyl]phenol.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩

Tramadol Hydrochloride and Acetaminophen Compounded Oral Suspension

DEFINITION

Tramadol Hydrochloride and Acetaminophen Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amounts of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) and acetaminophen ($C_8H_9NO_2$).

Prepare Tramadol Hydrochloride and Acetaminophen Compounded Oral Suspension containing 7.5 mg/mL of tramadol hydrochloride and 65 mg/mL of acetaminophen as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Tramadol Hydrochloride and Acetaminophen tablets[a]	750 mg of tramadol hydrochloride and 6500 mg of acetaminophen
Vehicle: a 1:1 mixture of Ora-Sweet[b] (sugar-free) and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Ultracet 37.5-mg/325-mg tablets, Ortho-McNeil Pharmaceutical, Inc., Raritan, NJ.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Tramadol Hydrochloride and Acetaminophen tablets* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tramadol hydrochloride and acetaminophen liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

- **TRAMADOL HYDROCHLORIDE**

Solution A: 20 mM of phosphoric acid and 4 g/L of sodium 1-hexane sulfonate
Mobile phase: Acetonitrile and *Solution A* (50:50). Filter and degas.
Diluent: Acetonitrile and water (50:50)
Standard solution: 0.15 mg/mL of USP Tramadol Hydrochloride RS in *Diluent*
Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.15 mg/mL of tramadol hydrochloride from Oral Suspension and *Diluent*, and centrifuge.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1.0 mL/min
Injection volume: 5 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for tramadol hydrochloride is about 6 min.]
Suitability requirements
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tramadol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

- **ACETAMINOPHEN**

Mobile phase: Acetonitrile and water (70:30). Filter and degas.
Standard solution: 65 µg/mL of USP Acetaminophen RS in *Mobile phase*
Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 65 µg/mL of acetaminophen from Oral Suspension and *Mobile phase*, and centrifuge.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1.0 mL/min

Trandolapril

$C_{24}H_{34}N_2O_5$ 430.54
1*H*-Indole-2-carboxylic acid, octahydro *N*-[(2*S*)-1-ethoxy-1-oxo-4-phenylbutan-2-yl]-1-alanyl (2*S*,3a*R*,7a*S*);
(2*S*,3a*R*,7a*S*)-1-[(*S*)-*N*-[(*S*)-1-Carboxy-3-phenylpropyl]alanyl] hexahydro-2-indolinecarboxylic acid, 1-ethyl ester [87679-37-6].

DEFINITION
Trandolapril contains NLT 98.0% and NMT 102.0% of trandolapril ($C_{24}H_{34}N_2O_5$), calculated on the anhydrous basis.

Trandolapril Tablets

DEFINITION
Trandolapril Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: To 1 L of 8.9 g/L of dibasic sodium phosphate anhydrous, add 1 mL of triethylamine and adjust with phosphoric acid to a pH of 3.5. Pass through a suitable filter of 0.45-µm pore size.
Mobile phase: Acetonitrile and *Buffer* (40:60)
Diluent: Acetonitrile and water (40:60)
Standard solution: 40 µg/mL of USP Trandolapril RS in *Diluent* prepared as follows. Transfer a suitable quantity of USP Trandolapril RS to a suitable volumetric flask. Add *Diluent* up to 70% of the flask volume. Sonicate if necessary. Dilute with *Diluent* to volume.

USP Monographs

www.webofpharma.com

Sample solution: Nominally 40 µg/mL of trandolapril in *Diluent* prepared as follows. Transfer a suitable quantity of trandolapril from NLT 10 Tablets to a suitable volumetric flask. Add *Diluent* up to 70% of the flask volume. Sonicate up to 30 min, if necessary, with occasional swirling. Dilute with *Diluent* to volume. Pass a portion of the solution through a membrane filter of 0.45-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 216 nm. For *Identification B*, use a diode array detector in the range of 190–400 nm.
Column: 4.6-mm × 15-cm; 3-µm packing L1
Flow rate: 1.2 mL/min
Injection volume: 20 µL
Run time: NLT 2 times the retention time of trandolapril

System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 3000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of trandolapril from the *Sample solution*
r_S = peak response of trandolapril from the *Standard solution*
C_S = concentration of USP Trandolapril RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩
Medium: Water, deaerated; 500 mL
Apparatus 2: 50 rpm
Time: 45 min
Mobile phase and **System suitability:** Proceed as directed in the *Assay*.
Standard stock solution: 0.2 mg/mL of USP Trandolapril RS prepared as follows. Transfer a suitable quantity of USP Trandolapril RS to a suitable volumetric flask. Add acetonitrile to about 5% of the flask volume, sonicate to dissolve, and dilute with *Medium* to volume.
Standard solution: (*L*/500) mg/mL of USP Trandolapril RS from the *Standard stock solution* in *Medium*, where *L* is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system: Proceed as directed in the *Assay*, except for the *Injection volume*.
Injection volume: 100 µL

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of trandolapril from the *Sample solution*
r_S = peak response of trandolapril from the *Standard solution*
C_S = concentration of USP Trandolapril RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

• **Organic Impurities**
Buffer: To 1 L of 7.0 g/L of sodium perchlorate monohydrate in water (0.05 M), add 2 g of octanesulfonic acid sodium salt followed by 1 mL of triethylamine. Adjust with diluted perchloric acid (1 in 10) to a pH of 2.0. Pass through a membrane filter of 0.45-µm pore size.
Solution A: Acetonitrile, tetrahydrofuran, and *Buffer* (11:1:28)
Solution B: Acetonitrile and *Buffer* (75:25)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
25	85	15
50	50	50
55	85	15
65	85	15

Diluent: Acetonitrile and *Buffer* (40:60)
Standard stock solution 1: 0.06 mg/mL each of USP Trandolapril Related Compound C RS and USP Trandolapril Related Compound D RS in acetonitrile. Sonicate to dissolve.
System suitability solution: 0.6 mg/mL of USP Trandolapril RS and 6 µg/mL each of USP Trandolapril Related Compound C RS and USP Trandolapril Related Compound D RS from *Standard stock solution 1* in *Diluent*. Add *Diluent* up to 70% of the flask volume, sonicate to dissolve, and cool to room temperature. Dilute with *Diluent* to volume.
Standard stock solution 2: 0.3 mg/mL of USP Trandolapril RS in *Diluent* prepared as follows. Transfer a suitable quantity of USP Trandolapril RS to a suitable volumetric flask. Add *Diluent* up to 70% of the flask volume, sonicate, and cool to room temperature. Dilute with *Diluent* to volume.
Standard solution: 6 µg/mL of USP Trandolapril RS in *Diluent* from *Standard stock solution 2*.
Sample solution: Nominally 600 µg/mL of trandolapril in *Diluent* prepared as follows. Transfer a suitable quantity of trandolapril from NLT 15 Tablets to a suitable volumetric flask. Add *Diluent* up to 50% of the flask volume and sonicate for 30 min. Dilute with *Diluent* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 50 µL

Trandolapril and Verapamil Hydrochloride Extended-Release Tablets

DEFINITION

Trandolapril and Verapamil Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) and verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the trandolapril and verapamil peaks of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peaks from the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  Buffer 1: 7 mL/L of triethylamine in water. Adjust with phosphoric acid to a pH of 3.0.
  Buffer 2: 0.82 mg/mL of sodium acetate anhydrous in acetic acid
  Mobile phase: Acetonitrile, methanol, and *Buffer 1* (240:160:600)
  Diluent 1: Methanol and water (80:20)
  Diluent 2: Acetonitrile, 2-aminoheptane, and *Buffer 2* (30: 0.5: 70). Adjust with 10 M sodium hydroxide to a pH of 5.0.
  Standard solution: 20 µg/mL of USP Trandolapril RS and 24 µg/mL of USP Verapamil Hydrochloride RS in *Diluent 1* prepared as follows. Add *Diluent 1* to USP Trandolapril RS and USP Verapamil Hydrochloride RS to fill about 70% of the volume of the flask, sonicate to facilitate dissolution, and then dilute with *Diluent 1* to volume.
  Sample solution 1: Nominally 20 µg/mL of trandolapril from NLT 5 Tablets in *Diluent 1* prepared as follows. Add *Diluent 1* to the sample, to fill about 50% of the volume of the flask, and sonicate for 45 min with occasional swirling. Cool and dilute with *Diluent 1* to volume. Pass this solution through a suitable filter of 0.45-µm pore size.
  Alternatively, *Sample solution 1* can be prepared as follows. Suspend NLT 20 Tablets in 950 mL of *Diluent 2* taken in a 1-L volumetric flask. Stir for about 2 h with a stir bar at NLT 800 rpm until the Tablets are completely disintegrated. [NOTE—Ensure that the Tablets do not adhere to the bottom of the vessel.] Remove the stir bar and rinse with *Diluent 2*. Dilute with *Diluent 2* to volume and shake thoroughly. Centrifuge a portion of the suspension for 10 min, pipet a portion of the supernatant, and pass through a suitable filter. Discard the first 5 mL of the filtrate.
  Sample solution 2: Nominally 24 µg/mL of verapamil hydrochloride in *Diluent 1* or *Diluent 2* from *Sample solution 1*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 216 nm. For *Identification B*, use a diode array detector in the range of UV 200–400 nm.
  Column: 4.6-mm × 15-cm; 3-µm packing L1
  Column temperature: 40°
  Flow rate: 1.3 mL/min
  Injection volume: 20 µL
  Run time: NLT 1.5 times the retention time of the trandolapril peak

USP Monographs

www.webofpharma.com

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0 for both the trandolapril and verapamil peaks
Relative standard deviation: NMT 2.0% for both the trandolapril and verapamil peaks
Analysis
Samples: *Standard solution*, *Sample solution 1*, and *Sample solution 2*
Calculate the percentage of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) and verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of trandolapril from *Sample solution 1* or verapamil from *Sample solution 2*
r_S = peak response of trandolapril or verapamil from the *Standard solution*
C_S = concentration of USP Trandolapril RS or USP Verapamil Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in *Sample solution 1* or verapamil hydrochloride in *Sample solution 2* (µg/mL)

Acceptance criteria
Trandolapril: 90.0%–110.0%
Verapamil hydrochloride: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩**: TEST 1**
For trandolapril
Medium: Water; 500 mL
Apparatus 2: 50 rpm
Time: 60 min
Buffer 1, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay* except for the following.
Flow rate: 1 mL/min
Injection volume: 100 µL
Mobile phase: Acetonitrile and *Buffer 1* (400:600)
Standard stock solution: Prepare 0.2 mg/mL of USP Trandolapril RS as follows. Transfer USP Trandolapril RS to a suitable volumetric flask, add about 5% of the volume of the flask of acetonitrile, sonicate to dissolve, and dilute with *Medium*.
Standard solution: (*L*/500) mg/mL in *Medium* from the *Standard stock solution*, where *L* is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V) \times (1/L) \times 100$$

r_U = peak response of trandolapril from the *Sample solution*
r_S = peak response of trandolapril from the *Standard solution*
C_S = concentration of USP Trandolapril RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 500 mL
L = label claim (mg/Tablet)

Tolerances: NLT 75% (*Q*) of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) is dissolved.
For verapamil hydrochloride
Acid stage medium: Simulated gastric fluid (without enzyme); 900 mL
Buffer stage medium: Simulated intestinal fluid (without enzyme); 900 mL
Apparatus 2: 50 rpm, with a sinker (see *Dissolution* ⟨711⟩, *Apparatus, Figure 2a*)
Times: 1 h in *Acid stage medium*; 2, 3.5, 5, and 8 h in *Buffer stage medium*
Mobile phase: Acetonitrile and *Buffer 1* (400:600)
Buffer 1, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay* except for the following.
Detector: UV 278 nm
Flow rate: 1 mL/min
Injection volume: 10 µL
Standard stock solution: Prepare 1.34 mg/mL of USP Verapamil Hydrochloride RS as follows. Transfer USP Verapamil Hydrochloride RS to a suitable volumetric flask, add about 20% of the volume of the flask of methanol, sonicate to dissolve, cool to room temperature, and dilute with water to volume.
Standard solution: (*L*/900) mg/mL in the respective *Medium* from the *Standard stock solution*, where *L* is the label claim in mg/Tablet
Sample solution: Withdraw 10 mL of solution at each time interval, and centrifuge at 2500 rpm for 5 min.
Analysis
Samples: *Standard solution* and *Sample solutions*
Place 1 Tablet in the sinker and place the sinker in the vessel. Prepare *Samples* as directed under *Sample solutions*.
Calculate the percentage of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved in the acid stage:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of verapamil from the *Sample solution*
r_S = peak response of verapamil from the *Standard solution*
C_S = concentration of USP Verapamil Hydrochloride RS in the *Standard solution*
V = volume of *Acid stage medium*, 900 mL
L = label claim (mg/Tablet)

Calculate the concentration (C_i) of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the sample withdrawn from the vessel at each buffer stage time point (*i*):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of verapamil from the *Sample solution* at each time point (*i*)
r_S = peak response of verapamil from the *Standard solution*
C_S = concentration of USP Verapamil Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved at each time point (*i*):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

USP Monographs

www.webofpharma.com

$$Result_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$Result_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$Result_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$Result_5 = (\{C_5 \times [V - (4 \times V_S)]\} + [(C_4 + C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of verapamil hydrochloride in the *Sample solution* at the specified time point (i) (mg/mL)
V = volume of *Buffer stage medium*, 900 mL
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn at each time point in the buffer stage (mL)

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved (%)
1	7–20
2	15–40
3.5	40–70
5	NLT 60
8	NLT 85

The percentages of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

• **DISSOLUTION** ⟨711⟩: **TEST 2**

[NOTE—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.]

For trandolapril and verapamil hydrochloride (acid stage)

[NOTE—During analysis, place the bi-layer Tablet in the dissolution vessel such that the trandolapril layer faces the bottom of the vessel.]

Medium: Simulated gastric fluid (without enzyme); 900 mL
Apparatus 2: 50 rpm, suitable wire helix sinkers
Times
Trandolapril: 45 min
Verapamil hydrochloride: 1 h
Buffer: Dissolve 6.8 g of monobasic potassium phosphate and the contents from one vial of paired ion chromatography reagent into a 1-L volumetric flask. Dissolve in approximately 950 mL of water. Adjust with dilute potassium hydroxide to a pH of 6.0 and then dilute with water to volume.
Solution A: Acetonitrile and *Buffer* (15:85)
Solution B: Acetonitrile and *Buffer* (60:40)
Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
6	0	100
13	0	100
14	100	0
20	100	0

Standard stock solution: 0.56 mg/mL of USP Trandolapril RS in methanol
Standard solution 1: (L/900) mg/mL of USP Trandolapril RS in 0.1 N hydrochloric acid from the *Standard stock solution*, where L is the label claim in mg/Tablet. [NOTE—For better recoveries during analysis, suitable quantities of an excipient mixture used in the formulation are mixed with the *Standard solution 1* before dilution as follows: 0.85 mg of excipient mixture per milliliter of *Standard solution 1* for trandolapril/verapamil hydrochloride Tablet strength 2/180; 1.05 mg of excipient mixture per milliliter of *Standard solution 1* for trandolapril/verapamil hydrochloride Tablet strengths 1/240, 2/240, and 4/240.]
Standard solution 2: (L/900) mg/mL of USP Verapamil Hydrochloride RS in 0.1 N hydrochloric acid, where L is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system: Procedure for trandolapril
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 2-mm × 30-mm; 7-µm packing L1
Flow rate: 1 mL/min
Injection volume: 250 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution 1* and *Sample solution*
Use a portion of the sample withdrawn at 45 min to analyze the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) dissolved and save the rest for analyzing verapamil hydrochloride.
Calculate the percentage of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) dissolved:

$$Result = (r_U/r_S) \times (C_S \times V) \times (1/L) \times 100$$

r_U = peak response of trandolapril from the *Sample solution*
r_S = peak response of trandolapril from *Standard solution 1*
C_S = concentration of USP Trandolapril RS in *Standard solution 1* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Instrumental conditions: Procedure for verapamil hydrochloride
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Wavelength range: 250–300 nm
Cell: 1 cm
Analysis
Samples: *Standard solution 2* and *Sample solution*

www.webofpharma.com

For the total labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved in the acid stage, combine the results from the analysis of the sample withdrawn at 45 min and also at 1 h.

Calculate the percentage of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved at each time point using a suitable multicomponent analysis software.

Tolerances

Trandolapril: NLT 80% (*Q*) of the labeled amount of trandolapril ($C_{24}H_{34}N_2O_5$) is dissolved.

Verapamil hydrochloride: See *Table 3* at 1 h.

For verapamil hydrochloride (buffer stage)

Buffer stage medium: Simulated intestinal fluid TS (without enzyme); 900 mL. Adjust with 0.2 N sodium hydroxide to a pH of 7.5.

Apparatus 2: 50 rpm

Times: 2, 3.5, 5, and 8 h

Sample solutions: Pass portions of the solution under test at each time interval through a suitable filter of 0.45-µm pore size.

Instrumental conditions and **Analysis:** Proceed as directed under verapamil hydrochloride (acid stage).

Tolerances: See *Table 3*.

Table 3

Time (h)	Amount Dissolved for Tablet Strength Trandolapril 2/ Verapamil Hydrochloride 180 (mg/mg) (%)	Amount Dissolved for All Other Tablet Strengths (%)
1	6–17	4–16
2	14–30	9–25
3.5	36–66	30–60
5	57–90	51–90

The percentages of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩, *Content Uniformity*: Meet the requirements

IMPURITIES

• **TRANDOLAPRIL RELATED IMPURITIES, PROCEDURE 1**

[NOTE—On the basis of the type of formulation, perform either *Trandolapril Related Impurities, Procedure 1* and *Content of Trandolapril Related Compound E*, or *Trandolapril Related Impurities, Procedure 2*. *Trandolapril Related Impurities, Procedure 2* is recommended when the formulation is a bi-layered Tablet.]

Buffer 1: Prepare a mixture of 2.72 g/L of monobasic potassium phosphate and 3.5 g/L of sodium 1-decane sulfonate. The pH of the resulting solution is about 4.68.

Buffer 2: Prepare a mixture of 2.72 g/L of monobasic potassium phosphate and 3 g/L of sodium 1-octane sulfonate. Adjust with triethylamine to a pH of 6.6.

Diluent: Acetonitrile, methanol, and water (25:25:50)

Solution A: Acetonitrile and *Buffer 1* (15:85)

Solution B: Acetonitrile, methanol, and *Buffer 2* (70:7:30)

Solution C: Acetonitrile, methanol, and *Buffer 2* (70:4:30)

Mobile phase: See *Table 4*.

75	0	100	0
95	0	100	0
100	74	26	0
110	74	26	0

Trandolapril related compound A stock solution: 5 µg/mL of USP Trandolapril Related Compound A RS prepared as follows. Transfer USP Trandolapril Related Compound A RS to a suitable volumetric flask, add about 10% of the volume of the flask of methanol, and sonicate to dissolve. Cool and dilute with *Diluent* to volume.

System suitability solution: 0.125 mg/mL of USP Trandolapril RS and 0.15 µg/mL of USP Trandolapril Related Compound A RS in *Diluent* prepared as follows. Add about 30% of the volume of the flask of methanol to USP Trandolapril RS, and sonicate to dissolve. Cool, add appropriate quantities of *Trandolapril related compound A stock solution*, and dilute with *Diluent* to volume.

Standard solution: 1.2 µg/mL of USP Trandolapril RS in *Diluent*

Sample solution: Nominally 0.125 mg/mL of trandolapril in *Diluent* prepared as follows. Transfer an equivalent to 6.25 mg of trandolapril, from finely powdered Tablets (NLT 10), to a 50-mL volumetric flask, add 30 mL of *Diluent*, and sonicate for 15 min with intermittent and vigorous shaking. Cool and dilute with *Diluent* to volume. Centrifuge the resulting solution at 2500 rpm for 20 min, and pass through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 50 µL

Run times: NLT 1.5 times the retention time of trandolapril for the *Standard solution*, and NLT 7.0 times for the *System suitability solution* and the *Sample solution*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between trandolapril and trandolapril related compound A, *System suitability solution*

Tailing factor: NMT 2.0 for trandolapril, *System suitability solution*

Relative standard deviation: NMT 5.0% for trandolapril, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of trandolapril from the *Standard solution*
C_S = concentration of USP Trandolapril RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 5*.

Table 5

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Trandolapril related compound E[a]	0.16	—
Trandolapril related compound A[b]	0.59	—
Trandolapril	1.00	—
Trandolapril isopropyl ester[b, c]	1.98	—
Trandolapril related compound C[b, d]	2.15	—
Trandolapril related compound D	3.79	3.5
Any unspecified impurity	—	0.5
Total impurities[e]	—	2.0

[a] This impurity is controlled using the procedure described under *Content of Trandolapril Related Compound E*.
[b] Process related impurity and is controlled in the drug substance.
[c] (2*S*,3a*R*,7a*S*)-1-[*N*-[(*S*)-1-Carboxy-3-phenylpropyl]-L-alanyl]hexahydro-2-indolinecarboxylic acid 1-isopropyl ester.
[d] (2*S*,3a*R*,7a*S*)-1-[*N*-[(*S*)-1-Carboxy-3-cyclohexylpropyl]-L-alanyl]hexahydro-2-indolinecarboxylic acid 1-ethyl ester.
[e] Total impurities include all process related and degradation impurities from both *Trandolapril Related Impurities* and *Verapamil Hydrochloride Related Impurities* procedures except for trandolapril related compound D and do not include the content of trandolapril related compound E.

• **TRANDOLAPRIL RELATED IMPURITIES, PROCEDURE 2**

[NOTE—*Trandolapril Related Impurities, Procedure 2* is recommended when the formulation is a bi-layered Tablet.]

Diluent: Ethanol and water (50:50)
Solution A: Acetonitrile and isopropanol (25:75)
Solution B: *Solution A*, triethylamine, phosphoric acid, and water (20: 0.1: 0.1: 80)
Solution C: *Solution A*, triethylamine, phosphoric acid, and water (40: 0.1: 0.1: 60)
Mobile phase: See *Table 6*.

Table 6

Time (min)	Solution B (%)	Solution C (%)
0	100	0
30	0	100
32	100	0
40	100	0

Standard stock solution: 0.05 mg/mL each of USP Trandolapril Related Compound D RS and USP Trandolapril Related Compound E RS prepared as follows. Add about 50% of the volume of the flask of alcohol and then dilute with water to volume.
System suitability solution: 0.8 mg/mL of USP Verapamil Hydrochloride RS and 4 µg/mL each of USP Trandolapril Related Compound D RS and USP Trandolapril Related Compound E RS prepared as follows. Transfer a suitable quantity of USP Verapamil Hydrochloride RS and a suitable quantity of *Standard stock solution* to a suitable volumetric flask, and dilute with *Diluent* to volume.
Standard solution: 2 µg/mL each of USP Trandolapril Related Compound D RS and USP Trandolapril Related Compound E RS from the *Standard stock solution* in *Diluent*
Sample solution: Cut off the trandolapril layer of a sufficient number of Tablets with a tablet cutter or scalpel. Finely powder the trandolapril layer mixture using a mortar and pestle and transfer a suitable quantity of the powder to a suitable volumetric flask as described in *Table 7*.

Table 7

Strength of Tablet [Trandolapril (mg)/ Verapamil Hydrochloride (mg)]	Amount of Trandolapril Layer Mixture (mg)	Initial Volume of the Diluent (mL)	Volume of the Flask (mL)
1/240	1050	25	25
2/180	1050	50	50
2/240	1050	50	50
4/240	1050	100	100

Dissolve the mixture in a volume of *Diluent* per *Table 7* and stir for about 10 min. Further sonication may be necessary for complete dissolution. Remove and rinse the stir bar with *Diluent* and dilute with *Diluent* to volume. Centrifuge the contents for about 10 min and use the supernatant. Pass through a suitable filter of 0.45-µm size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 and 278 nm
Column: 4.6-mm × 15-cm; 3-µm packing L1
Temperatures
Autosampler: 2°–8°
Column: 45°
Flow rate: 1 mL/min
Injection volume: 100 µL
Run time: NLT 3.0 times the retention time of trandolapril
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2 between verapamil and trandolapril related compound E, *System suitability solution*
Relative standard deviation: NMT 2.0% for both peaks, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Overlay the chromatograms at 215 nm and at 278 nm. Disregard any peaks detected in the chromatogram at 278 nm as verapamil related impurity peaks.
Calculate the percentage of trandolapril related compound D and trandolapril related compound E impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

USP Monographs

www.webofpharma.com

r_S = peak response of trandolapril related compound D or trandolapril related compound E from the *Standard solution*
C_S = concentration of USP Trandolapril Related Compound D RS or USP Trandolapril Related Compound E RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in the *Sample solution* (µg/mL)

Calculate the percentage of any unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each unspecified impurity from the *Sample solution*
r_S = peak response of trandolapril related compound D from the *Standard solution*
C_S = concentration of USP Trandolapril Related Compound D RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in the *Sample solution* (µg/mL)
F = relative response factor, 1.2

Acceptance criteria: See *Table 8*.

Table 8

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Trandolapril related compound E	0.66	2.0
Trandolapril	1.00	—
Trandolapril related compound D	1.97	3.5
Any unspecified impurity	—	0.5
Total impurities[a]	—	1.0

[a] Total impurities include all process related and degradation impurities from *Trandolapril Related Impurities, Procedure 2* except for trandolapril related compound D and trandolapril related compound E.

• **CONTENT OF TRANDOLAPRIL RELATED COMPOUND E**

[NOTE—The *Content of Trandolapril Related Compound E* procedure is recommended when *Trandolapril Related Impurities, Procedure 1* is used.]

Buffer: 2.72 g/L of monobasic potassium phosphate and 1.0 g/L of octane sulphonic acid. Adjust with 2% (v/v) phosphoric acid to a pH of 4.0.
Diluent 1: Acetonitrile and water (90:10)
Diluent 2: Acetonitrile and *Buffer* (20:80)
Mobile phase: See *Table 9*.

Table 9

Time (min)	Buffer (%)	Acetonitrile (%)
0	84	16
20	84	16
22	20	80
32	20	80
35	84	16
45	84	16

Standard stock solution: 0.05 mg/mL of USP Trandolapril Related Compound E RS prepared as follows. Transfer a suitable amount of USP Trandolapril Related Compound E RS to a suitable volumetric flask and add methanol to about 5% of the total volume. Sonicate to dissolve, cool, and dilute with *Diluent 2* to volume.
Standard solution: 0.5 µg/mL of USP Trandolapril Related Compound E RS in *Diluent 2* from *Standard stock solution*
Sample stock solution: Nominally 0.3 mg/mL of trandolapril prepared as follows. Transfer a quantity nominally equivalent to 7.5 mg of trandolapril, from finely powdered Tablets (NLT 10), to a 25-mL volumetric flask, add 15 mL of *Diluent 1*, and sonicate for 15 min with intermittent swirling. Cool and dilute with *Diluent 1* to volume.
Sample solution: Nominally 0.075 mg/mL of trandolapril in *Buffer* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.0-mm × 10-cm; 3-µm packing L1
Column temperature: 45°
Flow rate: 1 mL/min
Injection volume: 100 µL
Run times: NLT 1.5 times and NLT 3.5 times the retention time of trandolapril related compound E for the *Standard solution* and the *Sample solution*, respectively
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 5.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of trandolapril related compound E in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of trandolapril related compound E from the *Sample solution*
r_S = peak response of trandolapril related compound E from the *Standard solution*
C_S = concentration of USP Trandolapril Related Compound E RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of trandolapril in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 2.0%. Disregard peaks below 0.045%.

• **VERAPAMIL HYDROCHLORIDE RELATED IMPURITIES**

Buffer: 6.8 g/L of monobasic potassium phosphate and 1.0 g/L of sodium 1-octane sulfonate. Adjust with phosphoric acid to a pH of 2.5.
Diluent: Acetonitrile, methanol, and water (25:25:50)
Mobile phase: Acetonitrile and *Buffer* (33:67)
Verapamil related compound B stock solution: 0.05 mg/mL of USP Verapamil Related Compound B RS in *Diluent*
System suitability solution: 1.25 mg/mL of USP Verapamil Hydrochloride RS and 5 µg/mL of USP Verapamil Related Compound B RS in *Diluent*. Initially add *Diluent* to USP Verapamil Hydrochloride RS to fill about 50% of the volume of the flask, and sonicate to dissolve. Cool and add appropriate quantities of *Verapamil related compound B stock solution*, then dilute with *Diluent* to volume.
Standard stock solution: 0.3 mg/mL of USP Verapamil Hydrochloride RS in *Mobile phase*. Initially add *Mobile phase*

www.webofpharma.com

to about 70% of the volume of the flask, and sonicate to dissolve. Cool, and dilute with *Mobile phase* to volume.

Standard solution: 0.12 mg/mL of USP Verapamil Hydrochloride RS in *Mobile phase* from the *Standard stock solution*

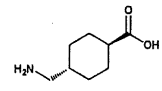
Sample solution: Nominally 1.2 mg/mL of verapamil hydrochloride in *Mobile phase* prepared as follows. Transfer a quantity equivalent to 240 mg of verapamil hydrochloride, from finely powdered Tablets (NLT 10), to a 200-mL volumetric flask, add 150 mL of *Mobile phase*, and sonicate for 30 min with intermittent vigorous shaking. Cool, and dilute with *Mobile phase* to volume. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 278 nm
Column: 4.0-mm × 10-cm; 3-µm packing L1
Column temperature: 30°
Flow rate: 1.2 mL/min
Injection volume: 10 µL
Run times: NLT 1.6 times the retention time of verapamil for the *Standard solution*, and NLT 3.0 times for the *System suitability solution* and the *Sample solution*

System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 1.5 between verapamil related compound B and verapamil, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$



r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of the verapamil from the *Standard solution*
C_S = concentration of USP Verapamil Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of verapamil hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: Disregard peaks below 0.02%.
Any other individual unknown impurity: NMT 0.5%
Total impurities: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in a well-closed container at 15°–25°.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Trandolapril RS
  USP Trandolapril Related Compound A RS
  (2*S*,3a*R*,7a*S*)-1-[*N*-[(*S*)-1-Carboxy-3-phenylpropyl]-L-alanyl]hexahydro-2-indolinecarboxylic acid 1-methyl ester.

ORGANIC IMPURITIES

- **Procedure**

Mobile phase: Dissolve 11.0 g of anhydrous monobasic sodium phosphate in 500 mL of water, and add 5 mL of triethylamine, followed by 1.4 g of sodium lauryl sulfate. Adjust with diluted phosphoric acid (10% w/w) to a pH of 2.5, and dilute with water to 600 mL. Mix this solution with 400 mL of methanol.

System suitability solution: 0.2 mg/mL of USP Tranexamic Acid RS and 0.002 mg/mL of USP Tranexamic Acid Related Compound C RS in water

www.webofpharma.com

Standard solution: 50 µg/mL of USP Tranexamic Acid RS in water
Sample solution: 10 mg/mL of Tranexamic Acid in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
Run time: 3 times the retention time of tranexamic acid
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 2.0 between tranexamic acid and 0.002 mg/mL of tranexamic acid related compound C
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each individual impurity in the portion of Tranexamic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (0.1F)$$

r_U = peak response for each impurity from the *Sample solution*
r_S = peak response for tranexamic acid from the *Standard solution*
C_S = concentration of USP Tranexamic Acid RS in the *Standard solution* (µg/mL)
C_U = concentration of Tranexamic Acid in the *Sample solution* (mg/mL)
F = relative response factor (see *Impurity Table 1*)

Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 0.2%
[NOTE—Disregard any peak less than 0.025%.]

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tranexamic acid related compound A[a]	2.1	1	0.1
Tranexamic acid related compound B[b]	1.5	1.2	0.2
Tranexamic acid related compound C[c]	1.1	0.005	0.1
Tranexamic Acid	1.0	1.0	—
Tranexamic acid related compound D[d]	1.3	0.006	0.1

[a] *trans,trans*-4,4′-(Iminodimethylene)di(cyclohexanecarboxylic)acid.
[b] *cis*-4-(Aminomethyl)cyclohexanecarboxylic acid.
[c] (*RS*)-4-(Aminomethyl) cyclohex-1-enecarbocylic acid.
[d] 4-Aminomethyl benzoic acid.

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩**:** Dry 1.00 g at 105° under vacuum for 2 h. It loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature not exceeding 30°.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Tranexamic Acid RS
USP Tranexamic Acid Related Compound C RS
(*RS*)-4-(Aminomethyl)cyclohex-1-enecarbocylic acid.
$C_8H_{13}NO_2$ 155

Add the following:

▲Tranexamic Acid Injection

DEFINITION
Tranexamic Acid Injection is a sterile solution of Tranexamic Acid in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of tranexamic acid ($C_8H_{15}NO_2$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Sample: Transfer the content of Injection into a beaker and heat on a hot plate at 100° for 30 min, until a paste appears. Then heat it in an oven to complete dryness at 110° for about 30 min.
Acceptance criteria: Meets the requirements
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: Dissolve 11 g of monobasic sodium phosphate in 500 mL of water, and add 5 mL of triethylamine. Add 1.4 g of sodium lauryl sulfate, adjust with diluted phosphoric acid (10% w/w) to a pH of 2.5, and dilute with water to 600 mL.
Mobile phase: Methanol and *Buffer* (40:60)
Standard solution: 1 mg/mL of USP Tranexamic Acid RS in water
Sample solution: Nominally 1 mg/mL of tranexamic acid prepared as follows. Transfer an accurately measured volume of Injection from a composite of contents from NLT 3 vials to a suitable volumetric flask, and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing *L1*
Column temperature: 35°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
Run time: 2 times the retention time of tranexamic acid
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of tranexamic acid ($C_8H_{15}NO_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tranexamic acid from the *Sample solution*
r_S = peak response of tranexamic acid from the *Standard solution*
C_S = concentration of USP Tranexamic Acid RS in the *Standard solution* (mg/mL)

www.webofpharma.com

C_U = nominal concentration of tranexamic acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer and **Mobile phase:** Prepare as directed in the *Assay*.

System suitability solution: 0.2 mg/mL of USP Tranexamic Acid RS and 2 µg/mL of USP Tranexamic Acid Related Compound C RS in water

Sensitivity solution: 0.01 mg/mL of USP Tranexamic Acid RS in water

Standard solution: 0.05 mg/mL of USP Tranexamic Acid RS in water

Sample solution: Nominally 10 mg/mL of tranexamic acid prepared as follows. Transfer an accurately measured volume of Injection to an appropriate volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm packing *L1*

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 3.3 times the retention time of tranexamic acid

System suitability

Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between tranexamic acid and tranexamic acid related compound C, *System suitability solution*

Add the following:

▲Tranexamic Acid Tablets

DEFINITION

Tranexamic Acid Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of tranexamic acid ($C_8H_{15}NO_2$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Sample: Finely powder 1 Tablet. Transfer a portion of the powdered Tablet, equivalent to 75 mg of tranexamic acid, to a suitable vial. Add 1 mL of water, mix on a vortex mixer for a few seconds, and sonicate for 1 min. Pass the suspension through a suitable filter onto a suitable watchglass. Evaporate the filtrate in an oven at 60° for 2 h, and then stir gently with a glass rod. Dry in an oven at 60° for another 1 h.

Acceptance criteria: The IR spectrum of the *Sample* corresponds to that of USP Tranexamic Acid RS.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

USP Monographs

www.webofpharma.com

ASSAY

• **PROCEDURE**

Solution A: Dissolve 10.5 g of monobasic sodium phosphate monohydrate in 1000 mL of water, and add 8 mL of triethylamine followed by 2.3 g of sodium dodecyl sulfate. Adjust with 85% phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Solution A* (15:85)

Standard solution: 2.6 mg/mL of USP Tranexamic Acid RS in water. Sonicate, if needed.

Sample solution: Nominally 2.6 mg/mL of tranexamic acid prepared as follows. Transfer a portion of finely powdered Tablets (NLT 20), equivalent to 650 mg of tranexamic acid, to a 250-mL volumetric flask. Add about 200 mL of water, sonicate for about 20 min with occasional shaking, and dilute with water to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; 3.5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: NLT 2 times the retention time of tranexamic acid

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tranexamic acid ($C_8H_{15}NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tranexamic acid from the *Sample solution*

r_S = peak response of tranexamic acid from the *Standard solution*

C_S = concentration of USP Tranexamic Acid RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tranexamic acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: Water; 900 mL

ASSAY
• **PROCEDURE**
Buffer: Dissolve 3.4 g of monobasic ammonium phosphate in about 900 mL of water in a 1-L volumetric flask. Adjust with phosphoric acid to a pH of 2.2 ± 0.1, and dilute with water to volume.
Mobile phase: Methanol and *Buffer* (3:7)
0.05 N sulfuric acid: Cautiously add 1.3 mL of sulfuric acid to 100 mL of water, cool to room temperature, and dilute to 1000 mL.
Diluent: Methanol, water, and *0.05 N sulfuric acid* (1:3:1)
Standard stock solution: Using a sonicator, dissolve USP Tranylcypromine Sulfate RS in *0.05 N sulfuric acid* and methanol (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a 400 µg/mL solution.
Standard solution: 40 µg/mL of USP Tranylcypromine Sulfate RS in *Diluent*, prepared from the *Standard stock solution*
Sample stock solution: Using a sonicator, dissolve Tranylcypromine Sulfate in methanol and *0.05 N sulfuric acid* (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a 400 µg/mL solution.
Sample solution: 40 µg/mL tranylcypromine sulfate in *Diluent*, prepared from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 4-µm packing L11
Column temperature: 30°
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $(C_9H_{11}N)_2 \cdot H_2SO_4$ in the portion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tranylcypromine Sulfate RS in the *Standard solution* (µg/mL)
C_U = concentration of tranylcypromine sulfate in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
INORGANIC IMPURITIES
• **Residue on Ignition** ⟨281⟩: NMT 0.1%
ORGANIC IMPURITIES
• **Procedure**
Buffer, 0.05 N sulfuric acid, and **Diluent:** Proceed as directed in the *Assay*.
Solution A: Methanol and *Buffer* (3:17)
Solution B: Methanol and *Buffer* (3:7)
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	100	0
25	0	100
37	0	100
39	100	0
45	100	0

Standard stock solution: 14 µg/mL of USP Tranylcypromine Sulfate RS, and 60 µg/mL each of USP Tranylcypromine Related Compound A RS and USP Tranylcypromine Related Compound B RS in *Diluent*. [NOTE—Sonicate as needed.]
Standard solution: Transfer a portion of the *Standard stock solution* to a suitable volumetric flask containing methanol and *0.05 N sulfuric acid* (30% of the final volume of each solvent). Dilute with *Diluent* to volume to obtain a solution containing 0.7 µg/mL of USP Tranylcypromine Sulfate RS and 3.0 µg/mL each of USP Tranylcypromine Related Compound A RS and USP Tranylcypromine Related Compound B RS.
Sample solution: Using a sonicator, dissolve Tranylcypromine Sulfate in methanol and *0.05 N sulfuric acid* (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a solution containing 680 µg/mL of tranylcypromine sulfate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 249 nm for tranylcypromine related compound B; 220 nm for all other specified and unspecified impurities
Column: 4.6-mm × 15-cm; 3-µm packing L1
Column temperature: 35°
Flow rate: 1.2 mL/min

USP Monographs

www.webofpharma.com

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between tranylcypromine and tranylcypromine related compound A, determined at 220 nm

Tailing factor: NMT 2.0 for tranylcypromine, determined at 220 nm

Relative standard deviation: NMT 6.0% for tranylcypromine and tranylcypromine related compound A, determined at 220 nm; NMT 6.0% for tranylcypromine related compound B, determined at 249 nm.

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Disregard the signal for tranylcypromine related compound B observed at 220 nm.]

Identify tranylcypromine related compound A, *cis*-hydrazide, *trans*-hydrazide, and any unspecified impurity using the data in *Impurity Table 1*. Calculate the percentage of each impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of the impurity from the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of USP Tranylcypromine Sulfate RS in the *Standard solution* (µg/mL)

C_U = concentration of Tranylcypromine Sulfate in the *Sample solution* (µg/mL)

F = response factor relative to tranylcypromine sulfate

Calculate the percentage of tranylcypromine related compound B in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response at 249 nm of tranylcypromine related compound B from the *Sample solution*

r_S = peak response at 249 nm of tranylcypromine related compound B from the *Standard solution*

C_S = concentration of USP Tranylcypromine Related Compound B RS in the *Standard solution* (µg/mL)

C_U = concentration of Tranylcypromine Sulfate in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of 3-phenylallylamine free base, 133.19

M_{r2} = molecular weight of 3-phenylallylamine hydrochloride (USP Tranylcypromine Related Compound B RS), 169.66

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

[NOTE—Tranylcypromine related compound B is determined at 249 nm. All other specified and unspecified impurities are determined at 220 nm.]

Total impurities: NMT 1.0% for sum of tranylcypromine related compound A, tranylcypromine related compound B, *cis*-hydrazide, *trans*-hydrazide, and any unspecified impurity.

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tranylcypromine related compound A[a]	0.82	0.74	0.50
Tranylcypromine sulfate	1.0	1.0	—
Tranylcypromine related compound B[b]	1.2	—	0.50
cis-Hydrazide[c]	1.4	0.86	0.50
trans-Hydrazide[d]	2.5	1.1	0.50
Any unspecified impurity	—	1.0	0.10

[a] (±)-*cis*-2-Phenylcyclopropanamine (*cis*-Cypromine).

[b] 3-Phenylallylamine (Cinnamylamine), monitored at 249 nm.

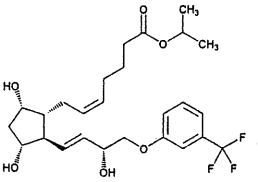
[c] (±)-*cis*-2-Phenylcyclopropanecarbohydrazide.

[d] (±)-*trans*-2-Phenylcyclopropanecarbohydrazide.

SPECIFIC TESTS

- **LOSS ON DRYING** ⟨731⟩: Dry a sample in vacuum at 60° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS



- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Tranylcypromine Sulfate RS

USP Tranylcypromine Related Compound A RS
(±)-*cis*-2-Phenylcyclopropanamine hydrochloride; *cis*-tranylcypromine hydrochloride.
$C_9H_{11}N \cdot HCl$ 169.65

USP Tranylcypromine Related Compound B RS
3-Phenylallylamine hydrochloride; cinnamylamine hydrochloride.
$C_9H_{11}N \cdot HCl$ 169.65

Travoprost

$C_{26}H_{35}F_3O_6$ 500.55

[1*R*-[1α(*Z*),2β(1*E*,3*R**),3α,5α]]-7-[3,5-Dihydroxy-2-[3-hydroxy-4-[3-(trifluoromethyl)phenoxy]-1-butenyl] cyclopentyl]-5-heptenoic acid, 1-methylethyl ester;
Isopropyl (*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(1*E*,3*R*)-3-hydroxy-4-[(α,α,α-trifluoro-*m*-tolyl)oxy]-1-butenyl] cyclopentyl]-5-heptenoate [157283-68-6].

DEFINITION

Travoprost contains NLT 96.0% and NMT 102.0% of travoprost ($C_{26}H_{35}F_3O_6$), calculated on the anhydrous and solvent-free basis.

[**CAUTION**—Great care should be taken to avoid contact with the body.]

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩

Standard solution: Use USP Travoprost RS.

www.webofpharma.com

Sample solution: Prepare as directed in the *Assay*.
Chromatographic system
Adsorbent: Chromatographic plate coated with silica gel that contains 20% silver nitrate
Application volume: 5 µL. [NOTE—To keep the spot size small, it is usually necessary to apply approximately 1–2 µL at a time, allowing the spot to dry between each application.]
Developing solvent system: Ethyl acetate and ethanol (4:1)
Spray reagent: 20% phosphomolybdic acid in ethanol
Analysis
Samples: *Standard solution* and *Sample solution*
Proceed as directed in the chapter. Spray the plate with *Spray reagent*, and heat it in an oven at 80°–100°. The travoprost will appear as black spots.
Acceptance criteria: Meets the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Buffer: Add 2.0 mL of phosphoric acid to 1 L of water. Adjust with sodium hydroxide to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer* (3:7)
Standard solution: Use USP Travoprost RS without dilution (0.5 mg/mL).
Sample solution: Transfer 25 mg of Travoprost to a 50-mL volumetric flask, and dissolve in 15 mL of acetonitrile. Add 25 mL of water, mix, and wait until the solution reaches room temperature. Dilute with water to volume, and mix.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 5-cm; packing L1
Flow rate: 3.0 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
[NOTE—USP Travoprost RS contains a small percentage of the 5,6-*trans* isomer. The relative retention times for travoprost and the 5,6-*trans* isomer are about 1.0 and 1.1, respectively.]
Suitability requirements
Resolution: NLT 1.5 between travoprost and the 5,6-*trans* isomer
Column efficiency: NLT 1500 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of travoprost ($C_{26}H_{35}F_3O_6$) in the portion of Travoprost taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Travoprost RS in the *Standard solution* (mg/mL)
C_U = concentration of Travoprost in the *Sample solution* (mg/mL)

Acceptance criteria: 96.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer, Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.
Analysis
Sample: *Sample solution*
Calculate the percentage of each impurity in the portion of Travoprost taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response for each individual impurity
r_T = sum of the responses of all the peaks
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Travoprost related compound A	0.11	1.0	0.2
Epoxide derivative[a]	0.55	1.0	0.4
15-*epi* Diastereomer[b]	0.90	1.1	0.1
5,6-*trans* Isomer[c]	1.16	1.0	3.5
15-Keto derivative[d]	1.45	1.6	0.3
Any other individual impurity	—	—	0.1
Total impurities	—	—	4.0

[a] (5*Z*)-(9*S*,11*R*,15*S*)-9,11,15-Trihydroxy-13,14-epoxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5-prostadienoic acid, isopropyl ester.
[b] (5*Z*,13*E*)-(9*S*,11*R*,15*S*)-9,11,15-Trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester.
[c] (5*E*,13*E*)-(9*S*,11*R*,15*R*)-9,11,15-Trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester.
[d] (5*Z*,13*E*)-(9*S*,11*R*)-9,11-Dihydroxy-15-oxo-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester.

• **LIMIT OF ETHYL ACETATE**

Standard solution: 50 µg/mL of ethyl acetate in *N,N*-dimethylacetamide
Sample solution: 0.02 g/mL of Travoprost in *N,N*-dimethylacetamide
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
