in which C is the concentration, in mg per mL, of USP Procainamide Hydrochloride RS in the *Standard preparation,* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Procainamide Hydrochloride Injection

» Procainamide Hydrochloride Injection is a sterile solution of Procainamide Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.
Labeling—Label it to indicate that the Injection is not to be used if it is darker than slightly yellow, or is discolored in any other way.
USP Reference standards ⟨11⟩—
USP Procainamide Hydrochloride RS
Identification—It responds to the *Thin-Layer Chromatographic Identification Test* ⟨201⟩, 5 µL of the clear supernatant being used to prepare the *Assay preparation* in the *Assay* and 5 µL of the stock solution being used to prepare the *Standard preparation* in the *Assay* being applied to the plate, and a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (22:2:1) being used to develop the chromatogram.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.35 USP Endotoxin Unit per mg of procainamide hydrochloride.
pH ⟨791⟩: between 4.0 and 6.0.
Particulate Matter in Injections ⟨788⟩: meets the requirements under Small-volume injections.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Procainamide Hydrochloride.*
Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of procainamide hydrochloride, to a 500-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this stock solution to a 100-mL volumetric flask, reserving the remainder of the stock solution for the *Identification* test. Dilute with *Mobile phase* to volume, and mix.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Procainamide Hydrochloride.* Calculate the quantity, in mg, of $C_{13}H_{21}N_3O \cdot HCl$ in each mL of the Injection taken by the formula:

$$10{,}000(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Procainamide Hydrochloride RS in the *Standard preparation,* V is the volume, in mL, of Injection taken, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Procainamide Hydrochloride Tablets

» Procainamide Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Procainamide Hydrochloride RS
Identification—Tablets respond to the *Thin-Layer Chromatographic Identification Test* ⟨201⟩, 5 µL of the clear supernatant used to prepare the *Assay preparation* in the *Assay* and 5 µL of the stock solution used to prepare the *Standard preparation* in the *Assay* being applied to the plate, and a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (22:2:1) being used to develop the chromatogram.

Dissolution ⟨711⟩—
Medium: 0.1 N hydrochloric acid; 900 mL.

www.webofpharma.com

Apparatus 2: 50 rpm.
Time: 60 minutes.
Procedure—Determine the amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 275 nm on filtered portions of the solution under test, suitably diluted with an amount of 0.01 N sodium hydroxide that is not less than twice the volume of the portion of test solution taken, in comparison with a Standard solution having a known concentration of USP Procainamide Hydrochloride RS in the same media.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$ is dissolved in 60 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Procainamide Hydrochloride.*
Assay preparation—Weigh and finely powder not less than 20 Procainamide Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of procainamide hydrochloride, to a 500-mL volumetric flask, add about 350 mL of methanol, and sonicate for 10 minutes in a 40° water bath. Allow the flask to cool to room temperature, dilute with methanol to volume, and mix. Centrifuge a portion of the suspension, transfer 5.0 mL of the clear supernatant obtained to a 100-mL volumetric flask, reserving the remainder of the clear supernatant for the *Identification* test. Dilute with *Mobile phase* to volume, and mix.
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Procainamide Hydrochloride.* Calculate the quantity of $C_{13}H_{21}N_3O \cdot HCl$ in the portion of Tablets taken by the formula:

$$10{,}000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Procainamide Hydrochloride RS in the *Standard preparation,* and r_U and r_S are the procainamide peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Procainamide Hydrochloride Extended-Release Tablets

» Procainamide Hydrochloride Extended-Release Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of procainamide hydrochloride ($C_{13}H_{21}N_3O \cdot HCl$).

Packaging and storage—Preserve in tight containers.
Labeling—The labeling indicates the *Dissolution Test* with which the product complies.
USP Reference standards ⟨11⟩—
USP Procainamide Hydrochloride RS
Identification—It responds to the *Thin-Layer Chromatographic Identification Test* ⟨201⟩, 5 µL of the stock solution prepared as directed for *Assay preparation* in the *Assay* and 5 µL of the *Stock standard solution* being applied to the plate, and a solvent system consisting of a mixture of ether, methanol, and ammonium hydroxide (25:5:1) being used to develop the chromatogram.

Dissolution ⟨711⟩—
TEST 1—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 1.*
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 4, and 6 hours.
Procedure—Determine the amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 224 nm, using filtered portions of the solution under test, diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Procainamide Hydrochloride RS in the same *Medium.*
Tolerances—The percentage of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved at the times specified conforms to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 30% and 60%
4	between 60% and 90%
6	not less than 75%

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2.*
Medium—Proceed as directed for *Method B* under *Delayed-Release Dosage Forms.*
ACID STAGE: 0.1 N hydrochloric acid; 900 mL for 1 hour.
BUFFER STAGE: 0.05 M phosphate buffer, pH 7.5; 900 mL (see *Buffer Solutions* under *Reagents, Indicators, and Solutions*) for not less than 8 hours.
Apparatus 2: 50 rpm, with sinkers.
Times: 1, 4, and 8 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 30% and 60%
4	between 60% and 90%
8	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3.*
Medium—Proceed as directed under *Test 2.*
Apparatus 2: 50 rpm, with sinkers.
Times: 1, 3, 6, and 8 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 25% and 50%
3	between 40% and 75%
6	between 65% and 90%
8	not less than 80%

TEST 4—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4.*
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 50 rpm.

www.webofpharma.com

Times: 1, 2, 4, 8, and 14 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1*.
Tolerances—The percentages of the labeled amount of $C_{13}H_{21}N_3O \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	not more than 30%
2	between 25% and 45%
4	between 45% and 75%
8	between 70% and 90%
14	not less than 80%

TEST 5—If the product complies with this test the labeling indicates that the product meets USP *Dissolution Test 5*.
Medium—Proceed as directed for *Method B* under *Delayed-Release Dosage Forms*.
ACID STAGE: 0.1 N hydrochloric acid; 1000 mL for 1 hour.
BUFFER STAGE: 0.05 M phosphate buffer, pH 7.5; 1000 mL (see *Buffer Solutions* under *Reagents, Indicators, and Solutions*) for not less than 8 hours.
Apparatus 2: 50 rpm, with sinkers.
Times: 1, 4, 6, and 8 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1*.
Tolerances—Proceed as directed for *Tolerances* in *Test 2*.
FOR 500 MG TABLETS—

Time (hours)	Amount dissolved
1	between 30% and 45%
4	between 55% and 75%
6	not less than 65%
8	not less than 75%

FOR 750 AND 1000 MG TABLETS—

Time (hours)	Amount dissolved
1	between 30% and 50%
4	between 60% and 80%
6	between 70% and 90%
8	not less than 75%

TEST 6—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 6*.
Medium—Proceed as directed for *Test 2*.
Apparatus 2: 50 rpm.
Times: 1, 4, and 8 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1*.
Tolerances—Proceed as directed for *Tolerances* in *Test 2*.
FOR 250 MG TABLETS—

Time (hours)	Amount dissolved
1	between 30% and 60%
4	between 60% and 90%
8	not less than 80%

FOR 500 MG TABLETS—

Time (hours)	Amount dissolved
1	between 30% and 50%
4	between 60% and 80%
8	not less than 85%

FOR 750 MG TABLETS—

Time (hours)	Amount dissolved
1	between 30% and 50%
4	between 60% and 80%
8	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 8*.
Medium—Proceed as directed for *Method B* under *Delayed-Release Dosage Forms*.
ACID STAGE:0.1 N hydrochloric acid; 900 mL for 1 hour.
BUFFER STAGE:0.05 M phosphate buffer, pH 7.5; 900 mL (see *Buffer Solutions* under *Reagents, Indicators, and Solutions*) for not less than 8 hours.
Apparatus 2: 50 rpm, with sinkers.
Times: 1, 4, 6, and 8 hours.
Procedure—Proceed as directed for *Procedure* in *Test 1*.
Tolerances—Proceed as directed for *Tolerances* in *Test 2*.

Time (hours)	Amount dissolved
1	between 33% and 50%
4	between 70% and 85%
6	not less than 80%
8	not less than 85%

Uniformity of dosage units ⟨905⟩: meet the requirements.

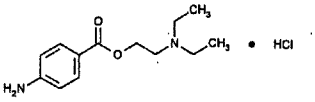
Assay—
Mobile phase—Prepare a suitable mixture of water, methanol, and triethylamine (140:60:1), adjust with phosphoric acid to a pH of 7.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Dissolve an accurately weighed quantity of USP Procainamide Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL (*Stock standard solution*). Quantitatively dilute an accurately measured volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL (*Standard preparation*).
Assay preparation—Transfer not fewer than 10 Tablets, accurately counted, to a 1000-mL volumetric flask, and add 100 mL of a mixture of methanol and methylene chloride (1:1). Place the flask in a 40° sonicator bath, and sonicate, with occasional shaking, until the Tablets have disintegrated completely. Add about 700 mL of methanol, and sonicate for 10 minutes, with occasional shaking. Allow to cool, dilute with methanol to volume, and mix. Filter a portion of this solution, discarding the first 10 mL of the filtrate. Quantitatively dilute an accurately measured volume of the filtrate with *Mobile phase* to obtain a solution having a concentration of about 0.5 mg of procainamide hydrochloride per mL. Use a portion of this stock solution for the *Identification* test. Quantitatively dilute another accurately measured volume of the stock solution with *Mobile phase* to obtain a solution

USP Monographs

www.webofpharma.com

having a concentration of about 0.05 mg per mL (*Assay preparation*).

Resolution solution—Prepare a solution of *p*-aminobenzoic acid in *Mobile phase* containing 0.1 mg per mL. Pipet 10 mL of this solution and 10 mL of the *Stock standard* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.



Chromatographic system (see *Chromatography*)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution:* the resolution, *R*, is not less than 2.0. Chromatograph replicate injections of the *Standard preparation:* the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for *p*-aminobenzoic acid and 1.0 for procainamide. Calculate the quantity, in mg, of procainamide hydrochloride ($C_{13}H_{21}N_3O \cdot HCl$) per Tablet taken by the formula:

$$(L/D)(C)(r_U/r_S)$$

in which *L* is the labeled quantity, in mg, of procainamide hydrochloride in each Tablet; *D* is the concentration, in mg per mL, of procainamide hydrochloride in the *Assay preparation,* based on the number of Tablets taken, the labeled quantity per Tablet, and the extent of dilution; *C* is the concentration, in mg per mL, of USP Procainamide Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Procaine Hydrochloride

$C_{13}H_{20}N_2O_2 \cdot HCl$ 272.77

Benzoic acid, 4-amino-, 2-(diethylamino)ethyl ester, monohydrochloride.

2-(Diethylamino)ethyl *p*-aminobenzoate monohydrochloride [51-05-8].

» Procaine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_{13}H_{20}N_2O_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards ⟨11⟩—
USP Procaine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: Dissolve 10 mg in 1 mL of water, add 1 drop each of hydrochloric acid and sodium nitrite solution (1 in 10), then add 1 mL of a solution prepared by dissolving 0.2 g of 2-naphthol in 10 mL of sodium hydroxide solution (1 in 10), and shake: a scarlet-red precipitate is formed.

C: It responds to the tests for *Chloride* ⟨191⟩.

Melting range ⟨741⟩: between 153° and 158°.

Bacterial Endotoxins Test ⟨85⟩—Where the label states that Procaine Hydrochloride is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains not more than 0.6 USP Endotoxin Unit per mg of procaine hydrochloride.

Sterility Tests ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

Acidity—To a solution of 1.0 g in 25 mL of water add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 0.50 mL is required for neutralization.

Loss on drying ⟨731⟩—Dry it over silica gel for 18 hours: it loses not more than 1.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.15%.

Chromatographic purity—

Solvent—Prepare a mixture of methanol and trichloroethane (7:3).

Standard preparations—Prepare a solution of USP Procaine Hydrochloride RS in *Solvent* containing 1.6 mg per mL. Dilute quantitatively with *Solvent* to obtain Standard preparations having the following compositions:

Standard preparation	Dilution	Concentration (mg RS per mL)	Percentage (%, for comparison with test specimen)
A	2.5 in 10	0.4	0.5
B	2.0 in 10	0.32	0.4
C	1.0 in 10	0.16	0.2
D	0.5 in 10	0.08	0.1

Test preparation—Transfer 1.6 g of Procaine Hydrochloride, accurately weighed, to a suitable capped container, add 20 mL of *Solvent*, close the container, and sonicate for 2 minutes. Use this solution as the *Test preparation.*

Procedure—Apply separately 10 µL of the *Test preparation* and 10 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture, prewashed with methanol and allowed to dry. Use a double-trough chromatographic chamber. Fill one trough with ammonium hydroxide, and allow the chamber to equilibrate for 1 hour. Position the plate in the other trough, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride and methanol (95:6) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations:* no secondary spot is more intense than the principal spot obtained from *Standard* (0.5%), and the sum of

USP Monographs

www.webofpharma.com

the intensities of all secondary spots obtained from the *Test preparation* does not exceed 1.0%.

Assay—Transfer about 0.5 g of Procaine Hydrochloride, accurately weighed, to a beaker, add 100 mL of cold water, 5 mL of hydrochloric acid, and 100 mg of potassium bromide, and stir until dissolved. Proceed as directed under *Nitrite Titration* ⟨451⟩, beginning with "cool to about 15°." Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 27.28 mg of $C_{13}H_{20}N_2O_2$.HCl.

Procaine Hydrochloride Injection

» Procaine Hydrochloride Injection is a sterile solution of Procaine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{20}N_2O_2 \cdot HCl$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass. The Injection may be packaged in 100-mL multiple-dose containers.

USP Reference standards ⟨11⟩—
USP Procaine Hydrochloride RS

Identification—Evaporate a portion of Injection, equivalent to about 20 mg of procaine hydrochloride, on a steam bath just to dryness, and dry over silica gel for 18 hours: the residue responds to *Identification* tests *A* and *B* under *Procaine Hydrochloride.*

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.6 USP Endotoxin Unit per mg of procaine hydrochloride.

pH ⟨791⟩: between 3.0 and 5.5.

Particulate Matter in Injections ⟨788⟩: meets the requirements under Small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Standard preparation—Transfer to a 125-mL separator about 50 mg, accurately weighed, of USP Procaine Hydrochloride RS, and dilute with water to 20 mL.

Assay preparation—Transfer to a 125-mL separator an accurately measured volume of Injection, equivalent to about 50 mg of procaine hydrochloride, and dilute with water to 20 mL.

Procedure—To the *Standard preparation* and also to the *Assay preparation* add 5 mL of 6 N ammonium hydroxide, then treat each as follows. Extract with five 25-mL portions of chloroform, and filter the combined extracts through about 1 g of anhydrous sodium sulfate supported on a pledget of glass wool. Receive the filtrate in a 200-mL volumetric flask, add chloroform to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, add chloroform to volume, and mix. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of $C_{13}H_{20}N_2O_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(W/V)(A_U/A_S)$$

in which W is the weight, in mg, of USP Procaine Hydrochloride RS used, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

Procaine Hydrochloride and Epinephrine Injection

» Procaine Hydrochloride and Epinephrine Injection is a sterile solution of Procaine Hydrochloride and Epinephrine Hydrochloride in Water for Injection. The content of epinephrine does not exceed 0.002 percent (1 in 50,000). It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ($C_9H_{13}NO_3$).

Packaging and storage—Preserve in single-dose or in multiple-dose, light-resistant containers, preferably of Type I or Type II glass.

Labeling—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

USP Reference standards ⟨11⟩—
USP Epinephrine Bitartrate RS
USP Procaine Hydrochloride RS

Color and clarity—Using the Injection as the *Test solution,* proceed as directed for *Color and clarity* under *Epinephrine Injection.*

Identification—Evaporate a portion of Injection, equivalent to about 20 mg of procaine hydrochloride, on a steam bath just to dryness, and dry over silica gel for 18 hours, protected from light: the residue responds to *Identification* tests *A* and *B* under *Procaine Hydrochloride.*

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.6 USP Endotoxin Unit per mg of procaine hydrochloride.

pH ⟨791⟩: between 3.0 and 5.5.

Content of epinephrine—

Alkaline ascorbate reagent—Mix 100 mL of alcohol, 80 mL of sodium hydroxide solution (1 in 5), and 8 mL of ascorbic acid solution (1 in 50). Prepare fresh on the day of use.

Standard preparation—Place about 18 mg of USP Epinephrine Bitartrate RS, accurately weighed, in a 100-mL volumetric flask, add sodium bisulfite solution (1 in 1000) to volume, and mix. Dilute this solution quantitatively with water to obtain a solution having a known concentration of about 10 µg of epinephrine per mL.

Procedure—Pipet a volume of Injection, equivalent to about 10 µg of epinephrine, into a 50-mL beaker. Into another 50-mL beaker pipet 1 mL of *Standard preparation.* Treat the contents of each beaker as follows. Add 10 mL of dilute hydrochloric acid (1 in 120), and heat gently to reduce the volume of solution to about 5 mL. Allow to cool to room temperature, then add 5 mL of sodium acetate solution (1 in 5), followed by 0.5 mL of potassium ferricyanide solution (1 in 400), and mix. At 2 minutes, accurately timed, after the last addition, add 20 mL of *Alkaline ascorbate reagent,* transfer the contents to a corresponding 50-mL volumetric flask with the aid of water, add water to volume, and mix. At 15 to 20 minutes after the addition of the *Alkaline ascorbate reagent,* determine the

USP Monographs

www.webofpharma.com

fluorescences of each solution and of a reagent blank, with a suitable fluorometer, with an excitation wavelength setting of 420 nm and a fluorescence wavelength setting of 520 nm. Calculate the quantity, in µg, of $C_9H_{13}NO_3$ in each mL of Injection taken by the formula:

$$(C/V)[(I_U - B)/(I_S - B)]$$

in which C is the concentration of epinephrine, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and I_U, I_S, and B are the fluorescence readings of the solutions from the Injection, the *Standard preparation*, and the reagent blank, respectively.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Standard preparation—Transfer to a 125-mL separator about 50 mg, accurately weighed, of USP Procaine Hydrochloride RS, and dilute with water to 20 mL.

Assay preparation—Transfer to a 125-mL separator an accurately measured volume of Injection, equivalent to about 50 mg of procaine hydrochloride, and dilute with water to 20 mL.

Procedure—To the *Standard preparation* and also to the *Assay preparation* add 5 mL of 6 N ammonium hydroxide, then treat each as follows. Extract with five 25-mL portions of chloroform, and filter the combined extracts through about 1 g of anhydrous sodium sulfate supported on a pledget of glass wool. Receive the filtrate in a 200-mL volumetric flask, add chloroform to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, add chloroform to volume, and mix. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of $C_{13}H_{20}N_2O_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(W/V)(A_U/A_S)$$

in which W is the weight, in mg, of USP Procaine Hydrochloride RS used, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Delete the following:

▲Procaine and Tetracaine Hydrochlorides and Levonordefrin Injection

» Procaine and Tetracaine Hydrochlorides and Levonordefrin Injection is a sterile solution of Procaine Hydrochloride, Tetracaine Hydrochloride, and Levonordefrin in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$), not less than 95.0 percent and not more than 105.0 percent of the labeled amount of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of levonordefrin ($C_9H_{13}NO_3$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

Labeling—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

Color and clarity—Using the Injection as the *Test solution*, proceed as directed for *Color and clarity* under *Mepivacaine Hydrochloride and Levonordefrin Injection*.

Identification—

A: Mix 10 mL of Injection with 10 mL of 3 N hydrochloric acid, cool to 0° in an ice bath, add 5 mL of sodium nitrite solution (1 in 5), stirring gently, add 2 mL of a solution of 0.1 g of 2-naphthol in 5 mL of 1 N sodium hydroxide, and observe immediately: a bright orange-red precipitate is formed (*presence of a primary aminophenyl group*).

B: It responds to the tests for *Identification Tests—General* ⟨191⟩, *Chloride*.

C: To about 25 mL of Injection add 1 drop of ferric chloride TS: the solution immediately turns a light green and changes to a light blue within 1 minute. Add 2 drops of 3 N hydrochloric acid: the color reverts to light green (*presence of levonordefrin*).

Bacterial Endotoxins Test ⟨ 85 ⟩—It contains not more than 0.6 USP Endotoxin Unit per mg of procaine hydrochloride.

pH ⟨ 791 ⟩: between 3.5 and 5.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay for procaine hydrochloride—Transfer 25.0 mL of Injection to a 250-mL beaker, add 10 mL of dilute hydrochloric acid (1 in 2), 15 mL of water, and 1.0 mL of formaldehyde solution, and allow to stand for 3 minutes. Titrate with 0.1 M sodium nitrite VS, using starch iodide paper as an external indicator. Perform a blank determination, and make any necessary correction. Calculate the quantity, in mg, of $C_{13}H_{20}N_2O_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(272.78/25)(V_2M_2 - 0.5V_1M_1)$$

in which V_2 is the volume, in mL, and M_2 is the exact molarity of the 0.1 M sodium nitrite solution used in the titration, V_1 and M_1 are as defined under *Assay for tetracaine hydrochloride*, and 272.78 is the molecular weight of procaine hydrochloride.

Assay for tetracaine hydrochloride—Transfer 50.0 mL of Injection to a 100-mL beaker, add 5 g of sodium acetate and 5 mL of isopropyl alcohol, and stir until the sodium acetate is dissolved. Add 1.5 mL of potassium thiocyanate solution (75 in 100), and stir while cooling in an ice bath. Keep in the ice bath for 1 hour, stirring about four times during the period. Do not stir excessively. Prepare a filtering crucible with double suitable filter paper, connect to a suction flask, and moisten the paper with a few drops of the clear supernatant. Remove the excess liquid by suction. Filter the mixture, and dry by suction. Transfer the entire contents of the crucible to the original beaker, and rinse the crucible with 10 mL of dilute hydrochloric acid (1 in 2), followed by 30 mL of water. Transfer the rinsings to the beaker. Cool in ice, and titrate with 0.02 M sodium nitrite VS, using starch iodide paper as an external indicator. Perform a blank determination, using 10 mL of

www.webofpharma.com

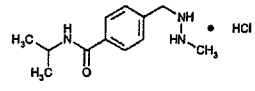
dilute hydrochloric acid (1 in 2) and 30 mL of water, and make any necessary correction. Calculate the quantity, in mg, of $C_{15}H_{24}N_2O_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(300.83/50)(V_1M_1)$$

in which V_1 is the volume, in mL, and M_1 is the exact molarity of the 0.02 M sodium nitrite used in the titration, and 300.83 is the molecular weight of tetracaine hydrochloride.

Assay for levonordefrin—

Ferro-citrate solution, *Buffer solution*, and *Standard preparation*—Prepare as directed under *Epinephrine Assay* ⟨391⟩.



Assay preparation—Proceed with Injection as directed for *Assay Preparation* under *Epinephrine Assay* ⟨391⟩, except to read "levonordefrin" where "epinephrine" is specified.

Procedure—Proceed as directed for *Procedure* under *Epinephrine Assay* ⟨391⟩. Calculate the quantity, in mg, of levonordefrin ($C_9H_{13}NO_3$) in each mL of the Injection taken by the formula:

$$(183.21/333.30)(0.05C/V)(A_U/A_S)$$

in which 183.21 and 333.30 are the molecular weights of levonordefrin and epinephrine bitartrate, respectively, C is the concentration, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*, and V is the volume, in mL, of Injection taken. ▲ (USP 1-May-2020)

Procarbazine Hydrochloride

$C_{12}H_{19}N_3O \cdot HCl$ 257.76

Benzamide, *N*-(1-methylethyl)-4-[(2-methylhydrazino)methyl]-, monohydrochloride.

N-Isopropyl-α-(2-methylhydrazino)-*p*-toluamide monohydrochloride [366-70-1].

» Procarbazine Hydrochloride contains not less than 98.5 percent and not more than 100.5 percent of $C_{12}H_{19}N_3O \cdot HCl$.

[**CAUTION**—*Handle Procarbazine Hydrochloride with exceptional care, since it is a highly potent agent.*]

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Procarbazine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
[NOTE—Use low-actinic glassware throughout this test.]
Solution: 10 µg per mL.
Medium: 0.1 N hydrochloric acid.
Absorptivities at 232 nm do not differ by more than 3.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Assay—Dissolve about 0.75 g of Procarbazine Hydrochloride, accurately weighed, in 100 mL of water. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically, using a calomel-glass electrode system. Each mL of 0.1 N sodium hydroxide is equivalent to 25.78 mg of $C_{12}H_{19}N_3O \cdot HCl$.

Procarbazine Hydrochloride Capsules

» Procarbazine Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of procarbazine ($C_{12}H_{19}N_3O$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Procarbazine Hydrochloride RS

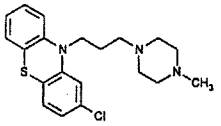
Identification—The polarogram of the solution employed for measurement in the *Assay* exhibits a half-wave potential ($E_{1/2}$) within ±0.03 volt of that of USP Procarbazine Hydrochloride RS, similarly measured ($E_{1/2}$ is about –0.16 volt against a saturated calomel electrode).

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of procarbazine ($C_{12}H_{19}N_3O$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 233 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Procarbazine Hydrochloride RS in the same medium.
Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{12}H_{19}N_3O$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
pH 12 buffer—Dissolve 5.43 mL of phosphoric acid, 4.60 mL of glacial acetic acid, and 4.95 g of boric acid in water to make 2000 mL. To 100 mL of this solution add 100 mL of 0.2 N sodium hydroxide. Prior to use, deaerate this solution by bubbling with scrubbed nitrogen.
Procedure— [NOTE—Use low-actinic glassware throughout this procedure.] Weigh the contents of not less than 20 Capsules, and determine the average weight per capsule. Mix the combined contents to obtain a homogeneous sample. Transfer an accurately weighed portion of this powder, equivalent to about 60 mg of procarbazine hydrochloride, to a 100-mL volumetric flask that previously has been flushed with nitrogen. Dissolve in *pH 12 buffer*, dilute with *pH 12 buffer* to volume, and centrifuge a portion of this solution at about 1500 rpm for about 3 minutes. Transfer 10 mL to 15 mL of the solution to a polarographic cell that is regulated at 25 ± 0.1°.

USP Monographs



www.webofpharma.com

Deaerate by bubbling scrubbed nitrogen through the solution for 5 minutes. Insert the dropping mercury electrode of a suitable polarograph, which is capable of measuring a current of 10 microamperes, using an average capillary, a mercury column height of 56 cm, and a drop rate of approximately 4 per second. Record the polarogram from –0.75 volt to +0.25 volt, using a saturated calomel electrode as the reference electrode. Determine the height of the current at a point 200 mV anodic of the half-wave potential. Calculate the quantity, in mg, of $C_{12}H_{19}N_3O$ in the portion of Capsule contents taken by the formula:

$$100(0.8585C)[i_U/i_S]$$

in which 0.8585 is the ratio of the molecular weight of procarbazine to that of procarbazine hydrochloride, i_U is the observed current of the solution from the Capsule contents and i_S is that determined similarly in a solution of USP Procarbazine Hydrochloride RS, the concentration of which is C mg per mL (about 600 µg per mL).

Prochlorperazine

$C_{20}H_{24}ClN_3S$ 373.94

10*H*-Phenothiazine, 2-chloro-10-[3-(4-methyl-1-piperazinyl) propyl]-;
2-Chloro-10-[3-(4-methyl-1-piperazinyl)propyl] phenothiazine [58-38-8].

DEFINITION

Prochlorperazine contains NLT 98.0% and NMT 101.0% of prochlorperazine ($C_{20}H_{24}ClN_3S$).

[NOTE—Throughout the following procedures, protect the sample, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES ⟨181⟩:** Meets the requirements when USP Prochlorperazine Maleate RS is used as the standard for comparison

ASSAY

- **PROCEDURE**

Sample: 400 mg of Prochlorperazine

Analysis: Transfer the *Sample* to a 125-mL conical flask. Add 30 mL of glacial acetic acid, and warm on a steam bath to dissolve. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination (see *Titrimetry ⟨541⟩*), and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 18.70 mg of prochlorperazine ($C_{20}H_{24}ClN_3S$).

Acceptance criteria: 98.0%–101.0%

IMPURITIES

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%

USP Prochlorperazine Maleate RS

Prochlorperazine Oral Solution

DEFINITION

Prochlorperazine Oral Solution contains an amount of Prochlorperazine Edisylate equivalent to NLT 92.0% and NMT 108.0% of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$).

[NOTE—Throughout the following procedures, protect the sample, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

- **A.**

Analysis: To 2 mL of Oral Solution add 3 mL of water and 3 or 4 drops of ferric chloride TS.

Acceptance criteria: A stable red color is produced.

- **B.**

Analysis: To 1 mL of Oral Solution add 10 mL of bromine TS, previously warmed to room temperature.

Acceptance criteria: Essentially no color change occurs (distinction from chlorpromazine hydrochloride, which immediately produces a green color).

ASSAY

- **PROCEDURE**

Ion-pairing solution: Dissolve 4.33 g of sodium 1-octanesulfonate in 500 mL of water. Add 4.0 mL of glacial acetic acid, and dilute with water to 1 L.

Mobile phase: Acetonitrile, methanol, and *Ion-pairing solution* (40:10:50)

Diluent: A mixture containing 1000 mL of distilled water, 8.6 mL of concentrated hydrochloric acid, and 1000 mL of methanol

Internal standard solution: 0.9 mg/mL of trifluoperazine hydrochloride in *Diluent*

Standard stock solution: 1.0 mg/mL of USP Prochlorperazine Maleate RS in *Diluent*

Standard solution: 0.09 mg/mL of trifluoperazine hydrochloride from *Internal standard solution* and 0.1 mg/mL of USP Prochlorperazine Maleate RS from *Standard stock solution*, in *Diluent*

Sample solution: Transfer a quantity of Oral Solution, equivalent to 10.0 mg of prochlorperazine, to a 100-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography ⟨621⟩, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 15-cm; 10-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for prochlorperazine and trifluoperazine are 1.0 and 1.3, respectively.]

USP Monographs

USP Prochlorperazine Maleate RS

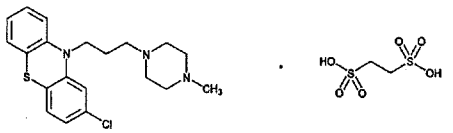
Prochlorperazine Suppositories

DEFINITION
Prochlorperazine Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$).
[NOTE—Throughout the following procedure, protect the sample, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION
• **A.**
Analysis: Place a quantity of Suppositories, equivalent to 5 mg of prochlorperazine, in a test tube. Add 4 mL of dilute hydrochloric acid (1 in 2), warm on a steam bath to melt the solid, and swirl to mix.
Acceptance criteria: A pink color develops in the aqueous layer.
• **B.**
Analysis: To the solution from *Identification* test *A*, add 10 mL of bromine TS.
Acceptance criteria: Essentially no color change occurs (distinction from chlorpromazine, which immediately produces a green color).

ASSAY
• **PROCEDURE**
Standard solution: Transfer 40 mg of USP Prochlorperazine Maleate RS to a 250-mL separator containing 75 mL of ether. Add 0.5 mL of 6 N ammonium hydroxide, and extract with four 65-mL portions of dilute hydrochloric acid (1 in 100), collecting the aqueous extracts in a 500-mL volumetric flask. Aerate the combined extracts for 15–20 min to remove dissolved ether. Add dilute hydrochloric acid (1 in 100) to volume. Pass a portion of the solution through filter paper, discarding the first 25 mL of the filtrate. To 25.0 mL of the subsequent filtrate add dilute hydrochloric acid (1 in 100) to make 200.0 mL.
Sample solution: Weigh, mash, and then mix NLT 15 Suppositories. Transfer a weighed quantity of the mass, equivalent to 25 mg of prochlorperazine, to a 100-mL beaker. Dissolve in 50 mL of ether, and transfer to a 250-mL separator with the aid of three 25-mL portions of ether. Proceed as directed for the *Standard solution*, beginning with "Extract with four 65-mL portions of dilute hydrochloric acid (1 in 100)".
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelengths: 254 and 278 nm
Cell: 1 cm
Blank: Dilute hydrochloric acid (1 in 100)
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Determine the absorbances of the *Standard* and *Sample solutions*, and calculate the differences in the absorbances of the two solutions at 254 and 278 nm.
Calculate the percentage of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$) in the portion of Suppositories taken:

$$\text{Result} = A_U/A_S \times (M_{r1}/M_{r2}) \times (W_S/W_U) \times 100$$



A_U = difference in the absorbances of the *Sample solution* at 254 nm and at 278 nm ($A_{254} - A_{278}$)
A_S = difference in the absorbances of the *Standard solution* at 254 nm and at 278 nm ($A_{254} - A_{278}$)
M_{r1} = molecular weight of prochlorperazine, 373.94
M_{r2} = molecular weight of prochlorperazine maleate, 606.09
W_S = weight of USP Prochlorperazine Maleate RS in the *Standard solution* (mg)
W_U = nominal amount of prochlorperazine in the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature below 37°. Do not expose the unwrapped Suppositories to sunlight.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Prochlorperazine Maleate RS

www.webofpharma.com

Prochlorperazine Edisylate

$C_{20}H_{24}ClN_3S \cdot C_2H_6O_6S_2$ 564.14

10*H*-Phenothiazine, 2-chloro-10-[3-(4-methyl-1-piperazinyl) propyl]-,1,2-ethanedisulfonate (1:1);
2-Chloro-10-[3-(4-methyl-1-piperazinyl)propyl] phenothiazine 1,2-ethanedisulfonate (1:1) [1257-78-9].

DEFINITION

Prochlorperazine Edisylate contains NLT 98.0% and NMT 101.5% of prochlorperazine edisylate ($C_{20}H_{24}ClN_3S \cdot C_2H_6O_6S_2$), calculated on the dried basis.

[NOTE—Throughout the following procedures, protect the sample, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

Prochlorperazine Maleate Tablets

DEFINITION
Prochlorperazine Maleate Tablets contain an amount of Prochlorperazine Maleate equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$).
[NOTE—Throughout the following procedures, protect the samples, Reference Standards, and solutions from light, and conduct the procedures without delay.]

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

▲• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.▲ (USP 1-Aug-2019)

ASSAY

Change to read:

• **PROCEDURE**
Ion-pairing solution: Dissolve 4.33 g of sodium 1-octanesulfonate in 500 mL of water. Add 4.0 mL of glacial acetic acid, and dilute with water to 1 L.
Mobile phase: Acetonitrile, methanol, and *Ion-pairing solution* (40:15:45)
Standard solution: 0.2 mg/mL of USP Prochlorperazine Maleate RS in *Mobile phase*
Sample solution: ▲Nominally equivalent to 0.12 mg/mL of prochlorperazine in *Mobile phase* prepared as follows.▲ (USP 1-Aug-2019) Transfer an equivalent to about 12 mg of prochlorperazine from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask. Add 60 mL of *Mobile phase*, sonicate for 3 min, and shake by mechanical means for 30 min. Dilute with *Mobile phase* to volume, and filter, discarding the first 10 mL of filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm. ▲For *Identification B*, use a diode array detector in the range of 210–400 nm.▲ (USP 1-Aug-2019)
Column: 3.9-mm × 30-cm; ▲10 µm▲ (USP 1-Aug-2019) packing L1
Flow rate: 2 mL/min
Injection volume: 10 µL

Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT ▲1.0%▲ (USP 1-Aug-2019)
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response ▲of prochlorperazine▲ (USP 1-Aug-2019) from the *Sample solution*
r_S = peak response ▲of prochlorperazine▲ (USP 1-Aug-2019) from the *Standard solution*
C_S = concentration of USP Prochlorperazine Maleate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of prochlorperazine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of prochlorperazine, 373.94
M_{r2} = molecular weight of prochlorperazine maleate, 606.09

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

Change to read:

• **Dissolution** ⟨711⟩
Medium: 0.1 N hydrochloric acid; 500 mL
Apparatus 2: 75 rpm
Time: 60 min
Standard solution: USP Prochlorperazine Maleate RS at a known concentration in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.
Instrumental conditions
Mode: UV
Analytical wavelength: 254 nm
▲**Analysis**
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$) dissolved:

$$\text{Results} = (A_U/A_S) \times C_S \times D \times (1/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Prochlorperazine Maleate RS in the *Standard solution*
D = dilution factor for *Sample solution*, if needed
L = label claim (mg/Tablet)
V = volume of *Medium*, 500 mL▲ (USP 1-Aug-2019)

Tolerances: NLT 75% (Q) of the labeled amount of prochlorperazine ($C_{20}H_{24}ClN_3S$) is dissolved.
• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

Change to read:

• **Organic Impurities**
Buffer solution: 1.36 g/L of sodium acetate trihydrate in water (0.01 M). Add 2.0 mL of triethylamine and 6.0 mL of glacial acetic acid per liter of solution.
Solution A: *Buffer solution*
Solution B: Acetonitrile
Mobile phase: See *Table 1*. Return to original conditions, and re-equilibrate the system for about 10 min.

Table 1

Procyclidine Hydrochloride

$C_{19}H_{29}NO \cdot HCl$ 323.90
1-Pyrrolidinepropanol, α-cyclohexyl-α-phenyl-, hydrochloride.
α-Cyclohexyl-α-phenyl-1-pyrrolidinepropanol hydrochloride [1508-76-5].

» Procyclidine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_{19}H_{29}NO \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a dry place.
USP Reference standards ⟨11⟩—
USP Procyclidine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: Dissolve about 250 mg in 10 mL of water in a separator, render alkaline with 6 N ammonium hydroxide, and extract with three 10-mL portions of ether. Filter the ether extracts slowly through a layer of about 2 g of anhydrous granular sodium sulfate supported on glass wool, evaporate the ether with a current of warm air, and scratch the surface of the container to induce crystallization of the residue: the procyclidine so obtained melts between 83° and 87°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩).

C: A solution (1 in 100) responds to the tests for *Chloride* ⟨191⟩.

pH ⟨791⟩: between 5.0 and 6.5, in a solution (1 in 100).
Loss on drying ⟨731⟩—Dry it in vacuum at 105° for 4 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.
Related compounds—Dissolve approximately 200 mg of Procyclidine Hydrochloride in 20 mL of water, and render the solution alkaline by adding 1.5 mL of 6 N ammonium hydroxide. Extract with three 15-mL portions of chloroform, wash the combined extracts with 20 mL of water, discard the water washing, and filter the chloroform solution through a layer of 3 to 4 g of anhydrous granular sodium sulfate supported on glass wool. Reduce the volume to 5 mL by evaporating with the aid of gentle heat and a current of air. Inject 2 µL of this solution into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, and record the chromatogram to 2.5 relative to the retention time of the principal (procyclidine) peak. Under typical conditions, the instrument contains a 1-m × 2-mm glass column packed with 10% polyethylene glycol 20,000 and 2% potassium hydroxide on packing S1A. The column is maintained at a temperature of about 180°, the injection port is maintained at 210°, the detector block is maintained at about 220°, and dry helium is used as the carrier gas at a flow rate of about 60 mL per minute. From the total area under the curve, excluding the solvent peak, calculate the percentage of total impurities by area normalization: not more than 4.0% is found.

www.webofpharma.com

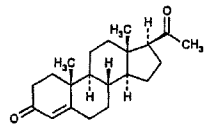
Assay—Dissolve about 700 mg of Procyclidine Hydrochloride, accurately weighed, in 75 mL of glacial acetic acid in a 250-mL beaker, warming, if necessary, to effect solution. Cool, add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 32.39 mg of $C_{19}H_{29}NO \cdot HCl$.

Procyclidine Hydrochloride Tablets

» Procyclidine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{19}H_{29}NO \cdot HCl$.

Packaging and storage—Preserve in tight containers, and store in a dry place.
USP Reference standards ⟨11⟩—
USP Procyclidine Hydrochloride RS

Identification—
A: Triturate a portion of finely powdered Tablets, equivalent to about 10 mg of procyclidine hydrochloride, with 20 mL of chloroform, filter, evaporate the filtrate on a steam bath to dryness, and dry the residue at 105° for 1 hour: the IR absorption spectrum of a potassium bromide dispersion of the procyclidine hydrochloride so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Procyclidine Hydrochloride RS.
B: A portion of finely powdered Tablets, equivalent to about 50 mg of procyclidine hydrochloride, responds to *Identification* test *B* under *Procyclidine Hydrochloride.*



Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_{19}H_{29}NO \cdot HCl$ dissolved, employing the procedure set forth in the *Assay,* making any necessary modifications.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{19}H_{29}NO \cdot HCl$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Related compounds—Using a portion of powdered Tablets, equivalent to 200 mg of procyclidine hydrochloride, proceed as directed in the test for *Related compounds* under *Procyclidine Hydrochloride.*

Assay—
Bromocresol purple solution—Dissolve 250 mg of bromocresol purple in dilute glacial acetic acid (1 in 50) to make 1000 mL.
Standard preparation—Transfer about 25 mg of USP Procyclidine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Bromocresol purple solution* to volume, and mix. The concentration of the *Standard preparation* is about 25 µg per mL.
Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 mg of procyclidine hydrochloride, to a 100-mL volumetric flask, add 10.0 mL of water, and mix. Dilute with *Bromocresol purple solution* to volume, mix, and allow the undissolved particles to settle. Use the supernatant as directed in the *Procedure.*
Procedure—Transfer 5.0 mL each of the *Standard preparation* and the *Assay preparation* to individual 60-mL separators. Transfer 0.5 mL of water and 4.5 mL of *Bromocresol purple solution* to a third separator to provide the blank. Extract each solution with 20.0 mL of chloroform, and filter each extract, discarding the first 5 mL of the filtrate. Concomitantly determine the absorbance of each subsequent filtrate in a 1-cm cell at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{19}H_{29}NO \cdot HCl$ in the portion of Tablets taken by the formula:

$$0.1C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Procyclidine Hydrochloride RS in the *Standard preparation,* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

Progesterone

$C_{21}H_{30}O_2$ 314.46
Pregn-4-ene-3,20-dione.
Progesterone [57-83-0].

» Progesterone contains not less than 97.0 percent and not more than 103.0 percent of $C_{21}H_{30}O_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.
USP Reference standards ⟨11⟩—
USP Progesterone RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩*, Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩*, Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 10 µg per mL.
Medium: methanol.
Melting range ⟨741⟩: between 126° and 131°. It may exist also in a polymorphic modification, melting at about 121°.
Specific rotation ⟨781S⟩: between +175° and +183°.
Test solution: 20 mg per mL, in dioxane.
Loss on drying ⟨731⟩—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.5% of its weight.

Assay—
Mobile phase—Prepare a filtered and degassed mixture of water and isopropyl alcohol (72:28). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

USP Monographs

www.webofpharma.com

Internal standard solution—Transfer about 66 mg of methyltestosterone to a 10-mL volumetric flask, add dilute alcohol (85 in 100) to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Progesterone RS in dilute alcohol (85 in 100) to obtain a solution having a known concentration of about 2.5 mg per mL. Transfer 4.0 mL of this solution to a 10-mL volumetric flask, add 1.0 mL of *Internal standard solution*, then add dilute alcohol (85 in 100) to volume, and mix to obtain a solution having a known concentration of about 1 mg of USP Progesterone RS per mL.

Assay preparation—Transfer about 10 mg of Progesterone, accurately weighed, to a 10-mL volumetric flask, add 1.0 mL of *Internal standard solution*, then add dilute alcohol (85 in 100) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the analyte and internal standard peaks is not less than 3.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 2.0 for progesterone and 1.0 for methyltestosterone. Calculate the quantity, in mg, of $C_{21}H_{30}O_2$ in the portion of Progesterone taken by the formula:

$$10C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Progesterone RS in the *Standard preparation;* and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Progesterone Injection

» Progesterone Injection is a sterile solution of Progesterone in a suitable solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{30}O_2$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

USP Reference standards ⟨11⟩—
USP Progesterone RS

Identification—Insert a pledget of fine glass wool into the base of a chromatographic tube of about 200 × 25 mm. Mix 8.0 mL of nitromethane with 7.0 g of purified siliceous earth in a 150-mL beaker until uniform, and transfer to the chromatographic tube, packing lightly with a suitable tamping rod. Pack a pledget of glass wool on the top of the column. Dilute 1 mL of the Injection with *n*-heptane to obtain a solution having a concentration of about 1 mg of progesterone per mL. Transfer 4.0 mL of this solution to the prepared column. Pass 300 mL of *n*-heptane through the column, discarding the first 120 mL of the eluate. Collect the subsequent eluate in a 250-mL beaker. Evaporate the solution under a stream of nitrogen on a steam bath to about 50 mL, transfer to a 100-mL beaker, and evaporate to dryness. Remove the last traces of *n*-heptane by adding 1 mL of methanol and again drying. Dry the specimen over silica gel for 4 hours: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Progesterone RS.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Mobile phase—Prepare a degassed mixture of alcohol and water (11:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Progesterone RS in 20 mL of tetrahydrofuran, and dilute quantitatively, and stepwise if necessary, with alcohol to obtain a solution having a known concentration of about 0.08 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of progesterone, to a 100-mL volumetric flask, add 20 mL of tetrahydrofuran to dissolve, and dilute with alcohol to volume. Transfer 8 mL of this solution to a 100-mL volumetric flask, dilute with alcohol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at about 40°. Chromatograph a sample of dimethyl sulfoxide, and identify the retention time, t_a, of this nonretarded compound to calculate the capacity factor, *k'*. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the capacity factor, *k'*, for progesterone is not less than 2.0; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—The run time for the *Assay preparation* must be at least twice that of the *Standard preparation*.] Calculate the quantity, in mg, of progesterone ($C_{21}H_{30}O_2$) in each mL of Injection taken by the formula:

$$1250(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Progesterone RS in the *Standard preparation; V* is the volume, in mL, of Injection taken; and r_U and r_S are the peak responses for progesterone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Progesterone Intrauterine Contraceptive System

» Progesterone Intrauterine Contraceptive System contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{30}O_2$. It is sterile.

Packaging and storage—Preserve in sealed, single-unit containers.

USP Reference standards ⟨11⟩—
USP Progesterone RS

Identification—Cut off and discard the sealed ends of the drug-containing cores of 2 Systems, and force the contents of

www.webofpharma.com

the tubes into a small centrifuge tube. Add 3 mL of methanol, insert the stopper in the tube, mix, centrifuge, and transfer the clear, supernatant to a small beaker. Evaporate the methanol to dryness, wash the residue with two 4-mL portions of cyclohexane, and discard the washings. Dry the residue in vacuum at 50° to constant weight: the IR absorption spectrum of a mineral oil dispersion of the dried residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Progesterone RS.

Sterility Tests ⟨71⟩: meets the requirements.

Uniformity of dosage units ⟨905⟩: meets the requirements.

Chromatographic purity—

Test solution—Remove the drug-containing core from 1 System, as directed in the *Assay*, transferring it to a small flask with 25 mL of methanol. Shake vigorously for several minutes, and allow the insoluble portion to settle. The resulting supernatant is the *Test solution*.

Procedure—Divide a 20- × 20-cm thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel mixture, into sections 2 cm apart. In successive sections of the plate, on a line 2 cm from the lower edge of the plate and parallel to it, apply 1 µL, 2 µL, 3 µL, and 100 µL of the *Test solution*. Develop the plate in a suitable pre-equilibrated chromatographic chamber with a solvent system consisting of a mixture of chloroform and ethyl acetate (2:1) until the solvent front has moved 10 cm above the point of application of the spots. Remove the plate, and allow to air-dry. Observe the dried plate under short-wavelength UV light (254 nm). If spots other than the principal spot are observed in the lane of the 100-µL specimen, estimate the concentration of each by comparison with the 1-µL (1%), 2-µL (2%), and 3-µL (3%) spots. The requirement is met if the sum of impurities in the 100-µL specimen does not exceed 3%.

Drug release pattern—Remove the attached sutures from 10 Systems, and secure each system to a corrosion-resistant wire of sufficient length such that the systems are completely immersed during the shaking operation but do not touch the bottoms of the flasks. Suspend each system by the attached wire from the arm of a mechanical shaker designed to travel 2.5 cm in each direction in a vertically reciprocating cycle, at a speed of 2.5 cycles per second, so that each system is immersed in a separate 250-mL volumetric flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°. Immerse the volumetric flasks in an insulated constant-temperature water bath, maintained at 60 ± 0.1° and having a suitable means of maintaining the water level, so that the water level of the bath is above the water level in the flasks. Employ a rack or other suitable means of support for the flasks in the water bath.

Operate the shaker under the conditions described above for 23.5 hours, then remove the flasks and the systems from the bath. Remove the systems from the flasks, and immerse each system in a different flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°, and immerse these flasks in the water bath. Repeat this shaking operation daily for 12 days, using different flasks each day.

Determine the quantity of progesterone in the solutions from each of the 12 days of testing as follows. Immediately add 15 mL of methanol to each solution, allow to cool to room temperature, dilute with water to volume, and mix. Concomitantly determine the UV absorbances of each test solution and of a solution of USP Progesterone RS in the same medium, having a known concentration of about 7 µg per mL, in 2-cm cells at the wavelength of maximum absorbance at about 248 nm, with a suitable spectrophotometer, against a blank of water and methanol (47:3). Calculate the progesterone release rate, in mg per day, in the solutions taken by the formula:

$$(A_U/A_S)(24/23.5)0.25C$$

in which A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Progesterone RS in the Standard solution. For the time points specified, the drug-release pattern conforms to *Acceptance Table 1* under *Drug Release* ⟨724⟩.

Day	Release Rate (mg per day)
6	1.05–1.45
9	0.95–1.35
12	0.90–1.30

Assay—Cut off the lower sealed end of the drug-containing core of a number of Progesterone Intrauterine Contraceptive Systems, sufficient to provide about 400 mg of progesterone, forcing the viscous liquid core into a 1000-mL volumetric flask. Cut the core sections in half lengthwise, using a sharp blade, taking precautions not to contaminate either the core material or the outside of the membranes. Transfer all of these sections of the systems to the flask containing the core material. Add about 500 mL of methanol to the flask, shake vigorously for 5 to 10 minutes, dilute with methanol to volume, and centrifuge a portion of the solution. Dilute 10.0 mL of the clear, supernatant with methanol to 250 mL, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Progesterone RS, previously dried and accurately weighed, in methanol having a known concentration of about 16 µg of progesterone per mL, in 1-cm cells at the wavelength of maximum absorbance at about 241 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of $C_{21}H_{30}O_2$ in each System taken by the formula:

$$25(C/N)(A_U/A_S)$$

which C is the concentration, in µg per mL, of USP Progesterone RS in the Standard solution; N is the number of Systems taken; and A_U and A_S are the absorbances of the test solution and the Standard solution, respectively.

Progesterone Injectable Suspension

» Progesterone Injectable Suspension is a sterile suspension of Progesterone in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{21}H_{30}O_2$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards ⟨11⟩—
USP Methyltestosterone RS
USP Progesterone RS

Identification—Filter a volume of well-shaken Injectable Suspension, equivalent to not less than 100 mg of progesterone, through a medium-porosity, sintered-glass crucible, filtering again through the same crucible if the fluid is not clear. Wash with several 5-mL portions of water until 2 mL of the last washing, evaporated on a steam bath, leaves no weighable residue: the washed solid, dried at 105° to constant weight, melts between 126° and 131°, and responds to *Identification* test *A* under *Progesterone*.

USP Monographs

www.webofpharma.com

pH ⟨791⟩: between 4.0 and 7.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and isopropyl alcohol (72:28). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩.)

Diluent—Prepare a mixture of alcohol and water (85 in 100).

Internal standard solution—Dissolve an accurately weighed quantity of USP Methyltestosterone RS in *Diluent* to obtain a solution containing about 6.6 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Progesterone RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 2.5 mg per mL.

Standard curve—To four separate polytef-lined, screw-capped centrifuge tubes, pipet 3-, 4-, 5-, and 6-mL portions, respectively, of the *Standard preparation*. Add *Diluent* to each tube to make about 8 mL of solution. Transfer 1.0 mL of *Internal standard solution* to each tube, and mix.

Assay preparation—Transfer an accurately measured volume of Injectable Suspension, equivalent to about 25 mg progesterone, to a polytef-lined, screw-capped, 25 mL test tube. Add 16 mL of *Diluent*, and shake until clear. Add 2.0 mL of *Internal standard solution*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 2.1-mm × 1-m column that contains packing L2. The chromatographic conditions are such that retention times of the internal standard and progesterone are between 3 and 6 minutes and 7 and 11 minutes, respectively. Chromatograph any solution of the *Standard curve*, and record the peak areas as directed for *Procedure:* the resolution, *R*, between progesterone and methyltestosterone is not less than 3.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (5.0 µL) of each solution of the *Standard curve* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Plot the progesterone to methyltestosterone peak ratio versus the concentration, in mg per mL, of progesterone in the *Standard curve* solutions. Extrapolate the progesterone to methyltestosterone peak ratio of the *Assay preparation* in the *Standard curve* so obtained, and determine the progesterone concentration, *C*, in mg per mL, in the *Assay preparation*. Calculate the amount, in mg, of progesterone ($C_{21}H_{30}O_2$) in each mL of the Injectable Suspension taken by the formula:

$$V/A(C)$$

in which *V* is the total volume of the *Assay preparation; A* is the volume in mL of Injectable Suspension taken; and *C* is the concentration of progesterone in the *Assay preparation* calculated above.

Progesterone Compounded Vaginal Inserts

DEFINITION

Progesterone Compounded Vaginal Inserts contain NLT 90.0% and NMT 110.0% of the labeled amount of progesterone ($C_{21}H_{30}O_2$).

Prepare Compounded Progesterone Vaginal Inserts in Fatty Acid Base or Polyethylene Glycol Base as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Progesterone (micronized)	25–600 mg
Fatty Acid Base or Polyethylene Glycol Base, a sufficient quantity to make	1 Insert

Calibrate the actual molds with the *Base* that is used for preparing the Inserts, and adjust the formula accordingly. Heat the *Base* slowly and evenly until melted. Slowly add the *Progesterone* powder to the melted base, with stirring. Mix thoroughly, and pour into molds. If preparing Inserts in *Fatty Acid Base*, cool in a refrigerator until solidified, trim, and wrap. If preparing Inserts in *Polyethylene Glycol Base*, cool, trim, and wrap.

ASSAY

• **Inserts in Fatty Acid Base**

Solution A: Dehydrated alcohol, isopropyl alcohol, and methanol (90:5:5)

Mobile phase: *Solution A* and water (55:45). Filter, and degas.

Diluent: *Solution A* and water (70:30)

System suitability stock solution A: 0.4 mg/mL of USP Methyltestosterone RS in *Mobile phase*

System suitability stock solution B: 0.4 mg/mL of USP Progesterone RS in *Mobile phase*

System suitability solution: Transfer 2.0 mL each of *System suitability stock solution A* and *System suitability stock solution B* to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Standard solution A: Prepare 0.25 mg/mL of USP Progesterone RS in *n*-propyl alcohol. Mix 5.0 mL of the solution with 10.0 mL of *Diluent*.

Standard solution B: Prepare 3 mg/mL of USP Progesterone RS in *n*-propyl alcohol. Transfer 3.0 mL of the solution to a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Sample solution A: Transfer 1 Insert, containing NMT 100 mg of progesterone, to a 100-mL volumetric flask. Dissolve in 90 mL of *n*-propyl alcohol, heat at 45° for 4 min, and sonicate for 10 min. Cool, and dilute with *n*-propyl alcohol to volume. Dilute quantitatively, and stepwise if necessary, with *n*-propyl alcohol, sonicating if necessary, to obtain a solution containing a nominal concentration of 0.25 mg/mL of progesterone. Transfer 5.0 mL of this solution to a 50-mL centrifuge tube, add 10.0 mL of *Diluent*, sonicate for 1 min, and centrifuge for 10 min at 2000 rpm. Pass the supernatant through a filter of 0.45-µm or finer pore size, discarding the first 4 mL of the filtrate.

Sample solution B: Transfer 1 Insert, containing more than 100 mg of progesterone, to a 200-mL volumetric flask. Dissolve in 180 mL of *n*-propyl alcohol, heat at 45° for 8 min, and sonicate for 5 min. Cool, and dilute with *n*-propyl alcohol to volume. Dilute quantitatively, and stepwise if necessary, with *n*-propyl alcohol, sonicating each dilution for 1 min, to obtain a solution with a nominal concentration of 0.09 mg/mL of progesterone. Transfer 15 mL of this solution to a 50-mL centrifuge tube, and centrifuge for 10 min at 2000 rpm. Pass the supernatant through a filter of 0.45-µm or finer pore size, discarding the first 4 mL of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 3.9-mm × 30-cm; packing L1

www.webofpharma.com

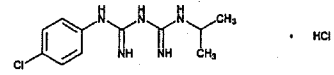
Column temperature: 40°
Flow rate: 1.0 mL/min
Injection volume: 10 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for methyltestosterone and progesterone are about 0.8 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 2.0 between methyltestosterone and progesterone
Tailing factor: NMT 2.0 for the progesterone peak
Relative standard deviation: NMT 2.0% for replicate injections for progesterone
Analysis
Samples: *Standard solution A* and *Sample solution A* or *Standard solution B* and *Sample solution B*
Calculate the percentage of the labeled amount of progesterone ($C_{21}H_{30}O_2$) in the Insert taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Progesterone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of progesterone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%
• **INSERTS IN POLYETHYLENE GLYCOL BASE**
Solution A, Mobile phase, System suitability stock solution A, System suitability stock solution B, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay* for *Inserts in Fatty Acid Base.*
Standard solution: 0.1 mg/mL of USP Progesterone RS in *Mobile phase*
Sample solution: Dissolve 1 Insert in 200 mL of *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution with a nominal concentration of 0.1 mg/mL of progesterone. Pass a 10-mL portion of the mixture through a filter of 0.45-µm or finer pore size, discarding the first 4 mL of the filtrate.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of progesterone ($C_{21}H_{30}O_2$) in the Insert taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$



r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Progesterone RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of progesterone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements for *Weight Variation*

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in light-resistant containers, and store in a refrigerator. Store Inserts in Fatty Acid Base in well-closed containers. Store Inserts in Polyethylene Glycol Base in tight containers, and do not dispense or store in polystyrene containers.
• **BEYOND-USE DATE:** NMT 90 days after the date on which they were compounded when stored in a refrigerator
• **LABELING:** Label Inserts to state whether they are Progesterone Vaginal Inserts in a Fatty Acid Base or in a Polyethylene Glycol Base. Label to state the amount of progesterone, in mg, in each Insert. Label to state that they are to be stored in a refrigerator. Label to state that wrappers are to be removed before use. If necessary, Inserts in Polyethylene Glycol Base may be moistened before insertion.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Methyltestosterone RS
USP Progesterone RS

Proguanil Hydrochloride

$C_{11}H_{16}ClN_5 \cdot HCl$ 290.19
Biguanide, 1-(4-chlorophenyl)-5-isopropyl, hydrochloride; 1-(*p*-Chlorophenyl)-5-isopropylbiguanide hydrochloride [637-32-1].

DEFINITION
Proguanil Hydrochloride contains NLT 98.5% and NMT 101.0% of proguanil hydrochloride ($C_{11}H_{16}ClN_5 \cdot HCl$), calculated on the dried basis.

Relative standard deviation: NMT 0.73%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of proguanil hydrochloride ($C_{11}H_{16}ClN_5 \cdot HCl$) in the portion of Proguanil Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of proguanil from the *Sample solution*
r_S = peak response of proguanil from the *Standard solution*
C_S = concentration of USP Proguanil Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Proguanil Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.0% on the dried basis

IMPURITIES

• **Residue on Ignition** ⟨281⟩**:** NMT 0.1%
• **Limit of Chloroaniline**
Solution A: 3.45 g/L solution of sodium nitrite
Solution B: 50 g/L solution of ammonium sulfamate
Solution C: 1 mg/mL of naphthylethylenediamine dihydrochloride in water. Prepare immediately before use.
Standard solution: 1.25 mg/L solution of chloroaniline
Sample solution: Dissolve 100 mg in 1 mL of 2 N hydrochloric acid, and dilute with water to 20 mL.
Analysis: Cool the *Sample solution* to 5°. Add 1 mL of *Solution A*, and allow to stand at 5° for 5 min. Add 2 mL of *Solution B*, and allow to stand for 10 min. Add 2 mL of *Solution C*, dilute with water to 50 mL, and allow to stand for 30 min.
Acceptance criteria: Any red color produced is not more intense than that of a standard prepared at the same time and in the same manner, using 20 mL of *Standard solution* (250 ppm).
• **Organic Impurities, Procedure 1**
[Note—On the basis of the synthetic route, perform either *Procedure 1* or *Procedure 2*. *Procedure 2* is recommended when proguanil related compound A, proguanil related compound E, proguanil related compound F, and proguanil related compound G (see *Table 3*) may be present.]
Mobile phase: Dissolve 3.78 g of sodium hexanesulfonate in a mixture of 1200 mL of methanol, 800 mL of water, and 10 mL of glacial acetic acid.
Identification solution: 0.5 µg/mL of USP Proguanil Related Compound C RS in *Mobile phase*
System suitability stock solution: 0.5 µg/mL of USP Proguanil Related Compound D RS in *Mobile phase*
System suitability solution: Dilute 1 mL of the *Standard stock solution* with *Mobile phase* to 200 mL. To 1 mL of the resulting solution, add 1 mL of *System suitability stock solution*.
Standard stock solution: 0.1 mg/mL of USP Proguanil Hydrochloride RS in *Mobile phase*
Standard solution: 0.2 µg/mL of USP Proguanil Hydrochloride RS from the *Standard stock solution* in *Mobile phase*
Sample solution: 0.1 mg/mL of Proguanil Hydrochloride in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 and 254 nm
Column: 4.6-mm × 12.5-cm; 5-µm packing L1, or 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: At least 5 times the retention time of the proguanil peak at both wavelengths
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 5 between proguanil related compound D and proguanil, *System suitability solution* at 230 nm
Relative standard deviation: NMT 10.0%, *Standard solution* at 230 nm
Analysis
Samples: *Identification solution*, *System suitability stock solution*, *Standard solution*, and *Sample solution*
[Note—The relative retention times for proguanil related compound D, proguanil, and proguanil related compound C are about 0.46, 1.0, and 2.5, respectively.]
Identify the components based on their relative retention times, and measure the responses for the major peaks.
Calculate the percentage of proguanil related compound C and proguanil related compound D, as detected at 230 nm, in the portion of Proguanil Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of proguanil related compound C or proguanil related compound D from the *Sample solution*
r_S = peak response of proguanil from the *Standard solution*
C_S = concentration of USP Proguanil Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Proguanil Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity, as detected at 230 nm, in the portion of Proguanil Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity at 230 nm from the *Sample solution*
r_S = peak response of proguanil at 230 nm from the *Standard solution*
C_S = concentration of USP Proguanil Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Proguanil Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity, as detected at 254 nm, in the portion of Proguanil Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

www.webofpharma.com

r_U = peak response of each impurity at 254 nm from the *Sample solution*
r_S = peak response of proguanil at 254 nm from the *Standard solution*
C_S = concentration of USP Proguanil Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Proguanil Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of total impurities as the sum of the calculated percentage contents of known and unknown impurities, considering each peak at the wavelength at which the peak shows the higher value.

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Proguanil related compound D[a]	0.46	0.2
Proguanil	1.0	—

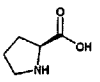
[d] 1-(3-Chlorophenyl)-5-isopropylbiguanide.
[e] 1-(3,4-Dichlorophenyl)-5-isopropylbiguanide.
[f] 1,5-Bis(4-chlorophenyl)biguanide.

SPECIFIC TESTS

• **ACIDITY OR ALKALINITY**
Sample: 400 mg
Analysis: Add 0.4 mL of methyl red–methylene blue TS to 35 mL of water maintained at 60°–65°. Neutralize with either 0.01 N sodium hydroxide or 0.01 N hydrochloric acid to a gray color. Add the *Sample*, and stir until completely dissolved.
Acceptance criteria: The solution is gray or green. NMT 0.2 mL of 0.01 N hydrochloric acid is required to change the color of the solution to reddish-violet.

• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry a sample at 105° for 2 h.
Acceptance criteria: NMT 0.5%



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at room temperature.

www.webofpharma.com

- **LABELING:** If a test for *Organic Impurities* other than *Procedure 1* is used, then the labeling states with which *Organic Impurities* test the article complies.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Proguanil Hydrochloride RS
  USP Proguanil Related Compound A RS
  1-Cyano-3-isopropylguanidine.

Proline

$C_5H_9NO_2$ 115.13
L-Proline [147-85-3].

DEFINITION
Proline contains NLT 98.5% and NMT 101.5% of L-proline ($C_5H_9NO_2$), calculated on the dried basis.

IDENTIFICATION

Change to read:

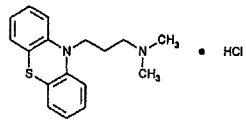
- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

ASSAY
- **PROCEDURE**
  Sample: 100 mg of Proline
  Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.
  Titrimetric system
  (See *Titrimetry* ⟨541⟩.)
  Mode: Direct titration
  Titrant: 0.1 N perchloric acid VS
  Endpoint detection: Potentiometric
  Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant*. Perform the *Blank* determination.
  Calculate the percentage of proline ($C_5H_9NO_2$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = volume of *Titrant* consumed by the *Sample* (mL)
V_B = volume of *Titrant* consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 115.1 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis



IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.4%
- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
  Standard solution: 0.50 mL of 0.020 N hydrochloric acid
  Sample: 0.73 g of Proline
  Acceptance criteria: NMT 0.05%
- **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩
  Standard solution: 0.10 mL of 0.020 N sulfuric acid
  Sample: 0.33 g of Proline
  Acceptance criteria: NMT 0.03%
- **IRON** ⟨241⟩**:** NMT 30 ppm
- **RELATED COMPOUNDS**
  System suitability solution: 0.4 mg/mL each of USP L-Proline RS and USP L-Threonine RS in 0.1 N hydrochloric acid
  Standard solution: 0.05 mg/mL of USP L-Proline RS in 0.1 N hydrochloric acid. [NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample solution*.]
  Sample solution: 10 mg/mL of Proline in 0.1 N hydrochloric acid
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
  Application volume: 5 µL
  Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)
  Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)
  System suitability
  Suitability requirements: The chromatogram of the *System suitability solution* exhibits two clearly separated spots.
  Analysis
  Samples: *System suitability solution*, *Standard solution*, and *Sample solution*
  After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.
  Acceptance criteria: Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.
  Individual impurities: NMT 0.5%
  Total impurities: NMT 2.0%

SPECIFIC TESTS
- **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
  Sample solution: 40 mg/mL in water
  Acceptance criteria: −84.3° to −86.3°
- **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 105° for 3 h: it loses NMT 0.4% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP L-Proline RS
  USP L-Threonine RS

www.webofpharma.com

Promazine Hydrochloride

$C_{17}H_{20}N_2S \cdot HCl$ 320.88

10*H*-Phenothiazine-10-propanamine, *N*,*N*-dimethyl-, monohydrochloride.

10-3-(Dimethylamino)propylphenothiazine monohydrochloride [53-60-1].

» Promazine Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Promazine Hydrochloride RS

Completeness and clarity of solution—A solution of it (1 in 10) and a 1 in 10 solution of it in chloroform are practically clear and show not more than a light yellow color.

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: Determine the absorbance of the assay solution employed for measurement of absorbance in the *Assay* at 301 nm, using 0.1 N hydrochloric acid as the blank. Similarly determine the absorbance of a 1 in 10 dilution of this solution, prepared with the same acid, at the wavelength of maximum absorbance at about 252 nm: the ratio $10(A_{252}/A_{301})$ is between 7.1 and 7.9.

C: It responds to the tests for *Chloride* ⟨191⟩.

Melting range, *Class I* ⟨741⟩: between 172° and 182°, but the range between beginning and end of melting does not exceed 3°.

pH ⟨791⟩: between 4.2 and 5.2, in a solution (1 in 20).

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Selenium ⟨291⟩—The absorbance of the solution from the *Test Solution*, prepared with 100 mg of Promazine Hydrochloride and 200 mg of magnesium oxide, is not greater than one-half that from the *Standard Solution* (0.003%).

Chromatographic purity—[NOTE—Perform this test under conditions of subdued light and with no unnecessary delays between the preparation of the solutions and the development of the chromatographic plate.]

Developing solvent—Mix 95 volumes of toluene with 15 volumes of alcohol and 1 volume of ammonium hydroxide.

Standard preparations—Dissolve an accurately weighed quantity of USP Promazine Hydrochloride RS in methanol to obtain *Standard preparation A* having a known concentration of 0.4 mg per mL. Dilute quantitatively with methanol to obtain *Standard preparations* having the following compositions:

Standard preparation	Dilution	Concentration (µg RS per mL)	Percentage (%, for comparison with test specimens)
A	(undiluted)	400	2.0
B	(1 in 2)	200	1.0
C	(3 in 10)	120	0.6
D	(1 in 10)	40	0.2

Test preparation—Dissolve an accurately weighed quantity of Promazine Hydrochloride in methanol to obtain a solution containing 20 mg per mL.

Procedure—Apply separately 10 µL of the *Test preparation* and 10 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Position the plate in a chromatographic chamber and develop the chromatograms in the *Developing solvent* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate by air drying for 15 minutes. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations:* the sum of the intensities of secondary spots obtained from the *Test preparation* corresponds to not more than 2.0% of related compounds, with no single impurity corresponding to more than 1.0%.

Assay— [NOTE—Use low-actinic glassware.] Transfer about 50 mg of Promazine Hydrochloride, previously dried and accurately weighed, to a 1000-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Without delay, concomitantly determine the absorbances of this solution and of a Standard solution of USP Promazine Hydrochloride RS in the same medium having a known concentration of about 50 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 301 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of Promazine Hydrochloride taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Promazine Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Promazine Hydrochloride and the Standard solution, respectively.

Promazine Hydrochloride Injection

» Promazine Hydrochloride Injection is a sterile solution of Promazine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards ⟨11⟩—
USP Promazine Hydrochloride RS

www.webofpharma.com

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—

A: It meets the requirements under *Identification—Organic Nitrogenous Bases* ⟨181⟩.

B: It responds to *Identification* test *B* under *Promazine Hydrochloride.*

Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 1.8 USP Endotoxin Units per mg of promazine hydrochloride.

pH ⟨791⟩: between 4.0 and 5.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay— [NOTE—Use low-actinic glassware.] Transfer a volume of Injection, equivalent to about 50 mg of promazine hydrochloride, to a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 10.0 mL of the solution to a 250-mL separator, add 20 mL of water, render alkaline with ammonium hydroxide, and extract with four 25-mL portions of ether. Extract the combined ether extracts with five 15-mL portions of 0.1 N hydrochloric acid, collecting the aqueous extracts in a 100-mL volumetric flask. Aerate to remove residual ether, dilute with 0.1 N hydrochloric acid to volume, and mix. Without delay, concomitantly determine the absorbances of this solution and of a Standard solution of USP Promazine Hydrochloride RS in the same medium having a known concentration of about 50 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 301 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in each mL of the Injection taken by the formula:

$$(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Promazine Hydrochloride RS in the Standard solution, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solution from the Injection and the Standard solution, respectively.

Promazine Hydrochloride Oral Solution

» Promazine Hydrochloride Oral Solution contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Promazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—

A: Dilute a volume of Oral Solution, equivalent to about 50 mg of promazine hydrochloride, with 0.01 N hydrochloric acid to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* ⟨181⟩, beginning with "Transfer the liquid to a separator": the Oral Solution meets the requirements of the test.

B: It responds to *Identification* test *B* under *Promazine Hydrochloride.*

pH ⟨791⟩: between 5.0 and 5.5.

Assay— [NOTE—Use low-actinic glassware.] Transfer an accurately measured volume of Oral Solution, or a quantitative dilution of it in water, equivalent to about 10 mg of promazine hydrochloride, to a 250-mL separator. Add water to adjust the volume to about 45 mL, add 3 mL of sodium hydroxide solution (1 in 10), mix, and extract the promazine with five 25-mL portions of ether. Wash the combined ether extracts with 25 mL of water, and discard the aqueous washings. Extract the combined ether extract with one 50-mL and four 25-mL portions of 0.1 N hydrochloric acid. Filter the acid extracts through a pledget of cotton washed with 0.1 N hydrochloric acid into a 250-mL volumetric flask, dilute with the same acid to volume, and mix. Without delay, concomitantly determine the absorbances of this solution and of a Standard solution of USP Promazine Hydrochloride RS in the same medium having a known concentration of about 40 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 301 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in each mL of the Oral Solution taken by the formula:

$$(0.25C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Promazine Hydrochloride RS in the Standard solution, V is the volume, in mL, of Oral Solution taken, and A_U and A_S are the absorbances from the assay solution and the Standard solution, respectively.

Delete the following:

▲Promazine Hydrochloride Syrup

» Promazine Hydrochloride Syrup contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩ —

USP Promazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—It responds to *Identification* test *B* under *Promazine Hydrochloride.*

Assay— [NOTE—Use low-actinic glassware.] Transfer a volume of Syrup, equivalent to about 10 mg of promazine hydrochloride, to a 250-mL separator. Proceed as directed in the *Assay* under *Promazine Hydrochloride Oral Solution,* beginning with "Add water to adjust the volume to about 45 mL." Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in each mL of the Syrup taken by the formula:

$$(0.25C/V)(A_U/A_S)$$

USP Monographs

www.webofpharma.com

in which C is the concentration, in µg per mL, of USP Promazine Hydrochloride RS in the Standard solution, V is the volume, in mL, of Syrup taken, and A_U and A_S are the absorbances of the solution from the Syrup and the Standard solution, respectively. ▲ (USP 1-May-2020)

Promazine Hydrochloride Tablets

» Promazine Hydrochloride Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Promazine Hydrochloride RS

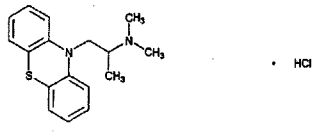
[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—

A: Shake a portion of powdered Tablets, equivalent to about 50 mg of promazine hydrochloride, with 25 mL of 0.01 N hydrochloric acid for 5 minutes, and filter: the solution meets the requirements under *Identification—Organic Nitrogenous Bases* ⟨181⟩.

B: It responds to *Identification* test *B* under *Promazine Hydrochloride*.

Disintegration ⟨701⟩: 30 minutes, with disks.



Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay— [NOTE—Use low-actinic glassware.] Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of promazine hydrochloride, to a 100-mL volumetric flask. Add 50 mL of 0.1 N hydrochloric acid, and shake by mechanical means for about 1 hour. Dilute with 0.1 N hydrochloric acid to volume, mix, and centrifuge a portion of the mixture. Transfer 10.0 mL of the clear, supernatant to a 250-mL separator, and proceed as directed in the *Assay* under *Promazine Hydrochloride Injection*, beginning with "add 20 mL of water." Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of Tablets taken by the formula:

$$C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Promazine Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Tablets and the Standard solution, respectively.

Promethazine Hydrochloride

$C_{17}H_{20}N_2S \cdot HCl$ 320.88

10*H*-Phenothiazine-10-ethanamine, *N*,*N*,α-trimethyl-, monohydrochloride, (±)-;
(±)-10-[2-(Dimethylamino)propyl]phenothiazine monohydrochloride [58-33-3].

DEFINITION

Promethazine Hydrochloride contains NLT 97.0% and NMT 101.5% of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$), calculated on the dried basis.

[NOTE—Throughout the following procedures, protect the samples, the Reference Standards, and the solutions containing them, by conducting the procedures without delay under subdued light or using low-actinic glassware.]

Promethazine Hydrochloride Injection

DEFINITION
Promethazine Hydrochloride Injection is a sterile solution of Promethazine Hydrochloride in Water for Injection. It contains NLT 95.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$).
[NOTE—Throughout the following procedures, protect the samples, the Reference Standards, and the solutions containing them, by conducting the procedures without delay under subdued light or using low-actinic glassware.]

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 3.7 g/L of ammonium acetate in water
Solution A: Acetonitrile and *Buffer* (30:70)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Acetonitrile (%)
0	100	0
10	60	40
18	60	40
18.1	100	0
25	100	0

Diluent: 0.1% triethylamine in methanol
System suitability solution: 1.0 µg/mL each of USP Promethazine Hydrochloride RS and USP Promethazine Related Compound B RS in *Diluent*
Standard solution: 0.05 mg/mL of USP Promethazine Hydrochloride RS in *Diluent*
Sample solution: Nominally 0.05 mg/mL of promethazine hydrochloride from a volume of Injection in *Diluent*
[NOTE—Sonication may be used in the preparation of *System suitability solution*, *Standard solution*, and *Sample solution*.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm. For *Identification B*, use a diode array detector in the range of 200–400 nm.
Column: 4.6-mm × 15-cm; 5-µm packing L1
Temperatures
Column: 30°
Autosampler: 4°
Flow rate: 1.4 mL/min
Injection volume: 15 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for promethazine and promethazine related compound B are 1.0 and 1.3, respectively.]
Suitability requirements
Resolution: NLT 5.0 between the promethazine and promethazine related compound B peaks, *System suitability solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–110.0%

IMPURITIES
• **ORGANIC IMPURITIES**
Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.
Standard solution: 1.0 µg/mL each of USP Promethazine Hydrochloride RS and USP Promethazine Related Compound B RS in *Diluent*
Sample solution: Nominally 500 µg/mL of promethazine hydrochloride from a volume of Injection in *Diluent*
[NOTE—Sonication may be used in the preparation of *Standard solution* and *Sample solution*.]
System suitability
Sample: *Standard solution*
[NOTE—See *Table 2* for the relative retention times.]
Suitability requirements
Resolution: NLT 5.0 between the promethazine and promethazine related compound B peaks
Relative standard deviation: NMT 2.0% for promethazine
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*
r_S = peak response of promethazine from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Sample solution* (µg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Promethazine Hydrochloride RS

USP Promethazine Related Compound B RS

Isopromethazine hydrochloride;
N,N-Dimethyl-2-(10*H*-phenothiazin-10-yl)propan-1-amine hydrochloride.
$C_{17}H_{20}N_2S \cdot HCl$ 320.88

Promethazine Hydrochloride Suppositories

» Promethazine Hydrochloride Suppositories contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{20}N_2S \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a cold place.

USP Reference standards ⟨11⟩—

USP Promethazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

Identification—Transfer a number of Suppositories, equivalent to about 50 mg of promethazine hydrochloride, to a 250-mL separator. Add 75 mL of solvent hexane and 25 mL of 0.01 N hydrochloric acid; shake to dissolve the solids. Using the aqueous phase, filtered through paper if necessary, proceed as directed under *Identification—Organic Nitrogenous Bases* ⟨181⟩, beginning with "Transfer the liquid to a separator."

Assay—

Palladium chloride solution—Add 5 mL of hydrochloric acid to a beaker containing 500 mg of palladium chloride. Warm on a steam bath to obtain a complete solution. Slowly add 200 mL of hot water. (If necessary, continue warming and add additional hydrochloric acid to maintain complete solution.) Transfer the solution to a 500-mL volumetric flask, and dilute with water to volume. To 50 mL of this solution add 250 mL of 2 M sodium acetate, and adjust with hydrochloric acid to a pH of 4.0. Transfer the solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Standard preparation—Using an accurately weighed quantity of USP Promethazine Hydrochloride RS, prepare a solution in 0.05 N hydrochloric acid containing about 0.1 mg in each mL. Protect the solution from light.

Assay preparation—Weigh 10 Suppositories and calculate the average. Carefully melt them, avoiding the use of excessive heat, and mix. Add 30 mL of hexanes to an accurately weighed portion, equivalent to about 50 mg of promethazine hydrochloride. Warm gently to dissolve, and transfer to a low-actinic separator. Rinse the transfer container with several small portions of the hexanes and 0.05 N hydrochloric acid, and add the rinsings to the separator. Extract with five 20-mL portions of 0.05 N hydrochloric acid shaking gently to avoid emulsions. Drain through glass wool prewashed with 0.05 N hydrochloric acid. Collect in a 500-mL low-actinic volumetric flask. Rinse the glass wool with additional 0.05 N hydrochloric acid, dilute the combined filtrate with 0.05 N hydrochloric acid to volume, and mix.

Procedure—Pipet 2.0 mL of the *Standard preparation*, *Assay preparation*, and 0.05 N hydrochloric acid into separate test tubes. Add 3.0 mL of *Palladium chloride solution* to each, and mix. Concomitantly determine the absorbances of the

www.webofpharma.com

Standard preparation and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 450 nm, with a suitable spectrophotometer, using the hydrochloric acid-palladium chloride solution as the reagent blank in the reference cell. Calculate the quantity, in mg, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of Suppositories taken by the formula:

$$500C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Promethazine Hydrochloride Tablets

DEFINITION

Promethazine Hydrochloride Tablets contain NLT 95.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$).

[NOTE—Throughout the following procedures, protect the samples, the Reference Standards, and the solutions containing them, by conducting the procedures without delay under subdued light or using low-actinic glassware.]

IDENTIFICATION

• **A.**

Standard solution: In a separator, dissolve 50 mg of USP Promethazine Hydrochloride RS in 40 mL of dilute hydrochloric acid (1 in 1000).

Sample solution: Shake a quantity of powdered Tablets, equivalent to 50 mg of promethazine hydrochloride, with 30 mL of chloroform, and filter into a beaker. Evaporate the chloroform, dissolve the residue in 40 mL of dilute hydrochloric acid (1 in 1000), and transfer the liquid to a separator.

Analysis: Separately treat the *Sample solution* and the *Standard solution* as follows. Add 2 mL of 1 N sodium hydroxide and 15 mL of carbon disulfide to the separators, and shake for 2 min. Centrifuge if necessary to clarify the lower phase, and pass through a dry filter, collecting the filtrate from each separator in a small flask provided with a glass stopper. Reduce the volume of the carbon disulfide extracts to 4–5 mL, and proceed as directed in *Identification—Organic Nitrogenous Bases* ⟨181⟩, beginning with "Determine the absorption spectra".

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Diluent: Dissolve 8.2 mL of hydrochloric acid in 1000 mL of water.

Mobile phase: Acetonitrile, water, and triethylamine (850:270:1)

System suitability stock solution: 1.2 mg/mL of USP Promethazine Related Compound B RS in *Diluent*. Sonicate to dissolve.

Standard solution: 0.1 mg/mL of USP Promethazine Hydrochloride RS in *Diluent*. Sonicate to dissolve.

System suitability solution: 0.09 mg/mL of USP Promethazine Hydrochloride RS and 0.12 mg/mL of USP Promethazine Related Compound B RS in *Diluent* from the *Standard solution* and *System suitability stock solution*, respectively

Sample stock solution: Nominally 2.5–5.0 mg/mL of promethazine hydrochloride prepared as follows. Transfer 20 Tablets to a volumetric flask of an appropriate size and add 50% of the flask volume of *Diluent*. Sonicate with swirling for NLT 20 min, or until the Tablets have fully disintegrated. Shake the flask for NLT 15 min and dilute with *Diluent* to volume.

Sample solution: Nominally 0.1 mg/mL of promethazine hydrochloride in *Diluent* from the *Sample stock solution*. Pass a portion through a filter of 0.45-µm pore size and use the clear filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 2.5 mL/min

Injection volume: 20 µL

Run time: NLT 2.5 times the retention time of promethazine

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for promethazine related compound B and promethazine are 0.82 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between promethazine and promethazine related compound B, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of promethazine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: Prepare a solution with a known concentration of USP Promethazine Hydrochloride RS in *Medium*.

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: Absorption maximum at about 249 nm

Analysis

Samples: *Standard solution* and *Sample solution*

www.webofpharma.com

Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times D \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Sample solution* (mg/mL)
D = dilution factor for the *Sample solution*

Tolerances: NLT 75% (Q) of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: 0.01 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 15 min
Standard solution: (L/900) mg/mL of USP Promethazine Hydrochloride RS in *Medium*, where L is the label claim (mg/Tablet)
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Instrumental conditions
Mode: UV
Analytical wavelength: Absorption maximum at about 249 nm
Cell: 0.2 cm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

  $C_{17}H_{20}N_2S \cdot HCl$ 320.88

Promethazine and Phenylephrine Hydrochloride Oral Solution

DEFINITION

Promethazine and Phenylephrine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) and phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$). It may contain suitable preservatives.

IDENTIFICATION

- **A.** The retention times of the promethazine and phenylephrine peaks of the *Sample solutions* correspond to those of the *Standard solution*, as obtained in the *Assay*.

Add the following:

- **▲B.** The UV absorption spectrum of both promethazine and phenylephrine peaks of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*, as obtained in the *Assay*. ▲ (USP 1-May-2019)

ASSAY

- **PROCEDURE**

Protect the sample and Standard solutions by using low-actinic glassware.

Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 950 mL of water, and carefully add 50 mL of acetonitrile. Adjust with phosphoric acid to an apparent pH of 3.0.

Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 500 mL of water, and add 500 mL of acetonitrile. Adjust with phosphoric acid to an apparent pH of 3.0.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS and 1.4 mg/mL of USP Phenylephrine Hydrochloride RS in *Solution A*

Standard stock solution B: 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS. Prepare by dissolving appropriate quantities of USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS into a volume of acetonitrile equivalent to 40% of the total volume of the flask and diluting with *Solution A* to volume.

Standard solution: 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.14 mg/mL of USP Phenylephrine Hydrochloride RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS. Prepare by adding 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask and diluting with *Solution A* to volume.

Promethazine hydrochloride sample solution: Nominally equivalent to 0.18 mg/mL of promethazine hydrochloride in *Solution A*

Phenylephrine hydrochloride sample solution: Nominally equivalent to 0.14 mg/mL of phenylephrine hydrochloride in *Solution A*

www.webofpharma.com

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 15 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben
Relative standard deviation: NMT 2.0% for both promethazine and phenylephrine
Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of promethazine from the *Promethazine hydrochloride sample solution*
r_S = peak response of promethazine from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*
Calculate the percentage of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phenylephrine from the *Phenylephrine hydrochloride sample solution*
r_S = peak response of phenylephrine from the *Standard solution*
C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of phenylephrine hydrochloride in the *Phenylephrine hydrochloride sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% for both promethazine hydrochloride and phenylephrine hydrochloride

IMPURITIES

Change to read:

- **ORGANIC IMPURITIES, PROCEDURE 1**

Protect the sample and Standard solutions by using low-actinic glassware.

Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust with phosphoric acid to a pH of 6.4.
5 N phosphoric acid: Dilute 12 mL of phosphoric acid with water to 100 mL.
Diluent: Methanol, water, and 5 N phosphoric acid (5:95:1)
Mobile phase: Acetonitrile, methanol, and *Solution C* (30:20:50)
Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*
Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent* from the *Standard solution*. Prepare at time of use.
Promethazine hydrochloride sample solution: Nominally equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 10 µL
Run time: ▲NLT▲ (USP 1-May-2019) 2 times the retention time of promethazine for Standards; ▲NLT▲ (USP 1-May-2019) 6 times the retention time of promethazine for samples
System suitability
Samples: *Standard solution* and *Sensitivity solution*
Suitability requirements
Tailing factor: NMT 1.5 for promethazine, *Standard solution*
Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*
Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = peak response of promethazine hydrochloride from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Promethazine	1.0	1.0	—
Phenothiazine	2.4	2.0	0.5
Methylphenothiazine[a]	4.2	2.0	0.5

▲[a] 10-Methyl-10*H*-phenothiazine.▲ (USP 1-May-2019)

Change to read:

• **ORGANIC IMPURITIES, PROCEDURE 2**

Protect the sample and Standard solutions by using low-actinic glassware.

Solution A, Solution B, Mobile phase, Standard stock solution B, and **Phenylephrine hydrochloride sample solution:** Prepare as directed in the *Assay*.

Standard stock solution A: 88 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*

Standard solution: 8.8 µg/mL of USP Promethazine Hydrochloride RS, 140 µg/mL of USP Sodium Benzoate RS, 250 µg/mL of USP Methylparaben RS, and 28 µg/mL of USP Propylparaben RS. Prepare by adding 5.0 mL of *Standard stock solution A* and 5.0 mL of *Standard stock solution B* into a 50-mL volumetric flask, and dilute with *Solution A* to volume.

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Solution A* from *Standard stock solution A*. Prepare at time of use.

Promethazine hydrochloride sample solution: Prepare as directed in the *Assay*. Use this solution to determine the promethazine related compounds and specified and unknown impurities.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 µL

System suitability

Samples: *Standard solution* and *Sensitivity solution*

[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]

Suitability requirements

Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben, *Standard solution*

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*

Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*

Identify the phenylephrine impurities using the relative retention times given in *Table 3*.

Calculate the percentage of each phenylephrine impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Phenylephrine hydrochloride sample solution*

r_S = peak response of promethazine hydrochloride from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phenylephrine hydrochloride in the *Phenylephrine hydrochloride sample solution* (µg/mL)

F = relative response factor for each impurity (see *Table 3*)

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Using the data in *Table 4*, calculate the percentage of promethazine specified and unidentified impurities and any unspecified impurities in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*

r_S = peak response of promethazine hydrochloride from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of promethazine hydrochloride in the *Promethazine hydrochloride sample solution* (µg/mL)

F = relative response factor for each impurity (see *Table 4*)

Acceptance criteria

Individual impurities: See *Table 2*, *Table 3*, and *Table 4*.

Total impurities: NMT 16.0%. Sum of the total phenylephrine impurities from *Table 3* and total promethazine impurities from *Table 4*.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩: The total aerobic microbial limit does not exceed 10^2 cfu/mL. The total yeasts and molds count does not exceed 10 cfu/mL. It meets the requirements for absence of *Escherichia coli*.
- **pH** ⟨791⟩: 3.7–4.7
- **ALCOHOL DETERMINATION** ⟨611⟩, *Procedures, Method II—Gas Chromatographic Method* (if present): 90.0%–110.0% of the labeled quantity of alcohol (C_2H_5OH).
- **DELIVERABLE VOLUME** ⟨698⟩: Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Methylparaben RS
  USP Phenylephrine Hydrochloride RS
  USP Promethazine Hydrochloride RS
  USP Propylparaben RS
  USP Sodium Benzoate RS

Promethazine and Phenylephrine Hydrochloride and Codeine Phosphate Oral Solution

DEFINITION

Promethazine and Phenylephrine Hydrochloride and Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$), phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$), and codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$). It may contain suitable preservatives.

IDENTIFICATION

- **A.** The retention times of the promethazine hydrochloride, phenylephrine hydrochloride, and codeine phosphate peaks from the *Sample solutions* correspond to those from the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

At all times, protect the sample and the Standard solutions by using low-actinic glassware.

Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptanesulfonic acid sodium salt monohydrate in 950 mL of water, and carefully add 50 mL of acetonitrile. Adjust with phosphoric acid to an apparent pH of 3.0.

Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptanesulfonic acid sodium salt monohydrate in 500 mL of water, and carefully add 500 mL of acetonitrile. Adjust with phosphoric acid to an apparent pH of 3.0.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS, 1.4 mg/mL of USP Phenylephrine Hydrochloride RS, and 2.8 mg/mL of USP Codeine Phosphate RS in *Solution A*

Standard stock solution B: 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS. Prepare by dissolving appropriate quantities of USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS in a volume of acetonitrile equivalent to 40% of the total volume of the flask and diluting with *Solution A* to volume.

Standard solution: 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.14 mg/mL of USP Phenylephrine Hydrochloride RS, 0.28 mg/mL of USP Codeine Phosphate RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS. Prepare by adding 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask and diluting with *Solution A* to volume.

Promethazine hydrochloride sample solution: Equivalent to 0.18 mg/mL, based on the label claim, of promethazine hydrochloride in *Solution A*

Phenylephrine hydrochloride sample solution: Equivalent to 0.14 mg/mL, based on the label claim, of phenylephrine hydrochloride in *Solution A*

Codeine phosphate sample solution: Equivalent to 0.28 mg/mL, based on the label claim, of codeine phosphate in *Solution A*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC

USP Monographs

www.webofpharma.com

Detector: UV 280 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 15 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben
Relative standard deviation: NMT 2.0% for promethazine, phenylephrine, and codeine
Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = promethazine peak response from the *Promethazine hydrochloride sample solution*
r_S = promethazine peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*
Calculate the percentage of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = phenylephrine peak response from the *Phenylephrine hydrochloride sample solution*
r_S = phenylephrine peak response from the *Standard solution*
C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of phenylephrine hydrochloride in the *Phenylephrine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Codeine phosphate sample solution*
Calculate the percentage of the labeled amount of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = codeine peak response from the *Codeine phosphate sample solution*
r_S = codeine peak response from the *Standard solution*
C_S = concentration of USP Codeine Phosphate RS, on the dried basis, in the *Standard solution* (mg/mL)
C_U = nominal concentration of codeine phosphate in the *Codeine phosphate sample solution* (mg/mL)
M_{r1} = molecular weight of codeine phosphate, 406.37
M_{r2} = molecular weight of anhydrous codeine phosphate, 397.37

Acceptance criteria: 90.0%–110.0% for promethazine hydrochloride, phenylephrine hydrochloride, and codeine phosphate

IMPURITIES

• **ORGANIC IMPURITIES, PROCEDURE 1**
At all times, protect the sample and the Standard solutions by using low-actinic glassware.
Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust with phosphoric acid to a pH of 6.4.
5 N phosphoric acid: Dilute 12 mL of phosphoric acid with water to 100 mL.
Diluent: Methanol, water, and *5 N phosphoric acid* (5:95:1)
Mobile phase: Acetonitrile, methanol, and *Solution C* (30:20:50)
Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*
Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*, prepared from *Standard solution*. Prepare at time of use.
Sample solution: Equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 10 µL
Run time: 2 times the retention time of promethazine, *Standard solution*; 6 times the retention time of promethazine, *Sample solution*
System suitability
Samples: *Standard solution* and *Sensitivity solution*
Suitability requirements
Tailing factor: NMT 1.5 for promethazine, *Standard solution*
Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*
Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = impurity peak response from the *Sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of promethazine hydrochloride in the *Sample solution* (µg/mL)
F = relative response factor for each impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.

www.webofpharma.com

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Promethazine	1.0	1.0	—
Phenothiazine	2.4	2.0	0.5
Methylphenothiazine[a]	4.2	2.0	0.5

[a] 10-Methylphenothiazine.

• **ORGANIC IMPURITIES, PROCEDURE 2**

At all times, protect the sample and the Standard solutions by using low-actinic glassware.

Solution A, Solution B, Mobile phase, Standard stock solution B, Codeine phosphate sample solution, and **Phenylephrine hydrochloride sample solution:** Proceed as directed in the *Assay*.

Standard stock solution A: 88 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*

Standard solution: 8.8 µg/mL of USP Promethazine Hydrochloride RS, 140 µg/mL of USP Sodium Benzoate RS, 250 µg/mL of USP Methylparaben RS, and 28 µg/mL of USP Propylparaben RS. Prepare by adding 5.0 mL of *Standard stock solution A* and 5.0 mL of *Standard stock solution B* to a 50-mL volumetric flask and diluting with *Solution A* to volume.

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*, prepared from *Standard stock solution A*. Prepare at time of use.

Promethazine hydrochloride sample solution: Proceed as directed in the *Assay*. Use this solution to determine promethazine related compounds and specified and unknown impurities.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution* and *Sensitivity solution*

[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]

Suitability requirements

Resolution: NLT 4.5 between benzoate and methylparaben, and NLT 1.5 between promethazine and propylparaben, *Standard solution*

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*

Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*

Analysis

Samples: *Phenylephrine hydrochloride sample solution* and *Standard solution*

Identify the phenylephrine impurities using the relative retention times listed in *Table 3*. Calculate the percentage of each phenylephrine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*

r_S = promethazine hydrochloride peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phenylephrine hydrochloride in the *Phenylephrine hydrochloride sample solution* (µg/mL)

F = relative response factor for each impurity (see *Table 3*)

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Using the data in *Table 4*, calculate the percentage of each promethazine impurity, unspecified impurity, and unidentified impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*

r_S = promethazine hydrochloride peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of promethazine hydrochloride in the *Promethazine hydrochloride sample solution* (µg/mL)

F = relative response factor for each impurity (see *Table 4*)

Samples: *Codeine phosphate sample solution* and *Standard solution*

Identify the codeine impurities using the relative retention times given in *Table 4*. Calculate the percentage of each codeine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*

r_S = promethazine hydrochloride peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of codeine phosphate in the *Codeine phosphate sample solution* (µg/mL)

F = relative response factor for each codeine impurity (see *Table 4*)

Acceptance criteria: See *Table 3* and *Table 4*.

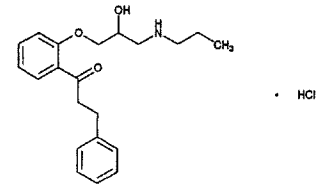
[j] Promethazine synthetic impurity. Do not quantify.
[k] Includes phenothiazine and methylphenothiazine from *Procedure 1*.



SPECIFIC TESTS

- **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩: The total aerobic microbial count does not exceed 10^2 cfu/mL. The total yeasts and molds count does not exceed 10^1 cfu/mL. It meets the requirements of the test for absence of *Escherichia coli*.
- **pH** ⟨791⟩: 3.7–4.7
- **Alcohol Determination,** *Method II* ⟨611⟩ (if present): 90.0%–110.0% of the labeled amount of C_2H_5OH
- **Deliverable Volume** ⟨698⟩: Meets the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP Reference Standards** ⟨11⟩
  USP Codeine Phosphate RS
  USP Methylparaben RS
  USP Phenylephrine Hydrochloride RS
  USP Promethazine Hydrochloride RS
  USP Propylparaben RS
  USP Sodium Benzoate RS

Propafenone Hydrochloride

$C_{21}H_{27}NO_3 \cdot HCl$ 377.90

1-Propanone, 1-[2-[2-hydroxy-3-(propylamino)propoxy] phenyl]-3-phenyl-, hydrochloride;
2′-[2-Hydroxy-3-(propylamino)propoxy]-3-phenylpropiophenone hydrochloride [34183-22-7].

DEFINITION

Propafenone Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{21}H_{27}NO_3 \cdot HCl$, calculated on the dried basis.

www.webofpharma.com

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)
- **B.** Dissolve 0.5 g of Propafenone Hydrochloride in 50 mL of water with heating. Adjust with 0.1 N sodium hydroxide to a pH of 9.5–10.0: a precipitate is formed. Cool the mixture, and filter. Add 1 mL of 6 N nitric acid and 2–3 drops of 0.1 N silver nitrate to the filtrate: a precipitate is formed, which dissolves upon the addition of a few drops of ammonium hydroxide.

ASSAY

- **PROCEDURE**

Sample solution: Transfer 250 mg of Propafenone Hydrochloride to a 125-mL flask. Dissolve in 30 mL of methanol, and add 15 mL of mercuric acetate TS.

Analysis: Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 37.79 mg of $C_{21}H_{27}NO_3 \cdot HCl$.

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

INORGANIC IMPURITIES

- **Residue on Ignition** ⟨281⟩: NMT 0.1%

ORGANIC IMPURITIES

- **Procedure**

Solvent A: 3.42 g/L of dipotassium hydrogen phosphate trihydrate. Adjust with phosphoric acid to a pH of 2.5.

Solvent B: Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solvent A (%)	Solvent B (%)
0	65	35
8	65	35
20	30	70
30	30	70
31	65	35
36	65	35

Diluent: *Solvent A* and *Solvent B* (13:7)

System suitability solution: 0.1 mg/mL of USP Propafenone Hydrochloride RS and USP Propafenone Related Compound B RS in *Diluent*

Standard solution: 0.001 mg/mL of USP Propafenone Hydrochloride RS in *Diluent*

Sample solution: 1 mg/mL of Propafenone Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1 mL/min

Injection size: 20 µL

Run time: NLT six times the retention time of propafenone

Suitability requirements

Resolution: NLT 3 between propafenone and propafenone related compound B

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Propafenone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of propafenone from the *Standard solution*

C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution*

C_U = concentration of Propafenone Hydrochloride in the *Sample solution*

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.3%. [NOTE—Disregard any peak below 0.03%.]

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Propafenone related compound B[a]	0.8	0.1
Impurity D[b]	2.3	0.1
Impurity G[c]	3.6	0.1
Impurity C[d]	4.1	0.1
Impurity F[e]	5.3	0.1
Individual unspecified impurities	—	0.1

[a] (2*E*)-1-[2-[(2*RS*)-2-Hydroxy-3-(propylamino)propoxy]phenyl]-3-phenylprop-2-en-1-one.

[b] 1-[2-[(2*RS*)-2,3-Dihydroxypropoxy]phenyl]-3-phenylpropan-1-one.

[c] 1,1′[Propyliminobis(2-hydroxypropane-3,1-diyl)oxy-2,1-phenylene]bis(3-phenylpropan-1-one.

[d] 1-[2-[[(2*RS*)-Oxiranyl]methoxy]phenyl]-3-phenylpropan-1-one.

[e] 1,1′-[2-Hydroxypropane-1,3-diylbis(oxy-2,1-phenylene)]bis(3-phenylpropan-1-one).

SPECIFIC TESTS

- **CLARITY OF SOLUTION:** Dissolve 1.0 g in 30 mL of hot water, and observe without delay: the solution initially is clear.
- **MELTING RANGE OR TEMPERATURE** ⟨741⟩: 171°–175°
- **pH** ⟨791⟩: 5.0–6.2, in a solution (1 in 200)
- **LOSS ON DRYING** ⟨731⟩: Dry a sample at 105° to constant weight: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at a temperature between 15° and 30°.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Propafenone Hydrochloride RS

USP Propafenone Related Compound B RS

(*RS*,*E*)-1-[2-[2-Hydroxy-3-(propylamino)propoxy]phenyl]-3-phenylprop-2-en-1-one.

Propafenone Hydrochloride Extended-Release Capsules

DEFINITION

Propafenone Hydrochloride Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: Dissolve 1.36 g/L of monobasic potassium phosphate in water, and adjust with phosphoric acid to a pH of 3.0 ± 0.1.
Mobile phase: Methanol and *Buffer* (50:50)
Diluent: 50% methanol in water
Standard solution: 0.1 mg/mL of USP Propafenone Hydrochloride RS in *Diluent*
Sample stock solution: Nominally 1 mg/mL of propafenone hydrochloride prepared as follows. Transfer a suitable amount of finely powdered contents from NLT 20 Capsules to an appropriate volumetric flask. Add about 60% of the final volume of *Diluent*, and sonicate with occasional swirling until the contents are completely disintegrated. Dilute with *Diluent* to volume and pass through a suitable filter of 0.45-µm pore size.
Sample solution: Nominally 0.1 mg/mL of propafenone hydrochloride in *Diluent* from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 2 times the retention time of propafenone
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of propafenone from the *Sample solution*
r_S = peak response of propafenone from the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of propafenone hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨711⟩

Test 1
Acid stage
Medium: 0.08 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 1 h
Diluent: 6.8 g/L of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 6.8.
Standard solution: (L/1000) mg/mL of USP Propafenone Hydrochloride RS in *Diluent*, where L is the label claim in mg/Capsule
Sample solution: At the specified time point, withdraw about 10 mL of the solution and pass through a suitable filter of 0.45-µm pore size. Discard at least the first 4 mL of the filtrate. Analyze the *Sample solution* immediately.
Instrumental conditions
Mode: UV
Analytical wavelengths: 305 and 375 nm
Cell: 0.2 cm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Measure and subtract the absorbance at 375 nm from the absorbance at 305 nm to obtain the absorbances for the *Sample solution* and *Standard solution*.
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved:

$$\text{Result}_1 = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: See *Table 1*.
Buffer stage
Proceed as directed in the *Acid stage*, except for the following parameters.
Buffer: Dissolve 108.88 g of monobasic potassium phosphate in water, add 14.4 g of sodium hydroxide, mix to dissolve, and dilute with water to 1 L. Adjust with 2 N sodium hydroxide to a pH of 6.8.
Solution A: *Buffer* and 2 N sodium hydroxide (64:36)
Medium: At 2 h of dissolution time, add 100 mL of *Solution A*, preheated at 37°, to 900 mL of 0.08 N hydrochloric acid.
Times: 4 and 12 h
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

www.webofpharma.com

Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at each time point (*i*):

$$Result_2 = C_2 \times V \times (1/L) \times 100$$
$$Result_3 = \{[C_3 \times (V - V_S)] + (C_2 \times V_S)\} \times (1/L) \times 100$$

C_i = concentration of propafenone hydrochloride in the portion of sample withdrawn at time point (*i*) (mg/mL)
V = volume of *Medium*, 1000 mL
L = label claim (mg/Capsule)
V_S = volume of *Medium* taken (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	1	5–25
2	4	40–70
3	12	NLT 75

The percentages of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Acid stage

Acid stage medium: 0.08 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm, with sinkers
Time: 1 h
Standard stock solution: 0.42 mg/mL of USP Propafenone Hydrochloride RS prepared as follows. Transfer a suitable amount of USP Propafenone Hydrochloride RS to a suitable volumetric flask. Add methanol, NMT 10% of the final volume, and sonicate to dissolve. Dilute with *Acid stage medium* to volume.
Standard solution: 0.021 mg/mL of USP Propafenone Hydrochloride RS in *Acid stage medium* from the *Standard stock solution*
Sample solution: Pass the solution through a suitable filter of 0.45-µm pore size. Dilute with *Acid stage medium* to a concentration similar to that of the *Standard solution*.
Instrumental conditions
Mode: UV
Analytical wavelength: 305 nm
Cell: 1 cm
Blank: *Acid stage medium*
Analysis
After 1 h in the *Acid stage medium* and the collection of the *Sample solution*, replace the portion of solution withdrawn with an equal volume of *Acid stage medium*. Continue for an additional 1 h in *Acid stage medium*.
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved:

$$Result_1 = (A_U/A_S) \times C_S \times D \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
D = dilution factor (mL/mL)
V = volume of *Acid stage medium*, 900 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 2*.

Buffer stage

Proceed as directed in the *Acid stage*, except for the following parameters.
Buffer stage medium: After 2 h in the *Acid stage*, add 100 mL of phosphate buffer (68 g of monobasic potassium phosphate and 42 g of sodium hydroxide in 1000 mL of water), preheated at 37°, to 900 mL of *Acid stage medium*; 1000 mL.
Times: 6 and 15 h
Standard stock solution: 0.48 mg/mL of USP Propafenone Hydrochloride RS prepared as follows. Transfer a suitable amount of USP Propafenone Hydrochloride RS to a suitable volumetric flask. Add methanol, NMT 10% of the final volume, and sonicate to dissolve. Dilute with *Buffer stage medium* to volume.
Standard solution: 0.048 mg/mL of USP Propafenone Hydrochloride RS in *Buffer stage medium* from *Standard stock solution*
Sample solution: Withdraw a 10-mL aliquot at each time point. Pass the solution through a suitable filter of 0.45-µm pore size. Dilute with *Buffer stage medium* to a concentration similar to that of the *Standard solution*.
Blank: *Buffer stage medium*
Instrumental conditions: See *Acid stage*.
Analysis
At the specified time points, replace the portion of solution withdrawn with 10 mL of *Buffer stage medium*.
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the sample withdrawn from the vessel at each time point (*i*):

$$Result_i = (A_U/A_S) \times C_S \times D$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
D = dilution factor (mL/mL)

Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at each time point (*i*):

$$Result_2 = \{[C_2 \times V] + (C_1 \times V_S)\} \times (1/L) \times 100$$
$$Result_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of propafenone hydrochloride in the portion of sample withdrawn at time point (*i*) (mg/mL)
V = volume of *Buffer stage medium*, 1000 mL
V_S = volume of the *Sample solution* withdrawn from the *Buffer stage medium* (mL)
L = label claim (mg/Capsule)

Tolerances: See *Table 2*.

www.webofpharma.com

Table 2

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	1	5–25
2	6	45–65
3	15	NLT 80

The percentages of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

Acid stage

Acid stage medium: 0.08 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm, with sinkers

Time: 2 h

Phosphate buffer: Dissolve 190.06 g of tribasic sodium phosphate in 1 L of water.

Diluent: *Phosphate buffer* and *Acid stage medium* (12:88). Adjust the pH to 6.8 with phosphoric acid or sodium hydroxide if necessary.

Standard solution: (L/1000) mg/mL of USP Propafenone Hydrochloride RS, where L is the label claim in mg/Capsule, prepared as follows. Transfer a suitable amount of USP Propafenone Hydrochloride RS to a suitable volumetric flask. Dissolve with 10% of final volume of methanol with aid of sonication. Dilute with *Diluent* to volume.

Sample solution: At the specified time point, withdraw 10 mL of the solution under test and centrifuge. Use the supernatant.

Instrumental conditions

Mode: UV

Analytical wavelengths: 305 nm

Cell: 0.2 cm

Blank: *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved:

$$\text{Result}_1 = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Acid stage medium*, 900 mL

Tolerances: See *Table 3*.

Buffer stage

Proceed as directed in the *Acid stage*, except for the following parameters.

Buffer stage medium: After the samples are withdrawn at 2 h, add 110 mL or appropriate amount of *Phosphate buffer*, preheated at 37°, to *Acid stage medium*, and adjust the pH to 6.8 with phosphoric acid or sodium hydroxide if necessary; 1000 mL.

Times: 4 and 12 h

Sample solution: At the specified time points, withdraw 10 mL of the solution and centrifuge. Use the supernatant.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + [C_1 \times V_S]\} \times (1/L) \times 100$$
$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of propafenone hydrochloride in the portion of sample withdrawn at time point (i) (mg/mL)
V = volume of *Buffer stage medium*, 1000 mL
V_S = volume of *Sample solution* withdrawn (mL)
L = label claim (mg/Capsule)

Tolerances: See *Table 3*.

Table 3

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	2	NMT 30
2	4	35–60
3	12	NLT 80

The percentages of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

▲**Test 4:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4*.

Acid stage

Acid stage medium: 0.08 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 2 h

Diluent: Dissolve 6.8 g of monobasic potassium phosphate with 1 L of water. Adjust with sodium hydroxide to a pH of 6.8.

Standard solution: 0.325 mg/mL of USP Propafenone Hydrochloride RS in *Diluent*

[NOTE—Sonication may be needed for dissolution.]

Sample solution: At the specified time point, withdraw 5 mL of the solution and pass through a suitable filter. Replace the portion of solution withdrawn with an equal volume of *Medium*.

Instrumental conditions

Mode: UV

Analytical wavelengths: 305 and 375 nm

Cell: 0.2 cm

Blank: *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

USP Monographs

www.webofpharma.com

Measure and subtract the absorbance at 375 nm from the absorbance at 305 nm to obtain the absorbances for the *Sample solution* and *Standard solution*.
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved:

$$Result_i = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: See *Table 4*.

Buffer stage
Proceed as directed in the *Acid stage*, except for the following parameters.
Buffer: Dissolve 108.88 g of monobasic potassium phosphate and 14.4 g of sodium hydroxide with 1 L of water. Adjust with 2 N sodium hydroxide to a pH of 6.8.
Solution A: *Buffer* and 2 N sodium hydroxide (64:36)
Medium: At 2 h of dissolution time, add 100 mL of *Solution A*, preheated at 37°, to the vessel containing 900 mL of 0.08 N hydrochloric acid.
Times: 3, 6, and 12 h
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$Result_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at each time point (i):

$$Result_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$
$$Result_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$
$$Result_4 = \{[C_4 \times V] + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of propafenone hydrochloride in the portion of sample withdrawn at time point (i) (mg/mL)
V = volume of *Medium*, 1000 mL
V_S = volume of *Medium* taken, 5 mL
L = label claim (mg/Capsule)

Tolerances: See *Table 4*.

Table 4

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	2	15–35
2	3	26–46
3	6	56–76
4	12	NLT 80

The percentages of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*. ▲(RB 8-Mar-2019)

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

Change to read:

- **ORGANIC IMPURITIES**

Keep all solutions containing propafenone hydrochloride in amber glassware.
Solution A: 0.015 M dibasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.5 ± 0.2.
Solution B: Acetonitrile
Mobile phase: See *Table* ▲*5*. ▲(RB 8-Mar-2019)

Propafenone Hydrochloride Tablets

DEFINITION

Propafenone Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$).

IDENTIFICATION

Change to read:

- **A.** The ▲▲ 2S (USP41) retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

▲• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲ 2S (USP41)

ASSAY

Change to read:

- **PROCEDURE**

Buffer: 0.1 M monobasic potassium phosphate prepared as follows. Dissolve 13.6 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 3.1, and then dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (32:68)

Standard solution: 0.15 mg/mL of USP Propafenone Hydrochloride RS in *Mobile phase*

Sample stock solution: Nominally 1.5 mg/mL of propafenone hydrochloride ▲▲ 2S (USP41) in *Mobile phase* prepared as follows. ▲Transfer an appropriate quantity of propafenone hydrochloride from NLT 20 powdered Tablets to a suitable volumetric flask, and ▲ 2S (USP41) add *Mobile phase* to ▲▲ 2S (USP41) 90% of the total volume. Sonicate for 10 min. Cool to room temperature, and dilute with *Mobile phase* to volume. Stir for 10 min, pass through a suitable filter of 0.45-µm pore size, and discard the first 5 mL of the filtrate.

Sample solution: Nominally 0.15 mg/mL of propafenone hydrochloride from *Sample stock solution* in *Mobile phase*. Pass through a suitable filter of 0.45-µm pore size, and discard the first 5 mL of the filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm. ▲For *Identification B*, use a diode array detector in the range of 200–400 nm. ▲ 2S (USP41)
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 45°
Flow rate: 1.2 mL/min
Injection volume: 20 µL
Run time: NLT 3 times the retention time of the propafenone peak

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of propafenone from the *Sample solution*
r_S = peak response of propafenone from the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of propafenone hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 75 rpm
Time: 30 min

Standard solution: 0.17 mg/mL of USP Propafenone Hydrochloride RS in 0.1 N hydrochloric acid prepared as follows. To a suitable quantity of USP Propafenone Hydrochloride RS in a suitable volumetric flask, add 0.1 N hydrochloric acid to fill 75% of the total volume. Place the flask in a water bath at 37° with stirring until completely dissolved. Remove the flask from the water bath, cool to room temperature, and dilute with 0.1 N hydrochloric acid to volume.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and discard the first 5 mL of the filtrate.

Instrumental conditions
Mode: UV
Analytical wavelength: 250 nm

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) dissolved:

www.webofpharma.com

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of propafenone from the *Sample solution*
A_S = absorbance of propafenone from the *Standard solution*
C_S = concentration of USP Propafenone Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim for propafenone hydrochloride (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$) is dissolved.

Propantheline Bromide

$C_{23}H_{30}BrNO_3$ 448.39

2-Propanaminium, *N*-methyl-*N*-(1-methylethyl)-*N*-[2-[(9*H*-xanthen-9-ylcarbonyl)oxy]ethyl]-, bromide; (2-Hydroxyethyl)diisopropylmethylammonium bromide xanthene-9-carboxylate [50-34-0].

DEFINITION

Propantheline Bromide contains NLT 98.0% and NMT 102.0% of propantheline bromide ($C_{23}H_{30}BrNO_3$), calculated on the dried basis.

IDENTIFICATION

- **A.**
  Sample solution: 6 mg/mL of Propantheline Bromide in chloroform
  Analysis: In a well-ventilated hood, apply 2 mL of *Sample solution* dropwise to a salt plate while continuously evaporating the solvent with the aid of an IR heat lamp and a current of dry air. Heat the residue at 105° for 15 min.
  Acceptance criteria: The IR absorption spectrum of the residue on the single salt plate exhibits maxima only at the same wavelengths as those of a similar preparation of USP Propantheline Bromide RS, treated in the same manner.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩
  Standard solution: 6 mg/mL USP Propantheline Bromide RS in chloroform
  Sample solution: 6 mg/mL of Propantheline Bromide in chloroform
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel
  Application volume: 5 µL
  Developing solvent system: Acetone and 1 N hydrochloric acid (1:1)
  Spray reagent: Potassium–bismuth iodide TS
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Develop the chromatogram until the solvent front has moved three-fourths the length of the plate. Dry the plate at 105° for 5 min. Spray the plate with *Spray reagent*, and heat at 105° for 5 min.
  Acceptance criteria: The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Bromide* ⟨191⟩
  Sample solution: 10 mg/mL
  Analysis: Add 2 mL of 2 N nitric acid to 5 mL of *Sample solution*.
  Acceptance criteria: This solution meets the requirements of the tests for bromide, except that in the test *A*, the chloroform layer may be yellow.

ASSAY

- **PROCEDURE**
  Sample solution: 600 mg
  Analysis: Dissolve the *Sample* in a mixture of 20 mL of glacial acetic acid and 15 mL of mercuric acetate TS, warming slightly if necessary to dissolve. Cool to room temperature. Titrate the *Sample solution* with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 44.84 mg of propantheline bromide ($C_{23}H_{30}BrNO_3$).
  Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **ORGANIC IMPURITIES**
  Buffer: 17.3 g of sodium dodecyl sulfate in 1000 mL of water containing 10 mL of phosphoric acid in a 2000-mL volumetric flask. Add 250 mL of 0.5 M sodium hydroxide, and while stirring, adjust with 0.5 M sodium hydroxide or dilute phosphoric acid (1 in 10) to a pH of 3.5 ± 0.05. Dilute with water to volume.
  Mobile phase: Acetonitrile and *Buffer* (55:45)
  Standard solution: 6.0 µg/mL of USP Propantheline Bromide Related Compound A RS, 1.5 µg/mL of USP Xanthanoic Acid RS, and 1.5 µg/mL of USP Xanthone RS in *Mobile phase*
  Sample solution: 0.3 mg/mL of Propantheline Bromide in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 4.6-mm × 25-cm; packing L7
  Flow rate: 2.0 mL/min
  Run time: NLT 1.5 times the retention time of the propantheline bromide peak
  Injection volume: 50 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Resolution: NLT 1.2 between the least resolved peaks
  Relative standard deviation: NMT 6.0% for each component
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of xanthanoic acid, xanthone, and propantheline bromide related compound A in the portion of Propantheline Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of xanthanoic acid, xanthone, or propantheline bromide related compound A from the *Sample solution*

r_S = peak response of xanthanoic acid, xanthone, or propantheline bromide related compound A from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of xanthanoic acid, xanthone, or propantheline bromide related compound A in the *Standard solution* (µg/mL)
C_U = concentration of Propantheline Bromide in the *Sample solution* (µg/mL)

Calculate the percentage of all unknown impurities in the portion of Propantheline Bromide taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each unknown impurity
r_T = sum of the responses of all the measured peaks

Acceptance criteria: Disregard any peak less than 0.1%.
Individual impurities: NMT 2.0% for propantheline bromide related compound A; NMT 0.5% each for xanthone and xanthanoic acid
Total impurities: NMT 3.0%

SPECIFIC TESTS
• **CONTENT OF BROMIDE**
Sample solution: 500 mg
Analysis: Dissolve the *Sample* in 40 mL of water, and add 10 mL of glacial acetic acid and 40 mL of methanol. Titrate the *Sample solution* with 0.1 N silver nitrate VS, using eosin Y TS as an indicator. Each mL of 0.1 N silver nitrate is equivalent to 7.990 mg of bromide.
Acceptance criteria: 17.5%–18.2% of bromide, calculated on the dried basis
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers.
• **USP REFERENCE STANDARDS** ⟨11⟩

Propantheline Bromide Tablets

DEFINITION
Propantheline Bromide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of propantheline bromide ($C_{23}H_{30}BrNO_3$).

IDENTIFICATION
• **A.**
Standard solution: 6 mg/mL of USP Propantheline Bromide RS in chloroform
Sample solution: Triturate the equivalent to 90 mg of propantheline bromide, from finely powdered Tablets, with 10 mL of chloroform. Filter, and wash the filter with 10 mL of chloroform, collecting the filtrate and washing in a separator. Add 10 mL of water, shake, and discard the chloroform layer. Wash the aqueous layer with two 10-mL portions of ether, and discard the ether washings. Filter the aqueous solution, and evaporate on a steam bath with the aid of a current of dry air to dryness. Dissolve the residue in 5 mL of chloroform.
Analysis: In a well-ventilated hood, apply 2 mL each of the *Standard solution* and *Sample solution* dropwise to separate salt plates while continuously evaporating the solvent with the aid of an IR heat lamp and a current of dry air. Heat the residues at 105° for 15 min.
Acceptance criteria: The IR absorption spectrum of the residue on the single salt plate exhibits maxima only at the same wavelengths as those of a similar preparation of USP Propantheline Bromide RS, treated in the same manner.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 17.3 g of sodium dodecyl sulfate in 1000 mL of water containing 10 mL of phosphoric acid in a 2000-mL volumetric flask. Add 250 mL of 0.5 M sodium hydroxide, and while stirring, adjust with 0.5 M sodium hydroxide or dilute phosphoric acid (1 in 10) to a pH of 3.5 ± 0.05. Dilute with water to volume.
Mobile phase: Acetonitrile and *Buffer* (55:45)
Standard solution: 0.3 mg/mL of USP Propantheline Bromide RS in *Mobile phase*
Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder equivalent to 15 mg of propantheline bromide to a 50-mL volumetric flask, and dissolve in *Mobile phase*. Dilute with *Mobile phase* to volume, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm; packing L7
Flow rate: 2.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propantheline bromide ($C_{23}H_{30}BrNO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Propantheline Bromide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of propantheline bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION,** *Procedure for a Pooled Sample* ⟨711⟩
Medium: pH 4.5 ± 0.05 acetate buffer prepared by mixing 1.64 g of anhydrous sodium acetate and 1.25 mL of glacial acetic acid with 500 mL of water, and diluting with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05; 500 mL
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: USP Propantheline Bromide RS at a known concentration in *Medium*

www.webofpharma.com

Sample solution: Filtered portion of solution under test
Buffer, Mobile phase, Chromatographic system, and System suitability: Prepare as directed in the *Assay*.
Analysis: Determine the amount of propantheline bromide ($C_{23}H_{30}BrNO_3$) dissolved by proceeding as directed in the *Assay*.
Tolerances: NLT 75% (*Q*) of the labeled amount of propantheline bromide ($C_{23}H_{30}BrNO_3$) is dissolved.

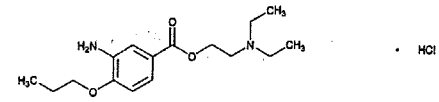
• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

• **Organic Impurities**

Buffer: 17.3 g of sodium dodecyl sulfate in 1000 mL of water containing 10 mL of phosphoric acid in a 2000-mL volumetric flask. Add 250 mL of 0.5 M sodium hydroxide, and while stirring, adjust with 0.5 M sodium hydroxide or dilute phosphoric acid (1 in 10) to a pH of 3.5 ± 0.05. Dilute with water to volume.
Mobile phase: Acetonitrile and *Buffer* (55:45)
Standard solution: 12.0 µg/mL of USP Propantheline Bromide Related Compound A RS, 3.0 µg/mL of USP Xanthanoic Acid RS, and 3.0 µg/mL of USP Xanthone RS in *Mobile phase*
Sample solution: Prepare as directed in the *Assay*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm; packing L7
Flow rate: 2.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 1.2 between the least resolved peaks
Relative standard deviation: NMT 6.0% for each component
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of xanthanoic acid, xanthone, and propantheline bromide related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$



r_U = peak response for xanthanoic acid, xanthone, or propantheline bromide related compound A from the *Sample solution*
r_S = peak response for xanthanoic acid, xanthone, or propantheline bromide related compound A from the *Standard solution*
C_S = concentration of xanthanoic acid, xanthone, or propantheline bromide related compound A in the *Standard solution* (µg/mL)
C_U = nominal concentration of propantheline bromide in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 4.0% of propantheline bromide related compound A; NMT 1.0% each of xanthone and xanthanoic acid. Disregard any peak less than 0.1%.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in well-closed containers.
• **USP Reference Standards** ⟨11⟩
USP Propantheline Bromide RS
USP Propantheline Bromide Related Compound A RS
9-Hydroxypropantheline bromide.
$C_{23}H_{30}BrNO_4$ 464.39
USP Xanthanoic Acid RS
$C_{14}H_{10}O_3$ 226.23
USP Xanthone RS
$C_{13}H_8O_2$ 196.21

Proparacaine Hydrochloride

$C_{16}H_{26}N_2O_3 \cdot HCl$ 330.85
Benzoic acid, 3-amino-4-propoxy-, 2-(diethylamino)ethyl ester, monohydrochloride;
2-(Diethylamino)ethyl 3-amino-4-propoxybenzoate monohydrochloride [5875-06-9].

DEFINITION

Proparacaine Hydrochloride contains NLT 97.0% and NMT 103.0% of proparacaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

• **A. Identification—Organic Nitrogenous Bases** ⟨181⟩: Meets the requirements
• **B. Ultraviolet Absorption**
Buffer: Proceed as directed for pH 6.0 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*). Dilute with water to prepare a 10% solution.
Analytical wavelength: 310 nm
Sample stock solution: 0.2 mg/mL of Proparacaine Hydrochloride
Sample solution: 0.02 mg/mL of Proparacaine Hydrochloride prepared as follows. To a volume of the *Sample stock solution* equivalent to 10% of the flask volume, add 2% of the flask volume of *Buffer*, and dilute with water to volume.
Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of a similarly prepared solution of USP Proparacaine Hydrochloride RS, concomitantly measured, and the respective absorptivities, calculated on the dried basis, do not differ by more than 3.0%.
• **C. Identification Tests—General,** *Chloride* ⟨191⟩
Sample solution: 20 mg/mL of Proparacaine Hydrochloride
Analysis: Proceed as directed in the chapter using the procedure for test *B*.
Acceptance criteria: Meets the requirements

ASSAY

• **Procedure**
Sample solution: Transfer 250 mg of Proparacaine Hydrochloride to a 250-mL conical flask. Add 80 mL of a 1-in-20 solution of acetic anhydride in glacial acetic acid, and heat on a steam bath for 10 min. Cool to room temperature, and add 10 mL of mercuric acetate TS.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Endpoint detection: Visual
Analysis: Titrate with *Titrant* to a blue-green endpoint using 1 or 2 drops of crystal violet TS as indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 33.09 mg of proparacaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$).
Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.15%
- **ORDINARY IMPURITIES** ⟨466⟩
  Standard solution and **Test solution:** Methanol
  Eluant: Butyl alcohol, glacial acetic acid, and water (5:1:3)
  Visualization: 1; 17
  Acceptance criteria: Meets the requirements

SPECIFIC TESTS
- **MELTING RANGE OR TEMPERATURE** ⟨741⟩: 178°–185°, but the range between beginning and end of melting does not exceed 2°.
- **LOSS ON DRYING** ⟨731⟩
  Analysis: Dry at 105° for 3 h.
  Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Proparacaine Hydrochloride RS

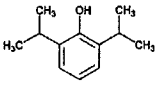
Proparacaine Hydrochloride Ophthalmic Solution

DEFINITION
Proparacaine Hydrochloride Ophthalmic Solution is a sterile, aqueous solution of Proparacaine Hydrochloride. It contains NLT 95.0% and NMT 110.0% of the labeled amount of proparacaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$).

IDENTIFICATION
- **A.**
  Solution A: Dilute hydrochloric acid (1 in 100)
  Solution B: 100 mg/mL of sodium nitrite
  Solution C: 20 mg/mL of 2-naphthol in 1 N sodium hydroxide
  Sample solution: 1 mL of Ophthalmic Solution
  Analysis 1: To the *Sample solution* in a test tube add 5 mL of *Solution A*, mix, and cool in an ice bath for 2 min. Add 2 drops of *Solution B*, stir, and cool again for 2 min. Add 1 mL of *Solution C*.
  Acceptance criteria 1: A scarlet-red precipitate is formed.
  Analysis 2: Add 5 mL of acetone to the test tube contents of *Analysis 1*.
  Acceptance criteria 2: The precipitate does not dissolve.

ASSAY
- **PROCEDURE**
  Buffer: 6.8 g/L of monobasic potassium phosphate. Add 5 mL of triethylamine, and adjust with 5 N potassium hydroxide to a pH of 7.5. Pass through a filter of 0.5-µm or finer pore size, and degas.
  Mobile phase: Acetonitrile and *Buffer* (40:60)
  Standard stock solution: 1 mg/mL of USP Proparacaine Hydrochloride RS
  Standard solution: 0.1 mg/mL of USP Proparacaine Hydrochloride RS in *Mobile phase* from the *Standard stock solution*. Use this solution within 6 h.
  Sample solution: Nominally equivalent to 0.1 mg/mL of proparacaine hydrochloride from a measured volume of Ophthalmic Solution in *Mobile phase*. Use this solution within 6 h.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 270 nm
  Column: 4.6-mm × 15-cm; 5-µm spherical packing L10
  Flow rate: 1.5 mL/min
  Injection volume: 10 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Column efficiency: NLT 3000 theoretical plates
  Tailing factor: NMT 1.5
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of proparacaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$



r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Proparacaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of proparacaine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–110.0%

SPECIFIC TESTS
- **STERILITY TESTS** ⟨71⟩: Meets the requirements
- **pH** ⟨791⟩: 3.5–6.0

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label it to indicate that it is to be stored in a refrigerator after the container is opened.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Proparacaine Hydrochloride RS

Propofol

$C_{12}H_{18}O$ 178.27
Phenol, 2,6-bis(1-methylethyl);
2,6-Diisopropylphenol [2078-54-8].

DEFINITION
Propofol contains NLT 98.0% and NMT 102.0% of propofol ($C_{12}H_{18}O$).

Propofol Injectable Emulsion

DEFINITION

Propofol Injectable Emulsion contains Propofol in a 10% (w/v) oil-in-water sterile emulsion. The aqueous component contains glycerol, a suitable antimicrobial agent, and Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of propofol ($C_{12}H_{18}O$). It contains a suitable emulsifying agent.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
Wavelength range: 200–450 nm
Standard solution: 100 µg/mL
Sample solution: Dilute a volume of Injectable Emulsion, equivalent to 10 mg of propofol, with isopropyl alcohol to 100 mL.
Medium: Isopropyl alcohol

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**
Diluent: Dilute 68 mL of water with isopropyl alcohol to 1 L.
Mobile phase: Tetrahydrofuran and water (4:6)
Standard solution: 0.8 mg/mL of USP Propofol RS in *Diluent*
Sample solution: Transfer a volume of well-shaken Injectable Emulsion, equivalent to about 40 mg of propofol, to a 50-mL volumetric flask. Dissolve in and dilute with isopropyl alcohol to volume, and mix. The solution contains about 0.8 mg/mL of propofol.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 275 nm
Column: 5-mm × 10-cm; 5-µm packing L1
Flow rate: 2 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 1000 theoretical plates
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of propofol ($C_{12}H_{18}O$) in the portion of Injectable Emulsion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Propofol RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of propofol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• **LIMIT OF FREE FATTY ACIDS**
[NOTE—To obtain a titer of sufficient sensitivity for the blank reagent, it is necessary to add stearic acid at a concentration of approximately 1.0 mmol/L.]
Blank titration: Weigh about 142.3 mg of stearic acid into a 500-mL volumetric flask. Dissolve in and dilute with dehydrated alcohol to volume to obtain the blank solution. Pipet 10 mL of the blank solution into a 100-mL beaker, and proceed as directed in the *Analysis*, beginning with "Add 0.5 mL of 0.05 N hydrochloric acid".
Calculate the blank correction, *B*, in mmol/L:

$$\text{Result} = (NV_{TB}/V_B) - N_{SA}$$

N = concentration of the titrant (mmol/L)
V_{TB} = volume of the titrant added between the first and second inflection points for the *Blank titration* (mL)
V_B = volume of the blank solution used for the analysis (mL)
N_{SA} = concentration of stearic acid (mmol/L)

Analysis
Sample: A volume of Injectable Emulsion, nominally equivalent to 100 mg of propofol
Transfer the *Sample* to a 100-mL beaker. Add 0.5 mL of 0.05 N hydrochloric acid, then dilute with a solution of alcohol and water (45:20) to 60 mL. Titrate with 0.05 M sodium hydroxide VS to a potentiometric endpoint, using a suitable electrode.
Calculate the free fatty acid content, in mmol/L:

$$\text{Result} = (NV_T/V_S) - B$$

N = concentration of the titrant (mmol/L)
V_T = volume of the titrant added between the first and second inflection points (mL)
V_S = volume of Injectable Emulsion used for the analysis (mL)
B = blank correction factor (mmol/L), calculated as shown above

www.webofpharma.com

Acceptance criteria: NMT 7 mmol/L

• **ORGANIC IMPURITIES**

Diluent, Mobile phase, and **Sample solution:** Proceed as directed in the *Assay*.

System suitability solution: Dissolve quantities of USP Propofol RS, USP Propofol Related Compound A RS, and USP Propofol Related Compound B RS in *Diluent* to obtain a solution with concentrations of 0.8 mg/mL of propofol, and 0.002 and 0.0008 mg/mL of propofol related compound A and propofol related compound B, respectively.

Standard solution: 0.002 mg/mL of USP Propofol Related Compound A RS and 0.0008 mg/mL of USP Propofol Related Compound B RS in *Diluent*

Chromatographic system: Proceed as directed in the *Assay*, except that detection is at 254 nm.

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for propofol related compound B, propofol, and propofol related compound A are about 0.8, 1.0, and 2.5, respectively.]

Suitability requirements

Resolution: NLT 2.5 between propofol and propofol related compound B

Column efficiency: NLT 1000 theoretical plates based on the propofol peak

Tailing factor: NMT 1.5 for the propofol peak

Relative standard deviation: NMT 2% for the propofol peak

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the content of propofol related compound A and propofol related compound B, as a percentage of the label content of propofol, in the portion of Injectable Emulsion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of propofol related compound A or propofol related compound B from the *Sample solution*

r_S = peak response of propofol related compound A or propofol related compound B from the *Standard solution*

C_S = concentration of USP Propofol Related Compound A RS or USP Propofol Related Compound B RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of propofol in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.5% of propofol related compound A; NMT 0.5% of propofol related compound B

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: It contains NMT 0.33 USP Endotoxin Units/mg of propofol.

• **STERILITY TESTS** ⟨71⟩: Meets the requirements

• **PH** ⟨791⟩: 4.5–8.5

• **GLOBULE SIZE DISTRIBUTION IN LIPID INJECTABLE EMULSIONS** ⟨729⟩: Meets the requirements

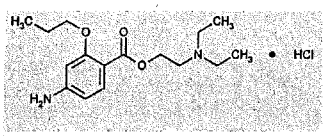
• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve under an inert atmosphere of nitrogen. Store at controlled room temperature. Do not freeze.

• **LABELING:** Label it to include the following: Shake well before use. Do not use if there is evidence of excessive creaming or aggregation, if large droplets are visible, or if there are other forms of phase separation indicating that the stability of the product has been compromised. Slight creaming, which should disappear after shaking, may be visible upon prolonged standing.

• **USP REFERENCE STANDARDS** ⟨11⟩



USP Propofol RS

USP Propofol Related Compound A RS
3,3′-5,5′-Tetraisopropyldiphenol.

USP Propofol Related Compound B RS
2,6-Diisopropyl-1,4-benzoquinone.

Delete the following:

▲Propoxycaine Hydrochloride

$C_{16}H_{26}N_2O_3 \cdot HCl$ 330.85

Benzoic acid, 4-amino-2-propoxy-, 2-(diethylamino)ethyl ester, monohydrochloride.

2-(Diethylamino)ethyl 4-amino-2-propoxybenzoate monohydrochloride [550-83-4].

» Propoxycaine Hydrochloride, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{16}H_{26}N_2O_3 \cdot HCl$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨ 11 ⟩ —
USP Propoxycaine Hydrochloride RS

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 10 µg per mL.

Medium: water.

Absorptivities at 303 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: A solution (1 in 100) responds to the tests for *Chloride* ⟨191⟩.

Melting range, *Class I* ⟨ 741 ⟩ : between 146° and 151°.

Loss on drying ⟨ 731 ⟩ —Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨ 281 ⟩ : not more than 0.2%.

Chromatographic purity—

Solvent—Prepare a mixture of chloroform and methanol (9:1).

Standard preparations—Dissolve a quantity of USP Propoxycaine Hydrochloride RS in *Solvent*, and dilute quantitatively, and stepwise if necessary, with *Solvent* to obtain a solution containing 0.5 mg per mL. Dilute quantitatively with *Solvent* to obtain Standard preparations having the following compositions:

www.webofpharma.com

Standard preparation	Dilution	Concentration (mg RS per mL)	Percentage (%, for comparison with test specimen)
A	1 in 2	0.25	0.5
B	1 in 5	0.10	0.2
C	1 in 10	0.05	0.1

Test preparation—Dissolve an accurately weighed quantity of Propoxycaine Hydrochloride in *Solvent* to obtain a solution containing 50 mg per mL.

Procedure—Apply separately 5 µL of the *Test preparation* and 5 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of chloroform, methanol, and isopropylamine (96:2:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate, with the aid of warm circulating air. Examine the plate under short-wavelength UV light, and again after exposing the plate to iodine vapors for a few minutes and spraying it with 7 N sulfuric acid. In each instance, compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: no secondary spot is more intense than the principal spot obtained from *Standard preparation A* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Test preparation* does not exceed 1.0%.

Assay—Dissolve about 500 mg of Propoxycaine Hydrochloride, previously dried and accurately weighed, in 200 mL of ice-cold water containing 1 g of potassium bromide and 2.5 mL of hydrochloric acid, and titrate with 0.1 M sodium nitrite VS, using starch iodide paper as an external indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 33.09 mg of $C_{16}H_{26}N_2O_3 \cdot HCl$. ▲ (USP 1-May-2020)

Delete the following:

▲Propoxycaine and Procaine Hydrochlorides and Levonordefrin Injection

» Propoxycaine and Procaine Hydrochlorides and Levonordefrin Injection is a sterile solution of Propoxycaine Hydrochloride, Procaine Hydrochloride, and Levonordefrin in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of propoxycaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$), not less than 95.0 percent and not more than 105.0 percent of the labeled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of levonordefrin ($C_9H_{13}NO_3$).

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.

Labeling—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

USP Reference standards ⟨ 11 ⟩ —
USP Procaine Hydrochloride RS
USP Propoxycaine Hydrochloride RS

Color and clarity—Using the Injection as the *Test solution*, proceed as directed for *Color and clarity* under *Mepivacaine Hydrochloride and Levonordefrin Injection*.

Identification—

A: Cool a mixture of 10 mL of Injection and 10 mL of 3 N hydrochloric acid in an ice bath to 0°, add 5 mL of sodium nitrite solution (1 in 5), stirring gently, and 2 mL of a solution of 0.1 g of 2-naphthol in 5 mL of 1 N sodium hydroxide, and observe immediately: a bright orange-red precipitate is formed (*presence of a primary aminophenyl group*).

B: It responds to the tests for *Identification Tests—General* ⟨191⟩, *Chloride*.

C: To about 25 mL of Injection add 1 drop of ferric chloride TS: the solution immediately turns a light green and changes to a light blue within 1 minute. Add 2 drops of 3 N hydrochloric acid: the color reverts to light green (*presence of levonordefrin*).

Bacterial Endotoxins Test ⟨ 85 ⟩ —It contains not more than 0.8 USP Endotoxin Unit per mg of propoxycaine hydrochloride.

pH ⟨ 791 ⟩ : between 3.5 and 5.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay for propoxycaine and procaine hydrochlorides —

Standard propoxycaine hydrochloride preparation—Prepare, by quantitative and stepwise dilution, a solution in dilute hydrochloric acid (1 in 6) containing about 50 µg of USP Propoxycaine Hydrochloride RS, accurately weighed, in each mL.

Standard procaine hydrochloride preparation—Prepare, by quantitative and stepwise dilution, a solution in dilute hydrochloric acid (1 in 6) containing about 200 µg of USP Procaine Hydrochloride RS, accurately weighed, in each mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of procaine hydrochloride, to a 125-mL separator containing 25 mL of chloroform and 10 mL of water. Add 5 mL of sodium carbonate TS, shake vigorously, allow the layers to separate, and transfer the chloroform layer to a second separator. Extract the aqueous layer with two 10-mL portions of chloroform, adding the extracts to the second separator. Extract the combined chloroform extracts with 35 mL of dilute hydrochloric acid (1 in 6), transfer the chloroform to a third separator, and transfer the acid extract to a 100-mL volumetric flask. Extract the chloroform with two 10-mL portions of dilute hydrochloric acid (1 in 6), add the acid extracts to the volumetric flask, add dilute hydrochloric acid (1 in 6) to volume, and mix. Transfer 15.0 mL of this solution to a second 100-mL volumetric flask, add dilute hydrochloric acid (1 in 6) to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* in 1-cm cells at 296 and 272 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of

USP Monographs

www.webofpharma.com

propoxycaine hydrochloride ($C_{16}H_{26}N_2O_3 \cdot HCl$) in each mL of the Injection taken by the formula:

$$(0.667C/V)(A_{296}A_4 - A_{272}A_3)/(A_1A_4 - A_2A_3)$$

in which C is the concentration, in µg per mL, of USP Propoxycaine Hydrochloride RS in the *Standard propoxycaine hydrochloride preparation*.

Calculate the quantity, in mg, of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$) in each mL of the Injection taken by the formula:

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.
pH 1.2 buffer solution: Dissolve 2.0 g of sodium chloride in water, add 7.0 mL of hydrochloric acid, and dilute with water to 1 L.
pH 6.8 buffer solution: 21.72 mg/mL of anhydrous dibasic sodium phosphate and 4.94 mg/mL of citric acid monohydrate in water
Media: Proceed as directed under *Method B* for *Delayed-Release Dosage Forms*, using 900 mL of *pH 1.2 buffer solution* during the *Acid stage*, and conduct the test for 1.5 h. For the *Buffer stage*, use 900 mL of *pH 6.8 buffer solution*, conduct the test for 2.5 h (this is the 4-h time point: 1.5 h in *Acid stage* plus 2.5 h in *Buffer stage*), conduct the test for the additional time points, always considering T_1 = 1.5 h, and use the acceptance criteria given under *Tolerances*.
Apparatus 1: 100 rpm
Times: 1.5, 4, 8, 14, and 24 h
Standard solution: USP Propranolol Hydrochloride RS at a known concentration in water
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.
Spectrometric conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: Maximum absorbance at 320 nm, with respect to a baseline drawn from 355 nm through 340 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Tolerances: The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1.5	NMT 30%
4	35%–60%
8	55%–80%
14	70%–95%
24	81%–110%

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
pH 1.2 buffer solution: Dissolve 2.0 g of sodium chloride in water, add 7.0 mL of hydrochloric acid, and dilute with water to 1 L.
pH 7.5 buffer solution: Dissolve 6.8 g of monobasic potassium phosphate and 1.6 g of sodium hydroxide in 900 mL of water, adjust with 1 N sodium hydroxide to a pH of 7.5, and dilute with water to 1 L.
Media: Proceed as directed under *Method B* for *Delayed-Release Dosage Forms*, using 900 mL of *pH 1.2 buffer solution* during the *Acid stage*, and conduct the test for 1 h. For the *Buffer stage*, use 900 mL of *pH 7.5 buffer solution*, conduct the test for 2 h (this is the 3-h time point: 1 h in *Acid stage* plus 2 h in *Buffer stage*), conduct the test for the additional time points, always considering T_1 = 1 h, and use the acceptance criteria given under *Tolerances*.
Apparatus 1: 50 rpm
Times: 1, 3, 6, and 12 h
Standard solution: USP Propranolol Hydrochloride RS at a known concentration in water
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.
Spectrometric conditions and **Analysis:** Proceed as directed under *Test 1*.
Tolerances: The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	NMT 20%
3	20%–45%
6	45%–80%
12	NLT 80%

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Acid stage medium: *pH 1.2 buffer solution* (prepared by dissolving 2.0 g of sodium chloride in water, adding 7.0 mL of hydrochloric acid, and diluting with water to 1000 mL); 900 mL
Buffer stage medium: pH 6.8 phosphate buffer; 900 mL
Apparatus 1: 100 rpm

USP Monographs

www.webofpharma.com

Standard stock solution: 1 mg/mL of USP Propranolol Hydrochloride RS in water
Working standard solution: Quantitatively dilute the *Standard stock solution* with water to obtain a final concentration of about (L/1000) mg per mL, where L is the Capsule label claim in mg.
Analysis: Conduct the test in *Acid stage medium* for 1.5 h, sample, and pass through a suitable filter of 0.45-µm or finer pore size. Replace the *Acid stage medium* with the *Buffer stage medium*, and conduct the test for 2.5 h (this is the 4-h time point: 1.5 h in *Acid stage medium* plus 2.5 h in *Buffer stage medium*), conduct the test for the additional time points, always considering T_1 = 1.5 h, and use the acceptance criteria given under *Tolerances*. Determine the amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved, using UV absorbances at the wavelength of maximum absorbance at about 320 nm, with respect to a baseline drawn from 355 nm through 340 nm, using a 1-cm cell and water as the blank.
Determine the percentage of propranolol hydrochloride dissolved using the spectrophotometric procedure as directed for *Test 1*.
Tolerances: The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1.5	NMT 15%
4	NMT 30%
8	25%–60%
14	55%–85%
24	NLT 75%

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Acid stage medium: *pH 1.2 buffer solution* (prepared by dissolving 2.0 g of sodium chloride in water, adding 7.0 mL of hydrochloric acid, and diluting with water to 1000 mL); 900 mL, deaerated
Buffer stage medium: pH 6.8 phosphate buffer; 900 mL, deaerated
Apparatus 1: 100 rpm
Times: 1.5 h in acid stage; 4, 8, 14, and 24 h in buffer stage
Standard solution: 0.18 mg/mL of USP Propranolol Hydrochloride RS in water
Analysis: Conduct the test in *Acid stage medium* for 1.5 h, sample, and pass through a suitable filter of 10-µm or finer pore size. Replace the *Acid stage medium* with the *Buffer stage medium*, and conduct the test for 2.5 h (this is the 4-h time point: 1.5 h in *Acid stage medium* plus 2.5 h in *Buffer stage medium*), conduct the test for the additional time points, always considering T_1 = 1.5 h, and use the acceptance criteria given under *Tolerances*. Determine the amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved, using UV absorbances at the wavelength of maximum absorbance at about 320 nm, with respect to a baseline drawn from 355 nm through 340 nm, using a 1-cm cell and water as the blank.
Tolerances: The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1.5	NMT 30%
4	27%–52%
8	52%–77%
14	70%–95%
24	81%–110%

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements
Procedure for content uniformity
Standard solution: 40 µg/mL of USP Propranolol Hydrochloride RS in methanol
Sample stock solution: Transfer the contents of 1 Capsule to a suitable volumetric flask. Add methanol (70% of the volume of the flask), swirl occasionally for 30 min, sonicate for 1 min, and then swirl occasionally for an additional 30 min. Dilute with methanol to volume, and centrifuge a portion of the solution. Use the clear supernatant for preparing the *Sample solution*.
Sample solution: Equivalent to 40 µg/mL in methanol from *Sample stock solution*
Spectrometric conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: 290 nm
Cell: 1 cm
Blank: Methanol
Calculate the percentage of $C_{16}H_{21}NO_2 \cdot HCl$ in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Propranolol Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers.
• **LABELING:** The labeling states the *Dissolution Test* with which the product complies.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Propranolol Hydrochloride RS

Propranolol Hydrochloride Injection

DEFINITION
Propranolol Hydrochloride Injection is a sterile solution of Propranolol Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of Propranolol Hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

USP Monographs

www.webofpharma.com

ASSAY

• **PROCEDURE**

Mobile phase: Dissolve 0.5 g of sodium dodecyl sulfate in 18 mL of 0.15 M phosphoric acid. Add 90 mL of acetonitrile and 90 mL of methanol, dilute with water to make 250 mL, and pass through a filter of 0.5-µm pore size.

Standard stock solution: 1 mg/mL of USP Propranolol Hydrochloride RS in methanol

Standard solution: 0.2 mg/mL of USP Propranolol Hydrochloride RS in methanol from *Standard stock solution*. Pass through a suitable filter of 0.7-µm or finer pore size.

System suitability stock solution: 0.25 mg/mL of procainamide hydrochloride in methanol

System suitability solution: Dilute with methanol, 5 mL each of *System suitability stock solution* and *Standard stock solution* in a nominally 25-mL volumetric flask, to volume.

Sample solution: Equivalent to 0.2 mg/mL of propranolol hydrochloride from a volume of Injection diluted with methanol

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for procainamide and propranolol are 0.6 and 1.0, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 2.0 between procainamide and propranolol, *System suitability solution*

Tailing factor: NMT 3.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of propranolol from the *Sample solution*

r_S = peak response of propranolol from the *Standard solution*

C_S = concentration of USP Propranolol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of propranolol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 55.6 USP Endotoxin Units/mg of propranolol hydrochloride

• **pH** ⟨791⟩: 2.8–4.0

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose, light-resistant containers, preferably of Type I glass.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Propranolol Hydrochloride RS

Propranolol Hydrochloride Tablets

» Propranolol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Propranolol Hydrochloride RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for propranolol, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Dissolution ⟨711⟩—

Medium: dilute hydrochloric acid (1 in 100); 1000 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 289 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Propranolol Hydrochloride RS in the same medium.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Procedure for content uniformity—Transfer 1 Tablet to a 100-mL volumetric flask, add 5 mL of dilute hydrochloric acid (1 in 100), and let stand, swirling occasionally, until it is disintegrated. Add about 70 mL of methanol, and sonicate for about 1 minute. Dilute with methanol to volume, mix, and centrifuge a portion of the solution. Dilute an aliquot of the clear solution quantitatively with methanol to provide a solution containing about 40 µg of propranolol hydrochloride per mL. Concomitantly determine the absorbances of this solution and of a solution of USP Propranolol Hydrochloride RS in methanol, at a known concentration of about 40 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 290 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of $C_{16}H_{21}NO_2 \cdot HCl$ in the Tablet by the formula:

$$(T/D)C(A_U/A_S)$$

in which T is the labeled quantity, in mg, of propranolol hydrochloride in the Tablet, D is the concentration, in µg per mL, of the solution from the Tablet, based on the labeled quantity per Tablet and the extent of dilution, C is the concentration, in µg per mL, of USP Propranolol Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—

Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Propranolol Hydrochloride*.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of propranolol hydrochloride, to a 50-mL volumetric flask, add 40 mL of methanol, shake, and sonicate for 5 minutes. Dilute with methanol to volume, mix, and filter through a 0.7-µm or finer

USP Monographs

www.webofpharma.com

porosity filter. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Propranolol Hydrochloride*. Calculate the quantity, in mg, of $C_{16}H_{21}NO_2 \cdot HCl$ in the portion of Tablets taken by the formula:

$$250C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Propranolol Hydrochloride in the *Standard preparation*, and r_U and r_S are the propranolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Propranolol Hydrochloride and Hydrochlorothiazide Tablets

» Propranolol Hydrochloride and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020)—
Test specimen—Transfer a quantity of finely powdered Tablets, equivalent to about 100 mg of propranolol hydrochloride, to a 50-mL centrifuge tube, add 15 mL of water and 1 mL of 1 N sodium hydroxide, and mix. Add 20 mL of ether, cap the tube, and shake by mechanical means for 5 minutes. Centrifuge the mixture, and transfer as much of the ether layer as possible to a second centrifuge tube. Add 0.05 mL of hydrochloric acid to the ether extract, and shake. Centrifuge, and discard the ether layer. Add 20 mL of ether to the residue in the tube, and shake by mechanical means for 5 minutes. Centrifuge, and discard the ether layer. Dry the residue in the tube in vacuum at about 50° for 30 minutes. Transfer a small amount of the dried residue to a mortar, and grind to fine powder.
Standard specimen: a similar preparation of USP Propranolol Hydrochloride RS.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020)—
Test specimen—Transfer a quantity of finely powdered Tablets, equivalent to about 100 mg of hydrochlorothiazide, to a 35-mL centrifuge tube, add 30 mL of acetone, mix, and allow to stand for 30 minutes, with occasional shaking. Centrifuge, and decant the acetone extract into a beaker, discarding the residue in the centrifuge tube. Evaporate the acetone extract on a steam bath to dryness, add 10 mL of 0.1 N sodium hydroxide, and mix, using a spatula to dislodge any residue from the beaker. Transfer the suspension to a 125-mL separator, and wash the beaker with about 5 mL of water, adding the washing to the separator. Add 50 mL of ether to the separator, shake for 2 minutes, and allow the phases to separate. Draw off the clear lower layer, filtering it into a beaker. Add 1 N hydrochloric acid dropwise with stirring until a pH of about 2 is reached. [NOTE—Precipitation occurs during the addition of the acid.] When precipitation is complete, decant the supernatant, and wash the precipitate with 5 mL of water. Dry the precipitate at 105° for 30 minutes.
Standard specimen: a similar preparation of USP Hydrochlorothiazide RS.

Dissolution ⟨711⟩—
Medium: 0.01 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.
Procedure—Filter a portion of the solution under test, transfer 10.0 mL of the filtrate to a suitable capped bottle, and add 5.0 mL of water, 1.0 mL of 5 N sodium hydroxide, and 25.0 mL of *n*-heptane. Cap the bottle, shake by mechanical means for 5 minutes, and allow the layers to separate, centrifuging if necessary, to obtain clear upper (*n*-heptane) and lower (aqueous) extracts. Determine the quantity, in µg, of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) in each mL of the *n*-heptane extract by employing UV absorption at the wavelength of maximum absorbance at about 293 nm, in comparison with an *n*-heptane Standard solution obtained by similarly treating and extracting a mixture of 5.0 mL of an aqueous solution having a known concentration of USP Propranolol Hydrochloride RS and 5.0 mL of a 0.005 N sodium hydroxide solution having a known concentration of USP Hydrochlorothiazide RS, using a blank consisting of the *n*-heptane extract obtained by similarly treating and extracting 10.0 mL of water. Determine the quantity, in µg, of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in each mL of the aqueous extract by employing UV absorption at the wavelength of maximum absorbance at about 273 nm, in comparison with the aqueous extract remaining from the preparation of the *n*-heptane Standard solution, using as a blank the aqueous extract remaining from the preparation of the *n*-heptane blank extract. Calculate the quantity, in mg, of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved by multiplying the quantity, in µg, of propranolol hydrochloride in each mL of the *n*-heptane extract from the solution under test by 2.25. Calculate the quantity, in mg, of $C_7H_8ClN_3O_4S_2$ dissolved by multiplying the quantity, in µg, of hydrochlorothiazide in each mL of the aqueous extract from the solution under test by 1.44.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ and not less than 80% *(Q)* of the labeled amount of $C_7H_8ClN_3O_4S_2$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements for *Content Uniformity* with respect to propranolol hydrochloride and hydrochlorothiazide.
Procedure for content uniformity—Transfer a Tablet to a suitable container, and add 500.0 mL of 0.1 N hydrochloric acid. Shake until the Tablet has disintegrated, sonicate for 30 seconds, shake by mechanical means for 30 minutes, and then repeat the sonication and shaking. Centrifuge a portion of the solution, and transfer 6.0 mL of the clear supernatant and 15.0 mL of water to a suitable capped bottle. Add 1.0 mL of 5 N sodium hydroxide and 25.0 mL of *n*-heptane, cap the bottle, shake by mechanical means for 5 minutes, and allow the layers to separate, centrifuging, if necessary, to obtain clear upper (*n*-heptane) and lower (aqueous) layers (test solutions). Prepare a similar Standard solution by mixing 6.0 mL of 0.1 N

www.webofpharma.com

hydrochloric acid, 3.0 mL of water, 6.0 mL of an aqueous solution having a known concentration of USP Propranolol Hydrochloride RS, and 6.0 mL of a 0.04 N sodium hydroxide solution having a known concentration of USP Hydrochlorothiazide RS, and proceeding as directed for the test solutions, beginning with "Add 1.0 mL of 5 N sodium hydroxide." Prepare similar blank *n*-heptane and aqueous extracts by adding 6.0 mL of 0.1 N hydrochloric acid to 15.0 mL of water, and proceeding as directed for the test solutions, beginning with "Add 1.0 mL of 5 N sodium hydroxide". Concomitantly determine the absorbances of the *n*-heptane test solution and the *n*-heptane Standard solution at the wavelength of maximum absorbance at about 293 nm, using the *n*-heptane blank extract to set the instrument. Calculate the quantity, in mg, of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) in the Tablet taken by the formula:

$$(12.5/6)(C)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Propranolol Hydrochloride RS in the *n*-heptane Standard solution; and A_U and A_S are the absorbances at 293 nm of the *n*-heptane test solution and the *n*-heptane Standard solution, respectively. Concomitantly determine the absorbances of the aqueous test solution and the aqueous Standard solution at the wavelength of maximum absorbance at about 273 nm, using the aqueous blank extract to set the instrument. Calculate the quantity, in mg, of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(11/6)(C)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Hydrochlorothiazide RS in the aqueous Standard solution; and A_U and A_S are the absorbances at 273 nm of the aqueous test solution and the aqueous Standard solution, respectively.

Related compounds—

Tetrabutylammonium hydroxide solution, Buffer, Mobile phase, and *Chromatographic system*—Proceed as directed under *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Benzothiadiazine Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer an accurately measured volume of this solution, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 µg per mL.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

Chromatographic system—Proceed as directed under *Assay,* except to chromatograph the *Standard solution:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken by the formula:

$$50(C/L)(r_U/r_S)$$

in which C is the concentration in µg per mL, of USP Benzothiadiazine Related Compound A RS in the *Standard solution; L* is the amount, in mg, of hydrochlorothiazide in the portion of Tablets taken, based on the labeled amount; and r_U and r_S are the peak areas of benzothiadiazine related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than 1.0% is found.

Assay—

Tetrabutylammonium hydroxide solution—Use a suitable aqueous or methanolic solution having a known concentration of tetrabutylammonium hydroxide.

Buffer—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water in a 2000-mL volumetric flask. Add 3.4 mL of phosphoric acid and a volume of *Tetrabutylammonium hydroxide solution* equivalent to about 2.6 g of tetrabutylammonium hydroxide, dilute with water to volume, and mix. Adjust, if necessary, with phosphoric acid or 10 N potassium hydroxide to a pH of 2.5 ± 0.1, and pass through a filter having a 0.5-µm or finer porosity.

Mobile phase—Prepare a suitable mixture of *Buffer* and methanol (850:150). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩) so that the retention time of propranolol is between 12 and 25 minutes.

Standard hydrochlorothiazide stock solution—Transfer about 25 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 100-mL volumetric flask, add 15 mL of methanol, and mix to dissolve. Dilute with *Buffer* to volume, and mix.

Standard propranolol hydrochloride stock solution—Dissolve an accurately weighed quantity of USP Propranolol Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.25J mg per mL, J being the ratio of the labeled quantity, in mg, of propranolol hydrochloride to the labeled quantity, in mg, of hydrochlorothiazide per Tablet.

Standard preparation—Transfer 5.0 mL of *Standard hydrochlorothiazide stock solution* and 5.0 mL of *Standard propranolol hydrochloride stock solution* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 50 µg of hydrochlorothiazide and 50J µg of propranolol hydrochloride per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of hydrochlorothiazide, to a 500-mL volumetric flask. Add 5 mL of water, mix, and allow to stand for 5 minutes, with occasional swirling. Add 75 mL of methanol, mix, and sonicate for 10 minutes, with occasional swirling, adding ice to the bath, if necessary, to maintain the temperature at not more than 20°. Add about 350 mL of *Buffer* to the flask, and sonicate for 10 minutes, with occasional swirling, maintaining the temperature of the bath at not more than 20°. Dilute with *Buffer* to volume, and mix. Centrifuge a portion of this solution, if necessary, to obtain a clear solution (*Assay preparation*).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 270-nm detector and a 4-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the propranolol peak is not less than 2500 theoretical plates; the tailing factor for the propranolol and hydrochlorothiazide peaks is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—The relative retention times are about 0.25 for benzothiadiazine related compound A, 0.4 for hydrochlorothiazide, and 1.0 for propranolol.]

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in mg, of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the same formula:

$$0.5C(r_U/r_S)$$

www.webofpharma.com

in which C is the concentration, in µg per mL, of the appropriate Reference Standard in the *Standard preparation;* and r_U and r_S are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Propylene Glycol

$C_3H_8O_2$ 76.09
1,2-Propanediol;
Propane-1,2-diol [57-55-6].

DEFINITION
Propylene Glycol contains NLT 99.5% of $C_3H_8O_2$.

IDENTIFICATION
[NOTE—Compliance is determined by meeting the requirements of *Identification* tests *A*, *B*, and *C*.]

Diluent: Methanol
Standard solution: 2.0 mg/mL of USP Propylene Glycol RS, 0.050 mg/mL of USP Ethylene Glycol RS, 0.050 mg/mL of USP Diethylene Glycol RS, and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol
Sample solution: 50 mg/mL of Propylene Glycol and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.53-mm × 30-m fused-silica coated with 3.0-µm G43 stationary phase, and a deactivated split liner with glass wool
Temperature
Injector: 220°
Detector: 250°
Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	4
100	50	120	10
120	50	220	6

Carrier gas: Helium
Injection size: 1.0 µL
Flow rate: 4.5 mL/min
Injection type: The split flow ratio is about 10:1.
System suitability
Sample: *Standard solution*
[NOTE—For informational purposes only. See *Impurity Table 1* for relative retention times for ethylene glycol, internal standard, and diethylene glycol. The retention time for propylene glycol is 4 min.]

Impurity Table 1

Component	Relative Retention Time
Ethylene glycol	0.8
Propylene glycol	1.0
Internal standard	1.7
Diethylene glycol	2.4

Suitability requirements
Resolution: NLT 5 between ethylene glycol and propylene glycol
Analysis
Sample: *Sample solution*
Acceptance criteria
Diethylene glycol: If a peak at the retention time for diethylene glycol is present in the *Sample solution*, the peak response ratio relative to 2,2,2-trichloroethanol is NMT the peak response ratio for diethylene glycol relative to 2,2,2-trichloroethanol in the *Standard solution*: NMT 0.10% for diethylene glycol.
Ethylene glycol: If a peak at the retention times for ethylene glycol is present in the *Sample solution*, the peak response ratio relative to 2,2,2-trichloroethanol is not more than the peak response ratio for ethylene glycol relative to 2,2,2-trichloroethanol in the *Standard solution*: NMT 0.10% for ethylene glycol is found.
- **C.** Examine the chromatograms obtained in *Identification* test *B*. The retention time of the propylene glycol peak of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY
- **PROCEDURE**
Sample: Propylene Glycol
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Thermal conductivity
Column: 1-m × 4-mm; 5% phase G16; support S5
Temperature
Injector: 240°
Detector: 250°
Column: Increase from 120° to 200° at a rate of 5°/min.
Carrier gas: Helium
Injection size: 10 µL
[NOTE—The approximate retention time for propylene glycol is 5.7 min, and the approximate retention times for the three isomers of dipropylene glycol, when present, are 8.2, 9.0, and 10.2 min, respectively.]
Analysis: Calculate the percentage of $C_3H_8O_2$ in the *Sample* by dividing the area under the propylene glycol peak by the sum of the areas under all of the peaks, excluding those due to air and water, and multiplying by 100:

$$\text{Result} = [r_U/(r_U + \Sigma r_U)] \times 100$$

r_U = peak response for Propylene Glycol from the *Sample*
Σr_U = sum of individual impurity peak responses, excluding those due to air and water, from the *Sample*

Acceptance criteria: NLT 99.5%

IMPURITIES

INORGANIC IMPURITIES

- **Residue on Ignition** ⟨281⟩

Sample: 50 g

Analysis: Heat the *Sample* in a tared 100-mL shallow dish until it ignites, and allow it to burn without further application of heat in a place free from drafts. Cool, moisten the residue with 0.5 mL of sulfuric acid, and ignite to constant weight.

Acceptance criteria: The weight of the residue is NMT 3.5 mg.

- **Chloride and Sulfate,** *Chloride* ⟨221⟩: A 1-mL portion shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (70 ppm).
- **Chloride and Sulfate,** *Sulfate* ⟨221⟩: A 5.0-mL portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (60 ppm).

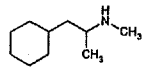
SPECIFIC TESTS

- **SPECIFIC GRAVITY** ⟨841⟩: 1.035–1.037
- **ACIDITY**

Sample: 10 mL of Propylene Glycol

Analysis: Add 1 mL of phenolphthalein TS to 50 mL of water, then add 0.1 N sodium hydroxide until the solution remains pink for 30 s. Add the *Sample*, and titrate with 0.10 N sodium hydroxide until the original pink color returns and remains for 30 s.

Acceptance criteria: NMT 0.20 mL of 0.10 N sodium hydroxide



- **WATER DETERMINATION,** *Method I* ⟨921⟩: NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Diethylene Glycol RS
USP Ethylene Glycol RS
USP Propylene Glycol RS

Propylhexedrine

$C_{10}H_{21}N$ 155.28

Cyclohexaneethanamine, *N*,α-dimethyl-, (±)-.
(±)-*N*,α-Dimethylcyclohexaneethylamine [101-40-6].

» Propylhexedrine contains not less than 98.0 percent and not more than 101.0 percent of $C_{10}H_{21}N$.

Packaging and storage—Preserve in tight containers.

Identification—

A: To 3 mL of water contained in a small flask add about 0.1 mL of it and 0.5 mL of 1 N hydrochloric acid, and agitate the mixture until clear. Add 20 mL of trinitrophenol TS, insert the stopper in the flask, shake vigorously for a few minutes, and allow to stand for 2 hours. Filter, wash the precipitate with about 20 mL of cold water, and dry in vacuum at 60° for 4 hours: the picrate so obtained melts between 108° and 110° (see *Melting Range or Temperature* ⟨741⟩).

[**CAUTION**—Picrates may explode.]

B: A solution, prepared as directed in *Identification* test *A*, yields a brown precipitate with iodine TS and a white precipitate with mercuric-potassium iodide TS.

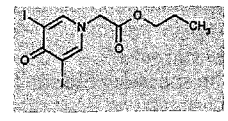
Specific gravity ⟨841⟩: between 0.848 and 0.852.

Assay—Tare a glass-stoppered conical flask containing about 15 mL of water, add quickly about 0.5 mL of Propylhexedrine, and again weigh. Add to the contents of the flask 30 mL of neutralized alcohol, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 15.53 mg of $C_{10}H_{21}N$.

Propylhexedrine Inhalant

» Propylhexedrine Inhalant consists of cylindrical rolls of suitable fibrous material impregnated with Propylhexedrine, usually aromatized, and contained in a suitable inhaler. The inhaler contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{10}H_{21}N$.

Packaging and storage—Preserve in tight containers (inhalers), and avoid exposure to excessive heat.



Identification—Place the contents of 1 inhaler in a glass-stoppered flask, add 50 mL of methanol, and allow to stand for 1 hour with frequent agitation. Filter, pressing out the roll on the filter. Add to the filtrate 1 N hydrochloric acid until it is slightly acid to moistened litmus paper, then add 30 mL of water, and evaporate to about 20 mL. Cool, transfer to a small separator, and shake with 10 mL of ether. Withdraw the water layer, warm it on a steam bath to expel any ether, and dilute to about 25 mL. From 10 mL of the solution, precipitate the propylhexedrine with trinitrophenol TS as directed in *Identification* test *A* under *Propylhexedrine*: the propylhexedrine picrate so obtained melts between 108° and 110° (see *Melting Range or Temperature* ⟨741⟩).

[**CAUTION**—Picrates may explode.]

Assay—Place the contents of 2 inhalers of Inhalant in the thimble of a continuous-extraction apparatus, and quickly assemble the apparatus. Rinse each of the emptied inhalers with about 20 mL of methanol, pouring the rinsings through the condenser into the extraction flask. Add through the condenser 20 mL to 30 mL of methanol, and extract for 15 to 20 cycles. Cool the extract, transfer it completely with the aid of small portions of methanol to a 100-mL volumetric flask, dilute with methanol to volume, and mix. To 50.0 mL of the solution add 25.0 mL of 0.1 N sulfuric acid VS, and evaporate to about 40 mL. Cool, add methyl red TS, and titrate the excess acid with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sulfuric acid is equivalent to 15.53 mg of $C_{10}H_{21}N$.

Delete the following:

▲Propyliodone

$C_{10}H_{11}I_2NO_3$ 447.01

1(4*H*)-Pyridineacetic acid, 3,5-diiodo-4-oxo-, propyl ester.
Propyl 3,5-diiodo-4-oxo-1(4*H*)pyridineacetate [587-61-1].

www.webofpharma.com

» Propyliodone contains not less than 99.0 percent and not more than 101.0 percent of $C_{10}H_{11}I_2NO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

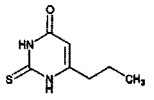
Identification—

A: Heat 100 mg with a few drops of sulfuric acid: violet vapors are evolved.

B: Reflux 1 g with 10 mL of 1 N sodium hydroxide for 30 minutes, add 10 mL of water, and acidify to litmus paper with hydrochloric acid: the precipitate of 3,5-diiodo-4-oxo-1(4*H*)-pyridineacetic acid, after being washed with water and dried at 105°, melts at about 245°.

Melting range 〈 741 〉: between 187° and 190°.

Acidity—Dissolve 1.0 g in 40 mL of hot *n*-propyl alcohol previously neutralized to phenolphthalein TS, cool, and allow to stand in an ice bath for 15 minutes with frequent shaking. Filter, wash the residue with neutralized *n*-propyl alcohol, combine the filtrate and washings, add phenolphthalein TS, and titrate with 0.050 N sodium hydroxide to a pink color that persists for 15 seconds: not more than 0.15 mL of 0.050 N sodium hydroxide is required for neutralization.



Loss on drying 〈 731 〉—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition 〈 281 〉: not more than 0.1%.

Iodine and iodide—Shake 2.4 g with 30 mL of water for 15 minutes, filter, and to 10 mL of filtrate add 1 mL of 2 N nitric acid, 1 mL of sodium nitrite solution (1 in 500), and 2 mL of chloroform. Shake, and centrifuge: any purple color in the chloroform layer is not darker than that obtained with a mixture of 6 mL of water and 4 mL of potassium iodide solution (2.6 in 100,000) treated in the same manner (0.01% of I).

Assay—Using about 15 mg of Propyliodone, accurately weighed, proceed as directed in the *Assay* under *Iodoquinol*. Each mL of 0.02 N sodium thiosulfate is equivalent to 0.7450 mg of $C_{10}H_{11}I_2NO_3$. ▲(USP 1-May-2020)

Propylthiouracil

$C_7H_{10}N_2OS$ 170.23

4(1*H*)-Pyrimidinone, 2,3-dihydro-6-propyl-2-thioxo-; 6-Propyl-2-thiouracil [51-52-5].

DEFINITION

Propylthiouracil contains NLT 98.0% and NMT 100.5% of propylthiouracil ($C_7H_{10}N_2OS$), calculated on the dried basis.

USP Propylthiouracil RS

Propylthiouracil Compounded Oral Suspension

DEFINITION

Propylthiouracil Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of propylthiouracil ($C_7H_{10}N_2OS$).

Prepare Propylthiouracil Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈795〉).

Propylthiouracil tablets[a] equivalent to	500 mg of propylthiouracil
Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Propylthiouracil 50-mg tablets, West-Ward Pharmaceutical Corp., Eatontown, NJ.

[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Propylthiouracil tablets* in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a propylthiouracil liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: 5 mM 1-heptanesulfonic acid, acetic acid (1% v/v), and methanol (40:45:15). Pass through a nylon 66 filter of 0.45-µm pore size, and degas.

Internal standard solution: 1.0 mg/mL of 6-methyl-2-thiouracil in methanol

Standard stock solution: 1.75 mg/mL of USP Propylthiouracil RS in methanol

Standard solution: Pipet 0.4 mL of the *Standard stock solution* into a 10-mL volumetric flask, and add 0.25 mL of the *Internal standard solution*. Dilute with *Mobile phase* to volume to obtain a nominal concentration of 70 µg/mL of propylthiouracil and 25 µg/mL of 6-methyl-2-thiouracil, and centrifuge.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 2 mL of Oral Suspension into a 10-mL volumetric flask, and dilute with methanol to volume to obtain a concentration of 1 mg/mL. Transfer 0.7 mL of the diluted solution to a 10-mL volumetric flask, and add 0.25 mL of the *Internal standard solution*. Dilute with *Mobile phase* to volume to obtain a nominal concentration of 70 µg/mL of propylthiouracil and 25 µg/mL of 6-methyl-2-thiouracil, and centrifuge.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 276 nm

Column: 3.0-mm × 15-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 0.4 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 6-methyl-2-thiouracil and propylthiouracil are about 0.25 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 10.0 between propylthiouracil and 6-methyl-2-thiouracil

Column efficiency: NLT 10,000 theoretical plates

Tailing factor: NMT 2.0 for the propylthiouracil peak

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of propylthiouracil ($C_7H_{10}N_2OS$) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of propylthiouracil to the internal standard from the *Sample solution*

R_S = peak response ratio of propylthiouracil to the internal standard from the *Standard solution*

C_S = concentration of USP Propylthiouracil RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of propylthiouracil in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 3.8–4.8

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of propylthiouracil from the *Sample solution*
r_S = peak response of propylthiouracil from the *Standard solution*
C_S = concentration of USP Propylthiouracil RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of propylthiouracil in the *Sample solution* (µg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Medium: Water; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Standard solution: USP Propylthiouracil RS at a known concentration in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter and dilute with *Medium* to a concentration that is similar to the *Standard solution*.
Instrumental conditions
Mode: UV
Analytical wavelength: Maximum absorbance at about 274 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the amount of propylthiouracil ($C_7H_{10}N_2OS$) dissolved from the UV absorbances.
Tolerances: NLT 85% (*Q*) of the labeled amount of propylthiouracil ($C_7H_{10}N_2OS$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Propylthiouracil RS

Protamine Sulfate

DEFINITION
Protamine Sulfate is a purified mixture of peptides obtained from the sperm or testes of Salmonidae, which has the property of neutralizing heparin. Each mg of Protamine Sulfate, calculated on the dried basis, neutralizes NLT 100 USP Heparin Units. It contains NLT 90.0% and NMT 110.0% of protamine sulfate, calculated on the dried basis.

IDENTIFICATION
• **A.** The retention times of the four major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
• **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Sulfate*: Meets the requirements
• **C. BIOIDENTITY**
Sample solution A: 0.15 mg/mL of Protamine Sulfate in water
Sample solution B: Dilute 2.0 mL of *Sample solution A* with water to 3.0 mL.
Sample solution C: Dilute 1.0 mL of *Sample solution A* with water to 3.0 mL.
Titrant: USP Heparin Sodium for Assays RS in water (about 80–120 USP Heparin Units/mL)
Analysis: [NOTE—Titrate each *Sample solution* in duplicate.] Transfer a volume of each *Sample solution* to the analytical cell of a suitable colorimeter, and set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range. Add *Titrant* in small volumes until there is a sharp increase in the absorbance, and note the volume of *Titrant* added. Perform the entire *Analysis* in triplicate for a total of 18 determinations.
Calculate the number of USP Heparin Units per mg of Protamine Sulfate in the volume of *Titrant* added at the endpoint.
Calculate the USP Heparin Units neutralized per mg of Protamine Sulfate taken:

$$\text{Result} = (V_T \times C_T)/(V_S \times C_U)$$

V_T = volume of *Titrant* added (mL)
C_T = concentration of *Titrant* (USP Heparin Units/mL)
V_S = volume of each *Sample solution* (mL)
C_U = concentration of Protamine Sulfate in each *Sample solution* (mg/mL)

Calculate the potency of the Protamine Sulfate as the average of the 18 values. Calculate the three standard deviations for the results obtained with each *Sample solution*. Calculate the three standard deviations for the results obtained with each of the three independent assays. The test is valid if each of the six standard deviations is NMT 5% of the average result.
Acceptance criteria: Each mg of Protamine Sulfate neutralizes NLT 100 USP Heparin Units on the dried basis.

ASSAY
• **PROCEDURE**
Solution A: 0.1 M monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 1.8. Pass through a membrane filter of 0.45-µm pore size, and degas before use.
Solution B: *Solution A* and acetonitrile (93.5: 6.5)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
15	55	45
25	55	45
30	85	15

[NOTE—Initial gradient composition may be adjusted as appropriate to obtain sufficient resolution. The end of the gradient can be increased to re-equilibrate the column for the next injection.]
Standard solution: 0.5 mg/mL of USP Protamine Sulfate RS in 0.01 M hydrochloric acid
Sample solution: 0.5 mg/mL of Protamine Sulfate in 0.01 M hydrochloric acid

www.webofpharma.com

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 55°
Flow rate: 1 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Retention time: The chromatogram of the *Standard solution* must show four major peaks (in increasing elution order: protamine peptides 1, 2, 3, and 4) with protamine peptide 4 eluting no later than 15 min. [NOTE—See the reference chromatogram provided with the USP Protamine Sulfate RS certificate.]
Resolution: NLT 2.0 between protamine peptides 1 and 2, calculated by the tangent method
Relative standard deviation: NMT 2.0% for the total integrated areas of at least six replicate injections, using vertical drop down integration
Analysis
Samples: *Standard solution* and *Sample solution*
Separately inject equal volumes of the *Standard solution* (at least six injections) and the *Sample solution*, record the chromatograms for approximately 30 min, and measure the responses for all the peaks using a full scale comparable to the height of the largest peak and using vertical drop down integration.
Calculate the percentage of protamine sulfate in the portion of Protamine Sulfate taken:

$$\text{Result} = \Sigma[(r_U/r_S) \times (C_S/C_U)] \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Protamine Sulfate RS in the *Standard solution* (mg/mL)
C_U = concentration of Protamine Sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% on the dried basis

IMPURITIES
• **RESIDUAL SOLVENTS** ⟨467⟩**:** Meets the requirements

Analysis
Sample: *Sample solution*
Proceed as directed in the *Assay*.
Calculate the percentage purity of Protamine Sulfate from the four protamine peptide peaks:

$$\text{Result} = [(r_{U1} + r_{U2} + r_{U3} + r_{U4})/r_T] \times 100$$

r_{U1} = peak response of protamine peptide 1 from the *Sample solution*
r_{U2} = peak response of protamine peptide 2 from the *Sample solution*
r_{U3} = peak response of protamine peptide 3 from the *Sample solution*
r_{U4} = peak response of protamine peptide 4 from the *Sample solution*
r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: NLT 92%

• **IRON** ⟨241⟩**:** NMT 10 ppm
• **METHYLMERCURY:** NMT 10 ppm, using a validated analytical procedure. [NOTE—Methylmercury determination is not necessary when the content for total mercury is less than the limit for methylmercury.]

SPECIFIC TESTS
• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 7.0 USP Endotoxin Units/mg
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 105° for 3 h.
Acceptance criteria: NMT 5%
• **ULTRAVIOLET ABSORBANCE**
Sample solution: 1.0% Solution of Protamine Sulfate in water
Instrumental conditions
Mode: UV
Wavelength range: 260–280 nm
Blank: Water
Acceptance criteria: The difference between the absorbance of the *Sample solution* at 260–280 nm and the *Blank* is NMT 0.1.
• **SULFATE**
Sample: 150 mg
Analysis: Dissolve the *Sample* in 75 mL of water, add 5 mL of 3 N hydrochloric acid, heat to boiling, and while maintaining the boiling point, slowly add 10 mL of barium chloride TS. Cover the vessel, and allow the mixture to stand on a steam bath for 1 h. Filter, wash the precipitate with several portions of hot water, dry, and ignite to constant weight. The weight of the barium sulfate, multiplied by 0.4117, represents the weight of sulfate in the portion of Protamine Sulfate taken.
Acceptance criteria: 16%–22% on the dried basis

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight and tamper-proof containers. Store at controlled room temperature or at 2°–8°.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Endotoxin RS
USP Heparin Sodium for Assays RS
USP Protamine Sulfate RS

Protamine Sulfate Injection

DEFINITION
Protamine Sulfate Injection is a sterile, isotonic solution of Protamine Sulfate. Protamine Sulfate used in the manufacture of Protamine Sulfate Injection complies with the compendial requirements stated in the Protamine Sulfate monograph. Each mg of Protamine Sulfate, used in the manufacture of the Injection, neutralizes NLT 100 USP Heparin Units, calculated on the dried basis. It contains NLT 90.0% and NMT 120.0% of the labeled amount of protamine sulfate.

IDENTIFICATION
• **A.** The retention times of the four major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
• **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Sulfate*: Meets the requirements

ASSAY
• **PROCEDURE**
Solution A: 0.1 M monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 1.8. Pass the solution

www.webofpharma.com

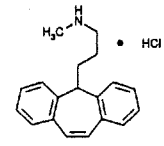
through a membrane filter of 0.45-µm pore size, and degas before use.
Solution B: *Solution A* and acetonitrile (93.5: 6.5)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
15	55	45
25	55	45
30	85	15

[NOTE—Initial gradient composition may be adjusted as appropriate to obtain sufficient resolution. The end of the gradient can be increased to re-equilibrate the column for the next injection.]
Standard solution: 0.5 mg/mL of USP Protamine Sulfate RS in 0.01 M hydrochloric acid
Sample solution: 0.5 mg/mL of protamine sulfate in 0.01 M hydrochloric acid
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 55°
Flow rate: 1 mL/min
Injection volume: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Retention time: The chromatogram of the *Standard solution* must show four major peaks (in increasing elution order: protamine peptides 1, 2, 3, and 4), with protamine peptide 4 eluting no later than 15 min. [NOTE—See the reference chromatogram provided with the USP Protamine Sulfate RS certificate.]
Resolution: NLT 2.0 between protamine peptides 1 and 2, calculated by the tangent method
Relative standard deviation: NMT 2.0% for the total integrated areas of the six chromatograms of the *Standard solution*, using vertical drop-down integration
Analysis
Samples: *Standard solution* and *Sample solution*
Separately inject equal volumes of the *Standard solution* (at least six injections) and the *Sample solution* into the chromatograph. Record the chromatograms for approximately 30 min, and measure the responses for all the peaks observed using a full-scale comparable to the height of the largest peak and using vertical drop-down integration.
Calculate the percentage of the labeled amount of protamine sulfate in the portion of Injection taken:

$$\text{Result} = \Sigma[(r_U/r_S) \times (C_S/C_U)] \times 100$$



r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Protamine Sulfate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of protamine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–120.0%

SPECIFIC TESTS
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: It contains NMT 7.0 USP Endotoxin Units/mg of protamine sulfate.
- **PH** ⟨791⟩: 6.0–7.0
- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass. Store at controlled room temperature or at 2°–8°.
- **LABELING:** Label it to indicate the approximate neutralization capacity in USP Heparin Units.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Protamine Sulfate RS

Protriptyline Hydrochloride

$C_{19}H_{21}N \cdot HCl$ 299.84
5*H*-Dibenzo[*a*,*d*]cycloheptene-5-propanamine, *N*-methyl-, hydrochloride.
N-Methyl-5*H*-dibenzo[*a*,*d*]cycloheptene-5-propylamine hydrochloride [1225-55-4].

» Protriptyline Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_{19}H_{21}N \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Protriptyline Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020)

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 10 µg per mL.
Medium: 0.1 N methanolic hydrochloric acid.
Absorptivities at 292 nm, calculated on the dried basis, do not differ by more than 3.0%.
C: It responds to tests *A* and *B* in *Identification Tests—General* ⟨191⟩ *Chemical Identification Tests, Chloride.*
D: Its X-ray diffraction pattern (see *X-ray Diffraction* ⟨941⟩) conforms to that of USP Protriptyline Hydrochloride RS.
pH ⟨791⟩: between 5.0 and 6.5, in a solution (1 in 100).
Loss on drying ⟨731⟩—Dry it at a pressure below 5 mm of mercury at 60° to constant weight: it loses not more than 0.3% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.

USP Monographs

www.webofpharma.com

Assay—Transfer about 700 mg of Protriptyline Hydrochloride, accurately weighed, to a 125-mL conical flask, and dissolve in 30 mL of glacial acetic acid. Add crystal violet TS and 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 29.98 mg of $C_{19}H_{21}N \cdot HCl$.

Protriptyline Hydrochloride Tablets

DEFINITION

Protriptyline Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of protriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: Dissolve 11 g of monobasic sodium phosphate and 1.9 g of sodium 1-hexanesulfonate in 900 mL of water. Dilute with water to 1 L and adjust with phosphoric acid to a pH of 2.9.
Solution A: Acetonitrile and *Buffer* (17:83)
Solution B: Acetonitrile and *Buffer* (50:50)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	0	100
20	0	100
25	100	0
30	100	0

Diluent: Mix 200 mL of alcohol and 40 mL of 2.5 N hydrochloric acid, and dilute with water to 1000 mL.
Standard solution: 200 µg/mL of USP Protriptyline Hydrochloride RS in *Diluent*
Sample solution: Nominally 200 µg/mL of protriptyline hydrochloride prepared as follows. Transfer NLT 5 Tablets to an appropriate volumetric flask. Add *Diluent* to about 80% of the flask volume, sonicate, and swirl as necessary to dissolve. Dilute with *Diluent* to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size and discard the first 8 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm. For *Identification B*, use a diode array detector in the range of 200–400 nm.
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 30°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of protriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Protriptyline Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of protriptyline hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: Water; 900 mL
Apparatus 1: 100 rpm
Time: 45 min
Standard solution: USP Protriptyline Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute the filtrate with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Analytical wavelength: 290 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of protriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Protriptyline Hydrochloride RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*, if needed
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of protriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

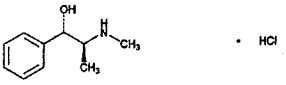
- **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Diluent, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.
Standard solution: 0.2 µg/mL of USP Protriptyline Hydrochloride RS in *Diluent*
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 5.0%

USP Monographs

www.webofpharma.com

Analysis
Samples: *Sample solution* and *Standard solution*
Calculate the percentage of each unspecified degradation product in the portion of Tablets taken:



$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified degradation product from the *Sample solution*
r_S = peak response of protriptyline hydrochloride from the *Standard solution*
C_S = concentration of USP Protriptyline Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of protriptyline hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: Disregard any impurity peaks less than 0.05%.
Any individual, unspecified degradation product: NMT 0.2%
Total degradation products: NMT 1.0%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Protriptyline Hydrochloride RS

Pseudoephedrine Hydrochloride

$C_{10}H_{15}NO \cdot HCl$ 201.69
Benzenemethanol, α-[1-(methylamino)ethyl]-, [*S*-(*R**,*R**)]-, hydrochloride;
(+)-Pseudoephedrine hydrochloride [345-78-8].

DEFINITION
Pseudoephedrine Hydrochloride contains NLT 98.0% and NMT 102.0% of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

Change to read:

Pseudoephedrine Hydrochloride Extended-Release Capsules

DEFINITION

Pseudoephedrine Hydrochloride Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Sample: Mix a portion of Capsule contents equivalent to 180 mg of pseudoephedrine hydrochloride, filter with 10 mL of chloroform, and collect using vacuum filtration. Maintain the vacuum until no further filtrate can be collected, and evaporate the chloroform on a steam bath, taking care to avoid overheating. Recrystallize the residue from a small amount of dehydrated alcohol.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Alcohol and 4 mg/mL of ammonium acetate solution (17:3)

Standard solution: 1.2 mg/mL of USP Pseudoephedrine Hydrochloride RS in alcohol

Sample solution: 1.2 mg/mL of pseudoephedrine hydrochloride in 0.01 N hydrochloric acid, prepared by transferring an appropriate amount of the contents of NLT 20 Capsules to a suitable volumetric flask and dissolving in 10% of the flask volume of 0.01 N hydrochloric acid by sonicating for 10 min. Cool to room temperature, dilute with 0.01 N hydrochloric acid to volume, and filter.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; packing L3

Flow rate: 0.7 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 3, 6, and 12 h

Standard solution: USP Pseudoephedrine Hydrochloride RS of a known concentration similar to that of the *Sample solution*, in *Medium*

Sample solution: Filtered portion of sample

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved, using the *Mobile phase* and *Chromatographic system* in the *Assay*.

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved
3	20%–50%
6	45%–75%
12	NLT 75%

The percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Pseudoephedrine Hydrochloride RS

Pseudoephedrine Hydrochloride Oral Solution

DEFINITION

Pseudoephedrine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

IDENTIFICATION

- **A. MELTING RANGE OR TEMPERATURE,** *Class I* ⟨741⟩

Sample: A volume of Oral Solution equivalent to 120 mg of pseudoephedrine hydrochloride

Analysis: Extract the *Sample* with two 30-mL portions of ether. Discard the extracts, and add 4 mL of 1 N sodium hydroxide. Extract with 30 mL of chloroform, and evaporate the chloroform on a steam bath, avoiding overheating.

Acceptance criteria: The pseudoephedrine so obtained melts at 118°.

- **B.**

Sample solution: 5 mg/mL of pseudoephedrine from the *Sample* in *Identification* test *A* in 0.1 N hydrochloric acid

Acceptance criteria: The *Sample solution* is dextrorotatory.

ASSAY

- **PROCEDURE**

Mobile phase: Alcohol and 0.40% ammonium acetate solution (17:3)

www.webofpharma.com

Standard solution: 1.2 mg/mL of USP Pseudoephedrine Hydrochloride RS in 0.01 N hydrochloric acid
Sample solution: 1.2 mg/mL of pseudoephedrine hydrochloride from an appropriate volume of Oral Solution in 0.01 N hydrochloric acid; filter the solution.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **Uniformity of Dosage Units** ⟨905⟩: Meets the requirements for Oral Solution packaged in single-unit containers
• **Deliverable Volume** ⟨698⟩: Meets the requirements for Oral Solution packaged in multiple-unit containers

SPECIFIC TESTS
• **Reaction:** It is acid to litmus.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight, light-resistant containers.
• **USP Reference Standards** ⟨11⟩
USP Pseudoephedrine Hydrochloride RS

Pseudoephedrine Hydrochloride Tablets

DEFINITION
Pseudoephedrine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of pseudo ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

IDENTIFICATION
• **A. Thin-Layer Chromatographic Identification Test** ⟨201⟩
Standard solution: 3 mg/mL of USP Pseudoephedrine Hydrochloride RS in water
Sample solution: Shake or mix 1 Tablet in 10 mL of water until the Tablet completely disintegrates. Sonicate for 5 min, centrifuge for 5 min, and pass through a nylon filter.
Chromatographic system
Developing solvent system: Butyl alcohol, glacial acetic acid, and water (8:2:2)
Analysis: Proceed as directed in the chapter.
Acceptance criteria: The R_f value and appearance of the principal spot from the *Sample solution* correspond to that from the *Standard solution*.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Mobile phase: Alcohol and 0.40% ammonium acetate solution (17:3)
Standard solution: 1.2 mg/mL of USP Pseudoephedrine Hydrochloride RS in 0.01 N hydrochloric acid
Sample solution: Nominally 1.2 mg/mL of pseudoephedrine hydrochloride in 0.01 N hydrochloric acid, prepared by transferring an appropriate amount of the contents of NLT 20 Tablets to a suitable volumetric flask and dissolving in 0.01 N hydrochloric acid by sonicating. Cool to room temperature, dilute with 0.01 N hydrochloric acid to volume, and filter.
Chromatographic system

Relative standard deviation: NMT 2.0% from five replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved.
Tolerances: NLT 75% (*Q*) of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩
Procedure for content uniformity
Mobile phase: Alcohol and 0.40% ammonium acetate solution (17:3)
Standard solution: 0.15 mg/mL of USP Pseudoephedrine Hydrochloride RS in a mixture of methanol and 0.01 N hydrochloric acid (1:4)
Sample solution: Transfer 1 Tablet to a 100-mL volumetric flask, add 20 mL of methanol, and shake for 30 min. Add 25 mL of 0.01 N hydrochloric acid, and sonicate to dissolve. Cool to room temperature, dilute with 0.01 N hydrochloric acid to volume, and filter.
Chromatographic system and **System suitability:** Proceed as directed in the *Assay*.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements for chewable tablets

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in tight containers.
• **USP Reference Standards** ⟨11⟩
USP Pseudoephedrine Hydrochloride RS

Pseudoephedrine Hydrochloride Extended-Release Tablets

DEFINITION

Pseudoephedrine Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

IDENTIFICATION

Change to read:

• **A. ▲Spectroscopic Identification Tests** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Sample: Triturate a number of Tablets, nominally equivalent to 180 mg of pseudoephedrine hydrochloride. Filter with about 10 mL of chloroform collected using vacuum filtration. Maintain the vacuum until no further filtrate can be collected, and evaporate the chloroform on a steam bath, taking care to avoid overheating. Recrystallize the residue from a small amount of dehydrated alcohol.
Acceptance criteria: Meet the requirements
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **Procedure**
Mobile phase: Alcohol and ammonium acetate solution (1 in 250) (850:150). Filter, and degas
Standard solution: 1.2 mg/mL of USP Pseudoephedrine Hydrochloride RS in alcohol
Sample stock solution: Transfer NLT 20 Tablets to a suitable container, add 500 mL of alcohol, and homogenize until the Tablets are dispersed. Quantitatively transfer the contents of the container to a 1000-mL volumetric flask, dilute with alcohol to volume, mix, and allow to stand for the solids to settle.
Sample solution: Transfer 25.0 mL of the supernatant from the *Sample stock solution* into a 50-mL volumetric flask, dilute with alcohol to volume, and mix. Pass a portion of this solution through a filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; packing L3
Flow rate: 0.7 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩

For Tablets labeled for dosing every 12 h

Test 1

Medium: Water; 900 mL
Apparatus 2: 50 rpm
Times: 1, 3, and 6 h
Mobile phase and **System suitability:** Proceed as directed in the *Assay*.
Standard solution: 0.13 mg/mL of USP Pseudoephedrine Hydrochloride RS in water
Sample solution: Filter a portion of the solution under test.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; packing *L3*
Flow rate: 0.7 mL/min
Injection volume: 50 µL
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved.
Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved (%)
1	25–45
3	50–75
6	NLT 75

The percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: Water; 900 mL
Apparatus 2: 50 rpm
Times: 1, 3, and 6 h
Standard solution: A known concentration of USP Pseudoephedrine Hydrochloride RS in *Medium*.
Sample solution: Pass portions of the solution under test through a filter of 0.45-µm pore size, and suitably dilute with *Medium*.
Analysis: Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved by comparing the maximum absorbance of *Sample solution* with that of *Standard solution* at about 214 nm.
Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved (%)
1	25–45
3	60–80
6	NLT 80

The percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

▲**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Medium, Apparatus, and **Times:** Proceed as directed in *Test 1*.
Solution A: Acetonitrile and water (45:55)
Mobile phase: 2.5 g/L of docusate sodium in *Solution A*. Add 1.0 mL of phosphoric acid. Adjust with ammonia water, 25% to a pH of 3.2.
Standard solution: (*L*/900) mg/mL of USP Pseudoephedrine Hydrochloride RS in *Medium*, where *L* is the label claim in mg/Tablet.
Sample solution: Withdraw a portion of the solution under test from each vessel at the specified time point and pass through a suitable filter of 0.45-µm pore size. Replace the portion of solution withdrawn with an equal volume of *Medium* previously equilibrated to 37.0° ± 0.5°.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 10 µL
Run time: NLT 1.5 times the retention time of pseudoephedrine
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the sample withdrawn from the vessel at each time point *i*:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of pseudoephedrine from the *Sample solution*
r_S = peak response of pseudoephedrine from the *Standard solution*
C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution*

Calculate the percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at each time point *i*:

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$
$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$
$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of pseudoephedrine hydrochloride in the portion of sample withdrawn at time point *i* (mg/mL)
V = volume of the *Medium*, 900 mL
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn at each time point (mL)

www.webofpharma.com

Tolerances: See *Table 3*.

Table 3

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	1	27–47
2	3	53–73
3	6	NLT 80

The percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*. ▲(RB 1-Mar-2019)

For Tablets labeled for dosing every 24 h

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.9% sodium chloride in water; 50 mL

Apparatus 7 (see *Drug Release* ⟨724⟩)**:** 30 cycles/min; 2–3 cm amplitude. To prepare the sample, see *Figure 1*.

Times: 2, 8, 14, and 24 h

Solution A: Transfer 200 mL of water to a 1000-mL volumetric flask. Add 3.4 mL of phosphoric acid and 5 mL of triethylamine. Add water to almost 900 mL. Adjust with 1 N sodium hydroxide to a pH of about 6.8, dilute with water to volume, and mix.

Mobile phase: Methanol and *Solution A* (100:900)

System suitability solution: 0.4 mg/mL of USP Pseudoephedrine Hydrochloride RS in water

Sample solution: Solution under test

Standard solution: Known concentrations of USP Pseudoephedrine Hydrochloride RS in water, in a range around the expected concentration of the *Sample solution* at each time interval.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 5-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample solution* and *Standard solution*

Measure the major peak responses of the *Standard solution* and *Sample solution*. Construct a calibration curve by plotting the peak response versus concentrations of the *Standard solution*. Determine the amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at each time interval from a linear regression analysis of the calibration curve.

Tolerances: See *Table* ▲4▲ (RB 1-Mar-2019).

Table ▲4▲ (RB 1-Mar-2019)

Time (h)	Amount Dissolved (%)
2	20–35
8	40–65
14	60–90
24	NLT 85

The percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Pseudoephedrine Hydrochloride RS

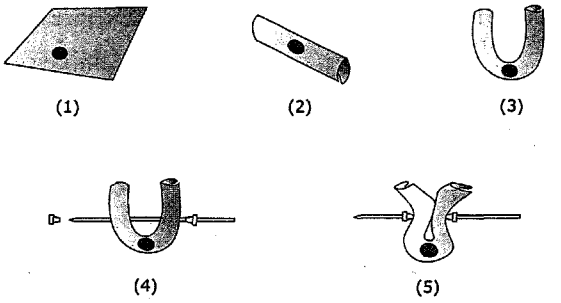

Figure 1. Steps to prepare the sample. (1) Place 1 Tablet on a 5-cm × 5-cm nylon netting. (2) Fold the netting over the Tablet. Continue folding until the Tablet is enclosed in the netting. (3) Fold the netting so that the two open ends meet. The Tablet should be enveloped in the center of the netting. (4) Insert a rod (see Drug Release ⟨724⟩, ▲Figure 5c)▲ (ERR 1-May-2019) through the netting to secure the Tablet. (5) Secure the netting with HPLC plastic ferrules or other appropriate device. Trim the excess netting. Attach each sample holder to the vertically reciprocating sample holder. (Pseudoephedrine Hydrochloride Extended-Release Tablets)

Pseudoephedrine Hydrochloride, Carbinoxamine Maleate, and Dextromethorphan Hydrobromide Oral Solution

DEFINITION

Pseudoephedrine Hydrochloride, Carbinoxamine Maleate, and Dextromethorphan Hydrobromide Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of carbinoxamine maleate ($C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$), dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$), and pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

IDENTIFICATION

- **A.** The retention times of the carbinoxamine maleate and dextromethorphan hydrobromide peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay* for *Carbinoxamine Maleate and Dextromethorphan Hydrobromide*.
- **B.** The retention time of the pseudoephedrine hydrochloride peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Pseudoephedrine Hydrochloride*.

ASSAY

- **CARBINOXAMINE MALEATE AND DEXTROMETHORPHAN HYDROBROMIDE**

Buffer: Dissolve about 4.4 g of dibasic potassium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 5.5.

Mobile phase: Methanol and *Buffer* (600:400)

Standard solution: 0.1 mg/mL of carbinoxamine maleate and 0.3 mg/mL of dextromethorphan hydrobromide from USP Carbinoxamine Maleate RS and USP Dextromethorphan Hydrobromide RS in water

Sample solution: Nominally 0.1 mg/mL of carbinoxamine maleate and 0.3 mg/mL of dextromethorphan hydrobromide from a suitable volume of Oral Solution in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L9

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for dextromethorphan and carbinoxamine are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between carbinoxamine and dextromethorphan

Tailing factor: NMT 2.0 for the dextromethorphan peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of the labeled amounts of carbinoxamine maleate ($C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$) and of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the appropriate analyte from the *Sample solution*

r_S = peak response of the appropriate analyte from the *Standard solution*

C_S = concentration of the appropriate Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the appropriate analyte in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of carbinoxamine maleate ($C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$) and 90.0%–110.0% of the labeled amount of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr$)

- **PSEUDOEPHEDRINE HYDROCHLORIDE**

Buffer: Dissolve about 4.4 g of dibasic potassium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 5.5.

Mobile phase: Methanol and *Buffer* (600:400)

Standard solution: 1.2 mg/mL of pseudoephedrine hydrochloride from USP Pseudoephedrine Hydrochloride RS in water

Sample solution: Nominally 1.2 mg/mL of pseudoephedrine hydrochloride from a suitable volume of Oral Solution in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 257 nm

Column: 4.6-mm × 25-cm; packing L9

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pseudoephedrine from the *Sample solution*

r_S = peak response of pseudoephedrine from the *Standard solution*

C_S = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$)

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

For single-unit containers

Acceptance criteria: Meets the requirements

- **DELIVERABLE VOLUME** ⟨698⟩

For multiple-unit containers

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩: The total aerobic microbial count does not exceed 10^2 cfu/g, the total combined molds and yeasts count does not exceed 10^1 cfu/g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

www.webofpharma.com

- **pH** ⟨791⟩: 3.0–5.0
- **Alcohol Determination,** *Method II* ⟨611⟩ (if present): 90.0%–110.0% of the labeled amount of alcohol (C_2H_5OH) is found.

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP Reference Standards** ⟨11⟩
  USP Carbinoxamine Maleate RS
  USP Dextromethorphan Hydrobromide RS
  USP Pseudoephedrine Hydrochloride RS

Pseudoephedrine Sulfate

$(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ 428.54
Benzenemethanol, α-[1-(methylamino)ethyl]-, [*S*-(*R**,*R**)]-, sulfate (2:1) (salt).
(+)-Pseudoephedrine sulfate (2:1) (salt) [7460-12-0].

» Pseudoephedrine Sulfate contains not less than 98.0 percent and not more than 100.5 percent of $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Pseudoephedrine Sulfate RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020)

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 500 µg per mL.
Medium: water.
Absorptivities at 257 nm, calculated on the dried basis, do not differ by more than 3.0%.
C: A solution of it responds to the test for *Sulfate* ⟨191⟩.
Melting range, *Class I* ⟨741⟩: between 174° and 179°, but the range between beginning and end of melting does not exceed 2°.
Specific rotation ⟨781S⟩: between +56.0° and +59.0°.
Test solution: 50 mg per mL, in water.
pH ⟨791⟩: between 5.0 and 6.5 in a solution (1 in 20).
Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.
Chloride ⟨221⟩—A 200-mg portion shows no more chloride than corresponds to 0.4 mL of 0.02 N hydrochloric acid (0.14%).

Ordinary impurities ⟨466⟩—
Test solution: alcohol.
Standard solution: alcohol.
Eluant: a mixture of alcohol, glacial acetic acid, and water (10:3:1).
Visualization: Expose the plate for 24 hours to iodine vapors in a pre-equilibrated closed chamber, on the bottom of which there are iodine crystals.

Assay—Dissolve about 150 mg of Pseudoephedrine Sulfate, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 42.85 mg of $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$.

Psyllium Hemicellulose

DEFINITION
Psyllium Hemicellulose is the alkali soluble fraction of the husk from *Plantago ovata* Forssk. It consists of a combination of highly substituted arabinoxylan polysaccharides. These polysaccharides are linear chains of xylose units (β-(1→4)-xylan) to which are attached single units of arabinose and additional xylose. Rhamnose, galactose, glucose, and rhamnosyluronic acid residues are also present as minor constituents. It contains NLT 75.0% of dietary soluble fiber, calculated on the dried basis.

IDENTIFICATION
- **A.** The powdered mucilage stains red with ruthenium red TS and lead acetate TS.
- **B.** It meets the requirements in *Specific Tests* for *Swell Volume.*

COMPOSITION
- **Content of Soluble Dietary Fiber**
  Alcohol solution: Transfer 82.0 mL of alcohol to a 100-mL volumetric flask, and dilute with water to volume.
  Buffer solution A: Dissolve 1.95 g of 2-(*N*-morpholino)-ethanesulfonic acid and 1.22 g of tris(hydroxymethyl) aminomethane in 170 mL of water. Adjust with 6 N sodium hydroxide to a pH of 8.2, and dilute with water to 200 mL. [Note—It is important to adjust the pH to 8.2 at 24°. If the *Buffer solution* temperature is 20°, adjust the pH to 8.3; if the temperature is 28°, adjust the pH to 8.1. For deviations at 20°–28°, adjust by interpolation.]
  Acid solution: Prepare 0.561 N hydrochloric acid by mixing 9.35 mL of 6 N hydrochloric acid in 70 mL of water. Dilute with water to 100.0 mL.
  Buffer solution B: Prepare a pH 6.0 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*).
  Protease solution: Dissolve 5 mg of protease in 0.1 mL of *Buffer solution B*
  Enzyme purity: To ensure the absence of undesirable enzymatic activities and the presence of desirable enzymatic activities, proceed as directed for *Sample solution* and *Analysis* using the substrates listed in *Table 1* in place of Psyllium Hemicellulose.

Table 1

Substrate	Weight (g)	Activity Tested
Pectin	0.2	Pectinase
Arabinogalactan	0.2	Hemicellulase
β-Glucan	0.2	β-Glucanase
Wheat starch	1.0	α-Amylase and amyloglucosidase
Corn starch	1.0	α-Amylase and amyloglucosidase
Casein	0.3	Protease

USP Monographs

www.webofpharma.com

The enzyme preparation is suitable if more than 90% of the original weight of pectin, arabinogalactan, and β-glucan is recovered; NMT 2% of the original weight of casein and corn starch is recovered; and NMT 1% of the original weight of wheat starch is recovered. [NOTE—Test the enzyme purity of every new lot of enzyme and at 6-month intervals thereafter.]

Blank solution: Using two 400-mL tall-form beakers, appropriately labeled, proceed as directed for *Analysis* without Psyllium Hemicellulose.

Sample solution: Weigh, in duplicate, approximately 0.2 g of Psyllium Hemicellulose, previously milled to a very fine powder. [NOTE—Duplicates should differ by less than 1 mg in weight.] Transfer duplicate samples to appropriately labeled tall-form 400-mL beakers, and proceed as directed for *Analysis*.

Analysis: Treat each solution in the following manner. Add 40 mL of *Buffer solution A* to the beaker. [NOTE—For the *Sample solution*, stir until the Psyllium Hemicellulose is completely dispersed.]

Add 125 µL of heat-stable α-amylase solution, and stir to ensure uniform mixing. Cover the beaker with aluminum foil, and incubate over a water bath maintained at 95°–100° for 15 min, with continuous agitation. [NOTE—Start timing once the water bath temperature reaches 95°. A total time of 35 min is usually sufficient.]

Remove the beaker from the water bath, and cool to 60°. Remove the aluminum foil, scrape any ring from inside the beaker, and disperse any gels in the bottom of the beaker with a spatula. Rinse the walls of the beaker and the spatula with 10 mL of water, collecting the rinsings in the beaker. Add 500 µL of *Protease solution*. Cover with aluminum foil, and incubate over a water bath maintained at 60 ± 3° for 30 min with continuous agitation. [NOTE—Start timing when the bath temperature reaches 60°.]

Remove the foil, and transfer 5 mL of *Acid solution* while stirring. Adjust, if necessary, with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.28 ± 0.07 at 60°. [NOTE—It is important to adjust the pH to 4.28 while the solution in the beaker is maintained at 60°; otherwise, the pH will increase at lower temperatures.]

Add 150 µL of amyloglucosidase solution while stirring. Cover with aluminum foil, and incubate over a water bath maintained at 60 ± 3° for 30 min with constant agitation. [NOTE—Start timing once the water bath reaches 60°.]

Transfer 40 mL of the beaker contents to a 50-mL centrifuge tube, and sonicate the tube contents for 3 min.[1] Centrifuge at 10,000–14,000 rpm for 10 min. Carefully pour the supernatant into a labeled 600-mL tared beaker. Do not disturb any pellet in the bottom of the centrifuge tube. Add the remaining sample from the original 400-mL beaker into the centrifuge tube still containing the pellet. Rinse the 400-mL beaker with 15–20 mL of water, and add the rinsing to the 50-mL centrifuge tube. Centrifuge the sample at 10,000–14,000 rpm for 10 min. Carefully pour the supernatant into the 600-mL beaker containing the first supernatant. Add 390 mL (measured before heating) of alcohol at 60° to the 600-mL beaker. Cover the beaker, and allow to stand for at least 1 h to form a precipitate.

Place 3 g of chromatographic siliceous earth into a clean air-dried crucible with a fritted disk. Heat the crucible containing chromatographic siliceous earth at 525° in a muffle furnace for at least 4 h. Cool. Pass deionized water through the crucible while applying constant suction. Rinse with acetone, and allow to air-dry. Store the crucible in a convection oven at 130° for at least 2 h before use. Weigh the prepared crucible to 0.1 mg before use. Wet the chromatographic siliceous earth in the crucible using a stream of *Alcohol solution* from a washing bottle, and apply suction to evenly distribute the chromatographic siliceous earth over the fritted disk. Maintaining the suction, transfer the supernatant and precipitate from the beaker to the crucible, and filter. Transfer any solid residue in the beaker with the aid of *Alcohol solution*. [NOTE—In some cases, gums may form during filtration, trapping liquid in the residue. If so, break the surface film with a spatula to improve filtration.]

Wash the residue in the crucible sequentially with 30 mL of *Alcohol solution*, 20 mL of alcohol, and 20 mL of acetone. Dry the crucible containing the residue at 100° in a convection oven for at least 4 h, and cool to room temperature in a desiccator.

Determine the weight of the residue (*R*).

Use one of the duplicate residues from the *Sample solution* and one of the blank residues from the *Blank solution* to determine the protein content, in mg, by placing the residue in a 500-mL Kjeldahl flask, and proceeding as directed for *Nitrogen Determination* ⟨461⟩, *Method I*. The protein content is determined by multiplying the content of nitrogen found by 6.25. Incinerate the residue from the remaining duplicate of the *Sample solution* and the *Blank solution* as directed for *Articles of Botanical Origin* ⟨561⟩, *Total Ash* at a reduced temperature of 525°, and determine the ash content as directed.

Calculate the corrected average weight of the blank (*B*), in mg:

$$B = R_B - P_B - A_B$$

R_B = weight of the average blank residue for duplicate blank determinations (mg)
P_B = content found in the test for protein in the blank (mg)
A_B = content of ash found in the blank (mg)

Calculate the percentage of soluble dietary fiber:

$$\text{Result} = [(R_U - P_U - A_U - B)/W_U] \times 100$$

R_U = weight of average residue for the duplicate *Sample solution* (mg)
P_U = content of protein found in the Psyllium Hemicellulose (mg)
A_U = content of ash found in the Psyllium Hemicellulose (mg)
B = average weight of the blank as calculated above
W_U = average weight of the Psyllium Hemicellulose taken (mg)

Acceptance criteria: NLT 75.0% of dietary soluble fiber on the dried basis

CONTAMINANTS

• LIMIT OF ALCOHOL

Internal standard solution: *n*-Propyl alcohol and water (1:99)

Standard stock solution: 5.0 mL of absolute alcohol at 20 ± 2°, diluted with water to 500.0 mL

Standard solution: 10.0 mL of *Standard stock solution* and 10.0 mL of *Internal standard solution*, diluted with water to 100.0 mL

Sample solution: 0.5 g of Psyllium Hemicellulose in 90 mL of water. Stir rapidly for 3 h using a magnetic stirrer. Add

[1] A suitable sonicator is Sonifier 250 (or equivalent), equipped with a 12-mm tip, from Branson Ultrasonic Corp., Danbury, CT, in which an output control value of 3 and a cycle time of 75% generate a power output of 43 W.

USP Monographs

www.webofpharma.com

10.0 mL of the *Internal standard solution*. Pass the *Sample solution* through a filter having a 0.45-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.53-mm × 30-m fused silica analytical; coated with 3.0-µm G43 stationary phase. [NOTE—A 0.53-mm × 2-m fused silica guard column may be used.]
Temperature: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	10	230	3

Injector: 250°
Detector: 300°
Carrier gas: Helium
Flow rate: 4 mL/min
Injection size: 0.5 µL
Injection type: Split flow ratio, 10:1

System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%, for replicate injections

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of alcohol in the portion of Psyllium Hemicellulose taken:

$$\text{Result} = (R_U/R_S) \times C_S \times (V/W) \times 100$$

R_U = ratio of the peak response of alcohol/peak response of *n*-propyl alcohol from the *Sample solution*
R_S = ratio of the peak response of alcohol/peak response of *n*-propyl alcohol from the *Standard solution*
C_S = concentration of alcohol in the *Standard stock solution* (mg/mL)
V = volume of the *Standard stock solution* (mL)
W = weight of Psyllium Hemicellulose taken to prepare the *Sample solution* (mg)

Acceptance criteria: NMT 12.0% (w/w)

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

SPECIFIC TESTS

- **SWELL VOLUME**

Sample: 0.50 g of Psyllium Hemicellulose
Analysis: Add the *Sample* to a glass-stoppered, 100-mL graduated mixing cylinder. To avoid material clumping, hold the cylinder at a 45° angle, and gently rotate it while using a wash bottle to forcefully add 30 mL of water. Add water to bring the total volume to 100 mL, and cap the cylinder. Invert the cylinder several times until a uniform suspension is achieved, and allow to stand. Gently invert the cylinder several times again at 4–8 h after the initial *Sample solution* preparation, and allow to stand. Allow the gel to settle for 16 h. Determine the volume of the gel.
Acceptance criteria: NLT 80 mL/g of Psyllium Hemicellulose

- **TOTAL ACIDITY:** Transfer 40 mL of the supernatant as obtained in the test for *Swell Volume* without disturbing the gel. Titrate with 0.03 N sodium hydroxide, using 1 mL of phenolphthalein TS as indicator.

Acceptance criteria: NMT 1.8 mL of 0.03 N sodium hydroxide is consumed

- **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN,** *Total Ash* ⟨561⟩**:** NMT 5.0%
- **ARTICLES OF BOTANICAL ORIGIN,** *Acid-Insoluble Ash* ⟨561⟩**:** NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

Psyllium Husk

DEFINITION
Psyllium Husk is the cleaned, dried seed coat (epidermis) separated by winnowing and thrashing from the seeds of *Plantago ovata* Forssk., known in commerce as Blond Psyllium, Indian Psyllium, or Ispaghula, or from *Plantago arenaria* Waldst. & Kit. (*Plantago psyllium* L.) known in commerce as Spanish or French Psyllium (Fam. *Plantaginaceae*), in whole or in powdered form.

IDENTIFICATION

- **A.** Mounted in cresol, cells, viewed microscopically, are composed of polygonal prismatic cells having 4–6 straight or slightly wavy walls.
- **B.** Mounted in alcohol and irrigated with water, viewed microscopically, the mucilage in the outer part of the epidermal cells swells rapidly and goes into solution.

IMPURITIES

- **ARTICLES OF BOTANICAL ORIGIN,** *Acid-Insoluble Ash* ⟨561⟩**:** NMT 1.0%
- **ARTICLES OF BOTANICAL ORIGIN,** *Limits of Elemental Impurities* ⟨561⟩**:** Meets the requirements
- **ORGANIC IMPURITIES PROCEDURE 1: LIGHT EXTRANEOUS MATTER**

[NOTE—Perform this test in a well-ventilated hood.]
Sample: 99–101 g of Psyllium Husk, weighed to 0.1 g accuracy
Analysis: Transfer the *Sample* to a 1000-mL tall-form beaker. Add 800 mL of trichloroethylene, previously adjusted to a temperature of 24°–26°, and maintain this temperature throughout the test. Stir the husk for 5 s, and allow it to settle while protecting the surface from drafts in the hood. Remove the floating material with a spoon made of 50-mesh screen, and transfer the material to a piece of filter paper in a dish. Stir the husk mixture again, allow it to settle, remove the floating material again, and combine it with the material on the paper. Repeat this procedure until no more material appears on the surface. Dry the removed material with the paper in a hood and then in an oven at 40° for 3 h. Cool to room temperature. Weigh the filter paper with the material. Brush the material off the paper, weigh the paper, and then calculate the percentage of light extraneous matter.
Acceptance criteria: NMT 5%

USP Monographs

www.webofpharma.com

• **ORGANIC IMPURITIES PROCEDURE 2: INSECT INFESTATION**
Sample: 25 g
Analysis: Transfer the *Sample* to a 250-mL beaker, add sufficient solvent hexane to saturate, add an additional 75–100 mL of solvent hexane, and allow to stand for 10 min, stirring occasionally with a stirring rod. Wet a sheet of filter paper with alcohol, and filter the mixture with the aid of vacuum. Discard the filtrate. Transfer the residue to the original beaker with the aid of alcohol. Add alcohol to bring the volume to 150 mL above the level of the transferred residue. Boil for 10 min. Filter through alcohol-wetted paper as above. Prepare a trap flask consisting of a 2000-mL graduated, narrow-mouth conical flask into which is inserted a rubber disk supported on a stiff metal rod 4 mm in diameter and longer than the height of the flask, the rod being threaded at the lower end and furnished with nuts and washers to hold the disk in place, and the disk being of the proper shape and size to prevent liquid in the body of the flask from spilling when it is pressed up against the neck from the inside. Transfer the residue to the trap flask, completing the transfer with the aid of hot water. Add sufficient hot water to bring the volume to 1000 mL. Add 20 mL of hydrochloric acid. Raise the rod, and support it so that the rubber disk is held above the liquid level. Rinse the rubber disk with hot water. Spray the inside of the neck of the flask with an antifoam spray. Boil for 30 min, and cool to room temperature. Add 40 mL of solvent hexane, and agitate for 1 min by tilting the flask and moving the rod vertically with wrist action. Allow to stand for 5 min. Add water to bring the level of liquid to the neck of the flask, and allow to stand for 20 min. Simultaneously rotate the disk to free it from settled material, and raise it as far as possible into the neck of the flask. Prepare a sheet of ruled filter paper with lines approximately 5 mm apart for filtration by moistening it with water and placing it on a vacuum funnel. Transfer the material trapped in the neck of the flask to the filter with the aid of water. If necessary, wash the paper with alcohol to remove traces of hexane. Place the paper on a 100-mm petri dish that has been wetted with a solution containing equal volumes of glycerin and alcohol. Add 35 mL of solvent hexane to the flask, and gently stir with the trapping rod. Add water to bring the liquid level into the neck of the flask. Allow to stand for 15 min. Using the same technique as before, transfer the trapped material onto a separate paper. Examine the papers at 30× magnification.
Acceptance criteria
Powdered Psyllium Husk: NMT 400 insect fragments, including mites and psocids
Whole Psyllium Husk: NMT 100 insect fragments, including mites and psocids
• **ARTICLES OF BOTANICAL ORIGIN,** *Pesticide Residue Analysis* ⟨561⟩: Meets the requirements

SPECIFIC TESTS
• **BOTANIC CHARACTERISTICS**
Histology—Husk: The epidermis is composed of large cells having transparent walls filled with mucilage, and the cells swell rapidly in aqueous mounts and appear polygonal to slightly rounded in a surface view when viewed from above (from below they appear elongated to rectangular). The swelling takes place mainly in the radial direction. The mucilage of the epidermal cells stains red with ruthenium red and lead acetate TS. The very occasional starch granules that are present in some of the epidermal cells and that may be found embedded in the mucilage are small and simple or compounded with four or more components.
Powdered psyllium seed husk: It is a pale to medium buff-colored powder having a slight pinkish tinge and a weak characteristic odor. Occasional single and 2- to 4-compound starch granules, the individual grains being spheroidal plano to angular convex from 2–10 µm in diameter, are found embedded in the mucilage. Entire or broken epidermal cells are filled with mucilage. In surface view, the epidermal cells appear polygonal to slightly rounded. Mucilage stains red with ruthenium red TS and lead acetate TS. Some of the elongated and rectangular cells representing the lower part of epidermis and also radially swollen epidermal cells can be found.
• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩: The total combined molds and yeasts count does not exceed 1000 cfu/g, and it meets the requirements of the test for absence of *Salmonella* species and *Escherichia coli.*
• **ARTICLES OF BOTANICAL ORIGIN,** *Total Ash* ⟨561⟩: NMT 4.0%
• **WATER DETERMINATION,** *Method II* ⟨921⟩: NMT 12.0%
• **SWELL VOLUME**
Sample: 3.5 g of Psyllium Husk
Analysis: Transfer 250 mL of simulated intestinal fluid TS without enzymes to a glass-stoppered 500-mL graduated cylinder. Gradually, with shaking, add the *Sample* until a uniform, smooth suspension is obtained. Dilute with the same fluid to 500 mL. Shake the cylinder for 1 min every 30 min for 8 h. Allow the gel to settle for 16 h (total time is 24 h). Determine the volume of the gel.
Acceptance criteria
Powdered Psyllium Husk: NLT 40 mL/g
Whole Psyllium Husk: NLT 35 mL/g

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers, secured against insect attack.

Psyllium Hydrophilic Mucilloid for Oral Suspension

DEFINITION
Psyllium Hydrophilic Mucilloid for Oral Suspension is a dry mixture of Psyllium Husk with suitable additives.

IDENTIFICATION
• **A. BOTANIC CHARACTERISTICS**
Microscopic: It shows occasional single and 2- to 4-compound starch granules, the individual grains being spheroidal plano to angular convex, 2–10 um in diameter, found embedded in the mucilage. Entire or broken epidermal cells are filled with mucilage. In surface view, the epidermal cells appear polygonal to slightly rounded. Mucilage stains red with ruthenium red TS and lead acetate TS. Some of the elongated and rectangular cells representing the lower part of epidermis and also radially swollen epidermal cells can be found.

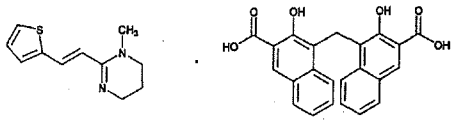
SPECIFIC TESTS
• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩: It meets the requirements of the tests for absence of *Salmonella* species and of *Escherichia coli.*
• **SWELL VOLUME**
Sample: Psyllium Hydrophilic Mucilloid for Oral Suspension, equivalent to 3.5 g of psyllium husk
Analysis: Transfer 250 mL of simulated intestinal fluid TS without enzymes to a glass-stoppered, 500-mL graduated cylinder. Gradually, with shaking, add the *Sample,* and shake until a uniform, smooth suspension is obtained. Dilute with the same fluid to 500 mL. Shake the cylinder for

www.webofpharma.com

1 min every 30 min for 8 h. Allow the gel to settle for 16 h (total time, 24 h). Determine the volume of the gel.
Acceptance criteria: NLT 110 mL

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.

Pumice



DEFINITION
Pumice is a substance of volcanic origin, consisting chiefly of complex silicates of aluminum, potassium, and sodium.

IMPURITIES
- **IRON**
  Sample solution: The remaining one-half of the filtrate from the test for *Water-Soluble Substances*
  Analysis: Acidify the *Sample solution* with hydrochloric acid, and add a few drops of potassium ferrocyanide TS.
  Acceptance criteria: No blue color is produced.

SPECIFIC TESTS
- **WATER-SOLUBLE SUBSTANCES**
  Sample: 10 g
  Analysis: Boil the *Sample* with 50 mL of water for 30 min, adding water from time to time to maintain approximately the original volume, and then filter. The filtrate is neutral to litmus. Evaporate one-half of this filtrate, dry at 105° for 1 h, and weigh the residue.
  Acceptance criteria: NMT 10 mg (NMT 0.20%)
- **ACID-SOLUBLE SUBSTANCES**
  Sample: 1 g
  Analysis: Boil the *Sample* with 25 mL of 3 N hydrochloric acid for 30 min, adding water from time to time to maintain approximately the original volume, then filter. Add five drops of sulfuric acid to the filtrate, evaporate to dryness, ignite, and weigh the residue.
  Acceptance criteria: NMT 60 mg (NMT 6.0%)
- **POWDERED PUMICE**
  Pumice flour or **superfine pumice:** NLT 97.0% of pumice flour or superfine pumice passes through a No. 200 standard mesh sieve.
  Fine pumice: NLT 95.0% of fine pumice passes through a No. 150 standard mesh sieve, and NMT 75.0% passes through a No. 200 standard mesh sieve.
  Coarse pumice: NLT 95.0% of coarse pumice passes through a No. 60 standard mesh sieve, and NMT 5.0% passes through a No. 200 standard mesh sieve.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label powdered Pumice to indicate, in descriptive terms, the fineness of the powder.

Pyrantel Pamoate

$C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$ 594.68

Pyrimidine, 1,4,5,6-tetrahydro-1-methyl-2-[2-(2-thienyl) ethenyl]-, (*E*)-, compd. with 4,4′-methylenebis[3-hydroxy-2-naphthalenecarboxylic acid] (1:1);
(*E*)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(2-thienyl)vinyl] pyrimidine 4,4′-methylenebis[3-hydroxy-2-naphthoate] (1:1) [22204-24-6].

DEFINITION
Pyrantel Pamoate contains NLT 97.0% and NMT 103.0% of $C_{34}H_{30}N_2O_6S$, calculated on the dried basis.

IDENTIFICATION

  Solution: 16 µg/mL in methanol
- **C.** The retention time of the major peaks due to pyrantel base and pamoic acid of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
  [NOTE—Use low-actinic glassware in preparing solutions of pyrantel pamoate, or otherwise protect the solutions from unnecessary exposure to bright light. Complete the *Assay* without prolonged interruption.]
  Mobile phase: Acetonitrile, glacial acetic acid, diethylamine, and water (92.8: 3: 1.2: 3)
  [NOTE—Increasing the amount of acetonitrile in the *Mobile phase* increases retention times. Increasing the amount of acetic acid, water, and diethylamine decreases retention times. Should the *Mobile phase* need to be adjusted, maintain the ratios among acetic acid, diethylamine, and water (1: 0.4: 1).]
  Standard solution: 80 µg/mL of USP Pyrantel Pamoate RS in *Mobile phase*
  Sample solution: 80 µg/mL of Pyrantel Pamoate in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 288 nm
  Column: 4.6-mm × 25-cm; packing L3
  Flow rate: 1 mL/min
  Injection size: 20 µL
  System suitability
  Sample: *Standard solution*
  [NOTE—The relative retention times for pamoic acid and pyrantel are 0.6 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 10.0 between pyrantel and pamoic acid
  Column efficiency: NLT 8000 theoretical plates for the pyrantel peak
  Tailing factor: NMT 1.3 for the pyrantel peak
  Relative standard deviation: NMT 1.0% for the pyrantel peak
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Record the chromatograms obtained for a period of NLT 2.5 times the retention times of pyrantel, and measure the responses for the major peaks.

USP Monographs

www.webofpharma.com

Calculate the percentage of $C_{34}H_{30}N_2O_6S$ in the portion of Pyrantel Pamoate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for pyrantel from the *Sample solution*
r_S = peak response for pyrantel from the *Standard solution*
C_S = concentration of USP Pyrantel Pamoate RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

OTHER COMPONENTS

• **CONTENT OF PAMOIC ACID**

Mobile phase: Acetonitrile, glacial acetic acid, diethylamine, and water (92.8: 3: 1.2: 3)

[NOTE—Increasing the amount of acetonitrile in the *Mobile phase* increases retention times. Increasing the amount of acetic acid, water, and diethylamine decreases retention times. Should the *Mobile phase* need to be adjusted, maintain the ratios among acetic acid, diethylamine, and water (1: 0.4: 1).]

Standard solution: 52 µg/mL of USP Pamoic Acid RS in *Mobile phase*

Sample solution: 80 µg/mL of Pyrantel Pamoate in *Mobile phase*

Injection size: 20 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{23}H_{16}O_6$ in the portion of Pyrantel Pamoate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for pamoic acid from the *Sample solution*
r_S = peak response for pamoic acid from the *Standard solution*
C_S = concentration of USP Pamoic Acid RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)

Acceptance criteria: 63.4%–67.3% of pamoic acid, calculated on the dried basis

IMPURITIES

INORGANIC IMPURITIES

• **Limit of Iron** ⟨241⟩

Analysis: To the residue obtained in the test for *Residue on Ignition*, add hydrochloric acid and nitric acid (3:2), and evaporate on a steam bath to dryness. Dissolve the residue in 2 mL of hydrochloric acid with the aid of gentle heat. Add 18 mL of hydrochloric acid, dilute with water to 50 mL, and mix. Dilute 5 mL of this solution with water to 47 mL.

Acceptance criteria: The limit is 0.0075%.

• **Residue on Ignition** ⟨281⟩: NMT 0.5%

Sample: 1.33 g

ORGANIC IMPURITIES

• **Procedure**

Diluent: Glacial acetic acid, diethylamine, and water (5:2:5)

Mobile phase: Acetonitrile and *Diluent* (92.8: 7.2).

[NOTE—Prepare the solutions immediately before use, and protect from light at all stages.]

Stock standard solution: 0.8 mg/mL of USP Pyrantel Pamoate RS. Dissolve in *Diluent*, using 7% of the final volume, and diluting with acetonitrile to volume.

Standard solution: 4 µg/mL of USP Pyrantel Pamoate RS in *Mobile phase* from the *Stock standard solution*

System suitability solution: Dissolve a quantity of USP Pyrantel Related Compound A RS first in the *Stock standard solution*, using 5% of the final volume. Dilute with *Diluent* to volume to obtain a solution with a concentration of 0.2 mg/mL of pyrantel related compound A and 40 µg/mL of pyrantel pamoate. Transfer a suitable portion of this solution, and dilute quantitatively with *Diluent* to obtain a solution with a final concentration of about 4 µg/mL of pyrantel related compound A and 0.8 µg/mL of pyrantel pamoate.

Sample solution: 0.8 mg/mL of pyrantel pamoate prepared by dissolving in *Diluent*, using 7% of the final volume, and diluting with acetonitrile to volume

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 288 nm

Column: 4.6-mm × 25-cm; packing L3

Flow rate: 1.0 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between pyrantel and pyrantel related compound A

Tailing factor: NMT 1.5 for the pyrantel peak

Relative standard deviation: NMT 10.0% for the pyrantel peak

Analysis

Samples: *Standard solution*, *System suitability solution*, and *Sample solution*

[NOTE—Record the chromatograms for about 4 times the retention time of pyrantel. Disregard any peak in the *Sample solution* having an area less than one-tenth the principal peak in the *Standard solution*.]

Calculate the percentage of pyrantel related compound A in the portion of Pyrantel Pamoate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for pyrantel related compound A from the *Sample solution*
r_S = peak response for pyrantel related compound A from the *System suitability solution*
C_S = concentration of USP Pyrantel Related Compound A RS in the *System suitability solution* (µg/mL)
C_U = concentration of pyrantel pamoate in the *Sample solution* (µg/mL)

Calculate the percentage of *Impurity B* or any other unspecified impurity in the portion of Pyrantel Pamoate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for impurity B or any individual unspecified impurity from the *Sample solution*
r_S = peak response for pyrantel from the *Standard solution*
C_S = concentration of USP Pyrantel Pamoate RS in the *Standard solution* (µg/mL)

www.webofpharma.com

C_U = concentration of pyrantel pamoate in the *Sample solution* (µg/mL)
F = relative response factor (see *Impurity Table 1*)

Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 1.0%

Impurity Table 1

  USP Pyrantel Related Compound A RS
  (*Z*)-1-Methyl-2-(2-(thiophen-2-yl)vinyl)-1,4,5,6-tetrahydropyrimidine.
  $C_{34}H_{30}N_2O_6S$ 594.69

Pyrantel Pamoate Oral Suspension

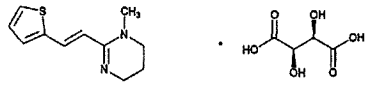
» Pyrantel Pamoate Oral Suspension is a suspension of Pyrantel Pamoate in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pyrantel ($C_{11}H_{14}N_2S$).

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Pyrantel Pamoate RS
Identification—[See *Note* in the *Assay*.]
A: Dilute a suitable volume of Oral Suspension with 0.05 N methanolic ammonium hydroxide to obtain a solution having a concentration of about 8 mg of pyrantel pamoate per mL. Similarly prepare a Standard solution of USP Pyrantel Pamoate RS. Shake both solutions by mechanical means, and centrifuge to obtain clear solutions. Apply a 100-µL portion of each solution to a 20- × 20-cm thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.50-mm layer of silica gel mixture. Develop the plate in a suitable chromatographic chamber containing the upper phase obtained by shaking together methyl isobutyl ketone, formic acid, and water (2:1:1). Develop the plate until the solvent front is about 2 cm from the top edge of the plate. Remove the plate, allow the solvent to evaporate, and examine the plate under UV light at about 365 nm: the R_F value of the principal spot from the test solution corresponds to that obtained from the Standard solution.
B: [Note—Prepare 0.05 N methanolic ammonium hydroxide by transferring 0.8 mL of ammonium hydroxide to a 250-mL volumetric flask containing 100 mL of methanol, diluting with methanol to volume, and mixing.] Dilute a suitable volume of Oral Suspension with 0.05 N methanolic ammonium hydroxide to obtain a solution having a concentration of about 16 mg of pyrantel pamoate per mL. Similarly prepare a Standard solution of USP Pyrantel Pamoate RS. Shake both solutions by mechanical means, and centrifuge to obtain clear solutions. Apply a 20-µL portion of each solution to an 18- × 24-cm sheet of chromatographic paper (Whatman No. 1 or equivalent) that previously has been prepared as follows. Impregnate the paper with a freshly prepared solution obtained by mixing 7 volumes of acetone and 3 volumes of glycine-sodium chloride-hydrochloric acid buffer solution (prepared by mixing 3 volumes of a solution that is 0.3 M with respect to both glycine and sodium chloride with 7 volumes of 0.3 M hydrochloric acid). Press the impregnated paper uniformly between white, nonfluorescent blotters to remove the excess solvent. Place the spotted chromatographic paper in a suitable chromatographic chamber, and develop by descending chromatography (see *Chromatography* ⟨621⟩), using as the solvent system the upper phase obtained by mixing ethyl acetate, butanol, and water (10:1:1). After developing for 20 hours, remove the paper from the chamber, air-dry for 10 minutes, transfer to an air-circulating oven, and dry at 60° for 30 minutes: the R_F value of the principal spot from the solution under test corresponds to that obtained from the Standard solution.
C: The retention times of the major peaks due to pyrantel base and pamoic acid in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Uniformity of dosage units ⟨905⟩—
FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume ⟨698⟩—
FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.
pH ⟨791⟩: between 4.5 and 6.0.
Assay— [Note—Use low-actinic glassware in preparing solutions of pyrantel pamoate, and otherwise protect the solutions from unnecessary exposure to bright light. Complete the assay without prolonged interruption.]
Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Pyrantel Pamoate.*
Assay preparation—Transfer by means of a pipet an accurately measured volume of Oral Suspension, equivalent to about 200 mg of pyrantel pamoate, into a 100-mL volumetric flask, disperse, and dilute with water to volume. While stirring the dispersion with a magnetic stirrer, transfer 1.0 mL of the aliquot to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, mix, and filter.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms obtained for a

USP Monographs



www.webofpharma.com

period of not less than 2.5 times the retention times of pyrantel base, and measure the responses for the major peaks. The relative retention times for pamoic acid and pyrantel base are about 0.6 and 1.0, respectively. Calculate the quantity, in mg, of pyrantel ($C_{11}H_{14}N_2S$) in each mL of the Oral Suspension taken by the formula:

$$2500(0.347)(C/V)(r_U/r_S)$$

in which 0.347 is the ratio of the molecular weight of pyrantel to that of pyrantel pamoate; C is the concentration, in mg per mL, of USP Pyrantel Pamoate RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses for pyrantel base obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pyrantel Tartrate

$C_{11}H_{14}N_2S \cdot C_4H_6O_6$ 356.39

Pyrimidine, 1,4,5,6-tetrahydro-1-methyl-2-[2-(2-thienyl) ethenyl]-, (*E*)-, (2*R*,3*R*)-2,3-dihydroxybutanedioate (1:1); (*E*)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(2-thienyl)vinyl] pyrimidine tartrate (1:1) [33401-94-4].

DEFINITION

Pyrantel Tartrate contains NLT 98.0% and NMT 102.0% of pyrantel tartrate ($C_{11}H_{14}N_2S \cdot C_4H_6O_6$), calculated on the dried basis.

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 10 µg per mL.
Medium: water.
Absorptivities at 268 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.
C: Boil 20 mg with 5 mL of 5 N sodium hydroxide: the odor of ammonia is perceptible.
Melting range ⟨741⟩: between 188° and 191°.
Water Determination, *Method I* ⟨921⟩: not more than 0.5%.
Residue on ignition ⟨281⟩: not more than 0.1%.
Assay—Place about 300 mg of Pyrazinamide, accurately weighed, in a 500-mL Kjeldahl flask, dissolve in 100 mL of water, and add 75 mL of 5 N sodium hydroxide. Connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 20 mL of boric acid solution (1 in 25) contained in a suitable receiver. Boil gently for 20 minutes, avoiding insofar as possible distilling any of the liquid, then boil vigorously to complete the distillation of the ammonia. Cool the liquid in the receiver if necessary, add methyl purple TS, and titrate with 0.1 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N hydrochloric acid is equivalent to 12.31 mg of $C_5H_5N_3O$.

Pyrazinamide Compounded Oral Suspension

DEFINITION
Pyrazinamide Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of pyrazinamide ($C_5H_5N_3O$).
Prepare Pyrazinamide Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Pyrazinamide tablets[a] equivalent to	1 g of pyrazinamide
Vehicle: a 1:1 mixture of Ora-Sweet[b] (regular or sugar-free) and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Pyrazinamide 500-mg tablets, Mikart Inc., Atlanta, GA.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Pyrazinamide tablets* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a pyrazinamide liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY
- **Procedure**
Solution A: 10 mM monobasic sodium phosphate, adjusted with phosphoric acid to a pH of 3.5
Mobile phase: Acetonitrile and *Solution A* (10:90). Filter and degas.
Standard stock solution: 1.0 mg/mL of USP Pyrazinamide RS in methanol
Standard solution: Pipet 1.0 mL of the *Standard stock solution* into a 10-mL volumetric flask, and dilute with

www.webofpharma.com

methanol to volume to obtain a solution with a nominal concentration of 0.1 mg/mL of pyrazinamide.
Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of sample into a 100-mL volumetric flask, and dilute with methanol to volume to obtain a solution having a nominal concentration of 0.1 mg/mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 25-cm; 5-µm packing L7
Flow rate: 0.8 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for pyrazinamide is about 6.5 min.]
Suitability requirements
Column efficiency: NLT 8000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pyrazinamide ($C_5H_5N_3O$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Pyrazinamide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of pyrazinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
- **pH** ⟨791⟩: 3.9–5.0

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a refrigerator.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded, when stored in a refrigerator or at controlled room temperature
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Pyrazinamide RS

Pyrazinamide Tablets

» Pyrazinamide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of pyrazinamide ($C_5H_5N_3O$).

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Pyrazinamide RS

Identification—
A: To a quantity of powdered Tablets, equivalent to about 1 g of pyrazinamide, add about 75 mL of isopropyl alcohol, heat on a steam bath, and filter while hot. Allow to cool, filter the crystals that form, and dry at 105° for 1 hour: the IR absorption spectrum of a mineral oil dispersion of the dried crystals so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Pyrazinamide RS. If a difference appears, dissolve portions of both the dried crystals and the Reference Standard in acetone, evaporate the solutions to dryness, and repeat the test on the residues.
B: The dried crystals obtained in *Identification* test *A* meet the requirements for *Identification* test *B* under *Pyrazinamide*.
C: To 20 mg of the dried crystals obtained in *Identification* test *A* add 5 mL of 5 N sodium hydroxide, and heat gently over an open flame: the odor of ammonia is perceptible.

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_5H_5N_3O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 268 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Pyrazinamide RS in the same *Medium*.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_5H_5N_3O$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—
Mobile phase—Prepare pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and adjust with phosphoric acid to a pH of 3.0. Mix 10 mL of acetonitrile with 1 L of this solution, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Transfer an accurately weighed quantity of USP Pyrazinamide RS to a suitable volumetric flask, dissolve in water, sonicating to dissolve, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.1 mg per mL. Transfer 20.0 mL of the solution to a 50-mL volumetric flask, dilute with water to volume, and mix.
System suitability solution—Transfer 1 mL of hydrochloric acid to a 5-mL volumetric flask, dilute with *Standard preparation* to volume, and mix. Keep this solution on a boiling water bath for 5 minutes, and cool.
Assay preparation—Accurately weigh not fewer than 20 Tablets, and grind to a fine powder. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of pyrazinamide, to a 500-mL volumetric flask, add 300 mL of water, and sonicate for 10 minutes. Dilute with water to volume, and mix. Filter a portion of this solution, discarding the first few mL of the filtrate. Transfer 20.0 mL of this filtrate to a 100-mL volumetric flask, dilute with water to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 270-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2500 theoretical plates; and the tailing factor for the pyrazinamide peak is not more than 1.3. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about

www.webofpharma.com

0.45 for pyrazinoic acid and 1.0 for pyrazinamide; and the resolution, *R*, between pyrazinamide and pyrazinoic acid is not less than 6.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of pyrazinamide ($C_5H_5N_3O$) in the portion of Tablets taken by the formula:

$$2.5C(r_U/r_S)$$

in which *C* is the concentration, in µg, of USP Pyrazinamide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pyrethrum Extract

DEFINITION

Pyrethrum Extract is a mixture of three naturally occurring, closely related insecticidal esters of chrysanthemic acid (pyrethrins I: jasmolin I, cinerin I, and pyrethrin I) and three closely related esters of pyrethric acid (pyrethrins II: jasmolin II, cinerin II, and pyrethrin II). It contains NLT 90.0% and NMT 110.0% of the labeled amount of pyrethrins (sum of pyrethrins I and pyrethrins II). The ratio of pyrethrins I to pyrethrins II in the Extract is NLT 0.8 and NMT 2.8. It may contain pigments characteristic of chrysanthemum species, triglyceride oils, terpenoids, and carotenoid. It may also contain suitable solvents and antioxidants. It contains no other added substances.

IDENTIFICATION

• **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Hexanes and tetrahydrofuran (97.75: 2.25)

Standard solution: 0.5 mg/mL of USP Pyrethrum Extract RS in hexanes

Sample solution: Nominally 0.5 mg/mL of pyrethrins from Extract in hexanes

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 25-cm; 5-µm packing L10

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

For relative retention times, see *Table 1*.

Table 1

Name	Relative Retention Time
Jasmolin I	0.78–0.80
Cinerin I	0.86–0.87
Pyrethrin I	1.0
Jasmolin II	1.95–2.15
Cinerin II	2.15–2.4
Pyrethrin II	2.55–2.88

Suitability requirements

Resolution: NLT 2.0 between individual pyrethrin peaks

Relative standard deviation: NMT 1.0%

Analysis 1

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyrethrins (sum of pyrethrins I and pyrethrins II) in the portion of Extract taken:

$$\text{Result} = \{\Sigma[(r_U/r_S) \times (C_S/C_U)]\} \times 100$$

r_U = peak response of individual pyrethrin from the *Sample solution*

r_S = peak response of individual pyrethrin from the *Standard solution*

C_S = concentration of individual pyrethrin in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyrethrins in the *Sample solution* (mg/mL)

Acceptance criteria 1: 90.0%–110.0%

Analysis 2

Sample: *Sample solution*

Calculate the ratio of pyrethrins I to pyrethrins II in the portion of Extract taken:

$$\text{Result} = A/B$$

A = sum of the quantities of pyrethrins I

B = sum of the quantities of pyrethrins II

Acceptance criteria 2: 0.8–2.8

C_S = concentration of USP Pyridostigmine Bromide RS in the *Standard solution* (µg/mL)
C_U = concentration of Pyridostigmine Bromide in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 1*. The reporting threshold is 0.02%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pyridostigmine related compound B	0.78	0.06
Pyridostigmine related compound A	0.92	0.06
Pyridostigmine	1.0	—
Any individual unspecified impurity	—	0.06
Total impurities	—	0.5

www.webofpharma.com

SPECIFIC TESTS
• **Loss on Drying** ⟨731⟩
Analysis: Dry at 100° for 4 h in a suitable vacuum drying tube, using phosphorus pentoxide as the desiccant.
Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight containers.
• **USP Reference Standards** ⟨11⟩
USP Pyridostigmine Bromide RS
USP Pyridostigmine Related Compound A RS
Pyridin-3-yl dimethylcarbamate.
$C_8H_{10}N_2O_2$ 166.18
USP Pyridostigmine Related Compound B RS
3-Hydroxy-1-methylpyridin-1-ium bromide.
C_6H_8BrNO 190.04

Pyridostigmine Bromide Injection

» Pyridostigmine Bromide Injection is a sterile solution of Pyridostigmine Bromide in a suitable medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}BrN_2O_2$.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light.
USP Reference standards ⟨11⟩—
USP Pyridostigmine Bromide RS

Identification—
A: The solution prepared for measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Pyridostigmine Bromide RS, concomitantly measured.
B: To 2 mL of Injection add 1 mL of 2 N nitric acid: the solution so obtained responds to the tests for *Bromide* ⟨191⟩.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 17.0 USP Endotoxin Units per mg of pyridostigmine bromide.
pH ⟨791⟩: between 4.5 and 5.5.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Transfer to a suitable separator an accurately measured volume of Injection, equivalent to about 20 mg of pyridostigmine bromide. Add 10 mL of 1 N hydrochloric acid, and mix. Extract with four 20-mL portions and one 15-mL portion of ethyl ether, and discard the extracts. Transfer the aqueous layer to a 100-mL volumetric flask, using about 25 mL of water to aid the transfer. Place the flask on a steam bath and warm, with the aid of a stream of nitrogen, to evaporate any residual ether, then cool the flask to room temperature, dilute with water to volume, and mix. Dilute 20.0 mL of the resulting solution with 0.1 N hydrochloric acid to 100.0 mL, and mix. Dissolve an accurately weighed quantity of USP Pyridostigmine Bromide RS in 0.1 N hydrochloric acid to obtain a Standard solution having a known concentration of about 40 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 269 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_9H_{13}BrN_2O_2$ in each mL of the Injection taken by the formula:

$$(0.5C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Pyridostigmine Bromide RS in the Standard solution, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solution from the Injection and the Standard solution, respectively.

Pyridostigmine Bromide Oral Solution

» Pyridostigmine Bromide Oral Solution contains, in each 100 mL, not less than 1.08 g and not more than 1.32 g of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$).

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Pyridostigmine Bromide RS
Identification—To 5 mL of Oral Solution in a separator add 100 mL of 2.5 N hydrochloric acid, and mix. Extract with five 20-mL portions of chloroform, place 2 mL of the aqueous solution in a 50-mL volumetric flask, and add water to volume: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Pyridostigmine Bromide RS, concomitantly measured.

Assay—
Phosphate solution—Dissolve 38 g of monobasic sodium phosphate and 2 g of anhydrous dibasic sodium phosphate in water to make 1000 mL. Adjust the pH, if necessary, by slight variation of the ratio of the two ingredients, to 5.3 ± 0.1.
Bromocresol green solution—Dissolve 250 mg of bromocresol green sodium salt in 250 mL of *Phosphate solution.*
Standard preparation—Dissolve a suitable quantity of USP Pyridostigmine Bromide RS, accurately weighed, in water, to obtain a solution having a known concentration of about 1.2 mg per mL.
Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 120 mg of pyridostigmine bromide, to a 100-mL volumetric flask, add water to volume, and mix.
Procedure—Transfer 10 mL each, accurately measured, of the *Assay preparation* and the *Standard preparation* to separate 125-mL separators. Into each separator pipet 10 mL of water, 20 mL of *Phosphate solution,* and 5 mL of *Bromocresol green solution.* Extract each solution with six 15-mL portions of chloroform, collecting the chloroform extracts in respective 100-mL volumetric flasks, then add chloroform to volume in each flask, and mix. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 415 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$) in the portion of Oral Solution taken by the formula:

$$100C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Pyridostigmine Bromide RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Pyridostigmine Bromide Tablets

DEFINITION

Pyridostigmine Bromide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests, Bromide*

Sample solution: Shake a quantity of finely powdered Tablets, equivalent to 100 mg of pyridostigmine bromide, with 20 mL of water for 5 min, and filter the mixture. Use the filtrate.

Acceptance criteria: Meet the requirements

ASSAY

- **PROCEDURE**

Mobile phase: Dissolve 1 g of sodium 1-heptanesulfonate in 500 mL of water in a 1000-mL volumetric flask, and add 5.0 mL of triethylamine and 100 mL of acetonitrile. Dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 3.0.

Diluent: Mix 11.2 g of phosphoric acid with 500 mL of water, and adjust with a 50% sodium hydroxide solution to a pH of 7.0. Dilute with water to 1000 mL.

Standard solution: 0.25 mg/mL of USP Pyridostigmine Bromide RS in *Diluent*

Sample solution: Nominally 0.25 mg/mL of pyridostigmine bromide prepared as follows. Finely powder NLT 20 Tablets and transfer a portion of the powder, equivalent to about 50 mg of pyridostigmine bromide, to a suitable volumetric flask. Add about 50% of the flask volume of *Diluent*, and shake for 30 min. Dilute with *Diluent* to volume, mix, and centrifuge. Use the supernatant.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4-mm × 30-cm; packing *L1*

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pyridostigmine Bromide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridostigmine bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 60 min

Standard solution: USP Pyridostigmine Bromide RS in *Medium* at a known concentration approximately the same as that of the *Sample solution*

Sample solution: Dilute with *Medium* and filter to obtain a concentration that is similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: 270 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Pyridostigmine Bromide RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of pyridostigmine bromide (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

- **ORGANIC IMPURITIES**

Solution A: 4.3 g/L of sodium dodecyl sulfate in water. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase: *Acetonitrile* and *Solution A* (30:70)

System suitability solution: 5 µg/mL each of USP Pyridostigmine Bromide RS and USP Pyridostigmine Related Compound A RS in *Mobile phase*

Sensitivity solution: 0.4 µg/mL of USP Pyridostigmine Bromide RS in *Mobile phase*

Standard solution 1: 0.005 mg/mL of USP Pyridostigmine Bromide RS in *Mobile phase*

Standard solution 2: 0.06 mg/mL of USP Pyridostigmine Bromide RS in *Mobile phase*

Sample solution: Nominally 1 mg/mL of pyridostigmine bromide prepared as follows. Transfer a portion of powdered Tablets equivalent to 100 mg of pyridostigmine bromide to a suitable volumetric flask with 100 mL of *Mobile phase*. Shake for 30 min, and pass a portion of the solution through a glass fiber filter.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm packing *L1*

Flow rate: 1.1 mL/min

Injection volume: 20 µL

Run time: NLT 2 times the retention time of pyridostigmine

System suitability

Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution 1*

[NOTE—See *Table 1* for the relative retention times.]

System suitability requirements

Resolution: NLT 1.5 between pyridostigmine and pyridostigmine related compound A, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution 1*

USP Monographs

www.webofpharma.com

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the percentage of pyridostigmine related compound A and any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pyridostigmine related compound A or any individual unspecified degradation product from the *Sample solution*

r_S = peak response of pyridostigmine from *Standard solution 1*

C_S = concentration of USP Pyridostigmine Bromide RS in *Standard solution 1* (mg/mL)

C_U = nominal concentration of pyridostigmine in the *Sample solution* (mg/mL)

Calculate the percentage of pyridostigmine related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pyridostigmine related compound B from the *Sample solution*

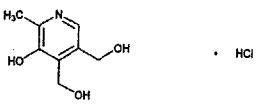
r_S = peak response of pyridostigmine from *Standard solution 2*

C_S = concentration of USP Pyridostigmine Bromide RS in *Standard solution 2* (mg/mL)

C_U = nominal concentration of pyridostigmine in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. Disregard any peak below 0.04%.

Table 1



Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pyridostigmine related compound B[a]	0.75	0.2
Pyridostigmine related compound A	0.92	0.2
Pyridostigmine	1.0	—
Any individual unspecified degradation product	—	0.2
Total degradation products	—	0.5

[a] 3-Hydroxy-1-methylpyridin-1-ium bromide.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Pyridostigmine Bromide RS
  USP Pyridostigmine Related Compound A RS
  Pyridin-3-yl dimethylcarbamate.

- **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩: Meets the requirements

ASSAY

- **PROCEDURE**

Mobile phase: Mix 10 mL of glacial acetic acid, 0.6 g of sodium 1-hexanesulfonate, and 700 mL of water in a 1000-mL volumetric flask. Adjust with glacial acetic acid or 1 N sodium hydroxide to a pH of 3.0. Add 235 mL of methanol, and dilute with water to volume.

Internal standard solution: 5 mg/mL of *p*-hydroxybenzoic acid in *Mobile phase*

Standard solution: Prepare a 0.5-mg/mL solution of USP Pyridoxine Hydrochloride RS in *Mobile phase*. Transfer 10.0 mL of this solution and 1.0 mL of *Internal standard solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Prepare a 0.5-mg/mL solution of Pyridoxine Hydrochloride in *Mobile phase*. Transfer 10.0 mL of this solution and 1.0 mL of *Internal standard solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for pyridoxine and *p*-hydroxybenzoic acid are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between pyridoxine and *p*-hydroxybenzoic acid

Relative standard deviation: NMT 3.0% for the ratios of the pyridoxine peak area response to the internal standard peak area response

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Pyridoxine Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

USP Monographs

www.webofpharma.com

R_U = internal standard ratio (peak response of pyridoxine/peak response of the internal standard) from the *Sample solution*
R_S = internal standard ratio (peak response of pyridoxine/peak response of the internal standard) from the *Standard solution*
C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Pyridoxine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%

SPECIFIC TESTS

• **CONTENT OF CHLORIDE**

Sample: 500 mg of Pyridoxine Hydrochloride
Blank: 50 mL of methanol
Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Direct titration
Titrant: 0.1 N silver nitrate VS
Endpoint detection: Visual
Analysis: Dissolve the *Sample* in 50 mL of methanol. Add 5 mL of glacial acetic acid and 2–3 drops of eosin Y TS. Titrate with the *Titrant*. Perform a *Blank* determination. Calculate the percentage of chloride (Cl) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 35.45 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 16.9%–17.6% on the dried basis

• **LOSS ON DRYING** ⟨731⟩: Dry a sample in vacuum over silica gel for 4 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Pyridoxine Hydrochloride RS

Pyridoxine Hydrochloride Injection

» Pyridoxine Hydrochloride Injection is a sterile solution of Pyridoxine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of Pyridoxine Hydrochloride ($C_8H_{11}NO_3 \cdot HCl$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.
USP Reference standards ⟨11⟩—
USP Pyridoxine Hydrochloride RS
Identification—Evaporate a volume of Injection, equivalent to about 50 mg of pyridoxine hydrochloride, on a steam bath to dryness. Add 5 mL of dehydrated alcohol, and again evaporate to dryness. Dry the residue at 105° for 3 hours: the residue so obtained responds to *Identification* tests *A* and *B* under *Pyridoxine Hydrochloride*.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 0.4 USP Endotoxin Unit per mg of pyridoxine hydrochloride.
pH ⟨791⟩: between 2.0 and 3.8.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Ammonium chloride–ammonium hydroxide buffer—Dissolve 16 g of ammonium chloride in 70 mL of water, add 16 mL of ammonium hydroxide, dilute with water to 100 mL, mix, and filter.

Chlorimide solution—Dissolve 40 mg of 2,6-dichloroquinone-chlorimide in 100 mL of isopropyl alcohol. Store the solution in a refrigerator, and use within 1 month. Do not use the solution if it has become pink.

Standard stock solution—Dissolve a suitable quantity of USP Pyridoxine Hydrochloride RS, accurately weighed, in 0.1 N hydrochloric acid, quantitatively dilute with the same solvent to obtain a solution having a known concentration of about 0.1 mg per mL, and mix. Keep the solution in an amber bottle, in a cool place.

Standard preparation—In a 100-mL volumetric flask dilute 10.0 mL of the *Standard stock solution* with water to volume, and mix. Prepare this solution daily as needed.

Assay preparation—Dilute an accurately measured volume of Injection, equivalent to about 100 mg of pyridoxine hydrochloride, quantitatively and stepwise with water to a concentration of about 10 µg of pyridoxine hydrochloride per mL.

Procedure—

(a) Pipet 5 mL of the clear *Assay preparation* into a flask, add 25.0 mL of isopropyl alcohol, and mix. Pipet 5 mL of the isopropyl alcohol dilution into a glass-stoppered, 25-mL graduated cylinder or test tube; and add in succession, mixing after each addition, 1.0 mL of *Ammonium chloride–ammonium hydroxide buffer*, 1.0 mL of sodium acetate solution (1 in 5), and 1.0 mL of water. Cool to about 25°, then add 1.0 mL of *Chlorimide solution*, and shake vigorously for 10 seconds, accurately timed. Ninety seconds, accurately timed, after the addition of the *Chlorimide solution*, determine the absorbance at the wavelength of maximum absorbance at about 650 nm, with a suitable spectrophotometer, using water as the blank. [NOTE—Make the reading promptly to avoid errors due to fading of the color.] Designate the absorbance as A_U.

(b) Repeat procedure *(a)*, but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as A_U'.

(c) Repeat procedure *(a)*, but substitute 5.0 mL of the *Standard preparation* for the 5.0 mL of the *Assay preparation*. Designate the absorbance as A_S.

(d) Repeat procedure *(c)*, but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as A_S'.

Calculate the quantity, in mg, of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in each mL of the Injection taken by the formula:

$$10(C/V)(A_U - A_U')/(A_S - A_S')$$

in which C is the concentration, in µg per mL, of USP Pyridoxine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and the other terms are as defined above.

USP Monographs

Pyridoxine Hydrochloride Tablets

DEFINITION

Pyridoxine Hydrochloride Tablets contain NLT 95.0% and NMT 115.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$).

IDENTIFICATION

• **A. Reaction with Ferric Ion**

Sample: Equivalent to 100 mg of pyridoxine hydrochloride from a quantity of powdered Tablets

Analysis: Add 5 mL of water to the *Sample*. Shake the mixture, filter into a test tube, and add 2 or 3 drops of ferric chloride TS.

Acceptance criteria: An orange to deep red color is produced.

ASSAY

• **Procedure**

Buffer: Dissolve 16 g of ammonium chloride in 70 mL of water, add 16 mL of ammonium hydroxide, dilute with water to 100 mL, and filter.

Color reagent: 0.4 mg/mL of 2,6-dichloroquinone chlorimide in isopropyl alcohol. [Note—Store the solution in a refrigerator, and use within one month. Do not use the solution if it has become pink.]

Standard stock solution: 0.1 mg/mL of USP Pyridoxine Hydrochloride RS in 0.1 N hydrochloric acid. [Note—Keep the solution in an amber bottle, in a cool place.]

Standard solution: 10 µg/mL of USP Pyridoxine Hydrochloride RS from the *Standard stock solution* diluted with water. [Note—Prepare this solution daily as needed.]

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer, with the aid of water, a portion of the powdered Tablets to a conical flask. Add 0.5 mL hydrochloric acid per each mg of the nominal amount of pyridoxine hydrochloride taken, then dilute with water to about 0.04 mg/mL, and heat on a steam bath until disintegration is complete. Cool, dilute with water to 10 µg/mL, and centrifuge a portion of the mixture.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: Visible

Analytical wavelength: 650 nm

Blank: Water

Analysis

Samples: *Standard solution* and *Sample solution*

Separately add 25.0 mL of isopropyl alcohol to 5 mL each of the *Standard solution* and the *Sample solution*. Transfer 5 mL of each of the resulting solutions to separate, glass-stoppered, 25-mL graduated cylinders or test tubes, and add in succession, mixing after each addition, 1.0 mL of *Buffer*, 1.0 mL of a 0.2-g/mL solution of sodium acetate, and 1.0 mL of water. Cool to 25°, add 1.0 mL of *Color reagent*, and shake vigorously for 10 s, accurately timed. Determine the absorbance 90 s after the addition of the *Color reagent*. Repeat the procedure both for the *Standard solution* and the *Sample solution*, but substitute 1.0 mL of a 50-mg/mL solution of boric acid solution for the 1.0 mL of water.

[Note—Make the reading promptly to avoid errors due to fading of the color.]

Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (A_U - A_U')/(A_S - A_S') \times (C_S/C_U) \times 100$$

A_U = absorbance of *Sample solution* with water

A_U' = absorbance of *Sample solution* with boric acid

A_S = absorbance of *Standard solution* with water

A_S' = absorbance of *Standard solution* with boric acid

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 95.0%–115.0%

PERFORMANCE TESTS

• **Dissolution,** *Procedure for a Pooled Sample* ⟨711⟩

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 1.40 mg/mL of sodium 1-hexanesulfonate

Standard solution: Known concentration of USP Pyridoxine Hydrochloride RS in *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with *Medium* if necessary

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak area of pyridoxine from the *Sample solution*

r_S = peak area of pyridoxine from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

Content uniformity

Standard solution: 10 µg/mL of USP Pyridoxine Hydrochloride RS in dilute hydrochloric acid (1 in 100)

Sample solution: Transfer 1 Tablet, finely powdered, to a 500-mL volumetric flask containing 300 mL of water, shake for 30 min, and dilute with water to volume. Filter a portion of the mixture, discarding the first 25 mL of the filtrate. Dilute an aliquot of the filtrate with dilute hydrochloric acid (1 in 100) to obtain 10 µg/mL of pyridoxine hydrochloride.

Instrumental conditions

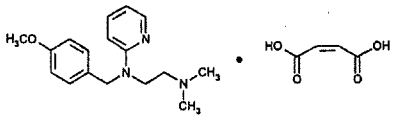
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: UV

Analytical wavelength: 290 nm

Cell: 1 cm

www.webofpharma.com



Blank: Dilute hydrochloric acid (1 in 100)
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the absorbances of the *Standard solution* and *Sample solution*.
Calculate the percentage of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (100/L)$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)
L = label claim (mg/Tablet)

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 10 µg per mL.
Medium: 0.5 N sulfuric acid.
Absorptivities at 236 nm and 312 nm, calculated on the dried basis, do not differ by more than 3.0%.
Melting range, *Class I* ⟨741⟩: between 99° and 103°.

Loss on drying ⟨731⟩—Dry it in vacuum over phosphorus pentoxide for 5 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.

Related compounds—
TEST 1—
Standard solution—Dissolve an accurately weighed quantity of USP Pyrilamine Maleate RS in a mixture of methanol and ammonium hydroxide (200:1) to obtain a solution having a known concentration of about 0.4 mg per mL. Quantitatively dilute this solution with the mixture of methanol and ammonium hydroxide (200:1) to obtain *Standard solutions A*, *B*, and *C* having the following compositions:

Standard solution	Dilution	Concentration (mg of RS per mL)	Percentage (%, for comparison with test specimen)
A	(1 in 4)	0.1	0.5
B	(3 in 20)	0.06	0.3
C	(1 in 20)	0.02	0.1

Test solution—Dissolve an accurately weighed quantity of Pyrilamine Maleate in a mixture of methanol and ammonium hydroxide (200:1) to obtain a solution having a known concentration of about 20 mg per mL.
Eluant: ethyl acetate, diethylamine, *n*-hexane, and methanol (93:7:1:1).
Procedure—Apply separately 10 µL of the *Test solution* and 10 µL of each of the three *Standard solutions* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. [NOTE—The plate has been prewashed for 2 hours with *Eluant* and dried.] Allow the spots on the plate to dry. Place the plate in a chromatographic chamber and develop the chromatograms in *Eluant* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate. View the plate under short-wavelength UV light and compare the intensities of any secondary spots from the chromatogram of the *Test solution* with those of the principal spots from the chromatograms of the *Standard solutions*. No secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot from *Standard solution A* (0.5%), and the sum of the intensities of all secondary spots from the *Test solution* corresponds to not more than 1.0%.
TEST 2—
Mobile phase—Prepare a filtered and degassed mixture of 0.01 M ammonium acetate, methanol, and triethylamine (40:60:0.1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Dissolve an accurately weighed quantity of USP Pyrilamine Maleate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 µg per mL.
Test solution—Transfer about 50 mg of Pyrilamine Maleate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 30-cm column that contains packing L11. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.
Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, run the chromatograph for 25

www.webofpharma.com

minutes, record the chromatograms, and measure the peak area responses, but do not measure the maleate peak area response, which elutes near the void volume. Calculate the percentage of each impurity in the portion of pyrilamine taken by the formula:

$$10{,}000(C/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Pyrilamine Maleate RS in the *Standard solution*; W is the weight, in mg, of the Pyrilamine Maleate taken to prepare the *Test solution*; r_i is the peak area response for each impurity; and r_S is the response of the *Standard solution*: not more than 0.3% of any individual impurity is found, and not more than 1.0% of total impurities is found.

Assay—Dissolve about 400 mg of Pyrilamine Maleate, previously dried and accurately weighed, in 50 mL of glacial acetic acid. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.07 mg of $C_{17}H_{23}N_3O \cdot C_4H_4O_4$.

Pyrilamine Maleate Tablets

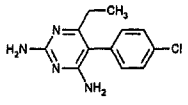
» Pyrilamine Maleate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{23}N_3O \cdot C_4H_4O_4$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—
USP Pyrilamine Maleate RS

Identification—Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* ⟨181⟩.

Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_{17}H_{23}N_3O \cdot C_4H_4O_4$ dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{17}H_{23}N_3O \cdot C_4H_4O_4$ is dissolved in 45 minutes.



Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—Proceed with Tablets as directed under *Salts of Organic Nitrogenous Bases* ⟨501⟩, determining the absorbance at the wavelength of maximum absorbance at about 312 nm. Calculate the quantity, in mg, of $C_{17}H_{23}N_3O \cdot C_4H_4O_4$ in the portion of Tablets taken by the formula:

$$0.05C(A_U/A_S)$$

in which C is the concentration, in µg per mL, calculated on the dried basis, of USP Pyrilamine Maleate RS in the *Standard Preparation*.

Pyrimethamine

$C_{12}H_{13}ClN_4$ 248.71

2,4-Pyrimidinediamine, 5-(4-chlorophenyl)-6-ethyl-.
2,4-Diamino-5-(*p*-chlorophenyl)-6-ethylpyrimidine [58-14-0].

» Pyrimethamine contains not less than 99.0 percent and not more than 101.0 percent of $C_{12}H_{13}ClN_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Pyrimethamine RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: Mix about 100 mg with 500 mg of anhydrous sodium carbonate, and ignite the mixture. Cool, add 5 mL of hot water, heat for 5 minutes on a steam bath, filter, and neutralize the filtrate with nitric acid: the solution meets the requirements of the test for *Chloride* ⟨191⟩.

C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Melting range ⟨741⟩: between 238° and 242°.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Ordinary impurities ⟨466⟩—
Test solution: a mixture of methanol and chloroform (1:1).
Standard solution: a mixture of methanol and chloroform (1:1).
Eluant: a mixture of *n*-propyl alcohol, glacial acetic acid, and water (8:1:1).
Visualization: 2.

Assay—
0.1% Phosphoric acid solution—Add 1 mL of phosphoric acid to water, and dilute to 1000 mL.
Mobile phase—Prepare a suitable degassed and filtered mixture of *0.1% Phosphoric acid solution* and acetonitrile (83:17). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Transfer an accurately weighed quantity of USP Pyrimethamine RS to a suitable volumetric flask, and dilute with *0.1% Phosphoric acid solution* to volume to obtain a solution having a known concentration of about 0.02 mg per mL.
Assay preparation—Transfer an accurately weighed quantity of Pyrimethamine to a suitable volumetric flask, and dilute with *0.1% Phosphoric acid solution* to volume to obtain a solution having a known concentration of about 0.02 mg per mL.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 2.0-mm × 10-cm column that contains 3-µm packing

USP Monographs

www.webofpharma.com

L11. The flow rate is about 0.3 mL per minute. Chromatograph replicate injections of the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, *k'*, is not less than 2.5; the tailing factor is not more than 1.8; and the relative standard deviation is not more than 1.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percentage, of $C_{12}H_{13}ClN_4$ in the portion of Pyrimethamine taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Pyrimethamine RS in the *Standard preparation;* C_U is the concentration, in mg per mL, of Pyrimethamine in the *Assay preparation* based on the weighed amount; r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and 100 is the percent conversion factor.

Pyrimethamine Compounded Oral Suspension

DEFINITION

Pyrimethamine Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$).

Prepare Pyrimethamine Compounded Oral Suspension 2 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Pyrimethamine powder	200 mg
Vehicle: a 1:1 mixture of Methylcellulose 1% Solution, and Syrup, *NF,* a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Place *Pyrimethamine powder* in a suitable mortar. Add 2 mL of the *Vehicle,* and triturate to make a smooth paste. Add an additional 10 mL of the *Vehicle* to the paste, and levigate to form a suspension. Add increasing volumes of *Vehicle* to make a liquid that is pourable. Transfer the contents of the mortar to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and 50 mM anhydrous sodium acetate (40:60). Pass through a PVDF membrane filter of 0.45-µm pore size, and degas.

System suitability solution: 0.20 mg/mL of USP Pyrimethamine RS (previously dried) and 0.10 mg/mL of USP Phenacetin RS (previously dried) in methanol

Standard solution: 0.20 mg/mL of USP Pyrimethamine RS (previously dried) in methanol

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.20 mg/mL of pyrimethamine from Oral Suspension in methanol. Sonicate, and mix on a vortex mixer.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Autosampler temperature: 10°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for phenacetin and pyrimethamine are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6.0 between the pyrimethamine and phenacetin peaks, *System suitability solution*

Column efficiency: NLT 8000 theoretical plates, *System suitability solution*

Tailing factor: NMT 1.5, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pyrimethamine from the *Sample solution*

r_S = peak response of pyrimethamine from the *Standard solution*

C_S = concentration of USP Pyrimethamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyrimethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 6.6–7.6

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.

• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored in a refrigerator or at controlled room temperature

• **LABELING:** Label it to indicate that it is to be well shaken before use, protect from light, and to state the *Beyond-Use Date.*

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Phenacetin RS

USP Pyrimethamine RS

Pyrimethamine Tablets

» Pyrimethamine Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Pyrimethamine RS

USP Monographs

www.webofpharma.com

Identification—

A: The UV absorption spectrum of the *Assay Preparation* exhibits maxima at the same wavelengths as that of a similar solution of USP Pyrimethamine RS.

B: To a quantity of powdered Tablets, equivalent to about 250 mg of pyrimethamine, add 25 mL of acetone, boil for 2 minutes, and filter through a sintered-glass crucible. Repeat this treatment three times with 25-mL portions of acetone. Evaporate the combined filtrates carefully on a steam bath with the aid of a current of air to dryness: the residue responds to *Identification* test *A* under *Pyrimethamine,* and melts between 237° and 242° (see *Melting Range or Temperature* ⟨741⟩).

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{12}H_{13}ClN_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 273 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Pyrimethamine RS in the same *Medium.*

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{12}H_{13}ClN_4$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Procedure for content uniformity—Transfer 1 Tablet to a 100-mL volumetric flask, add 25 mL of 0.1 N hydrochloric acid, warm the flask on a steam bath for 5 minutes, cool, dilute with 0.1 N hydrochloric acid to volume, mix, and filter, rejecting the first few mL of the filtrate. Pipet a portion of the clear filtrate, equivalent to about 2.5 mg of pyrimethamine, into a 250-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Dissolve an accurately weighed quantity of USP Pyrimethamine RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with 0.1 N hydrochloric acid to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{12}H_{13}ClN_4$ in the Tablet taken by the formula:

$$(T/D)C(A_U/A_S)$$

in which T is the labeled quantity, in mg, of pyrimethamine in the Tablet; D is the concentration, in µg per mL, of pyrimethamine in the solution from the Tablet, on the basis of the labeled quantity per Tablet and the extent of dilution; C is the concentration, in µg per mL, of USP Pyrimethamine RS in the Standard solution; and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—Proceed with Tablets as directed under *Salts of Organic Nitrogenous Bases* ⟨501⟩, diluting 5.0 mL each of the *Standard Preparation* and the *Assay Preparation,* respectively, with 0.5 N sulfuric acid to 200.0 mL and determining the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 273 nm. Calculate the quantity, in mg, of pyrimethamine ($C_{12}H_{13}ClN_4$) in the portion of Tablets taken by the formula:

$$50C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Pyrimethamine RS in the *Standard Preparation;* and A_U and A_S are as defined in the chapter.

Pyroxylin

Cellulose, nitrate.
Pyroxylin [9004-70-0].

» Pyroxylin is a product obtained by the action of a mixture of nitric and sulfuric acids on cotton and consists chiefly of cellulose tetranitrate $(C_{12}H_{16}N_4O_{18})_n$.

[NOTE—Dry Pyroxylin is a light yellow, matted mass of filaments, resembling raw cotton in appearance, but harsh to the touch. *It is exceedingly flammable,* burning, when unconfined, very rapidly and with a luminous flame. When kept in well-closed bottles and exposed to light, it is decomposed with the evolution of nitrous vapors, leaving a carbonaceous residue.]

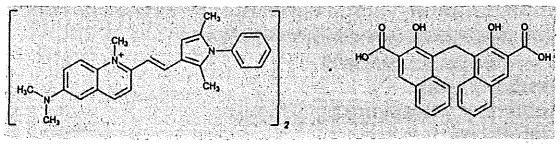
Pyroxylin available commercially is moistened with about 30 percent of alcohol or other suitable solvent. The alcohol or other solvent must be allowed to evaporate from the Pyroxylin to yield the dried substance described in this Pharmacopeia. Pyroxylin moistened with alcohol or other solvent may be used in the tests set forth in this monograph, provided the weight of test specimen taken corresponds to the specified amount of dry Pyroxylin.

Packaging and storage—Preserve loosely packed in cartons, protected from light.

Labeling—The label bears a caution statement to the effect that Pyroxylin is highly flammable.

Viscosity—Rotational Methods ⟨912⟩—Dissolve 48.8 g in a mixture of 88 g of alcohol and 193.2 g of toluene, and when solution is complete, add 70 g of ethyl acetate, and mix. Transfer the solution to the cup of a rotational type of viscometer, adjust the temperature to 25°, and determine the viscosity, making certain that the apparent viscosity reaches equilibrium before taking the final reading: the viscosity is between 110 and 147 poises.

Residue on ignition ⟨281⟩—Saturate about 500 mg, accurately weighed, with alcohol in a dish placed in cold water, and ignite the Pyroxylin at the top. When combustion is complete, heat the dish to redness, and cool: not more than 0.3% of residue remains.



Acidity and water-soluble substances—Stir 1.0 g with 20 mL of water for 10 minutes, and filter: the filtrate does not have an acid reaction to litmus. Evaporate 10 mL of the filtrate on a steam bath to dryness, and dry the residue at 105° for 1 hour: not more than 1.5 mg of residue remains.

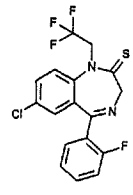
▲Pyrvinium Pamoate Tablets

DEFINITION
Pyrvinium Pamoate Tablets contain an amount of pyrvinium pamoate equivalent to NLT 92.0% and NMT 108.0% of the labeled amount of pyrvinium ($C_{26}H_{28}N_3^+$).

IDENTIFICATION
- **A.**
  Standard solution and **Sample solution:** Prepare as directed in the *Assay*.
  Analysis: Obtain the absorbance spectrum of the *Standard solution* and the *Sample solution* at 300–600 nm.
  Acceptance criteria: Concomitantly measured, the *Sample solution* exhibits the same maxima and minima at the same wavelengths as the *Standard solution*.

ASSAY
- **Procedure**
  Use low-actinic flasks in preparing the solutions, and otherwise protect the solutions from unnecessary exposure to bright light. Complete the *Assay* without prolonged interruption.
  Standard solution: 9 µg/mL of USP Pyrvinium Pamoate RS prepared as follows. Dissolve in 1 mL of acetic acid per each 3 mg of USP Pyrvinium Pamoate RS. Dilute with methanol to final volume. Further dilute in methanol, if necessary.
  Sample stock solution: Nominally 1 mg/L of pyrvinium prepared as follows. Place 500 mg of pyrvinium from a number of Tablets in a 500-mL volumetric flask, and add 25 mL of water and 25 mL of acetone. Completely disintegrate the Tablets by heating on a steam bath for 10 min with frequent mixing, allowing part of the acetone to boil off slowly. To the hot mixture add 250 mL of glacial acetic acid, and mix occasionally for 5 min without further heating to dissolve the pyrvinium pamoate. Dilute with methanol to volume at room temperature, and mix. Centrifuge a portion of the mixture until a clear solution is obtained. Use the clear solution to prepare the *Sample solution*.
  Sample solution: Nominally 6 µg/mL of pyrvinium from the *Standard stock solution* in methanol
  Instrumental conditions
  Mode: UV-Vis
  Analytical wavelength: 505 nm
  Cell: 1 cm
  Blank: Methanol
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of pyrvinium ($C_{26}H_{28}N_3^+$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$



A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Pyrvinium Pamoate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of pyrvinium pamoate in the *Sample solution* (µg/mL)
M_{r1} = molecular weight of pyrvinium, 382.52
M_{r2} = half of the molecular weight of pyrvinium pamoate, 575.70

Acceptance criteria: 92.0%–108.0%

PERFORMANCE TESTS
- **Disintegration** ⟨701⟩
  Time: 30 min
  Acceptance criteria: Meet the requirements
- **Uniformity of Dosage Units** ⟨905⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight, light-resistant containers.
- **USP Reference Standards** ⟨11⟩
  USP Pyrvinium Pamoate RS▲ (USP 1-May-2020)

Quazepam

$C_{17}H_{11}ClF_4N_2S$ 386.79
2*H*-1,4-Benzodiazepine-2-thione, 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-1-(2,2,2-trifluoroethyl)-.
7-Chloro-5-(*o*-fluorophenyl)-1,3-dihydro-1-(2,2,2-trifluoroethyl)-2*H*-1,4-benzodiazepine-2-thione [36735-22-5].

» Quazepam contains not less than 98.5 percent and not more than 101.5 percent of $C_{17}H_{11}ClF_4N_2S$, calculated on the dried basis.

USP Monographs

www.webofpharma.com

Packaging and storage—Preserve in well-closed containers.
USP Reference standards ⟨11⟩—
USP Quazepam RS
USP Quazepam Related Compound A RS
7-Chloro-1-(2,2,2 trifluoroethyl)-5-(2-Fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepine-2-one.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).

B: The R_F value of the principal spot in the chromatogram of the *Test solution* obtained in the test for *Related compounds* corresponds to that in the chromatogram of *Standard solution A.*

Melting range ⟨741⟩: between 146° and 151°, but the range between beginning and end of melting does not exceed 2°.
Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.2%.

Related compounds—
Test solution—Prepare a solution of Quazepam in methylene chloride containing 20 mg per mL.
Standard solution A—Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 20 mg per mL.
Standard solution B—Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 0.04 mg per mL (0.2%).
Standard solution C—Dissolve an accurately weighed quantity of USP Quazepam Related Compound A RS in methylene chloride to obtain a solution having a known concentration of about 0.2 mg per mL (1%).
Procedure—Separately apply 5 µL of the *Test solution* and 5 µL of each of the *Standard solutions* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of cyclohexane, ethyl acetate, and ether (170:40:25) in a paper-lined tank until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under short-wavelength UV light. Compare the intensity of the secondary spot in the chromatogram of the *Test solution* having the same R_F value as that of the primary spot of *Standard solution C:* the spot is not larger or more intense than the principal spot in the chromatogram of *Standard solution C.* Compare the intensities of any additional secondary spots observed in the chromatogram of the *Test solution* with that of the principal spot in the chromatogram of *Standard solution B:* the sum of the intensities of the additional secondary spots obtained from the *Test solution* corresponds to not more than 0.2%.
Assay—Dissolve about 500 mg of Quazepam, accurately weighed, in 150 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass-calomel electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 38.68 mg of $C_{17}H_{11}ClF_4N_2S$.

Quazepam Tablets

» Quazepam Tablets contain not less than 90 percent and not more than 110.0 percent of quazepam ($C_{17}H_{11}ClF_4N_2S$).

Packaging and storage—Preserve in a well-closed container.
USP Reference standards ⟨11⟩—
USP Ethylparaben RS
USP Quazepam RS
USP Quazepam Related Compound A RS
7-Chloro-1-(2,2,2 trifluoroethyl)-5-(2-Fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepine-2-one.

Identification—
A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* both relative to the internal standard as obtained in the *Assay.*
B: The R_F value of the principal spot in the chromatogram of the *Test solution* obtained in the test for *Related compounds* corresponds to that in the chromatogram of *Standard solution A.*

Dissolution ⟨711⟩—
Medium: 1% sodium lauryl sulfate; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{17}H_{11}ClF_4N_2S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 287 nm on filtered portions of the solution under test in comparison with a Standard solution having a known concentration of USP Quazepam RS dissolved in a small volume of methanol and diluted with *Dissolution Medium.*
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{17}H_{11}ClF_4N_2S$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Related compounds—
Test solution—Grind 10 Tablets to a fine powder. Dissolve an accurately weighed portion of the powder in methylene chloride to obtain a solution having a concentration of 10 mg of quazepam per mL. Mix for 30 minutes, and centrifuge.
Standard solution A—Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 10 mg per mL.
Standard solution B—Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 0.04 mg per mL (0.2%).
Standard solution C—Dissolve an accurately weighed quantity of USP Quazepam Related Compound A RS in methylene chloride to obtain a solution having a known concentration of about 0.3 mg per mL (1.5%).
Procedure—Separately apply 10 µL each of the *Test Solution* and *Standard solution A* and 5 µL each of *Standard solutions B* and C to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of cyclohexane, ethyl acetate, and ether (170:40:25) in a paper-lined tank until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under short-wavelength UV

www.webofpharma.com

light. Compare the intensity of the secondary spot in the chromatogram of the *Test solution* having the same R_F value as the principal spot in the chromatogram of *Standard solution C*. The spot is not larger or more intense than the principal spot obtained from *Standard solution C*. Compare the intensities of any additional secondary spots observed in the chromatogram of the *Test solution* with that of the principal spot in the chromatogram of *Standard solution B:* no additional secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B,* and the sum of the intensities of the additional secondary spots obtained from the *Test solution* is not more than 0.6%.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (7:3). Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve an accurately weighed quantity of USP Ethylparaben RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 0.19 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Quazepam RS in *Internal standard solution,* and dilute quantitatively, and stepwise if necessary, with *Internal standard solution* to obtain a solution having a known concentration of about 1.5 mg of quazepam per mL.

Assay preparation—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 15 mg of quazepam, to a 50-mL screw-capped centrifuge tube. Add 10.0 mL of *Internal standard solution,* and centrifuge for 30 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ethylparaben and quazepam is not less than 5.5; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For identification purposes, the relative retention times are about 0.4 for ethylparaben and 1.0 for quazepam.]

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of quazepam ($C_{17}H_{11}ClF_4N_2S$) in the portion of Tablets taken by the formula:

$$10C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Quazepam RS in the *Standard preparation;* and R_U and R_S are the ratios of the peak response of quazepam to that of ethylparaben obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Quetiapine Tablets

DEFINITION

Quetiapine Tablets contain an amount of quetiapine fumarate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197F▲** (CN 1-May-2020)

Standard solution: Dissolve 10 mg of quetiapine fumarate in 10 mL of acetone. Sonicate for 10 min. Filter and evaporate the solvent. Dissolve the residue in 2 mL of chloroform. Filter and use 20 µL of the filtrate for analysis.

Sample solution: Finely powder 10 Tablets. Dissolve an amount of the powder equivalent to 10 mg of quetiapine fumarate in 10 mL of acetone, avoiding large pieces of Tablet coating, if any. Sonicate for 10 min. Filter and evaporate the solvent. Dissolve the residue in 2 mL of chloroform. Filter and use the filtrate for analysis.

Blank: Filter 10 mL of acetone and evaporate the solvent. Dissolve the residue using 2 mL of chloroform and filter.

Analysis

Samples: *Standard solution, Sample solution,* and *Blank*

Add drop-wise approximately 20 µL of each of the samples separately onto a clean IR transmission window, allowing each drop to dry before adding the next. Record the spectra.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

- **PROCEDURE**

Buffer: 1.4 g/L of monobasic potassium phosphate in water. To 1 L of this solution, add 1 mL of triethylamine and adjust with dilute phosphoric acid to a pH of 6.5 (1 in 10, v/v).

Mobile phase: Acetonitrile and *Buffer* (35:65)

Standard solution: 0.1 mg/mL of USP Quetiapine Fumarate RS in *Mobile phase*

Sample stock solution: Nominally 2.0 mg/mL of quetiapine prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask. Add water to fill 5% of the final volume, and sonicate to disperse the Tablets. Add *Mobile phase* to fill 60% of the final volume, and sonicate for 30 min with intermittent shaking. Dilute with *Mobile phase* to volume. Centrifuge for 5 min. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Sample solution: Nominally 0.1 mg/mL of quetiapine prepared by diluting an aliquot of the *Sample stock solution* with *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

Run time: 2 times the retention time of quetiapine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times N \times (M_{r1}/M_{r2}) \times 100$$

www.webofpharma.com

r_U = peak response of quetiapine from the *Sample solution*
r_S = peak response of quetiapine from the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quetiapine in the *Sample solution* (mg/mL)
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1

Medium: Water; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 30 min
Buffer: 1.4 g/L of monobasic potassium phosphate in water. To 1 L of this solution, add 1 mL of triethylamine and adjust with dilute phosphoric acid to a pH of 6.0 (1 in 10).
Mobile phase: Acetonitrile and *Buffer* (35:65)
Standard stock solution: 3.3 mg/mL of USP Quetiapine Fumarate RS prepared as follows. Dissolve the Standard first in methanol using 10% of the final volume, and dilute with *Medium* to volume.
Standard solution: 0.03 mg/mL of USP Quetiapine Fumarate RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution through a suitable filter of 0.45-µm pore size. Dilute with *Medium* to a concentration similar to that of the *Standard solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 2 mL/min
Injection volume: 50 µL
Run time: 1.5 times the retention time of quetiapine
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times N \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

r_U = peak response of quetiapine from the *Sample solution*
r_S = peak response of quetiapine from the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) is dissolved.

Test 2

If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 1 g/L of sodium chloride in water; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 20 min
Standard stock solution: 1.3 mg/mL of USP Quetiapine Fumarate RS prepared as follows. Transfer a suitable quantity of USP Quetiapine Fumarate RS to a suitable volumetric flask. Dissolve in about 25% of the flask volume of methanol. Dilute with *Medium* to volume.
Standard solution: (L/900) mg/mL of USP Quetiapine Fumarate RS from a suitable volume of the *Standard stock solution* in *Medium*, where L is the label claim in mg/Tablet.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Blank: *Medium*
Instrumental conditions
Mode: UV
Analytical wavelength: 290 nm with background correction at 490 nm
Cell: See *Table 1*.

Table 1

Label claim, L (mg/Tablet)	Cell (cm)
25	1.0
50	1.0
100	0.5
150	0.2
200	0.2
300	0.1
400	0.1

Analysis
Samples: *Medium*, *Standard solution*, and *Sample solution*
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times N \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) is dissolved.

Test 3

If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: Water; 900 mL
Apparatus 2: 50 rpm

www.webofpharma.com

Times
For Tablets labeled to contain 25 mg: 30 min
For Tablets labeled to contain 50, 100, 200, 300, or 400 mg: 45 min
Standard solution: 0.34 mg/mL of USP Quetiapine Fumarate RS in 0.1 N hydrochloric acid
Dilute standard solution: 0.06 mg/mL of USP Quetiapine Fumarate RS from the *Standard solution* in 0.1 N hydrochloric acid
Sample solution: Withdraw a suitable portion of the solution under test. Transfer 9 mL of the portion to a 10-mL volumetric flask and dilute with 1 N hydrochloric acid to volume. Pass a portion of the resulting solution through a suitable filter of 0.45-µm pore size and discard the first 2 mL.
Instrumental conditions
Mode: UV
Analytical wavelength: 282 nm
Cells
For Tablets labeled to contain 25 or 50 mg: 0.5 cm
For Tablets labeled to contain 100, 200, 300, or 400 mg: 0.1 cm
Blank: 0.1 N hydrochloric acid
Analysis
Samples: *Standard solution, Dilute standard solution, Sample solution,* and *Blank*
For Tablets labeled to contain 25 or 50 mg
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times N \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Dilute standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Dilute standard solution* (mg/mL)
D = dilution factor, 1.1
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

For Tablets labeled to contain 100, 200, 300, or 400 mg
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times N \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
D = dilution factor, 1.1
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances
For Tablets labeled to contain 25 mg: NLT 75% (Q) of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) is dissolved.
For Tablets labeled to contain 50, 100, 200, 300, or 400 mg: NLT 70% (Q) of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) is dissolved.
• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

• **Organic Impurities**
Buffer: Dissolve 0.8 g of anhydrous dibasic sodium phosphate and 0.6 g of potassium dihydrogen orthophosphate in 1 L of water.
Solution A: Acetonitrile and *Buffer* (10:90). Adjust with dilute phosphoric acid (1 in 10, v/v) to a pH of 6.7.
Solution B: Acetonitrile
Diluent: Acetonitrile and *Solution A* (65:35)
Mobile phase: See *Table 2.*

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	80	20
20	75	25
30	65	35
35	35	65
55	25	75
56	80	20
65	80	20

System suitability solution: 0.5 mg/mL of USP Quetiapine System Suitability RS in *Diluent* prepared as follows. Transfer the required quantity of USP Quetiapine System Suitability RS to a suitable volumetric flask. Add 70% of the flask volume and sonicate to dissolve. Dilute with *Diluent* to volume.
Standard solution: 1.2 µg/mL of USP Quetiapine Fumarate RS in *Diluent.* Sonication may be used to aid in dissolution.
Sample solution: Nominally 0.5 mg/mL of quetiapine in *Diluent* from a portion of weighed and crushed Tablets (NLT 10). Sonicate for 10 min with intermittent shaking.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 45°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between quetiapine desethoxy and quetiapine peaks, *System suitability solution*
Tailing factor: NMT 1.5 for the quetiapine peak, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times N \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

www.webofpharma.com

r_S = peak response of quetiapine from the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quetiapine in the *Sample solution* (mg/mL)
N = number of moles of quetiapine/mole of quetiapine fumarate, 2
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09

Acceptance criteria: See *Table 3*. Disregard any peak with an area below 0.05% in the *Sample solution*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Quetiapine *N*-oxide[a]	0.28	0.2
Quetiapine related compound B	0.39	0.2
Quetiapine related compound G	0.69	0.2
Quetiapine desethoxy[b, c]	0.88	—
Quetiapine	1.0	—
Bis(dibenzothiazepinyl) piperazine[b, d]	2.0	—
Any individual unspecified degradation product	—	0.2
Total impurities	—	0.5

[a] 4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)-1-[2-(2-hydroxyethoxy)ethyl]piperazine 1-oxide.
[b] Process impurities controlled in the drug substance. Included for identification purposes only. Not reported for the drug product and not included in the total impurities.
[c] 2-[4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethanol.
[d] 1,4-Bis(dibenzo[*b,f*][1,4]thiazepin-11-yl)piperazine.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Quetiapine Fumarate RS
  USP Quetiapine System Suitability RS
  It contains quetiapine fumarate and at least 0.1% of each of the following impurities: Quetiapine related compound B: 11-(Piperazin-1-yl)dibenzo[*b,f*][1,4]thiazepine; Quetiapine related compound G: Dibenzo[*b,f*][1,4]thiazepin-11(10H)-one; and Quetiapine desethoxy: 2-[4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethanol.

Quetiapine Extended-Release Tablets

DEFINITION

Quetiapine Extended-Release Tablets contain quetiapine fumarate $[(C_{21}H_{25}N_3O_2S)_2 \cdot C_4H_4O_4]$ equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$).

IDENTIFICATION

Change to read:

- **A.** ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197F**▲ (CN 1-May-2020)
  Standard solution: Transfer 10 mg of USP Quetiapine Fumarate RS to a suitable vial. Add 10 mL of acetone and cap the vial. Sonicate for about 10 min. Allow the solution to equilibrate to room temperature. Evaporate the acetone completely. Add 2 mL of chloroform. Gently swirl for several minutes. Pass through a suitable filter of 0.45-µm pore size. Use the filtrate.
  Sample solution: Grind NLT 10 Tablets. Transfer an amount of powder equivalent to NLT 10 mg of quetiapine fumarate to a suitable vial. Add 10 mL of acetone and cap the vial. Sonicate for about 10 min. Allow the solution to equilibrate to room temperature. Evaporate the acetone completely. Add 2 mL of chloroform. Gently swirl for several minutes. Pass through a suitable filter of 0.45-µm pore size. Use the filtrate.
  Acceptance criteria: Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **PROCEDURE**
  Buffer: Dissolve 2.6 g/L of dibasic ammonium phosphate in water.
  Mobile phase: Methanol, acetonitrile, and *Buffer* (54:7:39)
  Diluent: Acetonitrile and water (50:50)
  System suitability stock solution: 0.05 mg/mL of USP Quetiapine Related Compound H RS in *Mobile phase*
  System suitability solution: 0.005 mg/mL of USP Quetiapine Related Compound H RS and 0.5 mg/mL of USP Quetiapine System Suitability RS in *Mobile phase* prepared as follows. Transfer 5 mg of USP Quetiapine System Suitability RS to a 10-mL volumetric flask. Add 7 mL of *Mobile phase* and sonicate to dissolve. Transfer 1 mL of *System suitability stock solution* to the volumetric flask. Dilute with *Mobile phase* to volume.
  Standard solution: 0.2 mg/mL of USP Quetiapine Fumarate RS in *Mobile phase*
  Sample stock solution: Transfer NLT 5 Tablets to a homogenizer vessel. Add 50 mL of acetonitrile, swirl to wet, and allow to stand for approximately 10 min. Add an additional 160 mL of *Diluent* and extract for about 10 min. Transfer the contents of the homogenizer to a 500-mL volumetric flask. Dilute with *Diluent* to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size and use the filtrate.
  Sample solution: Nominally 0.16–0.18 mg/mL of quetiapine from the *Sample stock solution* in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 230 nm
  Column: 4.6-mm × 25-cm; 5-µm packing L7
  Flow rate: 1.3 mL/min
  Injection volume: 30 µL
  Run time: NLT 2.5 times the retention time of quetiapine
  System suitability
  Samples: *System suitability solution* and *Standard solution*
  [NOTE—See ▲*Table 8*▲ (RB 1-Apr-2019) for the relative retention times.]

USP Monographs

Suitability requirements
Resolution: NLT 1.5 between quetiapine related compound G and quetiapine related compound H; NLT 2.0 between the quetiapine desthoxy and quetiapine peaks; *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times N \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quetiapine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩
Test 1
Medium 1: Citrate buffer, pH 4.8. Dissolve 9.6 g of anhydrous citric acid in 600 mL of water. Add 90 mL of 1 N sodium hydroxide. Dilute with water to 1 L; 900 mL.
Medium 2: Dissolve 17.9 g of dibasic sodium phosphate dodecahydrate in 400 mL of water. Add 460 mL of ▲1 N sodium hydroxide VS▲ (RB 1-Apr-2019) and dilute with water to 1 L; 100 mL.
[NOTE—It is recommended to check the pH of the mixture of 90 mL of *Medium 1* and 10 mL of *Medium 2*, which should be between 6.4 and 6.8. If the pH of the mixture is less than 6.4, 10 mL/L of ▲1 N sodium hydroxide VS▲ (RB 1-Apr-2019) may be added to *Medium 2*. If the pH of the mixture is greater than 6.8, 10 mL/L of ▲1 N hydrochloric acid VS▲ (RB 1-Apr-2019) may be added to *Medium 2*.]
Start the test with 900 mL of *Medium 1*. Add 100 mL of *Medium 2* to the vessel after 5 h of the test and continue the test.
Apparatus 1: 200 rpm
Times: 1, 6, 12, and 20 h
Diluent: *Medium 1* and *Medium 2* (90:10)
Standard solution: (L/400) mg/mL of USP Quetiapine Fumarate RS in *Diluent*, where L is the label claim in mg/Tablet
Sample solution: Pass a suitable portion of the solution under test through a suitable filter.
Instrumental conditions
Mode: UV
Analytical wavelength: About 290 nm
Blank: *Diluent*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration, C_i, of quetiapine ($C_{21}H_{25}N_3O_2S$) in *Medium* (mg/mL) after time point (i):

$$C_i = (A_U/A_S) \times C_S \times (M_{r1}/M_{r2}) \times N$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of quetiapine fumarate in the *Standard solution* (mg/mL)
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$
$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$
$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$
$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of quetiapine in *Medium* in the portion of sample withdrawn at each time point (mg/mL)
V = volume of *Medium*, 900 mL for 1 h; 1000 mL for 6-, 12-, and 20-h time points
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn from the vessel and replaced with *Medium* (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 20
2	6	47–69
3	12	65–95
4	20	NLT 85

The percentages of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.
Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: Water; 900 mL
Apparatus 1: 100 rpm
Times: 2, 4, 8, and 24 h
Standard solution: 0.03 mg/mL of USP Quetiapine Fumarate RS in water
Sample solution: Pass a suitable portion of the solution under test through a suitable filter of 0.45-µm pore size. Discard the first few milliliters of filtrate. Replace the volume withdrawn with an equal volume of *Medium*. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.
Instrumental conditions
Mode: UV
Analytical wavelength: 290 nm
Blank: Water
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration, C_i, of quetiapine ($C_{21}H_{25}N_3O_2S$) in *Medium* (mg/mL) after each time point (i):

$$C_i = (A_U/A_S) \times C_S \times D \times (M_{r1}/M_{r2}) \times N$$

USP Monographs

www.webofpharma.com

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of quetiapine fumarate in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*, if needed
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$
$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$
$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$
$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of quetiapine in *Medium* in the portion of sample withdrawn at each time point (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn from the vessel and replaced with *Medium* (mL)

Tolerances: See *Table 2*.

Table 2

Time Point (i)	Time (h)	Amount Dissolved (%)
1	2	5–25
2	4	20–45
3	8	45–75
4	24	NLT 85

The percentages of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: ▲0.1 N hydrochloric acid VS;▲ (RB 1-Apr-2019) 900 mL
Apparatus 2: 50 rpm
Times: 1, 4, and 8 h
Standard solution: USP Quetiapine Fumarate RS, equivalent to (L/900) mg/mL of quetiapine in *Medium*, where L is the label claim in mg/Tablet
Sample solution: Pass a suitable portion of the solution under test through a suitable full flow filter of 10-µm pore size.
Instrumental conditions
Mode: UV
Analytical wavelength: 295 nm
Cell
For 50-mg Tablets: 10 mm
For 150-, 200-, 300-, and 400-mg Tablets: 1 mm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (i):

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times N \times 100$$

Tolerances: See *Table 5*.

Table 5

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	2	10–30
2	4	30–50
3	8	60–80
4	24	NLT 85

The percentages of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 6: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.
Medium: pH 6.8 phosphate buffer (6.8 g/L of monobasic potassium phosphate and 0.9 g/L of sodium hydroxide in water. Adjust with 1 N sodium hydroxide VS or phosphoric acid to a pH of 6.8, and sonicate for NLT 10 min); 900 mL
Apparatus 2: 100 rpm, with sinker
Times: 1, 4, 8, and 16 h
Mobile phase: Methanol, trifluoroacetic acid, and water (40: 0.1: 60)
Standard solution: 0.1 mg/mL of USP Quetiapine Fumarate RS prepared as follows. Transfer an appropriate amount of USP Quetiapine Fumarate RS to a suitable volumetric flask, and add 5% of the final flask volume of methanol. Sonicate to dissolve, then dilute with *Medium* to volume.
Sample solution: Pass a suitable portion of the solution under test through a suitable filter of 0.45-µm pore size. Discard the first few milliliters of filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 5.0-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.2 mL/min
Injection volume: 10 µL
Run time: NLT 2.0 times the retention time of quetiapine
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Standard solution* and *Sample solution*

Calculate the concentration, C_i, of quetiapine ($C_{21}H_{25}N_3O_2S$) in *Medium* (mg/mL) after each time point (*i*):

$$C_i = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times N$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)
M_{r1} = molecular weight of quetiapine free base, 383.51
M_{r2} = molecular weight of quetiapine fumarate, 883.09
N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (*i*):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$
$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$
$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$
$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of quetiapine in *Medium* in the portion of sample withdrawn at each time point (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
V_S = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 6*.

Table 6

Time Point (*i*)	Time (h)	Amount Dissolved (for 50- and 150-mg Tablets) (%)	Amount Dissolved (for 200-, 300-, and 400-mg Tablets) (%)
1	1	NMT 15	NMT 10
2	4	21–41	21–41
3	8	56–76	51–71
4	16	NLT 80	NLT 80

The percentages of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

▲**Test 7:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.

www.webofpharma.com

Acid stage medium: Citrate buffer, pH 4.8 (9.6 g/L of anhydrous citric acid in water prepared as follows. Transfer a suitable quantity of anhydrous citric acid to an appropriate volumetric flask. Dissolve in 60% of the flask volume of water, then add 9% of the flask volume of 1 N sodium hydroxide VS. Dilute with water to volume); 900 mL, deaerated

0.05 M phosphate buffer solution: 17.9 g/L of dibasic sodium phosphate dodecahydrate solution prepared as follows. Transfer a suitable amount of dibasic sodium phosphate dodecahydrate to an appropriate volumetric flask containing 40% of the flask volume of water. Add 46% of the flask volume of 1 N sodium hydroxide VS and dilute with water to volume.

Buffer stage medium: Phosphate buffer, pH 6.6 (add 100 mL of *0.05 M phosphate buffer solution* to the *Acid stage medium*; adjust with 1 N sodium hydroxide VS or 1 N hydrochloric acid VS to obtain a pH of 6.6 ± 0.20, if necessary); 1000 mL

Apparatus 1: 20-mesh basket; 200 rpm

Times: 1 and 4 h in *Acid stage medium*; 6, 10, and 16 h in *Buffer stage medium*. The time in the *Buffer stage medium* includes the time in the *Acid stage medium*.

Procedure: Run the test in the *Acid stage medium* for the times specified. After 5 h, add 100 mL of *0.05 M phosphate buffer solution* and continue running the test in *Buffer stage medium* for the times specified.

Standard stock solution: 1.2 mg/mL of USP Quetiapine Fumarate RS prepared as follows. Transfer an appropriate amount of USP Quetiapine Fumarate RS into a suitable volumetric flask. Add 40% of the flask volume of methanol and sonicate to dissolve. Dilute with water to volume.

Acid stage standard solution: 0.03 mg/mL of USP Quetiapine Fumarate RS from *Standard stock solution* in *Acid stage medium*

Buffer stage standard solution: 0.03 mg/mL of USP Quetiapine Fumarate RS from *Standard stock solution* in *Buffer stage medium*

Acid stage sample solution: Pass a portion of the solution under test through a suitable filter, discarding the first portion of filtrate if needed. Dilute the filtrate further with *Acid stage medium*, if needed. Replace the portion of solution removed from the vessel with an equivalent volume of warmed *Acid stage medium*.

Buffer stage sample solution: Pass a portion of the solution under test through a suitable filter, discarding the first portion of filtrate if needed. Dilute the filtrate further with *Buffer stage medium*, if needed. Replace the portion of solution removed from the vessel with an equivalent volume of warmed *Buffer stage medium*.

Instrumental conditions

Suitability requirements

Relative standard deviation: NMT 2.0%, *Acid stage standard solution* and *Buffer stage standard solution*

Analysis

Samples: *Acid stage standard solution* and *Acid stage sample solution* or *Buffer stage standard solution* and *Buffer stage sample solution*

Calculate the concentration (C_i) of quetiapine ($C_{21}H_{25}N_3O_2S$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S \times D \times (M_{r1}/M_{r2}) \times N$$

A_U = absorbance of the *Acid stage sample solution* or *Buffer stage sample solution*

A_S = absorbance of the *Acid stage standard solution* or *Buffer stage standard solution*, corresponding to the related sample solution

C_S = concentration of quetiapine fumarate in *Acid stage standard solution* or *Buffer stage standard solution* (mg/mL)

D = dilution factor for the *Acid stage sample solution* or *Buffer stage sample solution*, if needed

M_{r1} = molecular weight of quetiapine free base, 383.51

M_{r2} = molecular weight of quetiapine fumarate, 883.09

N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V_A \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V_A) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V_B) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times V_B) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_5 = \{(C_5 \times V_B) + [(C_4 + C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of quetiapine in *Acid stage medium* or *Buffer stage medium* in the portion of sample withdrawn at each time point (mg/mL)

V_A = volume of *Acid stage medium*, 900 mL

L = label claim (mg/Tablet)

V_S = volume of the *Acid stage sample solution* or *Buffer stage sample solution* withdrawn from the vessel and replaced with *Acid stage medium* or *Buffer stage medium*, respectively (mL)

V_B = volume of *Buffer stage medium*, 1000 mL

Tolerances: See *Table 7*.

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*

r_S = peak response of quetiapine from the *Sample solution*

F = relative response factor for the corresponding degradation product from ▲*Table 8*▲ (RB 1-Apr-2019)

Acceptance criteria: See ▲*Table 8*▲ (RB 1-Apr-2019) Disregard peaks less than 0.05%.

▲**Table 8**▲ (RB 1-Apr-2019)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fumaric acid[a]	0.1	—	—
Quetiapine related compound G	0.48	1.4	0.2
Quetiapine related compound H	0.57	1.0	0.2
Quetiapine desethoxy[b]	0.87	—	—
Quetiapine	1.0	—	—
Quetiapine related compound B[b]	1.9	—	—
Any individual unspecified degradation product	—	1.0	0.2
Total degradation products	—	—	0.4

[a] Counter ion peak, not to be included in the total degradation products.

[b] Process impurity controlled in the drug substance. Included for identification purposes only. Not reported for the drug product and not included in the total degradation products.

ADDITIONAL REQUIREMENTS

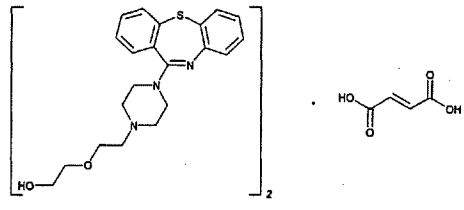
- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

- **USP REFERENCE STANDARDS** ⟨11⟩

USP Quetiapine Fumarate RS

USP Quetiapine Related Compound H RS

4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)-1-[2-(2-hydroxyethoxy)ethyl]piperazine 1-oxide.



$C_{21}H_{25}N_3O_3S$ 399.51

USP Quetiapine System Suitability RS

It contains quetiapine fumarate and at least 0.1% of each of the following impurities:

Quetiapine related compound B: 11-(Piperazin-1-yl) dibenzo[*b,f*][1,4]thiazepine; Quetiapine related compound G: Dibenzo[*b,f*][1,4]thiazepin-11(10*H*)-one; and Quetiapine desethoxy: 2-[4-(Dibenzo[*b,f*][1,4] thiazepin-11-yl)piperazin-1-yl]ethanol.

Quetiapine Fumarate

$(C_{21}H_{25}N_3O_2S)_2 \cdot C_4H_4O_4$ 883.09

Ethanol, 2-[2-(4-dibenzo[*b,f*][1,4]thiazepin-11-yl-1-piperazinyl)ethoxy]-, (*E*)-2-butenedioate (2:1) (salt); 2-[2-(4-Dibenzo[*b,f*][1,4]thiazepin-11-yl-1-piperazinyl) ethoxy]ethanol fumarate (2:1) (salt) [111974-72-2].

DEFINITION

Quetiapine Fumarate contains NLT 98.0% and NMT 102.0% of quetiapine fumarate [$(C_{21}H_{25}N_3O_2S)_2 \cdot C_4H_4O_4$], calculated on the dried basis.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩: between +14.4° and +15.4°.
Test solution: 20 mg per mL, in methanol.

Water Determination, *Method I* ⟨921⟩: not more than 1.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Limit of residual solvents—

Standard stock solution—Transfer about 50 mL of dimethylformamide to a 200-mL volumetric flask. Add about 75 mg each of acetone and acetonitrile and 30 mg each of methylene chloride and toluene, each accurately weighed by difference, and mix. Dilute with dimethylformamide to volume, and mix.

System suitability solution 1—Transfer about 25 mL of dimethylformamide to a 50-mL volumetric flask. Add 35 µL of dehydrated alcohol and 25 µL of methylene chloride. Dilute with dimethylformamide to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

System suitability solution 2—Transfer 2.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Standard solution—Transfer 4.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Test solution—Transfer about 60 mg of Quinapril Hydrochloride, accurately weighed, to a suitable headspace vial, add 5.0 mL of dimethylformamide, seal, and shake to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a headspace sampler, a 0.53-mm × 30-m fused-silica column coated with a 1.0-µm film of phase G16, and a split injection system. The carrier gas is helium, flowing at a rate of 6 mL per minute. The split flow rate is about 100 mL per minute, with a back pressure of 3.5 psi. The oven temperature of the headspace sampler is maintained at 60°, and the vial pressure is maintained at 6.1 psi. The temperature of the headspace loop and transfer lines is maintained at 65°. The vials are equilibrated for 10 minutes prior to injection, and injection occurs every 36 minutes. The chromatograph is programmed as follows. Initially the column temperature is maintained at 35° for 10 minutes, then the temperature is increased at a rate of 7° per minute to 150°, and maintained at 150° for 4 minutes. The injection port temperature is maintained at 180°, and the detector is maintained at 240°. Chromatograph *System suitability solution 1,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for methylene chloride and 1.0 for alcohol; the resolution, *R,* between methylene chloride and alcohol is not less than 1.2; the column efficiency, determined from the methylene chloride peak, is not less than 4900 theoretical plates; and the tailing factor for the methylene chloride peak is not more than 1.7. Chromatograph *System suitability solution 2,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 15.0%.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately

www.webofpharma.com

calculate the percentages, by weight, of acetone, acetonitrile, methylene chloride, and toluene in the portion of Quinapril Hydrochloride taken by the formula:

$$0.2(W_S/W_Q)(r_U/r_S)$$

in which W_S is the weight, in mg, of the appropriate solvent taken to prepare the *Standard stock solution*; W_Q is the weight, in mg, of Quinapril Hydrochloride taken to prepare the *Test solution*; and r_U and r_S are the peak responses of the relevant solvent obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% each of acetone and acetonitrile is found; and not more than 0.1% each of methylene chloride and toluene is found.

Related compounds—

Diluent, *Mobile phase*, and *Chromatographic system*—Prepare as directed in the *Assay*.

System suitability solution—Prepare as directed for the *System suitability preparation* in the *Assay*.

Standard solution—Dissolve accurately weighed quantities of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.5 mg of each per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of each quinapril related compound in the portion of Quinapril Hydrochloride taken by the formula:

$$100(V_U/W_U)C_S(r_U/r_S)$$

in which V_U is the volume, in mL, of the *Test solution*; W_U is the weight, in mg, of Quinapril Hydrochloride taken to prepare the *Test solution*; C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution*; and r_U and r_S are the peak areas of the corresponding quinapril related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% each of quinapril related compound A and quinapril related compound B is found. Calculate the percentage of each impurity in the portion of Quinapril Hydrochloride taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity obtained from the *Test solution*; and r_s is the sum of the responses of all the peaks obtained from the *Test solution*: not more than 0.2% of any individual impurity, other than quinapril related compound A and quinapril related compound B, is found; and not more than 2.0% of total impurities is found.

Content of chloride—Transfer about 100 mg of Quinapril Hydrochloride, accurately weighed, to a 100-mL beaker. Dissolve in 50 mL of water and 10 mL of alcohol. Acidify with nitric acid. Titrate with 0.01 N silver nitrate VS, and determine the endpoint potentiometrically, using suitable electrodes (see *Titrimetry* ⟨541⟩). Perform a blank determination, and make any necessary correction. Each mL of 0.01 N silver nitrate is equivalent to 0.3545 mg of chloride: not less than 7.2% and not more than 7.6% of chloride is found.

Assay—

Diluent—Prepare a mixture of pH 6.5, 0.025 M monobasic ammonium phosphate solution and acetonitrile (3:2).

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and methanesulfonic acid (72: 28: 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve accurately weighed quantities of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 2 mg of USP Quinapril Hydrochloride RS per mL and 0.005 mg each of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Quinapril Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 2 mg per mL.

Assay preparation—Transfer about 100 mg of Quinapril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector, a 4.6-mm × 3-cm guard column that contains 5-µm packing L10, and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the resolution between quinapril and quinapril related compound A is not less than 1.75; the resolution between quinapril and quinapril related compound B is not less than 3.5; the column efficiency is not less than 550 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the quinapril hydrochloride peaks. Calculate the quantity, in mg, of $C_{25}H_{30}N_2O_5 \cdot HCl$ in the portion of Quinapril Hydrochloride taken by the formula:

$$50C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Quinapril and Hydrochlorothiazide Tablets

DEFINITION

Quinapril and Hydrochlorothiazide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amounts of quinapril ($C_{25}H_{30}N_2O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

• **A.** The relative retention times of the major peaks from the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Buffer: Dissolve 1.36 g/L of monobasic potassium phosphate in water, add 2 mL of triethylamine, and adjust with phosphoric acid to a pH of 3.0. Pass through a suitable nylon filter of 0.45-µm pore size.

Mobile phase: See *Table 1*.

www.webofpharma.com

Table 1

Time (min)	Buffer (%)	Acetonitrile (%)
0	75	25
8	40	60
12	40	60
13	75	25
18	75	25

Diluent: Acetonitrile and *Buffer* (50:50)
Quinapril hydrochloride standard stock solution: 0.45 mg/mL of USP Quinapril Hydrochloride RS in *Diluent*
Hydrochlorothiazide standard stock solution: 0.5 mg/mL of USP Hydrochlorothiazide RS in *Diluent*
Standard solution: Dilute *Quinapril hydrochloride standard stock solution* and *Hydrochlorothiazide standard stock solution* with *Diluent* to final volume as given in *Table 2*.

Table 2

Tablet Strength Quinapril Hydrochloride/ Hydrochlorothiazide (mg/mg)	Quinapril Hydrochloride Standard Stock Solution (mL)	Hydrochlorothiazide Standard Stock Solution (mL)	Final Volume (mL)
10/12.5	5	5	100
20/12.5	10	5	200
20/25	5	5	100

Sample stock solution: Transfer 5 Tablets into a 250-mL volumetric flask, add 50 mL of *Diluent*, and sonicate for 15 min. Add about 50 mL of acetonitrile, and sonicate for 15 min with shaking. Add 50 mL of *Diluent*, and sonicate for 15 min. Dilute with *Diluent* to volume.
Sample solution: 0.02 mg/mL of quinapril in *Diluent* from the *Sample stock solution*. [NOTE—The hydrochlorothiazide concentration may vary depending on the ratio of quinapril hydrochloride to hydrochlorothiazide in the Tablet.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column oven temperature: 35°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *Standard solution*
Suitability requirements
Column efficiency: NLT 2500 theoretical plates from both quinapril and hydrochlorothiazide peaks
Tailing factor: NMT 2.0 for both quinapril and hydrochlorothiazide peaks
Relative standard deviation: NMT 2.0% for both quinapril and hydrochlorothiazide peaks
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of quinapril ($C_{25}H_{30}N_2O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of quinapril from the *Sample solution*
r_S = peak response of quinapril from the *Standard solution*
C_S = concentration of USP Quinapril Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinapril in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of quinapril, 438.52
M_{r2} = molecular weight of quinapril hydrochloride, 474.98

Calculate the percentage of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of hydrochlorothiazide from the *Sample solution*
r_S = peak response of hydrochlorothiazide from the *Standard solution*
C_S = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Buffer, Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.
Medium: Water; 900 mL
Apparatus 1: 100 rpm
Time: 20 min
Quinapril hydrochloride standard stock solution: 0.45 mg/mL of USP Quinapril Hydrochloride RS in *Diluent*
Hydrochlorothiazide standard stock solution: 0.55 mg/mL of USP Hydrochlorothiazide RS in *Diluent*
Standard solution: Prepare dilutions of *Quinapril hydrochloride standard stock solution* and *Hydrochlorothiazide standard stock solution* in *Medium* as directed in *Table 3*.

Table 3

Tablet Strength Quinapril Hydrochloride/ Hydrochlorothiazide (mg/mg)	Quinapril Hydrochloride Standard Stock Solution (mL)	Hydrochlorothiazide Standard Stock Solution (mL)	Final Volume (mL)
10/12.5	5	5	200
20/12.5	10	5	200
20/25	5	5	100

Sample solution: Pass a portion of the solution under test through a suitable nylon filter of 0.45-µm pore size, discarding the first few mL.
Analysis
Calculate the percentage of quinapril ($C_{25}H_{30}N_2O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of quinapril from the *Sample solution*
r_S = peak response of quinapril from the *Standard solution*
C_S = concentration of USP Quinapril Hydrochloride RS in the *Standard solution*
L = label claim for quinapril hydrochloride (mg/Tablet)
V = volume of *Medium*, 900 mL

USP Monographs

www.webofpharma.com

M_{r1} = molecular weight of quinapril, 438.52
M_{r2} = molecular weight of quinapril hydrochloride, 474.98

Calculate the percentage of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of hydrochlorothiazide from the *Sample solution*
r_S = peak response of hydrochlorothiazide from the *Standard solution*
C_S = concentration of USP Hydrochlorothiazide RS in the *Standard solution*
L = label claim for hydrochlorothiazide (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amounts of each quinapril ($C_{25}H_{28}N_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer and **Diluent:** Proceed as directed in the *Assay*.
Mobile phase: See *Table 4*.

Table 4

Time (min)	Buffer (%)	Acetonitrile (%)
0	90	10
10	60	40
30	30	70
31	90	10
40	90	10

Standard stock solution: 0.45 mg/mL of each USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS, and 0.50 mg/mL of each USP Hydrochlorothiazide RS and USP Benzothiadiazine Related Compound A RS in *Diluent*
Standard solution: 0.45 µg/mL of quinapril hydrochloride, quinapril related compound A, and quinapril related compound B, and 0.5 µg/mL of hydrochlorothiazide and benzothiadiazine related compound A from *Standard stock solution* in *Diluent*
Sample stock solution: Transfer 5 Tablets into a 250-mL volumetric flask, add 50 mL of diluent, and sonicate for 10 min to disperse the Tablets. Add about 50 mL of acetonitrile, and sonicate for 15 min with shaking. Add 50 mL of *Diluent*, and sonicate for 15 min. Dilute with *Diluent* to volume. Pass through a suitable nylon filter of 0.45-µm pore size.
Sample solution: For Tablet strengths of 10 mg/12.5 mg and 20 mg/12.5 mg of quinapril hydrochloride/hydrochlorothiazide, use *Sample stock solution* as is. For Tablet strength of 20 mg/25 mg of quinapril hydrochloride/hydrochlorothiazide, dilute 5 mL of *Sample stock solution* with *Diluent* to 10 mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column oven temperature: 35°
Sample temperature: 5°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 5000 theoretical plates from both quinapril and hydrochlorothiazide peaks
Tailing factor: NMT 2.0 for both quinapril and hydrochlorothiazide peaks
Relative standard deviation: NMT 5.0% for both quinapril and hydrochlorothiazide peaks
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of quinapril related compound A and quinapril related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of quinapril related compound A or quinapril related compound B from the *Sample solution*
r_S = peak response of USP Quinapril Related Compound A RS or USP Quinapril Related Compound B RS from the *Standard solution*
C_S = concentration of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinapril in the *Sample solution* (mg/mL)

Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzothiadiazine related compound A from the *Sample solution*
r_S = peak response of benzothiadiazine related compound A from the *Standard solution*
C_S = concentration of USP Benzothiadiazine Related Compound A RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each other impurity from the *Sample solution*
r_S = peak response of quinapril from the *Standard solution*
C_S = concentration of USP Quinapril Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinapril in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of quinapril, 438.52
M_{r2} = molecular weight of quinapril hydrochloride, 474.98

Acceptance criteria: See *Table 5*.

Identification—

A: Thin-Layer Chromatographic Identification Test ⟨201⟩—*Test solution*—Transfer a quantity of finely powdered Tablets, equivalent to about 10.0 mg of quinapril, to a 15-mL centrifuge tube; add 5 mL of methanol; mix; and centrifuge for 10 minutes.
Standard solution—Transfer about 10.8 mg of USP Quinapril Hydrochloride RS to a 15-mL centrifuge tube, add 5 mL of methanol, mix, and centrifuge for 10 minutes.
Application volume: 25 µL.
Developing solvent system: a mixture of methanol and ethyl acetate (1:1).
Procedure—Proceed as directed in the chapter, except to wash the plate in methanol and air-dry it prior to use.
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{25}H_{30}N_2O_5$ dissolved by employing the procedure set forth in the *Assay,* using a filtered portion of the solution under test as the *Assay preparation,* using methanol to prepare the *Standard preparation,* and making any necessary volumetric adjustments with water.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{25}H_{30}N_2O_5$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.
PROCEDURE FOR CONTENT UNIFORMITY—
Solvent, Buffered solvent, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*
Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*
Test solution—Transfer 1 Tablet to a volumetric flask. Add a volume of *Solvent,* equivalent to about one-half the flask volume; sonicate for 5 minutes; and shake by mechanical means for about 15 minutes. Dilute with *Solvent* to volume, mix, and pass through a suitable filter, discarding the first portion of the filtrate. Dilute a portion of the filtrate quantitatively, and stepwise if necessary, with *Solvent* to obtain a solution containing about 0.108 mg of quinapril hydrochloride per mL.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of quinapril ($C_{25}H_{30}N_2O_5$) in each Tablet taken by the formula:

$$(438.52/474.98)C(L/D)(r_U/r_S)$$

USP Monographs

www.webofpharma.com

in which 438.52 and 474.98 are the molecular weights of quinapril and quinapril hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard solution; L* is the labeled quantity, in mg, of quinapril in each Tablet; *D* is the concentration, in mg per mL, of quinapril hydrochloride in the *Test solution;* and r_U and r_S are the quinapril peak areas obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—

Solvent, Buffered solvent, and *Mobile phase*—Prepare as directed in the *Assay.*

Resolution solution—Dissolve accurately weighed quantities of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS in *Solvent* to obtain a solution having known concentrations of about 0.1 mg of USP Quinapril Hydrochloride RS and 0.005 mg each of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS per mL.

Standard solution—Dissolve accurately weighed quantities of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS in *Solvent,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.5 µg each of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.6 for quinapril related compound B, 1.0 for quinapril, and 2.0 for quinapril related compound A; and the resolution, *R,* between quinapril and quinapril related compound A and between quinapril and quinapril related compound B is not less than 2.0. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the column efficiency is not less than 600 theoretical plates; the tailing factor for the quinapril and quinapril related compound A peaks is less than 1.5 and that for the quinapril related compound B peak is less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for quinapril and not more than 3.0% for each quinapril related compound.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of each quinapril related compound in the portion of Tablets taken by the formula:

$$500CD(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; D* is the dilution factor used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding quinapril related compound obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.0% of quinapril related compound A is found; not more than 3.0% of quinapril related compound B is found; and not more than 3.6% of total impurities is found.

Assay—

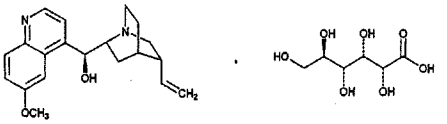
Solvent—Prepare a mixture of water and acetonitrile (65:35).

Buffered solvent—Prepare a mixture of pH 6.5, 0.05 M dibasic potassium phosphate and acetonitrile (65:35).

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and methanesulfonic acid (65: 35: 0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Quinapril Hydrochloride RS in *Solvent* to obtain a solution having a known concentration of about 1.08 mg per mL. Quantitatively dilute with *Buffered solvent* to obtain a solution having a known concentration of about 0.108 mg per mL.

Assay preparation—Transfer 10 Tablets to a 500-mL volumetric flask, add about 300 mL of *Solvent,* and sonicate until the Tablets have disintegrated. Shake by mechanical means for about 15 minutes, dilute with *Solvent* to volume, mix, and centrifuge. Dilute quantitatively, and stepwise if necessary, with *Solvent* to obtain a solution having a concentration of about 0.1 mg of quinapril per mL; and pass through a suitable filter, discarding the first portion of the filtrate.



Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 6.0-mm × 4-cm column that contains 3-µm packing L10. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the column efficiency is not less than 600 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of quinapril ($C_{25}H_{30}N_2O_5$) in the portion of Tablets taken by the formula:

$$500CD(438.52/474.98)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard preparation; D* is the dilution factor used to prepare the *Assay preparation;* 438.52 and 474.98 are the molecular weights of quinapril and quinapril hydrochloride, respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Quinidine Gluconate

$C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$ 520.57

Cinchonan-9-ol, 6′-methoxy-, (9*S*)-, mono-D-gluconate (salt); Quinidine mono-D-gluconate (salt) [7054-25-3].

DEFINITION

Quinidine Gluconate is the gluconate of an alkaloid that may be obtained from various species of *Cinchona* and their hybrids, from *Remijia pedunculata* Flückiger (Fam. Rubiaceae), or prepared from quinine. Quinidine Gluconate contains NLT 99.0% and NMT 100.5% of total alkaloid salt, calculated as quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) on the dried basis.

USP Monographs

www.webofpharma.com

IDENTIFICATION

• **A.**

Sample solution: 1-in-2000 solution of Quinidine Gluconate in dilute sulfuric acid (1 in 350)

Acceptance criteria: The *Sample solution* exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.

• **B.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities*.

• **C.**

Sample solution: 20 mg/mL of Quinidine Gluconate

Acceptance criteria: The *Sample solution* is dextrorotatory.

• **D.**

Sample: Dissolve 700 mg of Quinidine Gluconate in 5 mL of water with the aid of heat. Add 1 mL of glacial acetic acid and 200 mg of phenylhydrazine hydrochloride.

Analysis: Heat in a water bath for 15 min, cool, and scratch the inner surface of the tube with a glass rod.

Acceptance criteria: Orange crystals are formed.

ASSAY

• **PROCEDURE**

Sample solution: Dissolve 150 mg of Quinidine Gluconate in 10 mL of glacial acetic acid, heating gently if necessary, and cool the solution.

Titrimetric system

Mode: Titrimetry

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: To the *Sample solution* add 20 mL of acetic anhydride and 4 drops of *p*-naphtholbenzein TS, and titrate with *Titrant* from a 10-mL microburet to a green endpoint. Perform a blank determination, and make any necessary corrections (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 26.03 mg of total alkaloid salt, calculated as quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$).

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.15%

• **ORGANIC IMPURITIES**

Standard solution A: 6 mg/mL of USP Quinidine Gluconate RS in diluted alcohol

Standard solution B: 0.06 mg/mL of USP Quinidine Gluconate RS in diluted alcohol from *Standard solution A*

Standard solution C: 0.04 mg/mL of USP Quininone RS (corresponding to 0.06 mg of the gluconate) and 0.08 mg/mL of cinchonine (corresponding to 0.12 mg of the gluconate) in diluted alcohol

Sample solution: 6 mg/mL of Quinidine Gluconate in diluted alcohol

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform, acetone, and diethylamine (50:40:10)

Analysis

Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*

Proceed as directed in the chapter. The solvent chamber is used without previous equilibration. When the solvent front has moved about 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray with glacial acetic acid. Locate the spots on the plate by examination under long-wavelength UV light. Then spray the plate with potassium iodoplatinate TS.

Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution C* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spots appearing at the R_F value of Quinidine Gluconate and dihydroquinidine gluconate (the two spots most evident from *Standard solution A*), any additional fluorescent spot is not greater in size or intensity than the principal spot of *Standard solution B*. After treatment with potassium iodoplatinate TS, any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution C*.

• **LIMIT OF DIHYDROQUINIDINE GLUCONATE**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

Solution B: Dissolve 10.0 mL of diethylamine in water to prepare a 100-mL solution.

Mobile phase: Acetonitrile, *Solution A, Solution B,* and water (100:20:20:860). Adjust with *Solution B* to a pH of 2.6.

System suitability solution: 0.2 mg/mL each of quinidine gluconate and dihydroquinidine hydrochloride prepared as follows. Dissolve a suitable quantity of each quinidine gluconate and dihydroquinidine hydrochloride in about 10% of total volume of methanol, and dilute with *Mobile phase* to volume.

Sample solution: 0.26 mg/mL of Quinidine Gluconate in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 3.9-mm × 30-cm; packing L1

Injection volume: 50 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively.]

Suitability requirements

Resolution: NLT 2.5 between quinidine and dihydroquinidine

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Acceptance criteria: 20%; the response of the dihydroquinidine peak is NMT 0.25 that of the quinidine peak.

SPECIFIC TESTS

• **LOSS ON DRYING** ⟨731⟩

Analysis: Dry a sample at 105° for 1 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Quinidine Gluconate RS

USP Quininone RS

$C_{20}H_{22}N_2O_2$ 322.40

www.webofpharma.com

Quinidine Gluconate Injection

DEFINITION

Quinidine Gluconate Injection is a sterile solution of Quinidine Gluconate in Water for Injection. Each mL contains amounts of quinidine gluconate and dihydroquinidine gluconate totaling to NLT 76 mg and NMT 84 mg of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$).

IDENTIFICATION

• **A.**

Sample solution: 1-in-150 solution of Injection in dilute sulfuric acid (1 in 350)

Acceptance criteria: The *Sample solution* exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.

• **B.**

Sample solution: 1-in-4 solution of Injection

Acceptance criteria: The *Sample solution* is dextrorotatory.

• **C.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities*.

ASSAY

• **PROCEDURE**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

Solution B: Dissolve 10.0 mL of diethylamine in water to prepare a 100-mL solution.

Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (100:20:20:860). Adjust with *Solution B* to a pH of 2.6.

System suitability solution: 0.2 mg/mL each of quinidine gluconate and dihydroquinidine hydrochloride prepared as follows. Dissolve a suitable quantity of each quinidine gluconate and dihydroquinidine hydrochloride in about 10% of the total volume of methanol, and dilute with *Mobile phase* to volume.

Standard solution: 0.26 mg/mL of USP Quinidine Gluconate RS in *Mobile phase*

Sample stock solution: Transfer a volume of Injection, equivalent to 400 mg of quinidine gluconate, to a 50-mL volumetric flask, and dilute with methanol to volume.

Sample solution: Transfer 3 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 3.9-mm × 30-cm column; packing L1

Injection volume: 50 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively.]

Suitability requirements

Resolution: NLT 2.5 between quinidine and dihydroquinidine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity in mg/mL of the sum of quinidine gluconate and dihydroquinidine gluconate in the portion of Injection taken:

$$\text{Result} = (r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S}) \times (C_S/V) \times F$$

$r_{B,U}$ = peak response of quinidine from the *Sample solution*

$r_{D,U}$ = peak response of dihydroquinidine from the *Sample solution*

$r_{B,S}$ = peak response of quinidine from the *Standard solution*

$r_{D,S}$ = peak response of dihydroquinidine from the *Standard solution*

C_S = concentration of USP Quinidine Gluconate RS in the *Standard solution* (mg/mL)

V = volume of the Injection taken (mL)

F = dilution factor, 5000/3

Acceptance criteria: Each mL contains amounts of quinidine gluconate and dihydroquinidine gluconate totaling to NLT 76 mg and NMT 84 mg of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$).

IMPURITIES

• **ORGANIC IMPURITIES**

Standard solution A: 6 mg/mL of USP Quinidine Gluconate RS in diluted alcohol

Standard solution B: 0.06 mg/mL of USP Quinidine Gluconate RS in diluted alcohol from the *Standard solution A*

Standard solution C: 0.04 mg/mL of USP Quininone RS (corresponding to 0.06 mg of the gluconate) and 0.08 mg/mL of cinchonine (corresponding to 0.12 mg of the gluconate) in diluted alcohol

Sample solution: Mix, equivalent to 80 mg of quinidine gluconate from a volume of Injection, with 25 mL of water. Add 2 drops of 2 N sulfuric acid, and extract with 50 mL of ether, discarding the ether extract. To the aqueous solution add 2 mL of 1 N sodium hydroxide, extract with 50 mL of ether, wash the extract with 25 mL of water, and discard the aqueous solutions. Evaporate the ether extract just to dryness, and dissolve the residue in 10 mL of alcohol.

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform, acetone, and diethylamine (5:4:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Proceed as directed in the chapter. The solvent chamber is used without previous equilibration. When the solvent front has moved about 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray with glacial acetic acid. Locate the spots on the plate by examination under long-wavelength UV light. Then spray the plate with potassium iodoplatinate TS.

Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution C* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spots appearing at the R_F value of quinidine gluconate and dihydroquinidine gluconate (the two spots most evident from *Standard solution A*), any additional fluorescent spot is not greater in size or intensity than the principal spot of *Standard solution B*. After the treatment with potassium iodoplatinate TS, any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution C*.

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.6 USP Endotoxin Unit/mg of quinidine gluconate

Quinidine Gluconate Extended-Release Tablets

DEFINITION

Quinidine Gluconate Extended-Release Tablets contain amounts of quinidine gluconate and dihydroquinidine gluconate totaling NLT 90.0% and NMT 110.0% of the labeled amount of quinidine gluconate, calculated as quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$).

IDENTIFICATION

• **A.**
Sample solution: Shake an amount, equivalent to 50 mg of quinidine gluconate from powdered Tablets, with 100 mL of dilute sulfuric acid (1 in 350), and filter.
Acceptance criteria: The filtrate so obtained exhibits a vivid blue fluorescence when viewed under long-wavelength UV light. On the addition of hydrochloric acid, the fluorescence disappears.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **C.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities*.

ASSAY

• **PROCEDURE**
Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.
Solution B: Dissolve 10.0 mL of diethylamine in water to prepare a 100-mL solution.
Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (100:20:20:860). Adjust with *Solution B* to a pH of 2.6, if found to be lower.
System suitability solution: Transfer 10 mg each of quinidine gluconate and dihydroquinidine hydrochloride to a 50-mL volumetric flask. Dissolve in 5 mL of methanol, and dilute with *Mobile phase* to volume.
Standard solution: 0.2 mg/mL of USP Quinidine Gluconate RS in *Mobile phase*
Sample stock solution: To an amount equivalent to 160 mg of quinidine gluconate from NLT 20 finely powdered Tablets in a 100-mL volumetric flask add 80 mL of a mixture of methanol and water (1:1), and sonicate until evenly dispersed. Cool to room temperature, dilute with a mixture of methanol and water (1:1) to volume, and filter, discarding the first 20 mL of the filtrate.
Sample solution: 0.19 mg/mL of quinidine gluconate in *Mobile phase* prepared as follows. Transfer 3.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 3- to 5-mm × 25- to 30-cm; packing L1
Flow rate: 1.5 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively, for the *System suitability solution*.]
Suitability requirements
Resolution: NLT 1.2 between quinidine and dihydroquinidine, *System suitability solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the sum of the percentages of quinidine gluconate and dihydroquinidine gluconate in the Tablets taken:

$$\text{Result} = [(r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S})] \times (C_S/C_U) \times 100$$

$r_{B,U}$ = peak response of quinidine from the *Sample solution*
$r_{D,U}$ = peak response of dihydroquinidine from the *Sample solution*
$r_{B,S}$ = peak response of quinidine from the *Standard solution*
$r_{D,S}$ = peak response of dihydroquinidine from the *Standard solution*
C_S = concentration of USP Quinidine Gluconate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinidine gluconate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.
Medium: Add 6.9 g of anhydrous sodium acetate and 0.525 mL of glacial acetic acid to 1 L of water. Adjust with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 5.4; 900 mL.
Apparatus 2: 75 rpm
Times: 1, 2, 4, and 8 h
Standard solution: A known concentration of USP Quinidine Gluconate RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium* if necessary, in comparison with the *Standard solution* concentration.
Instrumental conditions
Mode: UV
Analytical wavelength: 235 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the percentage of the labeled amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved from UV absorbances of the *Sample solution* and *Standard solution*.
Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved
1	30%–50%

USP Monographs

www.webofpharma.com

Table 1 *(continued)*

Time (h)	Amount Dissolved
2	45%–65%
4	60%–85%
8	NLT 85%

The percentages of the labeled amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Medium: 0.1 N hydrochloric acid; 600 mL
Apparatus 2: 75 rpm
Times: Proceed as directed for *Test 1*.
Standard solution: A known concentration of USP Quinidine Gluconate RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium* if necessary, in comparison with the *Standard solution* concentration.
Instrumental conditions
Mode: UV
Analytical wavelength: 235 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the percentage of the labeled amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved from UV absorbances of the *Sample solution* and *Standard solution*.
Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved
1	30%–45%
2	45%–60%
4	60%–80%
8	NLT 85%

The percentages of the labeled amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.
Medium: Proceed as directed for *Test 1*.
Apparatus: Proceed as directed for *Test 1*, using 8-mesh sinker baskets.[1]
Times: 1, 2, and 4 h
Standard solution: USP Quinidine Gluconate RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, in comparison with the *Standard solution* concentration.
Instrumental conditions
Mode: UV
Analytical wavelength: 235 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved from the UV absorbances of the *Sample solution* and the *Standard solution*.

[1] A suitable sinker is available from Van Kel, www.varianinc.com, catalog number 12-3062.

Tolerances: See *Table 3*.

Table 3

Time (h)	Amount Dissolved
1	20%–50%
2	40%–70%
4	NLT 75%

The percentages of the labeled amount of quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$) dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩
Procedure for content uniformity
Standard solution: 0.0525 mg/mL of USP Quinidine Gluconate RS in 0.1 N hydrochloric acid
Sample solution: Transfer 1 intact or powdered Tablet to a 250-mL volumetric flask, and add 125 mL of 0.1 N hydrochloric acid. Heat the sample with frequent agitation just to boiling, and cool to room temperature. Dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 20 mL of filtrate. If necessary, further dilute quantitatively with 0.1 N hydrochloric acid.
Instrumental conditions
Mode: UV
Cell: 1 cm
Analytical wavelength: 347 nm
Blank: 0.1 N hydrochloric acid
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Concomitantly determine the absorbances of the *Samples*.
Calculate the percentage of the labeled amounts of active ingredients, calculated as quinidine gluconate ($C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$), in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Quinidine Gluconate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinidine gluconate in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Standard solution A: 6 mg/mL of USP Quinidine Gluconate RS in diluted alcohol
Standard solution B: 0.06 mg/mL of USP Quinidine Gluconate RS in diluted alcohol from *Standard solution A*
Standard solution C: 0.04 mg/mL of USP Quininone RS (corresponding to 0.06 mg of the gluconate) in diluted alcohol
Sample solution: Nominally equivalent to 6 mg/mL of quinidine gluconate prepared as follows. Shake a quantity of powdered Tablets, equivalent to about 150 mg of quinidine gluconate, with 25 mL of diluted alcohol for 10 min, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Chloroform, acetone, and diethylamine (50:40:10)

USP Monographs

www.webofpharma.com

Analysis

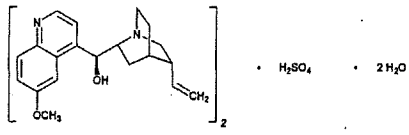
Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*

Proceed as directed in the chapter. The solvent chamber is used without previous equilibration. When the solvent front has moved 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray with glacial acetic acid. Locate the spots on the plate by examination under long-wavelength UV light.

Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution C* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spots appearing at the R_F value of quinidine gluconate and dihydroquinidine gluconate (the two spots most evident from *Standard solution A*), any additional fluorescent spot is not greater in size or intensity than the principal spot of *Standard solution B.*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** The labeling indicates the *Dissolution Test* with which the product complies.
- **USP REFERENCE STANDARDS** ⟨11⟩



USP Quinidine Gluconate RS

USP Quininone RS

Cinchonan-9-one, 6′-methoxy-, (8alpha)-.

$C_{20}H_{22}N_2O_2$ 322.40

Quinidine Sulfate

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ 782.94

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$ 746.93

Cinchonan-9-ol, 6′-methoxy-, (9*S*)-, sulfate (2:1) (salt), dihydrate;

Quinidine sulfate (2:1) (salt) dihydrate [6591-63-5].

Anhydrous [50-54-4].

DEFINITION

Quinidine Sulfate is the sulfate of an alkaloid obtained from various species of *Cinchona* and their hybrids and from *Remijia pedunculata* Flückiger (Fam. Rubiaceae), or prepared from quinine. It contains NLT 99.0% and NMT 101.0% of total alkaloid salt, calculated as Quinidine Sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4]$, on the anhydrous basis.

IDENTIFICATION

- **A.**

Sample solution: 1-in-2000 solution of Quinidine Sulfate in dilute sulfuric acid (1 in 350)

Acceptance criteria: The *Sample solution* exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.

- **B.** The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution,* as obtained in *Organic Impurities.*
- **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩

Sample solution: 20-mg/mL solution made with the aid of a few drops of hydrochloric acid

Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**

Sample solution: Dissolve 200 mg of Quinidine Sulfate in 20 mL of glacial acetic acid, heating if necessary, and cool the solution.

Titrimetric system

Mode: Titrimetry

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: To the *Sample solution* add 20 mL of acetic anhydride and 4 drops of *p*-naphtholbenzein TS, and titrate with *Titrant* from a 10-mL microburet to a green endpoint. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 24.90 mg of total alkaloid salt, calculated as quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4]$.

Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **ORGANIC IMPURITIES**

Standard solution A: 6 mg/mL of USP Quinidine Sulfate RS in diluted alcohol

Standard solution B: 0.06 mg/mL of USP Quinidine Sulfate RS in diluted alcohol from *Standard solution A*

Standard solution C: 0.05 mg/mL of USP Quininone RS (corresponding to 0.06 mg of the sulfate) and 0.10 mg/mL of cinchonine (corresponding to 0.12 mg of the sulfate) in diluted alcohol

Sample solution: 6 mg/mL of Quinidine Sulfate in diluted alcohol

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography.*)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform, acetone, and diethylamine (50:40:10)

Analysis

Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*

Proceed as directed in the chapter. The solvent chamber is used without previous equilibration. When the solvent front has moved 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray with glacial acetic acid. Locate the spots on the plate by examination under long-wavelength UV light. Then spray the plate with potassium iodoplatinate TS.

Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution C* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spots appearing at the R_F value of quinidine sulfate and dihydroquinidine sulfate (the two spots most evident from *Standard solution A*), any additional fluorescent spot is not greater in size or intensity than the principal spot of *Standard solution B.* After the treatment with potassium iodoplatinate TS, any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution C.*

- **LIMIT OF DIHYDROQUINIDINE SULFATE**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

USP Monographs

www.webofpharma.com

Solution B: Dilute 10.0 mL of diethylamine with water to 100 mL.
Mobile phase: Acetonitrile, *Solution B*, *Solution A*, and water (100:20:20:860). Adjust with diethylamine to a pH of 2.6.
System suitability solution: 0.2 mg/mL each of USP Quinidine Sulfate RS and dihydroquinidine hydrochloride prepared as follows. Dissolve a suitable quantitiy of each USP Quinidine Sulfate RS and dihydroquinidine hydrochloride in about 10% of total volume of methanol, and dilute with *Mobile phase* to volume.
Sample solution: 0.2 mg/mL of Quinidine Sulfate in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 3.9-mm × 30-cm; packing L1
Injection volume: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively.]
Suitability requirements
Resolution: NLT 2.5 between quinidine and dihydroquinidine
Relative standard deviation: NMT 2.0%
Analysis
Sample: *Sample solution*
Acceptance criteria: 20.0%; the response of the dihydroquinidine peak is NMT 0.25 that of the quinidine peak.

SPECIFIC TESTS
- **CHLOROFORM–ALCOHOL-INSOLUBLE SUBSTANCES**
Sample solution: Warm 2 g of Quinidine Sulfate with 15 mL of chloroform and dehydrated alcohol mixture (2:1) at 50° for 10 min.
Analysis: Pass the *Sample solution* through a tared, sintered-glass filter, using gentle suction. Wash the filter with five 10-mL portions of the chloroform–alcohol mixture (2:1), dry at 105° for 1 h, and weigh.
Acceptance criteria: NMT 0.1%; the weight of the residue does not exceed 2 mg.
- **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
Sample solution: 20 mg/mL of Quinidine Sulfate in 0.1 N hydrochloric acid
Acceptance criteria: +275° to +288° on the anhydrous basis
- **WATER DETERMINATION,** *Method I* ⟨921⟩**:** 4.0%–5.5%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Quinidine Sulfate RS
USP Quininone RS
Cinchonan-9-one, 6′-methoxy-, (8-alpha)-.
$C_{20}H_{22}N_2O_2$ 322.40

Quinidine Sulfate Capsules

» Quinidine Sulfate Capsules contain amounts of quinidine sulfate and dihydroquinidine sulfate totaling not less than 90.0 percent and not more than 110.0 percent of the labeled amount of quinidine sulfate, calculated as $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Quinidine Sulfate RS
USP Quininone RS
$C_{20}H_{22}N_2O_2$ 322.40

Identification—
A: Shake a quantity of the contents of Capsules, equivalent to about 100 mg of quinidine sulfate, with 10 mL of dilute sulfuric acid (1 in 350), and filter: an appropriate dilution of the filtrate exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid the fluorescence disappears.
B: In the test for *Chromatographic purity*, the R_F value of the principal spot obtained from the *Test preparation* corresponds to that from the *Standard preparation*.
C: Shake a quantity of the contents of Capsules, equivalent to about 100 mg of quinidine sulfate, with 10 mL of dilute hydrochloric acid (1 in 100), and filter: the filtrate responds to the tests for *Sulfate* ⟨191⟩.

Dissolution ⟨711⟩—
Medium: 0.01 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 248 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Quinidine Sulfate RS in the same *Medium*.
Tolerances—Not less than 85% (*Q*) of the labeled amount of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Procedure for content uniformity—Transfer the contents of 1 Capsule to a 250-mL volumetric flask, add about 175 mL of dilute hydrochloric acid (1 in 100), and shake by mechanical means for 30 minutes. Add dilute hydrochloric acid (1 in 100) to volume, and mix. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Concomitantly determine the absorbances of this solution, quantitatively diluted, if necessary, and a Standard solution of USP Quinidine Sulfate RS in dilute hydrochloric acid (1 in 100) having a known concentration of about 40 µg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 345 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of active ingredients, calculated as quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$, in the Capsule taken by the formula:

$$(TC/D)(A_U/A_S)$$

in which T is the labeled quantity, in mg, of quinidine sulfate in the Capsule, D is the concentration, in µg per mL, of quinidine sulfate in the solution from the Capsule, based on the labeled quantity per Capsule and the extent of dilution, C is the concentration, in µg per mL, of USP Quinidine Sulfate RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Capsule and the Standard solution, respectively.
Chromatographic purity—Shake a quantity of the contents of Capsules, equivalent to about 150 mg of quinidine sulfate, with 25 mL of diluted alcohol for 10 minutes, and filter.

USP Monographs

www.webofpharma.com

Using this as the *Test preparation,* proceed as directed in the test for *Chromatographic purity* under *Quinidine Sulfate.*

Assay—

Methanesulfonic acid solution, Diethylamine solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed for *Limit of dihydroquinidine sulfate* under *Quinidine Sulfate.*

Standard preparation—Transfer about 20 mg of USP Quinidine Sulfate RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer the contents of not fewer than 20 Capsules to a container, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 160 mg of quinidine sulfate, to a 100-mL volumetric flask, add 80 mL of methanol, and shake the flask by mechanical means for 30 minutes. Dilute with methanol to volume, mix, and filter, discarding the first 10 mL of the filtrate. Transfer 3.0 mL of the filtrate to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure —Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into a chromatograph. Calculate the quantity, in mg, of the sum of quinidine sulfate and dihydroquinidine sulfate in the portion of Capsules taken by the formula:

$$(2500/3)C(r_{b,U} + r_{d,U})/(r_{b,S} + r_{d,S})$$

in which C is the concentration, in mg per mL, of USP Quinidine Sulfate RS in the *Standard preparation;* $r_{b,U}$ and $r_{b,S}$ are the peak responses of quinidine obtained from the *Assay preparation* and the *Standard preparation,* respectively; and $r_{d,U}$ and $r_{d,S}$ are the peak responses of dihydroquinidine obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Quinidine Sulfate Compounded Oral Suspension

DEFINITION

Quinidine Sulfate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of quinidine sulfate [$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$]. Prepare Quinidine Sulfate Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Quinidine Sulfate	1 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), *NF,* and Vehicle for Oral Suspension, *NF,* a sufficient quantity to make	100 mL

If using *Quinidine Sulfate* tablets, place in a suitable mortar, and comminute into a fine powder, or add *Quinidine Sulfate* powder to the mortar. Add 15 mL of the *Vehicle,* and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar to the calibrated bottle. Add sufficient *Vehicle* to volume, and mix well.

ASSAY

• **PROCEDURE**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.

Mobile phase: Acetonitrile, *Solution A, Solution B,* and water (10:1:1:40)

Standard solution: 100 µg/mL of USP Quinidine Sulfate RS in *Mobile phase*

Sample solution: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the *Sample solution* into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for quinidine sulfate is about 8.5 min.]

Suitability requirements

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of quinidine sulfate [$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$] in the portion of Oral Suspension taken:

$$\text{Result} = [(r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S})] \times (C_S/V) \times 100$$

$r_{B,U}$ = peak response of quinidine from the *Sample solution*

$r_{D,U}$ = peak response of dihydroquinidine from the *Sample solution*

$r_{B,S}$ = peak response of quinidine from the *Standard solution*

$r_{D,S}$ = peak response of dihydroquinidine from the *Standard solution*

C_S = concentration of USP Quinidine Sulfate RS in the *Standard solution* (mg/mL)

V = volume of Oral Suspension taken (mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩**:** 3.4–4.4

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature, or in a refrigerator.

• **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded when stored at room temperature, or in a refrigerator

• **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date.*

• **USP REFERENCE STANDARDS** ⟨11⟩

DEFINITION

Quinidine Sulfate Tablets contain amounts of quinidine sulfate and dihydroquinidine sulfate totaling NLT 90.0% and NMT

USP Monographs

www.webofpharma.com

110.0% of the labeled amount of quinidine sulfate, calculated as quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$.

IDENTIFICATION

• **A.**

Analysis: Shake the equivalent to 100 mg of quinidine sulfate from powdered Tablets, with 10 mL of dilute sulfuric acid (1 in 350), and filter.

Acceptance criteria: An appropriate dilution of the filtrate exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.

• **B.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities*.

• **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩

Analysis: Shake the equivalent to 100 mg of quinidine sulfate from powdered Tablets, with 10 mL of dilute hydrochloric acid (1 in 100), and filter.

Acceptance criteria: The filtrate meets the requirements.

ASSAY

• **PROCEDURE**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

Solution B: Dilute 10.0 mL of diethylamine with water to 100 mL.

Mobile phase: Acetonitrile, *Solution B*, *Solution A*, and water (100:20:20:860). Adjust with diethylamine to a pH of 2.6.

System suitability solution: 0.2 mg/mL each of USP Quinidine Sulfate RS and dihydroquinidine hydrochloride prepared as follows. Dissolve a suitable quantitiy of each USP Quinidine Sulfate RS and dihydroquinidine hydrochloride in about 10% of total volume of methanol, and dilute with *Mobile phase* to volume.

Standard solution: 0.2 mg/mL of USP Quinidine Sulfate RS in *Mobile phase*

Sample stock solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to 160 mg of quinidine sulfate, to a 100-mL volumetric flask. Add 80 mL of methanol, and shake the flask by mechanical means for 30 min. Dilute with methanol to volume, and filter, discarding the first 10 mL of filtrate.

Sample solution: Nominally equivalent to 0.192 mg/mL of quinidine sulfate in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 3.9-mm × 30-cm; packing L1

Injection volume: 50 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively.]

Suitability requirements

Resolution: NLT 2.5 between quinidine and dihydroquinidine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of quinidine sulfate (quinidine sulfate and dihydroquinidine sulfate) in the portion of the Tablets taken:

$$\text{Result} = (r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S}) \times (C_S/C_U) \times 100$$

$r_{B,U}$ = peak response of quinidine from the *Sample solution*

$r_{D,U}$ = peak response of dihydroquinidine from the *Sample solution*

$r_{B,S}$ = peak response of quinidine from the *Standard solution*

$r_{D,S}$ = peak response of dihydroquinidine from the *Standard solution*

C_S = concentration of USP Quinidine Sulfate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of quinidine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: USP Quinidine Sulfate RS in *Medium*

Sample solution: Dilute with *Medium* to a concentration that is similar to the *Standard solution*. Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

Mode: UV

Analytical wavelength: 248 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 85% (*Q*) of the labeled amount of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O)]$ is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

Procedure for content uniformity

Standard solution: 40 µg/mL of USP Quinidine Sulfate RS in dilute hydrochloric acid (1 in 100)

Sample solution: Transfer a crushed Tablet to a 250-mL volumetric flask, add 175 mL of dilute hydrochloric acid (1 in 100), and shake by mechanical means for 30 min. Add dilute hydrochloric acid (1 in 100) to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Dilute quantitatively, if necessary.

Instrumental conditions

Mode: UV

Cell: 1 cm

Analytical wavelength: 345 nm

Blank: Water

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of quinidine sulfate and dihydroquinidine sulfate, calculated as quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$, in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Quinidine Sulfate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of quinidine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Standard solution A: 6 mg/mL of USP Quinidine Sulfate RS in diluted alcohol

USP Monographs

www.webofpharma.com

Standard solution B: 0.06 mg/mL of USP Quinidine Sulfate RS in diluted alcohol from *Standard solution A*
Standard solution C: 0.05 mg/mL of USP Quininone RS (corresponding to 0.06 mg of the sulfate) and 0.10 mg/mL of cinchonine (corresponding to 0.12 mg of the sulfate) in diluted alcohol
Sample solution: Equivalent to 6 mg/mL of quinidine sulfate in diluted alcohol prepared as follows. Shake an amount equivalent to 150 mg of quinidine sulfate from a suitable amount of powdered Tablets in 25 mL of diluted alcohol for 10 min, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Chloroform, acetone, and diethylamine (50:40:10)
Analysis
Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*
Proceed as directed in the chapter. The solvent chamber is used without previous equilibration. When the solvent front has moved 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray with glacial acetic acid. Locate the spots on the plate by examination under long-wavelength UV light. Then spray the plate with potassium iodoplatinate TS.
Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution C* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spots appearing at the R_F value of quinidine sulfate and dihydroquinidine sulfate (the two spots most evident from *Standard solution A*), any additional fluorescent spot is not greater in size or intensity than the principal spot of *Standard solution B*. After the treatment with potassium iodoplatinate TS, any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution C*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Quinidine Sulfate RS
USP Quininone RS
Cinchonan-9-one, 6'-methoxy-, (8alpha)-.
$C_{20}H_{22}N_2O_2$ 322.40

Quinidine Sulfate Extended-Release Tablets

DEFINITION

Quinidine Sulfate Extended-Release Tablets contain amounts of quinidine sulfate and dihydroquinidine sulfate totaling to NLT 90.0% and NMT 110.0% of the labeled amount of quinidine sulfate, calculated as $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$.

IDENTIFICATION

• **A.**
Sample: 50 mg of quinidine sulfate from powdered Tablets
Analysis: Shake with 100 mL of dilute sulfuric acid (1 in 350), and filter.
Acceptance criteria: The filtrate so obtained exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.
• **B.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities*.
• **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩
Sample: 100 mg of quinidine sulfate from powdered Tablets
Analysis: Shake with 10 mL of dilute hydrochloric acid (1 in 100), and filter.
Acceptance criteria: The filtrate meets the requirements.

ASSAY

• **PROCEDURE**
Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.
Solution B: Dilute 10.0 mL of diethylamine with water to 100 mL.
Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (100:20:20:860). Adjust with diethylamine to a pH of 2.6.
System suitability solution: 0.2 mg/mL each of USP Quinidine Sulfate RS and dihydroquinidine hydrochloride prepared as follows. Dissolve a suitable quantity of each USP Quinidine Sulfate RS and dihydroquinidine hydrochloride in about 10% of total volume of methanol, and dilute with *Mobile phase* to volume.
Standard solution: 0.2 mg/mL of USP Quinidine Sulfate RS in *Mobile phase*
Sample stock solution: Transfer 160 mg of quinidine sulfate from the contents of NLT 20 Tablets to a 100-mL volumetric flask. Add 80 mL of methanol, and shake the flask by mechanical means for 30 min. Dilute with methanol to volume and filter, discarding the first 10 mL of the filtrate.
Sample solution: Transfer 3.0 mL of the filtrate from the *Sample stock solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 3.9-mm × 30-cm; packing L1
Injection volume: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for quinidine and dihydroquinidine are 1 and 1.5, respectively.]
Suitability requirements
Resolution: NLT 2.5 between quinidine and dihydroquinidine
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quinidine sulfate (quinidine sulfate and dihydroquinidine sulfate) in the portion of Tablets taken:

$$\text{Result} = [(r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S})] \times (C_S/C_U) \times 100$$

$r_{B,U}$ = peak response of quinidine from the *Sample solution*
$r_{D,U}$ = peak response of dihydroquinidine from the *Sample solution*
$r_{B,S}$ = peak response of quinidine from the *Standard solution*
$r_{D,S}$ = peak response of dihydroquinidine from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of USP Quinidine Sulfate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinidine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90%–110%

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Times: 1, 4, and 12 h
Detector: UV 248 nm
Standard solution: A known concentration of USP Quinidine Sulfate RS in *Medium*
Sample solution: Pass a portion of solution under test through a suitable filter. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.
Analysis: Calculate the percentage of the labeled amount of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ dissolved:
Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved
1	20%–50%
4	43%–73%
12	NLT 70%

The percentages of the labeled amount of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium, Apparatus, Time, Detector, Standard solution, Sample solution, and **Analysis:** Proceed as directed in *Test 1*
Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved
1	10%–35%
4	30%–55%
12	NLT 75%

The percentages of the labeled amount of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ dissolved at the times specified conform to *Acceptance Table 2* in ⟨711⟩.

• **Uniformity of Dosage Units** ⟨905⟩

Procedure for content uniformity
Standard solution: 40 µg/mL of USP Quinidine Sulfate RS in dilute hydrochloric acid (1 in 100)
Sample solution: Transfer the contents of 1 Tablet to a 250-mL volumetric flask. Add about 175 mL of dilute hydrochloric acid (1 in 100), and shake by mechanical means for 30 min. Add dilute hydrochloric acid (1 in 100) to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Determine the absorbances of this solution, diluted, if necessary.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: Spectrophotometry
Cell: 1 cm
Analytical wavelength: 345 nm

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in well-closed, light-resistant containers.

www.webofpharma.com

• **LABELING:** The labeling indicates the *Dissolution Test* with which the product complies.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Quinidine Sulfate RS
USP Quininone RS
Cinchonan-9-one, 6′-methoxy-, (8alpha)-.
$C_{20}H_{22}N_2O_2$ 322.40

Quinine Sulfate

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ 782.94
Cinchonan-9-ol, 6′-methoxy-, (8α,9*R*)-, sulfate (2:1) (salt), dihydrate;
Quinine sulfate (2:1) (salt) dihydrate [207671-44-1].
Anhydrous 746.93
[804-63-7].

DEFINITION
Quinine Sulfate is the sulfate of an alkaloid obtained from the bark of species of *Cinchona*. It contains NLT 99.0% and NMT 101.0% of total alkaloid salt, calculated as $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$, on the anhydrous basis.

IDENTIFICATION
• **A.** A 0.5-mg/mL solution in dilute sulfuric acid (1 in 350) exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.
• **B.** The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard stock solution*, as obtained in the test for *Organic Impurities*.
• **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩
Sample solution: 20-mg/mL solution made with the aid of a few drops of hydrochloric acid
Acceptance criteria: Meets the requirements

ASSAY
• **PROCEDURE**
Sample: 200 mg of Quinine Sulfate
Analysis: Dissolve the *Sample* in 20 mL of acetic anhydride, and add 4 drops of *p*-naphtholbenzein TS. Titrate with 0.1 N perchloric acid VS from a 10-mL microburet to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 24.90 mg of total alkaloid salt, calculated as quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4]$.
Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
• **CHLOROFORM–ALCOHOL-INSOLUBLE SUBSTANCES**
Sample: 2 g
Analysis: Warm the *Sample* with 15 mL of a mixture of chloroform and dehydrated alcohol (2:1) at 50° for 10 min. Pass through a tared, sintered-glass filter, using gentle suction. Wash the filter with five 10-mL portions of the chloroform–alcohol mixture, dry at 105° for 1 h, and weigh.
Acceptance criteria: The weight of the residue is NMT 2 mg (0.1%).

• **ORGANIC IMPURITIES**
Standard stock solution: 6 mg/mL of USP Quinine Sulfate RS, in diluted alcohol
Standard solution A: 0.06 mg/mL of USP Quinine Sulfate RS from the *Standard stock solution*, in diluted alcohol
Standard solution B: 0.05 mg/mL of USP Quininone RS (corresponding to 0.06 mg/mL of the sulfate), and 0.10 mg/mL of cinchonidine (corresponding to 0.12 mg/mL of the sulfate), in diluted alcohol
Sample solution: 6 mg/mL of Quinine Sulfate, in diluted alcohol
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Chloroform, acetone, and diethylamine (5:4:1). [NOTE—The solvent chamber being used without previous equilibration.]
Analysis
Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*
Proceed as directed for *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*. Allow the spots to dry, and develop the chromatogram in a solvent system until the solvent front has moved 15 cm. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying with glacial acetic acid, and examine under long-wavelength UV light.
Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution B* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spot appearing at the R_F value of quinine, any additional fluorescent spot is not greater in size or intensity than the spot of *Standard solution A*. Spray the plate with potassium iodoplatinate TS. Any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution B*.
• **DIHYDROQUININE SULFATE**
Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.
Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.
Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (100:20:20:860). Adjust with *Solution B* to a pH of 2.6 if found to be lower.
System suitability solution: 0.2 mg/mL of USP Quinine Sulfate RS and 0.2 mg/mL dihydroquinine prepared as follows. Dissolve in methanol using 5% of the final volume, and dilute with *Mobile phase* to volume.
Sample solution: 0.2 mg/mL of Quinine Sulfate in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: 235 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 1 mL/min
Injection size: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for quinine and dihydroquinine are 1 and 1.5, respectively.]

USP Monographs

Quinine Sulfate Capsules

DEFINITION
Quinine Sulfate Capsules contain amounts of quinine sulfate and dihydroquinine sulfate totaling NLT 90.0% and NMT 110.0% of the labeled amount of quinine sulfate, calculated as $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$.

IDENTIFICATION
• **A.**
Sample: Nominally 100 mg of quinine sulfate from the contents of Capsules
Analysis: Shake the *Sample* with 100 mL of dilute sulfuric acid (1 in 350), and filter.
Acceptance criteria: An appropriate dilution of the filtrate exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.
• **B.** The R_F value of the principal spot from the *Sample solution* corresponds to that from *Standard solution A*, as obtained in the test for *Organic Impurities*.
• **C. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests, Sulfate*
Sample: Nominally 20 mg of quinine sulfate from the contents of Capsules
Analysis: Shake the *Sample* with 10 mL of dilute hydrochloric acid (1 in 100), and filter.
Acceptance criteria: The filtrate meets the requirements.
• **D.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.
Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.
Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (100:20:20:860). Adjust with *Solution B* to a pH of 2.6 if the pH is found to be lower.
System suitability solution: 0.2 mg/mL each of USP Quinine Sulfate RS and dihydroquinine, dissolved in 10% of the final volume of methanol. Dilute with *Mobile phase* to volume.
Standard solution: 0.2 mg/mL of USP Quinine Sulfate RS in *Mobile phase*
Sample stock solution: Nominally 1.6 mg/mL of quinine sulfate in methanol prepared as follows. Transfer an amount, equivalent to 160 mg of quinine sulfate from the contents of NLT 20 Capsules, to a 100-mL volumetric flask, add 80 mL of methanol, and shake the flask by mechanical means for 30 min. Dilute with methanol to volume, and filter, discarding the first 10 mL of the filtrate.
Sample solution: Nominally 0.2 mg/mL of quinine sulfate in *Mobile phase* from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 1 mL/min
Injection volume: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for quinine and dihydroquinine are 1 and 1.5, respectively.]
Suitability requirements
Resolution: NLT 1.2 between quinine and dihydroquinine
Relative standard deviation: NMT 2.0% for the quinine peak
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ calculated as the sum of quinine sulfate and dihydroquinine sulfate in the portion of Capsules taken:

$$\text{Result} = [(r_{b,U} + r_{d,U})/(r_{b,S} + r_{d,S})] \times (C_S/C_U) \times 100$$

$r_{b,U}$ = peak area response of quinine from the *Sample solution*
$r_{d,U}$ = peak area response of dihydroquinine from the *Sample solution*
$r_{b,S}$ = peak area response of quinine from the *Standard solution*
$r_{d,S}$ = peak area response of dihydroquinine from the *Standard solution*
C_S = concentration of USP Quinine Sulfate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Test 1
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm

USP Monographs

www.webofpharma.com

Time: 45 min
Detection: UV maximum at about 248 nm
Standard solution: Prepare a solution of known concentration of USP Quinine Sulfate RS in *Medium*.
Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ dissolved.
Tolerances: NLT 75% (*Q*) of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Solution A: Add 7.0 mL of methanesulfonic acid to 4.0 mL of glacial acetic acid, and dilute with water to 100 mL.
Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.
Mobile phase: Water, acetonitrile, *Solution A*, and *Solution B* (81:15:2:2). Adjust with *Solution B* to a pH of 3.0.
Standard solution: Prepare a solution of known concentration of USP Quinine Sulfate RS in *Medium*.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and suitably dilute with *Medium*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.2 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0 for the quinine peak
Relative standard deviation: NMT 2.0% for the sum of quinine and dihydroquinine peaks
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ dissolved.

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times D \times V \times 100$$

r_U = sum of the peak responses of quinine and dihydroquinine from the *Sample solution*
r_S = sum of the peak responses of quinine and dihydroquinine from the *Standard solution*
C_S = concentration of USP Quinine Sulfate RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
M_{r1} = molecular weight of quinine sulfate, 782.94
M_{r2} = molecular weight of anhydrous quinine sulfate, 746.92
D = dilution factor of the *Sample solution*
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ is dissolved.

• **Uniformity of Dosage Units** ⟨905⟩
Procedure for content uniformity
Diluent: Hydrochloric acid (1 in 100)
Standard solution: 40 µg/mL of USP Quinine Sulfate RS in *Diluent*
Sample solution: Transfer the contents of one Capsule to a 250-mL volumetric flask, add 175 mL of *Diluent*, and shake by mechanical means for 30 min. Add *Diluent* to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV
Cell: 1 cm
Analytical wavelength: Maximum at about 345 nm
Blank: Water
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Quinine Sulfate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of quinine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **Organic Impurities**
Standard stock solution: 6 mg/mL of USP Quinine Sulfate RS in diluted alcohol
Standard solution A: 0.06 mg/mL of USP Quinine Sulfate RS from the *Standard stock solution* in diluted alcohol
Standard solution B: 0.05 mg/mL of USP Quininone RS (corresponding to 0.06 mg/mL of the sulfate) and 0.10 mg/mL of cinchonidine (corresponding to 0.12 mg/mL of the sulfate) in diluted alcohol
Sample solution: Nominally 6 mg/mL of quinine sulfate in diluted alcohol prepared as follows. Shake the equivalent of 150 mg of quinine sulfate from the contents of Capsules with 25 mL of diluted alcohol for 10 min, and filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Chloroform, acetone, and diethylamine (50:40:10). [Note—The solvent chamber being used without previous equilibration.]
Analysis
Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*
Proceed as directed in *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography*. Allow the spots to dry, and develop the chromatogram using a solvent chamber without previous equilibration. When the solvent front has moved about 15 cm, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying with glacial acetic acid, and examine under long-wavelength UV light.
Acceptance criteria: Any spot produced by the *Sample solution* at the R_F value of a spot produced by *Standard solution B* is not greater in size or intensity than that corresponding spot. Apart from these spots and from the spot appearing at the R_F value of quinine sulfate, any

www.webofpharma.com

additional fluorescent spot is not greater in size or intensity than the spot from *Standard solution A*. Spray the plate with potassium iodoplatinate TS. Any spot produced by the *Sample solution* is not greater in size or intensity than a corresponding spot from *Standard solution B*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Quinine Sulfate RS
  USP Quininone RS
  Cinchonan-9-one, 6′-methoxy-, (8α)-.
  $C_{20}H_{22}N_2O_2$ 322.40

Quinine Sulfate Tablets

DEFINITION

Quinine Sulfate Tablets contain amounts of quinine sulfate and dihydroquinine sulfate totaling NLT 90.0% and NMT 110.0% of the labeled amount of quinine sulfate, calculated as $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

IDENTIFICATION

- **A.**
  Sample: Nominally 100 mg of quinine sulfate from powdered Tablets
  Analysis: Shake the *Sample* well with 100 mL of dilute sulfuric acid (1 in 350), and filter.
  Acceptance criteria: An appropriate dilution of the filtrate exhibits a vivid blue fluorescence. On the addition of a few drops of hydrochloric acid, the fluorescence disappears.
- **B.** The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution A*, as obtained in the test for *Organic Impurities*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩
  Sample: Nominally 20 mg of quinine sulfate from powdered Tablets
  Analysis: Shake *Sample* with 10 mL of dilute hydrochloric acid (1 in 100), and filter
  Acceptance criteria: The filtrate meets the requirements.
- **D.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.
  Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.
  Mobile phase: Acetonitrile, *Solution B*, *Solution A*, and water (10:2:2:86). Adjust with *Solution B* to a pH of 2.6 if the pH is found to be lower.
  System suitability solution: 0.2 mg/mL each of USP Quinine Sulfate RS and dihydroquinine, dissolved in 10% of the final volume of methanol. Dilute with *Mobile phase* to volume.
  Standard solution: 0.2 mg/mL of USP Quinine Sulfate RS in *Mobile phase*
  Sample stock solution: Nominally 1.6 mg/mL of quinine sulfate prepared as follows. Transfer an equivalent to 160 mg of quinine sulfate from NLT 20 powdered Tablets to a 100-mL volumetric flask, add 80 mL of methanol, and shake by mechanical means for 30 min. Dilute with methanol to volume, and filter, discarding the first 10 mL of the filtrate.
  Sample solution: Nominally 0.2 mg/mL of quinine sulfate in *Mobile phase* from the *Sample stock solution*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 235 nm
  Column: 3.9-mm × 30-cm; packing L1
  Flow rate: 1 mL/min
  Injection volume: 50 µL
  System suitability
  Sample: *System suitability solution*
  [NOTE—The relative retention times for quinine and dihydroquinine are 1 and 1.5, respectively.]
  Suitability requirements
  Resolution: NLT 1.2 between quinine and dihydroquinine
  Relative standard deviation: NMT 2.0% for the quinine peak
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of the labeled amount of quinine sulfate and dihydroquinine sulfate in the portion of Tablets taken:

$$\text{Result} = [(r_{B,U} + r_{D,U})/(r_{B,S} + r_{D,S})] \times (C_S/C_U) \times 100$$

$r_{B,U}$	= peak area response of quinine from the *Sample solution*
$r_{D,U}$	= peak area response of dihydroquinine from the *Sample solution*
$r_{B,S}$	= peak area response of quinine from the *Standard solution*
$r_{D,S}$	= peak area response of dihydroquinine from the *Standard solution*
C_S	= concentration of USP Quinine Sulfate RS in the *Standard solution* (mg/mL)
C_U	= nominal concentration of quinine sulfate in the *Sample solution* (mg/mL)

  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩
  Medium: 0.01 N hydrochloric acid; 900 mL
  Apparatus 1: 100 rpm
  Time: 45 min
  Detection: UV maximum at about 248 nm
  Standard solution: Prepare a solution of known concentration of USP Quinine Sulfate RS in *Medium*.
  Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*
  Analysis: Determine the percentage of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot H_2O]$ dissolved.
  Tolerances: NLT 75% (*Q*) of the labeled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩
  Procedure for content uniformity
  Diluent: Hydrochloric acid (1 in 100)
  Standard solution: 40 µg/mL of USP Quinine Sulfate RS in *Diluent*
  Sample solution: Transfer the contents of one powdered Tablet to a 250-mL volumetric flask, add 175 mL of *Diluent*, and shake by mechanical means for 30 min. Add *Diluent* to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate.
  Instrumental conditions
  (See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Rabies Immune Globulin

» Rabies Immune Globulin conforms to the regulations of the FDA concerning biologics (see *Biologics* ⟨1041⟩). It is a sterile, nonpyrogenic, slightly opalescent solution consisting of globulins derived from blood plasma or serum that has been tested for the absence of hepatitis B surface antigen, derived from selected adult human donors who have been immunized with rabies vaccine and have developed high titers of rabies antibody. It has a potency such that when labeled as 150 International Units (IU) per mL, it has a geometric mean lower limit (95% confidence) potency value of not less than 110 IU per mL, and proportionate lower limit potency values for other labeled potencies, based on the U.S. Standard Rabies Immune Globulin and using the CVS Virus challenge, by neutralization test in mice or tissue culture. It contains not less than 10 g and not more than 18 g of protein per 100 mL, of which not less than 80 percent is monomeric immunoglobulin G, having a sedimentation coefficient in the range of 6.0 to 7.5S, with no fragments having a sedimentation coefficient less than 6S and no aggregates having a sedimentation coefficient greater than 12S. It contains 0.3 M glycine as a stabilizing agent, and it contains a suitable preservative. It has a pH between 6.4 and 7.2, measured in a solution diluted to contain 1 percent of protein with 0.15 M sodium chloride. It meets the requirements of the test for heat stability.

Packaging and storage—Preserve at a temperature between 2° and 8°.
Expiration date—The expiration date is not later than 1 year after date of issue from manufacturer's cold storage (5°, 1 year).
Labeling—Label it to state that it is not for intravenous injection.

Racepinephrine

$C_9H_{13}NO_3$ 183.20
1,2-Benzenediol, 4-[1-hydroxy-2-(methylamino)ethyl]-, (±)-.
(±)-3,4-Dihydroxy-α-[(methylamino)methyl]benzyl alcohol [329-65-7].

» Racepinephrine is a racemic mixture of the enantiomorphs of epinephrine. It contains not less than 97.0 percent and not more than 102.0 percent of $C_9H_{13}NO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

Change to read:

USP Reference standards ⟨11⟩—
▲▲ (CN 1-May-2018)
▲USP Epinephrine Bitartrate RS▲ (ERR 1-Aug-2018)
USP Norepinephrine Bitartrate RS
Identification—To 5 mL of pH 4.0 acid phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) add 0.5 mL of a solution of Racepinephrine (1 in 1000) and 1.0 mL of 0.1 N iodine. Mix, and allow to stand for 5 minutes. Add 2 mL of sodium thiosulfate solution (1 in 40): a deep red color is produced.
Specific rotation ⟨781S⟩: between −1° and +1°.
Test solution: 10 mg per mL, in 0.6 N hydrochloric acid.
Loss on drying ⟨731⟩—Dry it in vacuum over silica gel for 18 hours: it loses not more than 2.0% of its weight.
Residue on ignition ⟨281⟩: not more than 0.5%.
Limit of adrenalone—Its absorptivity (see *Ultraviolet-Visible Spectroscopy* ⟨857⟩) at 310 nm, determined in a solution in dilute hydrochloric acid (1 in 200) containing 2 mg per mL, is not more than 0.2.

Limit of norepinephrine—
Epinephrine standard solution—Dilute with methanol an accurately measured volume of a solution of USP Epinephrine Bitartrate RS in formic acid containing about 364 mg per mL

USP Monographs

www.webofpharma.com

to obtain a solution having a concentration of about 20 mg per mL.

Norepinephrine standard solution—Dilute with methanol an accurately measured volume of a solution of USP Norepinephrine Bitartrate RS in formic acid containing 16 mg per mL to obtain a solution having a known concentration of 1.6 mg per mL.

Test solution—Dissolve 200 mg of Racepinephrine in 1.0 mL of formic acid, dilute with methanol to 10.0 mL, and mix.

Procedure—Apply 5-µL portions of *Epinephrine standard solution*, *Norepinephrine standard solution*, and *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow to dry, and develop the chromatogram in an unsaturated tank using a solvent system consisting of a mixture of *n*-butanol, water, and formic acid (7:2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm circulating air. Spray with Folin-Ciocalteu Phenol TS, followed by sodium carbonate solution (1 in 10): the R_F value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Epinephrine standard solution*. Any spot obtained from the *Test solution* is not larger nor more intense than the spot with the same R_F value obtained from the *Norepinephrine standard solution*, corresponding to not more than 4.0% of norepinephrine.

Assay—

Ferro-citrate solution, *Buffer solution*, and *Standard preparation*—Prepare as directed under *Epinephrine Assay* ⟨391⟩.

Assay preparation—Transfer about 10 mg of Racepinephrine, accurately weighed, to a 1-liter volumetric flask. Dilute with sodium bisulfite solution (1 in 500) to volume, and mix.

Procedure—Proceed as directed for *Procedure* under *Epinephrine Assay* ⟨391⟩. Calculate the quantity, in mg, of $C_9H_{13}NO_3$ in the portion of Racepinephrine taken by the formula:

$$(183.20/333.29)C(A_U/A_S)$$

in which 183.20 and 333.29 are the molecular weights of racepinephrine and epinephrine bitartrate, respectively, C is the concentration, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Racepinephrine Inhalation Solution

DEFINITION

Racepinephrine Inhalation Solution is a sterile solution of Racepinephrine in Purified Water prepared with the aid of Hydrochloric Acid, or of Racepinephrine Hydrochloride in Purified Water. It contains NLT 90.0% and NMT 110.0% of the labeled amount of racepinephrine ($C_9H_{13}NO_3$).

IDENTIFICATION

• **A.**

Sample solution: 0.5 mL of Inhalation Solution

Analysis: To 5 mL of pH 4.0 acid phthalate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*) add the *Sample solution* and 1.0 mL of 0.1 N iodine. Mix, and allow to stand for 5 min. Add 2 mL of sodium thiosulfate solution (1 in 40).

Acceptance criteria: A deep red color is produced.

ASSAY

• **PROCEDURE**

Solution A: 0.05 M monobasic sodium phosphate and methanol (85:15)

Mobile phase: 0.005 M sodium 1-octanesulfonate in *Solution A*

System suitability solution: 0.04 mg/mL of dopamine hydrochloride and 0.01 mg/mL of USP Epinephrine Bitartrate RS in *Solution A*

Standard solution: 0.1 mg/mL of USP Epinephrine Bitartrate RS in *Solution A*

Sample solution: Nominally 0.055 mg/mL of racepinephrine prepared as follows. Transfer a suitable volume of Inhalation Solution equivalent to 11 mg of racepinephrine to a suitable volumetric flask, and dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between dopamine and racepinephrine, *System suitability solution*

Tailing factor: NMT 1.2 for racepinephrine, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of racepinephrine ($C_9H_{13}NO_3$) in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Epinephrine Bitartrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of racepinephrine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of racepinephrine, 183.20

M_{r2} = molecular weight of epinephrine bitartrate, 333.29

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **STERILITY TESTS** ⟨71⟩: Meets the requirements

• **PH** ⟨791⟩: 2.0–3.5

• **COLOR AND CLARITY**

Standard solution: Dilute 2.0 mL of 0.100 N iodine VS with water to 500 mL.

Sample solution: A portion of Inhalation Solution

Analysis: Visually examine the *Sample solution* in a suitable clear glass test tube against a white background.

Acceptance criteria: The *Sample solution* is not pinkish, and it contains no precipitate.

If any yellow color is observed in the *Sample solution*, concomitantly determine the absorbances of the *Sample*

USP Monographs

www.webofpharma.com

solution and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm.
The absorbance of the *Sample solution* does not exceed that of the *Standard solution*.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Do not freeze.
- **LABELING:** The label indicates that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

Add the following:

▲• **USP REFERENCE STANDARDS** ⟨11⟩
USP Epinephrine Bitartrate RS▲ (ERR 1-Aug-2018)

Racepinephrine Hydrochloride

$C_9H_{13}NO_3 \cdot HCl$ 219.67

» Racepinephrine Hydrochloride is a racemic mixture of the hydrochlorides of the enantiomorphs of epinephrine. It contains not less than 97.0 percent and not more than 102.0 percent of $C_9H_{13}NO_3 \cdot HCl$, calculated on the anhydrous basis.

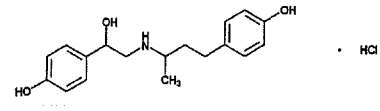
Packaging and storage—Preserve in tight, light-resistant containers.

Change to read:

USP Reference standards ⟨11⟩—
▲▲ (CN 1-May-2018)
▲USP Epinephrine Bitartrate RS▲ (ERR 1-Aug-2018)
USP Norepinephrine Bitartrate RS

Identification—

Change to read:



A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—*Solution:* 50 µg per mL. [NOTE—Use USP Epinephrine Bitartrate RS in the preparation of the *Standard solution*.] *Medium:* water.
B: A solution (1 in 100) meets the requirements of the tests for *Chloride* ⟨191⟩.
Specific rotation ⟨781S⟩: between −1° and +1°.
Test solution: 10 mg per mL, in 0.12 N hydrochloric acid.
Water Determination, *Method I* ⟨921⟩: not more than 0.5%.
Residue on ignition ⟨281⟩: not more than 0.5%.
Other requirements—It meets the requirements for *Limit of adrenalone* and *Limit of norepinephrine* under *Racepinephrine*.

Assay—
Mobile phase—Prepare a filtered and degassed solution of 0.17 N acetic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 150 µg per mL.
Assay preparation—Transfer about 25 mg of Racepinephrine Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 4.0 mL of this solution to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution containing about 100 µg per mL.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{13}NO_3 \cdot HCl$ in the portion of Racepinephrine Hydrochloride taken by the formula:

$$0.25C(219.67/333.30)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation:* 219.67 and 333.30 are the molecular weights of racepinephrine hydrochloride and epinephrine bitartrate, respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ractopamine Hydrochloride Suspension

$C_{18}H_{23}NO_3 \cdot HCl$ 337.84
Benzenemethanol, 4-hydroxy-α-[[[3-(4-hydroxyphenyl)-1-methylpropyl]amino]methyl]-, hydrochloride;
(±)-all-*rac*-*p*-Hydroxy-α-[[[3-(*p*-hydroxyphenyl)-1-methylpropyl]amino]methyl]benzyl alcohol, hydrochloride [90274-24-1].

DEFINITION
Ractopamine Hydrochloride Suspension contains NLT 10% and NMT 20%, by weight, of ractopamine hydrochloride ($C_{18}H_{23}NO_3 \cdot HCl$) in water. [NOTE—The material partially precipitates out at room temperature to form a slurry, and redissolves when heated to 50°–60°.]

IDENTIFICATION

Change to read:

• ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy:* **197K**▲ (CN 1-May-2020)
Sample: Dry a portion of Ractopamine Hydrochloride Suspension under vacuum for 3 h at 60°.

ASSAY
• **Procedure**
Solution A: 5.75 mg/mL solution of monobasic ammonium phosphate adjusted with 10% phosphoric acid to a pH of 4.0 ± 0.1
Solution B: 1.1 mg/mL solution of 1-heptanesulfonic acid sodium salt in *Solution A*
Mobile phase: Stabilizer-free tetrahydrofuran and *Solution B* (3:17)

www.webofpharma.com

Diluent: Stabilizer-free tetrahydrofuran and water (3:17). [NOTE—The *Standard solutions* and *System suitability solution* are stable for up to 72 h at room temperature. The *Sample solution* is stable for up to 90 h at room temperature.]
System suitability solution: 100 µg/mL of USP Ractopamine Hydrochloride RS and 10 µg/mL of USP Raspberry Alcohol RS in *Diluent*
Standard solution A: 0.08 mg/mL of USP Ractopamine Hydrochloride RS in *Diluent*
Standard solution B: 0.1 mg/mL of USP Ractopamine Hydrochloride RS in *Diluent*
Standard solution C: 0.12 mg/mL of USP Ractopamine Hydrochloride RS in *Diluent*
Sample stock solution: Stir Ractopamine Hydrochloride Suspension in a 60° water bath for up to 1 h, to ensure complete dissolution. While hot, transfer 700 mg of the Ractopamine Hydrochloride Suspension dropwise to a 100-mL volumetric flask, and dilute with *Diluent* to volume.
Sample solution: Dilute a portion of the *Sample stock solution* with *Diluent* (1:10).
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 226 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution B*
Suitability requirements
Resolution: NLT 1.5 between raspberry alcohol and ractopamine, *System suitability solution*
Tailing factor: NLT 0.7 and NMT 2.0 for the ractopamine peak, *Standard solution B*
Relative standard deviation: NMT 2.0% for three replicate injections, *Standard solution B*
Analysis
Samples: *Standard solutions* and *Sample solution*
Prepare a calibration curve using the three ractopamine peak responses from *Standard solutions A, B,* and *C* and their corresponding concentrations. From the graph determine the concentration, C, in mg/mL, of ractopamine hydrochloride in the *Sample solution*.
Calculate the percentage (w/w) of $C_{18}H_{23}NO_3 \cdot HCl$ in the portion of Ractopamine Hydrochloride Suspension taken:

$$\text{Result} = (V/W) \times C_S \times D \times 100$$

V = volume of the *Sample stock solution*, 100 mL
W = weight of Ractopamine Hydrochloride Suspension taken (mg)
C_S = concentration of ractopamine hydrochloride from the *Sample solution*
D = dilution factor to prepare the *Sample solution*, 10

Acceptance criteria: 10%–20% of $C_{18}H_{23}NO_3 \cdot HCl$

IMPURITIES

ORGANIC IMPURITIES

Raloxifene Hydrochloride Tablets

DEFINITION

Raloxifene Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

Sample: Transfer a quantity of powdered Tablets, equivalent to 120 mg of raloxifene hydrochloride, to a suitable container. Add 20 mL of water, and shake to form a uniform slurry. Centrifuge, and discard the supernatant. Add 5 mL of isopropyl alcohol, shake to form a slurry, filter, and rinse the residue with isopropyl alcohol. Dry the residue at 105° for 30 min. Alternatively, add 40 mL of water to the powdered Tablets and vortex to form a uniform slurry. Centrifuge, and discard the supernatant. Repeat the washing process. Add 40 mL of methanol to the residue, vortex to form a uniform slurry, and centrifuge. Transfer the clear liquid to an appropriate container and evaporate to dryness.

Analysis: Prepare a potassium bromide dispersion with the *Sample*. Similarly prepare the Standard, starting with a slurry containing 12 mg/mL of USP Raloxifene Hydrochloride RS in water.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: Dissolve 7.2 g of monobasic potassium phosphate in 1000 mL of water. Add 1.3 mL of phosphoric acid, and further adjust with phosphoric acid or potassium hydroxide solution to a pH of 2.5 ± 0.1.

Mobile phase: Acetonitrile and *Buffer* (33:67)

Diluent: Acetonitrile and *Buffer* (60:40)

System suitability solution: Prepare as directed in the test for *Organic Impurities*.

Standard solution: 0.06 mg/mL of USP Raloxifene Hydrochloride RS in *Diluent*

Sample solution: Transfer a sufficient quantity of Tablets to a volumetric flask of suitable size, add *Diluent*, and shake to disintegrate the Tablets. Sonicate if necessary. Dilute with *Diluent* to obtain a solution having a concentration of 0.06 mg/mL of raloxifene hydrochloride, based on the label claim. Filter, and use the clear solution.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 15-cm; 3.5-µm base-deactivated packing L7

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between raloxifene and raloxifene related compound C, *System suitability solution*

Tailing factor: NMT 2.0 for raloxifene, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Raloxifene Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of raloxifene hydrochloride from the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Test 1

Medium: 0.1% polysorbate 80; 1000 mL

Apparatus 2: 50 rpm

Time: 30 min

Mobile phase: Acetonitrile, water, and triethylamine (500:500:2). Adjust with phosphoric acid to a pH of 4.0.

Triethylamine phosphate suspension: Add 2.0 mL of triethylamine to 500 mL of acetonitrile, and adjust with phosphoric acid to a pH of 4.0. [NOTE—Triethylamine phosphate will precipitate; keep the suspension well mixed.]

Standard solution: Prepare a solution having a known concentration equivalent to the expected concentration of the *Sample solution* by dissolving USP Raloxifene Hydrochloride RS in a small volume (NMT 10% of the final volume) of methanol. Dilute with *Medium* to volume, and mix the resulting solution with *Triethylamine phosphate suspension* (1:1).

Sample solution: Pass a portion of the solution under test through an appropriate filter of 0.45-µm pore size. Mix the resulting solution and *Triethylamine phosphate suspension* (1:1).

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 15-cm; 3.5-µm base-deactivated packing L10. If the analyte peak splits, use a guard column containing packing L3.

Flow rate: 2 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

USP Monographs

www.webofpharma.com

C_S = concentration of USP Raloxifene Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
F = volume of *Medium*, 1000 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of raloxifene hydrochloride is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 1% sodium dodecyl sulfate in 0.05 M phosphate buffer prepared as follows. 1.7 g/L of sodium hydroxide and 7 g/L of monobasic sodium phosphate monohydrate. Adjust to a pH of 7.5, if necessary. Add 10 g of sodium dodecyl sulfate per L; 900 mL.
Apparatus 2: 75 rpm
Time: 45 min
Buffer: 2.8 g/L of sodium dodecyl sulfate. Adjust with glacial acetic acid to a pH of 4.0.
Diluent: Acetonitrile and water (50:50)
Mobile phase: Acetonitrile and *Buffer* (55:45)
Standard stock solution: 0.48 mg/mL of USP Raloxifene Hydrochloride RS in *Diluent*
Standard solution: 0.072 mg/mL of USP Raloxifene Hydrochloride RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 286 nm
Column: 3.9-mm × 15-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 10 µL
Run time: NLT 1.3 times the retention time of raloxifene
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Raloxifene Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (*Q*) of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.
Medium: pH 2.2 phosphate buffer prepared as follows. Dissolve 3.7 g of monobasic potassium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.2; 1000 mL.
Apparatus 2: 50 rpm
Time: 20 min
Mobile phase: Acetonitrile, water, and triethylamine (400:600:2). Adjust with diluted phosphoric acid to a pH of 4.0.
Standard stock solution: 0.30 mg/mL of USP Raloxifene Hydrochloride RS prepared as follows. Transfer an appropriate amount of USP Raloxifene Hydrochloride RS to a suitable volumetric flask and add 50% of the flask volume of methanol. Sonicate for 20 min with occasional shaking and then dilute with *Medium* to volume.
Standard solution: 0.06 mg/mL of USP Raloxifene Hydrochloride RS in *Medium* from the *Standard stock solution*
Sample solution: Centrifuge a portion of the solution under test and use the clear supernatant. [NOTE—The use of a centrifuge speed of 2000 rpm for 10 min may be suitable.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 290 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
Run time: NLT 1.7 times the retention time of raloxifene
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Raloxifene Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 1000 mL
L = label claim (mg/Tablet)

Tolerances: NLT 80% (*Q*) of the labeled amount of raloxifene hydrochloride ($C_{28}H_{27}NO_4S \cdot HCl$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Buffer: Dissolve 9.0 g of monobasic potassium phosphate in 1000 mL of water. Add 0.5 mL of phosphoric acid, and further adjust with phosphoric acid or potassium hydroxide solution to a pH of 3.0 ± 0.1.
Solution A: *Buffer* and acetonitrile (75:25)
Solution B: *Buffer* and acetonitrile (50:50)
Mobile phase: See *Table 1*. Adjust the start time of the gradient step on the basis of the instrument's dwell volume.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.00	100	0
5.00	100	0
36.25	0	100
38.25	100	0

USP Raltegravir Related Compound E RS
N-{2-[4-(Benzylcarbamoyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl]propan-2-yl}-5-methyl-1,3,4-oxadiazole-2-carboxamide.
$C_{20}H_{22}N_6O_5$ 426.43

Raltegravir Tablets

DEFINITION

Raltegravir Tablets contain an amount of Raltegravir Potassium equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of raltegravir ($C_{20}H_{20}FN_6O_5$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197A OR 197K▲** (CN 1-May-2020)
Sample: Grind a Tablet, and use a suitable amount of the powdered Tablet to prepare a specimen.
Acceptance criteria: The spectrum obtained from the *Sample* shows bands at approximately 1633, 1515, 1188, 810, and 728 cm^{-1}, similar to the spectrum from the Standard similarly obtained. [NOTE—Peak positions may vary slightly between instruments (within ±10 cm^{-1}). Other peaks may be present in the spectra that do not appear in this list.]
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**
Buffer: 1.36 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.
Mobile phase: Acetonitrile and *Buffer* (29:71)
Solution A: Acetonitrile and water (50:50)
Diluent: Acetonitrile and water (30:70)
Standard solution: 0.22 mg/mL of USP Raltegravir Potassium RS in *Diluent*
Sample stock solution: Nominally equivalent to 8 mg/mL of raltegravir from Tablets prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask and dilute with *Solution A* to volume. Stir the flask vigorously for 1 h. Centrifuge a portion of the solution and use the supernatant for *Sample solution* preparation.
Sample solution: Nominally 0.2 mg/mL of raltegravir in *Diluent* from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm; 5-µm packing *L1*
Column temperature: 40°
Flow rate: 2 mL/min
Injection volume: 30 µL
Run time: NLT 1.5 times the retention time of raltegravir
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of raltegravir ($C_{20}H_{20}FN_6O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of raltegravir from the *Sample solution*
r_S = peak response of raltegravir from the *Standard solution*
C_S = concentration of USP Raltegravir Potassium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of raltegravir in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of raltegravir, 444.44
M_{r2} = molecular weight of raltegravir potassium, 482.51

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: *Water*; 900 mL, deaerated
Apparatus 2: 100 rpm with sinker
Times: 15 and 60 min
Buffer: 1.36 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer* (38:62)
Diluent: Acetonitrile and water (20:80)
Standard solution: 0.48 mg/mL of USP Raltegravir Potassium RS in *Diluent*. Sonicate, if necessary, to dissolve prior to final dilution.
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 303 nm
Column: 4.6-mm × 10-cm; packing L1
Column temperature: 40°
Flow rate: 5 mL/min
Injection volume: 10 µL
Run time: 1 min

Suitability requirements
Resolution: NLT 1.5 between raltegravir related compound E and raltegravir, *System suitability solution*
Relative standard deviation: NMT 10.0%, *Standard solution*
Analysis
Samples: *Sample solution*, *Peak identification solution*, and *Standard solution*
Calculate the percentage of any individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any individual impurity from the *Sample solution*
r_S = peak response of raltegravir from the *Standard solution*
C_S = concentration of USP Raltegravir Potassium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of raltegravir in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of raltegravir, 444.44
M_{r2} = molecular weight of raltegravir potassium, 482.51
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Reporting threshold is 0.1%.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Raltegravir amine[a]	0.14	1.0	—[b]
Raltegravir formididyl analog[c]	0.29	1.0	—[b]
Raltegravir oxalyl analog[d]	0.33	1.0	0.3
Raltegravir oxalylacetohydrazide analog[e]	0.48	0.75	0.5
Raltegravir related compound E	0.83	1.0	—[b]
Raltegravir	1.0	—	—
Any individual unspecified impurity	—	1.0	0.2
Total impurities	—	—	0.8

[a] 2-(2-Aminopropan-2-yl)-*N*-(4-fluorobenzyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidine-4-carboxamide.
[b] This is a process impurity controlled in the drug substance and not monitored in the drug product.
[c] (*E*)-2-(2-{[(Dimethylamino)methylidene]amino}propan-2-yl)-*N*-(4-fluorobenzyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidine-4-carboxamide.
[d] 2-[(2-(4-[(4-Fluorobenzyl)carbamoyl]-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl}propan-2-yl)amino]-2-oxoacetic acid.
[e] 2-(2-[2-(2-Acetylhydrazinyl)-2-oxoacetamido]propan-2-yl}-*N*-(4-fluorobenzyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidine-4-carboxamide.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Raltegravir Potassium RS
USP Raltegravir Related Compound E RS
N-{2-[4-(Benzylcarbamoyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl]propan-2-yl}-5-methyl-1,3,4-oxadiazole-2-carboxamide.
$C_{20}H_{22}N_6O_5$ 426.43

Raltegravir Chewable Tablets

DEFINITION

Raltegravir Chewable Tablets contain an amount of Raltegravir Potassium equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of raltegravir ($C_{20}H_{21}FN_6O_5$).

www.webofpharma.com

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197A OR 197K▲** (CN 1-May-2020)

Sample: Grind a Tablet, and use a suitable amount of the powdered Chewable Tablet to prepare a specimen.

Acceptance criteria: The spectrum obtained from the *Sample* shows bands at approximately 1633, 1515, 1188, 810, and 728 cm^{-1}, similar to the spectrum from the Standard similarly obtained. [NOTE—Peak positions may vary slightly between instruments (within ±10 cm^{-1}). Other peaks may be present in the spectra that do not appear in this list.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: 1.36 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.
Solution A: Acetonitrile and *Buffer* (20:80)
Solution B: Acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
25	50	50
25.1	100	0
30	100	0

Diluent: Acetonitrile and water (30:70)
Standard solution: 0.11 mg/mL of USP Raltegravir Potassium RS in *Diluent*
Sample stock solution: Nominally equivalent to 1 mg/mL of raltegravir from Chewable Tablets prepared as follows. Transfer NLT 10 Chewable Tablets to a suitable volumetric flask and dilute with *Diluent* to 20% of the flask volume. Stir the contents of the flask for about 10 min to break apart the Chewable Tablets. Dilute with *Diluent* to volume and stir the contents of the flask for about 1 h. Centrifuge a portion of the solution and use the supernatant for *Sample solution* preparation.
Sample solution: Nominally 0.1 mg/mL of raltegravir from the *Sample stock solution* in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing *L1*
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 15 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of raltegravir ($C_{20}H_{21}FN_6O_5$) in the portion of Chewable Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of raltegravir from the *Sample solution*
r_S = peak response of raltegravir from the *Standard solution*
C_S = concentration of USP Raltegravir Potassium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of raltegravir in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of raltegravir, 444.44
M_{r2} = molecular weight of raltegravir potassium, 482.51

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: *Water*; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 15 min
Buffer: 1.36 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.
Mobile phase: Acetonitrile and *Buffer* (38:62)
Diluent: Acetonitrile and water (30:70)
Standard solution: (*L*/900) mg/mL of raltegravir from USP Raltegravir Potassium RS in *Diluent*, where *L* is the label claim in mg/Chewable Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 303 nm
Column: 4.6-mm × 10-cm; packing *L1*
Column temperature: 40°
Flow rate: 5 mL/min
Injection volume: 30 µL
Run time: 1 min
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of raltegravir ($C_{20}H_{21}FN_6O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (1/L) \times V \times D \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of raltegravir from the *Sample solution*
r_S = peak response of raltegravir from the *Standard solution*
C_S = concentration of the USP Raltegravir Potassium RS in the *Standard solution* (mg/mL)
L = label claim (mg/Chewable Tablet)
V = volume of *Medium*, 900 mL
D = dilution factor for the *Sample solution*, if applicable
M_{r1} = molecular weight of raltegravir, 444.44
M_{r2} = molecular weight of raltegravir potassium, 482.51

Tolerances: NLT 85% (*Q*) of the labeled amount of raltegravir is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Mobile phase, Diluent, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Peak identification solution: Prepare a solution containing 2 mg/mL of USP Raltegravir Potassium RS in 1 N sodium hydroxide solution. Stir the solution for 2 h at room temperature. Transfer 5 mL of this solution to a 50-mL volumetric flask and add 5 mL of 1 N hydrochloric acid. Dilute with *Diluent* to volume. [NOTE—In situ degradation generates the raltegravir amine and raltegravir oxalylacetohydrazide analog peaks along with a small peak for raltegravir oxalyl analog impurity.]

System suitability solution: 0.1 mg/mL of USP Raltegravir Potassium RS and 0.2 µg/mL of USP Raltegravir Related Compound E RS in *Diluent*

Standard stock solution: Use the *Standard solution* prepared in the *Assay*.

Standard solution: 0.22 µg/mL of USP Raltegravir Potassium RS in *Diluent* from *Standard stock solution*

System suitability

Samples: *System suitability solution* and *Standard solution* [NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between raltegravir related compound E and raltegravir, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Sample solution*, *Peak identification solution*, and *Standard solution*

Calculate the percentage of any individual impurity in the portion of Chewable Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any individual impurity from the *Sample solution*

r_S = peak response of raltegravir from the *Standard solution*

C_S = concentration of USP Raltegravir Potassium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of raltegravir in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of raltegravir, 444.44

M_{r2} = molecular weight of raltegravir potassium, 482.51

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Reporting threshold is 0.1%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Raltegravir amine[a]	0.42	1.0	—[b]
Raltegravir formididyl analog[c]	0.53	1.0	—[b]
Raltegravir oxalyl analog[d]	0.69	0.70	0.2

Ramipril

$C_{23}H_{32}N_2O_5$ 416.51

Cyclopenta[*b*]pyrrole-2-carboxylic acid, 1-[2-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl] octahydro-, [2*S*-[1[*R**(*R**)],2α,3aβ,6aβ]]-;
(2*S*,3a*S*,6a*S*)-1-[(*S*)-*N*-[(*S*)-1-Carboxy-3-phenylpropyl]alanyl] octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid, 1-ethyl ester [87333-19-5].

DEFINITION

Ramipril contains NLT 98.0% and NMT 102.0% of ramipril ($C_{23}H_{32}N_2O_5$), calculated on the dried basis.

IDENTIFICATION

Change to read:

• **A.** ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

• **B:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

www.webofpharma.com

ASSAY

• **PROCEDURE**

Buffer: 0.1% solution of sodium dodecyl sulfate. Adjust with phosphoric acid to a pH of 2.4 ± 0.1.

Mobile phase: Acetonitrile and *Buffer* (450:550). Adjust with phosphoric acid to a pH of 2.75 ± 0.1.

System suitability solution: 0.2 mg/mL of USP Ramipril RS and 0.01 mg/mL of USP Ramipril Related Compound A RS, in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Ramipril RS in *Mobile phase*

Sample stock solution: 1 mg/mL of Ramipril prepared as follows. Dissolve 100 mg of Ramipril in 10 mL of acetonitrile in a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: 0.2 mg/mL of Ramipril in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1.8 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 2.0 between ramipril and ramipril related compound A

Column efficiency: NLT 4000 theoretical plates for the ramipril peak

Relative standard deviation: NMT 1.0% for ramipril peak

Analysis

Samples: *Standard solution* and *Sample solution*

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for ramipril from the *Sample solution*

r_S = peak response for ramipril from the *Standard solution*

C_S = concentration of USP Ramipril RS in the *Standard solution* (mg/mL)

C_U = concentration of Ramipril in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%

• **LIMIT OF PALLADIUM**

Diluent: Water and nitric acid (997:3)

Standard stock solution: Dissolve 50 mg of palladium metal taken in a 100-mL volumetric flask, in 9 mL of hydrochloric acid, and dilute with water to volume.

Standard solutions: 0.02, 0.03, and 0.05 µg/mL of palladium in *Diluent* from *Standard stock solution*

Sample solution: 2 mg/mL of Ramipril in *Diluent*

Blank solution: 1.5 mg/mL of magnesium nitrate in *Diluent*

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 247.6 nm palladium emission line

Lamp: Palladium hollow-cathode

Flame: Air–acetylene

Injection volume: 20 µL each for the *Standard solutions* and *Sample solution*, and 10 µL for the *Blank solution*

Analysis: Concomitantly determine the absorbances of the *Standard solutions*, *Sample solution*, and the *Blank solution*.

Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of palladium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C_P, in µg/mL, of palladium in the *Sample solution*.

Calculate the percentage of palladium in the portion of Ramipril taken:

$$\text{Result} = (C_P/C_R) \times 100$$

C_P = concentration of palladium in the *Sample solution* (µg/mL)

C_R = concentration of Ramipril in the *Sample solution* (µg/mL)

Acceptance criteria: 20 ppm

• **ORGANIC IMPURITIES**

Solution A: 2.0 g of sodium perchlorate in a mixture of 800 mL of water and 0.5 mL of triethylamine. Adjust with phosphoric acid to a pH of about 3.6 ± 0.1, and add 200 mL of acetonitrile.

Solution B: 2.0 g of sodium perchlorate in a mixture of 300 mL of water and 0.5 mL of triethylamine. Adjust with phosphoric acid to a pH of about 2.6 ± 0.1, and add 700 mL of acetonitrile.

System suitability solution: 0.5 mg/mL each of USP Ramipril RS, USP Ramipril Related Compound A RS, USP Ramipril Related Compound B RS, USP Ramipril Related Compound C RS, and USP Ramipril Related Compound D RS in *Solution B*

Standard solution: 5 µg/mL of USP Ramipril RS in *Solution B*

Sample solution: 1 mg/mL of Ramipril in *Solution A*. Keep the *Sample solution* cold until injected.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
6	90	10
7	75	25
20	65	35
30	25	75
40	25	75
45	90	10
55	90	10

[NOTE—Make adjustments at the 75:25 ratio stage, if necessary, to achieve elution of ramipril 16–19 min after injection of the *Standard solution*.]

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm × 25-cm; 3-µm packing L1

Column temperature: 65°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sample solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between ramipril related compound A and ramipril, *System suitability solution*

www.webofpharma.com

Tailing factor: 0.8–2.0 for ramipril, *Sample solution*
Relative standard deviation: NMT 5.0% for ramipril, *Standard solution*

Ramipril Capsules

DEFINITION

Ramipril Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{23}H_{32}N_2O_5$.

IDENTIFICATION

Change to read:

• **A. ▲Spectroscopic Identification Tests** ⟨197⟩, *Ultraviolet-Visible Spectroscopy*: **197U**▲ (CN 1-May-2020)
Phosphoric acid solution: 30 mL/L of phosphoric acid in water
Diluent: Acetonitrile and *Phosphoric acid solution* (2:3)
Standard solution: 0.2 mg/mL of USP Ramipril RS in *Diluent*. Sonicate for 1 min, if necessary, for complete dissolution.
Sample solution: Use the *Sample solution* prepared as directed in the *Assay*.
Wavelength range: 200–400 nm
Path length: 0.1-cm cell
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **Procedure**
Buffer: Dissolve 17 g of monobasic potassium phosphate and 11.2 g of sodium perchlorate in 750 mL of water in a 1-L flask. Dilute with water to volume. Adjust with phosphoric acid to a pH of 2.3.
Solution A: Acetonitrile, *Buffer*, and water (1:2:2). [Note—Do not filter *Solution A*.]
Solution B: Acetonitrile, *Buffer*, and water (9:10:6). [Note—Do not filter *Solution B*.]
Phosphoric acid solution and **Diluent:** Prepare as directed in *Identification* test *A*.
Mobile phase: Use the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
50	0	100
51	0	100
51.1	100	0
60	100	0

Standard solution: 0.2 mg/mL of USP Ramipril RS and 0.002 mg/mL of USP Ramipril Related Compound A RS in *Diluent*

USP Monographs

www.webofpharma.com

Sample stock solution: Transfer the contents of 8 Capsules into each of the flasks as described in *Table 1*. Add Capsule shells into the flasks. Add acetonitrile per *Table 1*, and swirl to agitate the contents. Sonicate for 15 min, and mechanically shake for 10 min. Dilute with acetonitrile to volume for Capsule strengths 5.0 and 10 mg only. For 1.25- and 2.5-mg Capsules, use the solution as is without further dilution. [NOTE—Extracts from the vial cap may result in extraneous peaks.]

Table 1

Strength of Capsule (mg)	Volumetric Flask Size (mL)	Acetonitrile (mL)
1.25	50	25
2.5	100	50
5.0	100	70
10	200	140

Sample solution: Nominally 0.2 mg/mL of ramipril in *Phosphoric acid solution* from the *Sample stock solution*. Pass through a nylon filter of 0.20-µm pore size, and discard the first 2 mL of filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1 with a guard column, packing L1
Temperature: 60°
Flow rate: 1.5 mL/min
Injection size: 50 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.5 between ramipril and ramipril related compound A
Tailing factor: NMT 2.5 for the ramipril peak
Relative standard deviation: NMT 2.0% for the ramipril peak

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{23}H_{32}N_2O_5$, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ramipril from the *Sample solution*
r_S = peak response of ramipril from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
C_U = nominal concentration of ramipril in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: 0.1 N hydrochloric acid; 500 mL
Apparatus 2: 50 rpm, with sinkers. [NOTE—A suitable sinker is catalog number CAPWHT-02 available from www.QLA-LLC.com.]
Time: 30 min
Standard solution: 0.01 mg/mL of USP Ramipril RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Phosphoric acid solution: Prepare as directed in *Identification* test *A*.
Mobile phase: Acetonitrile and *Phosphoric acid solution* (2:3)

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Temperature: 30°
Flow rate: 1 mL/min
Injection size: 25 µL
Suitability requirements
Sample: *Standard solution*
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ramipril dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of ramipril is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements
Procedure for content uniformity
Phosphoric acid solution: Prepare as directed in *Identification* test *A*.
Mobile phase: Acetonitrile and *Phosphoric acid solution* (2:3). Pass through a nylon filter of 0.45-µm pore size.
Standard solution: 0.03 mg/mL of USP Ramipril RS in *Mobile phase*. Sonicate for 1 min, if not dissolved completely.
Sample solution: Transfer the contents of 1 Capsule into a suitable flask as described in *Table 2*. Add *Mobile phase* (about 50% of total volume), and sonicate for 25 min. Mechanically shake for 10 min, and dilute with *Mobile phase* to volume. Further dilute the solution from the 10-mg strength Capsule with *Mobile phase*, as shown in *Table 2*. Pass through a nylon filter of 0.20-µm pore size, and discard the first 2 mL of filtrate.

Table 2

Strength of Capsule (mg)	Volumetric Flask Size (mL)	Dilution Volume (mL)	Volumetric Flask (mL)
1.25	50	—	—
2.5	100	—	—
5.0	200	—	—
10	50	6.0	50

Chromatographic system: Proceed as directed in the test for *Dissolution*.

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{23}H_{32}N_2O_5$, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response of ramipril from the *Sample solution*
r_S = peak response of ramipril from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
C_U = concentration of ramipril in the *Sample solution* (mg/mL)

IMPURITIES

ORGANIC IMPURITIES

• **Procedure**

Buffer, Solution A, Solution B, Phosphoric acid solution, Diluent, Standard solution, and **Sample solution:** Proceed as directed in the *Assay*.

Sensitivity solution: 0.1 µg/mL of ramipril in *Diluent* from the *Standard solution*

Chromatographic system: Prepare as directed in the *Assay*.

Suitability requirements

Samples: *Standard solution* and *Sensitivity solution*

Resolution: NLT 2.5 between ramipril and ramipril related compound A, *Standard solution*

Tailing factor: NMT 2.5 for the ramipril peak, *Standard solution*

Relative standard deviation: NMT 2.0% for the ramipril peak, *Standard solution*

Signal-to-noise ratio: NLT 10 for the ramipril peak, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100 \times (1/F)$$

r_U = peak response of each individual impurity from the *Sample solution*
r_S = peak response of ramipril from the *Standard solution*
C_U = nominal concentration of ramipril in the *Sample solution* (mg/mL)
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
F = relative response factor (see *Impurity Table*)

Acceptance criteria

Individual impurities: See *Impurity Table*.

Total impurities: NMT 8.0% for Capsule strength 1.25 mg, NMT 7.0% for Capsule strength 2.5 mg, and NMT 6.0% for Capsule strengths 5 mg and 10 mg. [NOTE—Total impurities include the sum of individual specified and unspecified degradants. Disregard any peak below 0.1%.]

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Ramipril RS

USP Ramipril Related Compound A RS
(2*S*,3a*S*,6a*S*)-1-[(*S*)2-[[(*S*)1-(Methoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]-octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid.
$C_{22}H_{30}N_2O_5$ 402.48

Ramipril Tablets

DEFINITION

Ramipril Tablets contain NLT 90.0% and NMT 105.0% of the labeled amount of ramipril ($C_{23}H_{32}N_2O_5$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A or 197K▲ (CN 1-May-2020)

Sample: Finely powder a suitable number of Tablets and transfer a portion of the powder, equivalent to 100 mg of ramipril, to a suitable beaker. Add 25 mL of methanol, shake to dissolve, and pass through the filter. Evaporate the solution in air and heat to complete dryness at 105° for 1 h.

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: 2 g of sodium perchlorate in a mixture of 0.5 mL of triethylamine and 800 mL of water. Adjust with phosphoric acid to a pH of 3.6, and add 200 mL of acetonitrile.

Solution B: 2 g of sodium perchlorate in a mixture of 0.5 mL of triethylamine and 300 mL of water. Adjust with phosphoric acid to a pH of 2.6, and add 700 mL of acetonitrile.

Mobile phase: *Solution A* and *Solution B* (60:40)

Diluent: 6.8 g of monobasic sodium phosphate in 500 mL of water. Add 1000 mL each of methanol and acetonitrile. Adjust with phosphoric acid to a pH of 5.5.

Standard solution: 0.1 mg/mL of USP Ramipril RS in *Diluent*

Sample stock solution: Nominally 0.25 mg/mL of ramipril from NLT 10 Tablets prepared as follows. Add 50% of the final volume of *Diluent* to the flask and sonicate to disperse the Tablets. Sonicate for an additional 30 min and dilute with *Diluent* to volume.

Sample solution: Nominally 0.1 mg/mL of ramipril from the *Sample stock solution* in *Diluent*. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: 15 min

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ramipril ($C_{23}H_{32}N_2O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ramipril from the *Sample solution*

r_S = peak response of ramipril from the *Standard solution*

C_S = concentration of USP Ramipril RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ramipril in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–105.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard stock solution: 0.25 mg/mL of USP Ramipril RS in methanol

Standard solution: (*L*/500) mg/mL of USP Ramipril RS in *Medium* from the *Standard stock solution* where *L* is the label claim of ramipril in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Solution A, Solution B, Mobile phase, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay* except for the *Injection volume*.

Injection volume: 100 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ramipril ($C_{23}H_{32}N_2O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Ramipril RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim for ramipril (mg/Tablet)

Tolerances: NLT 80% (*Q*) of the labeled amount of ramipril ($C_{23}H_{32}N_2O_5$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A and **Solution B:** Prepare as directed in the *Assay*.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
6	70	30
30	30	70
40	30	70
45	70	30
50	70	30

System suitability solution: 50 µg/mL each of USP Ramipril RS, USP Ramipril Related Compound A RS, and USP Ramipril Related Compound D RS in *Solution B*

Sensitivity solution: 1 µg/mL of USP Ramipril RS in *Solution B*

Standard solution: 0.005 mg/mL of USP Ramipril RS in *Solution B*

Sample solution: Nominally 1 mg/mL of ramipril prepared as follows. Finely powder NLT 20 Tablets and transfer a portion of the powder to an appropriate volumetric flask. Add about 60% of the flask volume of *Solution A*, and sonicate for 30 min with intermittent shaking to dissolve. Dilute with *Solution A* to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm × 25-cm; 3-µm packing L1

Column temperature: 65°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution*

Suitability requirements

C: A solution of it meets the requirements of the tests for *Chloride* ⟨191⟩.
pH ⟨791⟩: between 4.5 and 6.0, in a solution (1 in 100).
Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.75% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.

Chromatographic purity—
Diluent, Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*
Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*
Test solution—Prepare as directed for *Assay preparation* in the *Assay.*
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the ranitidine peak and the peaks due to impurities and degradation products listed in the table below.

Name	Relative Retention Time
Ranitidine simple nitroacetamide[1]	0.14
Ranitidine oxime[2]	0.21
Ranitidine amino alcohol[3]	0.45
Ranitidine diamine[4]	0.57
Ranitidine *S*-oxide[5]	0.64
Ranitidine *N*-oxide[6]	0.72
Ranitidine complex nitroacetamide[7]	0.84
Ranitidine formaldehyde adduct[8]	1.36
Ranitidine *bis*-compound[9]	1.75

[1] *N*-Methyl-2-nitroacetamide.
[2] 3-(Methylamino)-5,6-dihydro-2*H*-1,4-thiazin-2-one oxime.
[3] {5-[(Dimethylamino)methyl]furan-2-yl}methanol.
[4] 5-{[(2-Aminoethyl)thio]methyl}-*N*,*N*-dimethyl-2-furanmethanamine (ranitidine related compound A).
[5] *N*-{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl)sulfinyl]ethyl}-*N'*-methyl-2-nitro-1,1-ethenediamine (ranitidine related compound C).
[6] *N*,*N*-Dimethyl(5-{[(2-{[1-(methylamino)-2-nitroethenyl]amino}ethyl) sulphanyl]methyl}furan-2-yl)methanamine *N*-oxide.
[7] *N*-{2-[({5-[(Dimethylamino)methyl]furan-2-yl}methyl)sulphanyl]ethyl}-2-nitroacetamide.
[8] 2,2'-Methylenebis(*N*-{2-[({5-[(dimethylamino)methyl]furan-2-yl}methyl)-sulphanyl]ethyl}-*N'*-methyl-2-nitroethene-1,1-diamine).
[9] *N*,*N'*-bis{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl)thio]ethyl}-2-nitro-1,1-ethenediamine (ranitidine related compound B).

Measure the responses for the major peaks, and calculate the percentage of each impurity in the portion of Ranitidine Hydrochloride taken by the formula:

$$100CV/W(r_i/r_S)$$

in which *C* is the concentration, in mg per mL, of ranitidine hydrochloride in the *Standard solution; V* is the volume, in mL, of the *Test solution; W* is the weight, in mg, of Ranitidine Hydrochloride taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the ranitidine peak response obtained from the *Standard solution:* not more than 0.3% of ranitidine bis-compound is found, not more than 0.1% of any other single impurity is found, and not more than 0.5% of total impurities is found. The reporting level for impurities is 0.05%.

Assay—
Phosphate buffer—Place approximately 1900 mL of water in a 2.0-L volumetric flask, accurately add 6.8 mL of phosphoric acid, and mix. Accurately add 8.6 mL of 50% sodium hydroxide solution, and dilute with water to volume. If necessary, adjust with 50% sodium hydroxide solution or phosphoric acid to a pH of 7.1, and filter.
Solution A—Prepare a mixture of *Phosphate buffer* and acetonitrile (98:2).
Solution B—Prepare a mixture of *Phosphate buffer* and acetonitrile (78:22).
Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Diluent—Use *Solution A.*
Standard preparation—Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.125 mg of ranitidine hydrochloride per mL.
Resolution solution—Transfer about 1.3 mg of USP Ranitidine Resolution Mixture RS to a 10-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.
[NOTE—USP Ranitidine Resolution Mixture RS contains ranitidine hydrochloride and four related impurities: ranitidine amino alcohol hemifumarate, ranitidine diamine hemifumarate, ranitidine *N*-oxide, and ranitidine complex nitroacetamide.]
Assay preparation—Transfer about 25 mg of Ranitidine Hydrochloride, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 10-cm column containing 3.5-µm packing L1 that is stable from pH 1 to 12. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	100→0	0→100	linear gradient
10–15	0	100	isocratic
15–16	0→100	100→0	linear gradient
16–20	100	0	re-equilibration

Chromatograph the *Resolution solution,* and identify the peaks using the table of impurities and degradation products (found above): the resolution, *R,* between the peaks for ranitidine *N*-oxide and ranitidine complex nitroacetamide is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of $C_{13}H_{22}N_4O_3S \cdot HCl$ in the portion of Ranitidine Hydrochloride taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of ranitidine hydrochloride in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

USP Monographs

www.webofpharma.com

Ranitidine Injection

» Ranitidine Injection is a sterile solution of Ranitidine Hydrochloride in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ranitidine ($C_{13}H_{22}N_4O_3S$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers of Type I glass, protected from light. Store below 30°. Do not freeze.
Labeling—Label Injection to state both the content of the active moiety and the content of the salt used in formulating the article.
USP Reference standards ⟨11⟩—
USP Ranitidine Hydrochloride RS
USP Ranitidine Related Compound A RS
5-[[(2-Aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furanmethanamine, hemifumarate salt.
USP Ranitidine Related Compound C RS
N-{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl) sulfinyl]ethyl}-*N*′-methyl-2-nitro-1,1-ethenediamine.

Identification—
A: The R_F value of the principal spot observed in the chromatogram of the *Test preparation* obtained as directed in the *Chromatographic purity* test corresponds to that obtained from the *Standard preparation.*
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*
Bacterial Endotoxins Test ⟨85⟩—It contains not more than 7.00 USP Endotoxin Units per mg of ranitidine.
pH ⟨791⟩: between 6.7 and 7.3.
Particulate Matter in Injections ⟨788⟩: meets the requirements under small-volume injections.

Chromatographic purity—
Test preparation—Dilute Injection quantitatively with water, if necessary, to obtain a solution containing 25 mg of ranitidine per mL. [NOTE—Use Injection of lower concentration without dilution as directed under *Procedure.*]
Standard preparation—Dissolve USP Ranitidine Hydrochloride RS in water to obtain a solution having a known concentration of 560 µg per mL. Dilute portions of this *Standard preparation* quantitatively with water to obtain solutions having concentrations of 280 µg per mL (*Diluted standard preparation A*), 140 µg per mL (*Diluted standard preparation B*), 84 µg per mL (*Diluted standard preparation C*), 28 µg per mL (*Diluted standard preparation D*), and 14 µg per mL (*Diluted standard preparation E*), respectively.
Resolution preparation—Dissolve USP Ranitidine Related Compound A RS in methanol to obtain a solution having a known concentration of 1.27 mg per mL.
Procedure—Apply separately 10 µL of the *Standard preparation, Diluted standard preparations A, B, C, D* and *E,* and the required volume of the *Test preparation,* equivalent to 250 µg of ranitidine, to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. In addition, apply separately a further loading of the same volume of the *Test preparation* to the same plate, and on top of this application, apply 10 µL of the *Resolution preparation.* Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25:15:5:1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparation* and *Diluted standard preparations* (*A, B, C, D,* and *E*): the system suitability requirements are met when there is complete resolution between the primary spots of the *Test preparation,* and the *Resolution preparation* and if a spot is observed in the chromatogram of *Diluted standard preparation E.* The major secondary spot is not greater in size or intensity than the principal spot produced by the *Standard preparation* (2.0%), and no other secondary spot is greater in size or intensity than the principal spot produced by *Diluted standard preparation A* (1.0%). The sum of the intensities of all secondary spots obtained from the *Test preparation,* corresponds to not more than 5.0%.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Mobile phase—Prepare a filtered and degassed mixture of methanol and 0.1 M aqueous ammonium acetate (85:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.112 mg (equivalent to 0.100 mg of ranitidine base) per mL.
System suitability solution—Dissolve accurately weighed quantities of USP Ranitidine Hydrochloride RS and USP Ranitidine Related Compound C RS in *Mobile phase* to obtain a solution having known concentrations of about 0.112 mg per mL and 0.01 mg per mL, respectively.
Assay preparation—Dilute an accurately measured volume of Injection, quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of 0.1 mg of ranitidine per mL.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 322-nm detector and a 4.6-mm × 20- to 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ranitidine hydrochloride and *N*-[2-[[[5-[(dimethylamino)methyl]-2-furanyl]methyl]sulfinyl]ethyl]-*N*′-methyl-2-nitro-1,1-ethenediamine (ranitidine related compound C) is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the ranitidine hydrochloride peak is not more than 2.0; the column efficiency determined from the ranitidine hydrochloride peak is not less than 700 theoretical plates; and the relative standard deviation for replicate injections is not more than 2%.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{22}N_4O_3S$ in the portion of Injection taken by the formula:

$$(314.40/350.87)(L/D)(C)(r_U/r_S)$$

in which 314.40 and 350.87 are the molecular weights of ranitidine and ranitidine hydrochloride, respectively; *L* is the labeled quantity of ranitidine in the Injection taken; *D* is the concentration, in mg per mL, of ranitidine in the *Assay preparation* on the basis of the labeled quantity and the extent

www.webofpharma.com

of dilution; *C* is the concentration, in mg per mL, of USP Ranitidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Ranitidine Oral Solution

» Ranitidine Oral Solution is a solution of Ranitidine Hydrochloride in water. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ranitidine ($C_{13}H_{22}N_4O_3S$).

Packaging and storage—Preserve in tight, light-resistant containers. Store below 25°. Do not freeze.

USP Reference standards ⟨11⟩—
USP Ranitidine Hydrochloride RS
USP Ranitidine Related Compound A RS
5-[[(2-Aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furanmethanamine, hemifumarate salt.
USP Ranitidine Related Compound C RS
N-{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl) sulfinyl]ethyl}-*N'*-methyl-2-nitro-1,1-ethenediamine.

Identification—

A: The R_F value of the principal spot observed in the chromatogram of the *Test preparation* obtained as directed in the *Chromatographic purity* test corresponds to that obtained from the *Standard preparation.*

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial enumeration tests ⟨61⟩ **and *Tests for specified microorganisms*** ⟨62⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli;* and the total aerobic microbial count does not exceed 100 cfu per mL.

pH ⟨791⟩: between 6.7 and 7.5.

Chromatographic purity—

Test preparation— [NOTE—Apply a quantity of extractives from Oral Solution to the chromatographic plate so as to achieve a nominal loading of 200 µg of ranitidine.] Transfer a weighed quantity of Oral Solution, equivalent to 10 mg of ranitidine, to a suitable syringe. Attach the tip of the syringe to the top of a cartridge (11 mm × 12 mm) of volume 0.5 mL containing 0.4 g of an L1 packing for high-pressure liquid chromatography that has been previously prepared by passage of 10 mL of methanol followed by passage of 20 mL of 0.5 M ammonia solution. Add 2.0 mL of 0.5 M ammonia solution to the syringe and force the mixture slowly through the cartridge. Repeat with 2 further 3-mL portions of 0.5 M ammonia solution. Discard all the liquid that has traversed the cartridge. Pass 5 mL of a mixture of 0.1 M hydrochloric acid and methanol (3:1) through the cartridge, and collect the eluant in a clean round-bottom, 25-mL flask. Repeat this with another 5-mL portion of the same eluting mixture and collect the eluant in the same flask. Evaporate the contents of the flask to dryness at a temperature not exceeding 30°. Redissolve the residue in 1.0 mL of a mixture of methanol and water (50:50).

Standard preparation—Dissolve USP Ranitidine Hydrochloride RS in a mixture of methanol and water (50:50) to obtain a solution having a known concentration of 448 µg (equivalent to 400 µg of ranitidine) per mL. Dilute portions of this *Standard preparation* quantitatively with the mixture of methanol and water (50:50) to obtain solutions having concentrations of 224 µg per mL *(Diluted standard preparation A),* 112 µg per mL *(Diluted standard preparation B),* 56 µg per mL *(Diluted standard preparation C),* 22 µg per mL *(Diluted standard preparation D),* and 11 µg per mL *(Diluted standard preparation E),* respectively.

Resolution preparation—Dissolve USP Ranitidine Related Compound A RS in methanol to obtain a solution having a known concentration of 1.27 mg per mL.

Procedure—Apply separately 10 µL of the *Standard preparation,* the *Diluted standard preparations (A, B, C, D,* and *E),* and 20 µL (superposition of 2 × 10 µL) of the *Test preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. In addition, apply separately a further loading of 10 µL of the *Test preparation* to the same plate, and on top of this application, apply 10 µL of the *Resolution preparation.* Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25:15:5:1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparation* and *Diluted standard preparations (A, B, C, D,* and *E):* the system suitability requirements are met when there is complete resolution between the primary spots of the *Test preparation* and the *Resolution preparation* and if a spot is observed in the chro matogram of *Diluted standard preparation E.* The major secondary spot is not greater in size or intensity than the principal spot produced by the *Standard preparation* (2.0%), and no other secondary spot is greater in size or intensity than the principal spot produced by *Diluted standard preparation A* (1.0%). The sum of the intensities of all secondary spots obtained from the *Test preparation* corresponds to not more than 5.0%. [NOTE—Spots established as arising from other components in the formulation are to be ignored.]

Assay—

Mobile phase, Standard preparation, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Ranitidine Injection,* the chromatographic column being fitted with a suitable pre-column also containing packing L1.

Assay preparation—Dilute an accurately measured quantity of Oral Solution, quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of 0.1 mg of ranitidine per mL.

Procedure—Separately inject an equal quantity (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of ranitidine ($C_{13}H_{22}N_4O_3S$) in the portion of Oral Solution taken by the formula:

$$(314.40/350.87)(L/D)(C)(r_U/r_S)$$

in which 314.40 and 350.87 are the molecular weights of ranitidine and ranitidine hydrochloride respectively; *L* is the labeled quantity of ranitidine in the Oral Solution taken; *D* is the concentration, in mg per mL, of ranitidine in the *Assay preparation,* on the basis of the labeled quantity and the extent of dilution; *C* is the concentration, in mg per mL, of USP Ranitidine Hydrochloride RS in the *Standard preparation;* and

USP Monographs

www.webofpharma.com

r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ranitidine Tablets

» Ranitidine Tablets contain an amount of ranitidine hydrochloride ($C_{13}H_{22}N_4O_3S \cdot HCl$) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ranitidine ($C_{13}H_{22}N_4O_3S$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Ranitidine Hydrochloride RS
USP Ranitidine Related Compound A RS
5-[[(2-Aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furanmethanamine, hemifumarate salt.
USP Ranitidine Related Compound C RS
N-{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl)sulfinyl]ethyl}-*N'*-methyl-2-nitro-1,1-ethenediamine.

Identification—
A: The R_F value of the principal spot observed in the chromatogram of the *Test preparation* obtained as directed in the *Chromatographic purity* test corresponds to that obtained from the *Standard preparation*.
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.
C: Shake a quantity of crushed Tablets, equivalent to about 100 mg of ranitidine, with 2 mL of water, and filter: the filtrate responds to the tests for *Chloride* ⟨191⟩.

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_{13}H_{22}N_4O_3S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 314 nm using filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Ranitidine Hydrochloride RS in the same medium.
Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{13}H_{22}N_4O_3S$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.

Chromatographic purity—
Test preparation—Prepare a filtered solution in methanol containing 20 mg of ranitidine per mL (equivalent to 22.4 mg of ranitidine hydrochloride per mL) by shaking an appropriate number of Tablets in a suitable volume of methanol until the tablets have disintegrated completely.
Standard preparations—Dissolve USP Ranitidine Hydrochloride RS in methanol to obtain a solution having a known concentration of 0.22 mg per mL. Dilute portions of this *Standard preparation* quantitatively with methanol to obtain solutions having concentrations of 110 µg per mL (*Diluted standard preparation A*), 66 µg per mL (*Diluted standard preparation B*), 22 µg per mL (*Diluted standard preparation C*), and 11 µg per mL (*Diluted standard preparation D*), respectively.
Resolution preparation—Dissolve USP Ranitidine Related Compound A RS, 5-[[(2-aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furanmethanamine, hemifumarate salt, in methanol to obtain a solution having a known concentration of 1.27 mg per mL.
Procedure—Apply separately 10 µL of the *Test preparation*, the *Standard preparation*, and *Diluted standard preparations A*, *B*, *C*, and *D* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. In addition, apply separately 10 µL of the *Test preparation* to the same plate, and on top of this application, apply 10 µL of the *Resolution preparation*. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25:15:5:1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and air-dry. Expose the plate to iodine vapor in a closed chamber until the chromatogram is fully revealed. Examine the plate, and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparation* and *Diluted standard preparations A*, *B*, *C*, and *D*: the system suitability requirements are met if there is complete resolution between the primary spots in the chromatogram of the combined *Test preparation* and the *Resolution preparation*, and if a spot is observed in the chromatogram of *Diluted standard preparation D*. No single secondary spot exhibits an intensity greater than that of *Diluted standard preparation A* (0.5%), and no other secondary spot exhibits an intensity greater than that of *Diluted standard preparation B* (0.3%). The sum of the intensities of all secondary spots obtained from the *Test preparation* correspond to not more than 2.0%.

Assay—
Mobile phase, *Standard preparation*, *System suitability solution*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Ranitidine Injection*.
Assay preparation—Transfer 10 Tablets to a minimum of 250 mL of *Mobile phase*, accurately measured. Shake the mixture until the Tablets have disintegrated completely, and filter. Dilute the filtrate quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of ranitidine similar to that of the *Standard preparation*.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{22}N_4O_3S$ in the portion of Tablets taken by the formula:

$$(314.40/350.87)(L/D)(C)(r_U/r_S)$$

in which 314.40 and 350.87 are the molecular weights of ranitidine and ranitidine hydrochloride, respectively; *L* is the labeled amount, in mg, of ranitidine in each tablet; *D* is the concentration, in mg per mL, of ranitidine in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; C is the concentration, in mg per mL, of USP Ranitidine Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

www.webofpharma.com

Ranitidine in Sodium Chloride Injection

» Ranitidine in Sodium Chloride Injection is a sterile solution of Ranitidine Hydrochloride and Sodium Chloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of both ranitidine ($C_{13}H_{22}N_4O_3S$) and sodium chloride.

Packaging and storage—Preserve in glass containers, preferably of Type I or Type II glass, or in containers of suitable plastic, protected from light. Store at a temperature between 2° and 25°. Do not freeze.

USP Reference standards ⟨11⟩—
USP Ranitidine Hydrochloride RS
USP Ranitidine Related Compound A RS
5-[[(2-Aminoethyl)thio]methyl]-*N*,*N*-dimethyl-2-furanmethanamine, hemifumarate salt.
USP Ranitidine Related Compound C RS
N-{2-[({5-[(Dimethylamino)methyl]-2-furanyl}methyl) sulfinyl]ethyl}-*N'*-methyl-2-nitro-1,1-ethenediamine.

Identification—
A: The R_F value of the principal spot observed in the chromatogram of the *Test preparation* obtained as directed in the *Chromatographic purity* test corresponds to that obtained from the *Standard preparation.*
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay.*
C: Meets the requirements of the tests for *Sodium* ⟨191⟩ and for *Chloride* ⟨191⟩.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 7.0 USP Endotoxin Units per mg of ranitidine.

pH ⟨791⟩: between 6.7 and 7.3.

Chromatographic purity—
Test preparation— [NOTE—Apply a quantity of extractives from Injection to the chromatographic plate to achieve a nominal loading of 200 µg of ranitidine.] Transfer an accurately measured volume of Injection, equivalent to 10 mg of ranitidine, to a suitable flask, add about 5 times this volume of alcohol, and evaporate to dryness at a temperature not exceeding 30°. Redissolve the residue in 1.0 mL of a mixture of methanol and water (50:50).
Standard preparation—Dissolve USP Ranitidine Hydrochloride RS in a mixture of methanol and water (50:50) to obtain a *Standard preparation* having a known concentration of 672 µg (equivalent to 600 µg of ranitidine base) per mL. Dilute portions of this *Standard preparation* quantitatively, and stepwise if necessary, with the mixture of methanol and water (50:50) to obtain solutions having concentrations of 448 µg per mL (*Diluted standard preparation A*), 224 µg per mL (*Diluted standard preparation B*), 112 µg per mL (*Diluted standard preparation C*), 56 µg per mL (*Diluted standard preparation D*), and 11 µg per mL (*Diluted standard preparation E*), respectively.
Resolution preparation—Dissolve USP Ranitidine Related Compound A RS in methanol to obtain a solution having a known concentration of 1.27 mg per mL.
Procedure—Apply separately 10 µL of the *Standard preparation*, the *Diluted standard preparations* (*A*, *B*, *C*, *D*, and *E*) and 20 µL (superposition of 2 × 10 µL) of the *Test preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. In addition, apply separately a further loading of 10 µL of the *Test preparation* to the same plate, and on top of this application, apply 10 µL of the *Resolution preparation.* Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25:15:5:1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparation* and *Diluted standard preparations* (*A*, *B*, *C*, *D*, and *E*): the system suitability requirements are met when there is complete resolution between the primary spots of the *Test preparation* and the *Resolution preparation* and if a spot is observed in the chromatogram of *Diluted standard preparation E*. The major secondary spot is not greater in size or in intensity than the principal spot produced by the *Standard preparation* (3.0%), and no other secondary spot is greater in size or intensity than the principal spot produced by *Diluted standard preparation A* (2.0%). The sum of the intensities of all secondary spots obtained from the *Test preparation* corresponds to not more than 6.0%.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay for ranitidine—
Mobile phase, Standard preparation, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay* under *Ranitidine Injection.*
Assay preparation—Dilute an accurately measured volume of Injection, quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of 0.1 mg of ranitidine per mL.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{22}N_4O_3S$ in the portion of Injection taken by the formula:

$$(314.40/350.87)(L/D)(C)(r_U/r_S)$$

in which 314.40 and 350.87 are the molecular weights of ranitidine and ranitidine hydrochloride, respectively; *L* is the labeled quantity of ranitidine in the Injection taken; *D* is the concentration, in mg per mL, of ranitidine in the *Assay preparation*, on the basis of the labeled quantity and the extent of dilution; *C* is the concentration, in mg per mL, of USP Ranitidine Hydrochloride RS in the *Standard preparation* and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for sodium chloride—Dilute an accurately measured volume of Injection, quantitatively and stepwise if necessary, with water to obtain a suitable volume of a solution having a concentration of about 0.5 mg of sodium chloride per mL. Titrate with 0.1 N silver nitrate VS using a silver-silver chloride electrode. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride. From the determined concentration per mL, subtract the quantity (35.453/314.40)*W* so as to correct for the chloride present as ranitidine hydrochloride where *W* is the quantity, in mg per mL, of ranitidine as determined in the *Assay for ranitidine.* Multiplication of the answer by 1.648 gives the amount of sodium chloride per mL.

USP Monographs

www.webofpharma.com

Rauwolfia Serpentina

DEFINITION

Rauwolfia Serpentina is the dried root of *Rauwolfia* (L.) Bentham ex Kurz (Fam. Apocynaceae), sometimes having fragments of rhizome and aerial stem bases attached. It contains NLT 0.15% of reserpine–rescinnamine group alkaloids, calculated as reserpine.

IDENTIFICATION

• **A. Chemical Identification**

[Note—In these analyses, use formamide treated as directed if it has an ammoniacal odor.]

Immobile solvent: Formamide and acetone (30:70)

Mobile solvent A: Isooctane, carbon tetrachloride, piperidine, and tertiary butyl alcohol (90:60:4:2)

Mobile solvent B: Chloroform, isooctane, and tertiary butyl alcohol (75:75:2)

Spray solution: 250 mg/mL of trichloroacetic acid in methanol

Standard solution: 200 mg/mL of USP Rauwolfia Serpentina RS in alcohol. [Note—Warm USP Rauwolfia Serpentina RS with alcohol at 55°–65° for 30 min, with occasional mixing. Cool, and filter.]

Sample solution: Reduce 10 g of Rauwolfia Serpentina root to a fine powder. Treat a 1-g portion as in the preparation of the *Standard solution*.

Analysis A: Line the sides of a chromatographic chamber suitable for ascending chromatography (see *Chromatography* ⟨621⟩) with blotting paper. Transfer *Mobile solvent A* to the bottom of the container, and cover the chamber. Immerse a 20-cm × 20-cm sheet of filter paper (Whatman No. 1 or equivalent) in the *Immobile solvent*, and blot between paper toweling. Allow the acetone solvent to evaporate completely. Apply 1-µL portions of the *Sample solution* and the *Standard solution* to a line 2.5 cm from the bottom of the filter paper. Allow to dry. Apply a 2-µL portion of the *Immobile solvent* to each spot, allow to dry, and suspend the paper so that it dips into the *Mobile solvent*. Cover the chamber and after 1 h, when the *Mobile solvent* has risen approximately seven-eighths of the height of the paper, remove the chromatogram and dry at 90° in a current of air. Spray the paper lightly and evenly with the *Spray solution*, and dry at 90° for 10 min.

Analysis B: Use the apparatus described in *Analysis A*, but containing a glass trough with 2 mL of ammonium hydroxide to saturate the atmosphere of the tank with ammonia (NH_3). Transfer *Mobile solvent B* to the bottom of the tank outside the trough. Complete the test as described in *Analysis A*, omitting the *Spray solution*. Examine both chromatograms under UV light, and note the fluorescent spots.

Acceptance criteria: In both chromatograms, the *Sample solution* yields spots corresponding in position and color to those from the *Standard solution*.

COMPOSITION

• **Procedure**

Apparatus: A medium-sized continuous-extraction apparatus provided with a 250-mL flask and a 35-mm × 80-mm thimble is convenient, although a smaller apparatus may be used.

[Note—Protect the flask and thimble and all solutions of Rauwolfia Serpentina alkaloids from direct or strong light.]

Solvents: Alcohol, chloroform, and 1,1,1-trichloroethane. [Note—Use 1,1,1-trichloroethane with a boiling range between 73° and 76°.]

Standard stock solution: Dissolve 20.0 mg of USP Reserpine RS in 25 mL of hot alcohol, cool, dilute with alcohol to 50.0 mL, and mix. When stored in a tightly-stoppered, light-resistant bottle in the dark, this solution is chromogenically stable for several weeks.

Standard solution: Dilute 5.0 mL of the *Standard stock solution* with alcohol to 100.0 mL, and mix before using.

Analysis: Extract 2.5 g of finely powdered Rauwolfia Serpentina, accurately weighed, in a continuous-extraction apparatus for 4 h. Use 100 mL of vigorously boiling alcohol as solvent, and a few boiling chips to prevent bumping. Wash the extract into a 100-mL volumetric flask with alcohol, cool, dilute with alcohol to volume, and mix. Transfer 20.0 mL to a separator containing 200 mL of 0.5 N sulfuric acid, mix, and extract with three 25-mL portions of 1,1,1-trichloroethane. Lubricate stopcocks only with lubricants insoluble in trichloroethane or chloroform (polytef stopcocks are satisfactory). Drain the lower phase as completely as possible. Wash each of the 1,1,1-trichloroethane extracts in a second separator containing 50 mL of 0.5 N sulfuric acid, and discard the trichloroethane extracts.

Extract the weakly basic alkaloids from the first acid solution with 25-, 15-, 15-, 10-, 10-, and 10-mL portions of chloroform. Wash each chloroform extract with the acid in the second separator, then with two 10-mL portions of sodium bicarbonate solution (1 in 50) in two additional separators. Filter the chloroform extracts through chloroform-washed cotton into a 100-mL volumetric flask containing 10 mL of alcohol. Dilute with alcohol to volume, and mix. Transfer duplicate 10.0-mL aliquots to glass-stoppered, 25-mL conical flasks, and mix with 4 mL of alcohol. Evaporate with gentle heating almost to dryness, place in a vacuum desiccator, and evaporate to dryness. Dissolve the residues by agitating with 5.0 mL of alcohol.

Transfer duplicate 5.0-mL aliquots of the *Standard solution* to flasks. Add 2.0 mL of 0.5 N sulfuric acid to one of the sample flasks and to one of the standard flasks (the blanks). Add to the other flasks 1.0 mL of 0.5 N sulfuric acid and 1.0 mL of sodium nitrite solution (3 in 1000). Mix the contents of each flask, and warm in a water bath at 50°–60° for 20 min. Cool, add to each flask 500 µL of sulfamic acid solution (1 in 20), and mix. After stabilization of the solution colors, determine their absorbances in 1-cm cells at 390 nm, relative to a blank consisting of a mixture of alcohol and water (2:1).

Calculate the quantity of reserpine–rescinnamine group alkaloids, in mg, in the sample taken:

$$\text{Result} = 5(A - A_0)/(S - S_0)$$

A = absorbance of the nitrite-treated sample
A_0 = absorbance of the sample blank
S = corresponding absorbance of the solution from the respective *Standard solution* aliquot
S_0 = corresponding absorbance of the blank from the respective *Standard solution* aliquot

Acceptance criteria: NLT 0.15% of reserpine–rescinnamine group alkaloids, calculated as reserpine

CONTAMINANTS

• **Articles of Botanical Origin** ⟨561⟩, *Pesticide Residue Analysis*: Meets the requirements

SPECIFIC TESTS

• **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩: Rauwolfia Serpentina (as a ground root) meets the requirements of the tests for absence of *Salmonella* species.

www.webofpharma.com

- **ARTICLES OF BOTANICAL ORIGIN** ⟨561⟩, *Methods of Analysis, Foreign Organic Matter*: NMT 2.0% of stems and NMT 3.0% of other foreign organic matter
- **ARTICLES OF BOTANICAL ORIGIN** ⟨561⟩, *Methods of Analysis, Acid-Insoluble Ash*: NMT 2.0%
- **LOSS ON DRYING** ⟨731⟩

Analysis: Dry at 100° to constant weight.

Acceptance criteria: It loses NMT 12.0% of its weight.

- **BOTANICAL CHARACTERISTICS**

Macroscopic

Unground Rauwolfia Serpentina root: This occurs as segments usually 5–15 cm in length (pieces sometimes shorter) and 3–20 mm in diameter. The pieces are subcylindrical to tapering, rather tortuous or curved, rarely branched, but bearing occasional twisted rootlets, which are larger, more abundant, and more rigid and woody on the thicker parts of the roots. Externally: light brown to grayish yellow to grayish brown; dull, rough, or slightly wrinkled longitudinally yet peculiarly smooth to the touch; occasionally showing small circular rootlet scars in the larger pieces, with some exfoliation of the bark in small areas to reveal the paler wood beneath. When scraped, the bark separates readily from the wood. Fracture short, but irregular, the longer pieces readily breaking with a snap, slightly fibrous marginally. The freshly fractured surfaces show a rather thin layer of grayish yellow bark, with the pale yellowish white wood constituting 80% of the radius. The smoothed transverse surface of larger pieces shows a finely radiate stele with three or more clearly marked growth rings; a small knoblike protuberance is frequently noticeable at the center. The wood is hard and of relatively low density. The odor is indistinct, earthy, and reminiscent of stored white potatoes.

Microscopic

Rauwolfia Serpentina root: A transverse section shows externally 2–8 alternating strata of cork cells, the strata with larger cells alternating with strata made up of markedly smaller cells (distinction from *R. canescens*). Each stratum composed of smaller cells includes 3–5 tangentially arranged cell layers; each stratum made up of larger cells includes 1–6 tangential layers. In a cross-sectional view, the largest central cells of the larger cell group measure 40–90 µm radially and up to 75 µm tangentially (although usually smaller); the cells of the smaller cell groups measure 5–20 µm radially and up to 75 µm tangentially. The walls are thin and suberized. The secondary cortex consists of several rows of tangentially elongated to isodiametric parenchyma cells, most being densely filled with starch grains; others (the short latex cells) occur singly or in short series and contain brown resin masses. The secondary phloem is relatively narrow and is made up of phloem parenchyma (bearing starch grains and less commonly tabular to angular calcium oxalate crystals up to 20 µm in length; also, occasionally, with some brown resin masses in outer cells and phloem rays) interlaid with scattered sieve tissue and traversed by phloem rays 2–4 cells in width. Sclerenchyma cells (stone cells and fibers) are absent in root (distinction from other species of *Rauwolfia*). Cambium is indistinct, narrow, dark, and wavering. The secondary xylem represents the large bulk of the root and shows one or more prominent annual rings with a denser core of wood 500 µm across at the center. The xylem is composed of many wood wedges separated by xylem rays, and on closer examination reveals vessels in interrupted radial rows, much xylem parenchyma, many large-celled xylem rays, few wood fibers, and tracheids, all lignified-walled. The xylem fibers occur in both tangential and radial rows. The xylem rays are 1–12, occasionally up to 16, cells in width.

Rauwolfia Serpentina rhizome: This is similar to that of the root except for the presence of a prominent cortex, pericycle fibers, bicollateral vascular bundles, and a small central pith. The pericycle fibers occur singly or in groups of 2–5, and have thick, nonlignified walls and tapering, often lobed ends, with subterminal enlargements having thin walls and broad lumina. Vessel elements up to 485 µm are found. The xylem rays are 1–4 cells in width, with lignified and pitted walls. Internal phloem strands occur embedded in the outer region of the pith. The xylem fibers are somewhat less wavy than those of the root. The pith consists of starch parenchyma cells, among which are scattered short latex cells with yellowish contents stained brown with iodine TS.

Ground Rauwolfia Serpentina root: This is brownish to reddish gray in color. Present are very numerous starch grains (mostly simple, two- to three-compound, occasionally four-compound); simple grains spheroid, ovate, muller-shaped, plano- to angular-convex, or irregular; hilum simple, Y-shaped, stellate, or irregularly cleft; unaltered grains 6–34 µm (average 20 µm) in diameter, mostly in the lower range (maximum sizes larger than in *R. canescens* and *R. micrantha*); altered grains up to 50 µm in diameter; large unaltered grains show polarization cross clearly; calcium oxalate prisms and cluster crystals scattered, 10–15 µm in size; brown resin masses and yellowish granular secretion masses occur occasionally; isolated cork cells elongated, up to 90 µm in length; phelloderm and phloem parenchyma cells similar in appearance; vessels subcylindrical, up to 360 µm in length and 20–57 µm in diameter (narrower than in *R. canescens*) (the wall markings generally consist of simple pits, with bordered pits adjacent to xylem ray cells), the vessel end walls oblique to transverse, generally with openings in the end walls, some vessels showing tyloses; tracheids pitted, with moderately thick, tapering, beaded walls, with relatively broad lumina, polygonal in cross-section; xylem parenchyma cells with moderately thick walls with simple circular pits, cells polygonal in cross-section, bearing considerable starch; phloem and xylem-ray cells with pitted walls bearing much starch, sometimes with brown resin masses, xylem fibers with thick, heavily lignified walls showing small transverse and oblique linear pits and pointed simple to bifurcate ends, measuring 200–750 µm in length (shorter than in *R. micrantha* and *R. canescens*). No phloem fibers or sclereids are present in root (colorless nonlignified pericycle or primary phloem fibers, single or in small groups, may be present from rhizome or stem tissues).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature, in a dry place, secure against insect attack.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Rauwolfia Serpentina RS
USP Reserpine RS

Powdered Rauwolfia Serpentina

» Powdered Rauwolfia Serpentina is Rauwolfia Serpentina reduced to a fine or a very fine powder, and adjusted, if necessary, to conform to the

USP Monographs

www.webofpharma.com

requirements for reserpine-rescinnamine group alkaloids by admixture with lactose or starch or with a powdered rauwolfia serpentina containing a higher or lower content of these alkaloids. It contains not less than 0.15 percent and not more than 0.20 percent of reserpine-rescinnamine group alkaloids, calculated as reserpine.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature, in a dry place, secure against insect attack (see *Preservation* under *Vegetable and Animal Drugs*, and the *General Notices*).
USP Reference standards ⟨11⟩—
USP Rauwolfia Serpentina RS
USP Reserpine RS
Identification—It conforms to the requirements for *Ground Rauwolfia Serpentina root* under *Botanic characteristics* and meets the requirements of the test for *Chemical identification* under *Rauwolfia Serpentina*.
Microbial enumeration tests ⟨61⟩ **and *Tests for specified microorganisms*** ⟨62⟩—It meets the requirements of the test for absence of *Salmonella* species.
Acid-insoluble ash ⟨561⟩: not more than 2.0%.
Assay—Proceed with Powdered Rauwolfia Serpentina as directed in the *Assay* under *Rauwolfia Serpentina*.

Rauwolfia Serpentina Tablets

» Rauwolfia Serpentina Tablets contain an amount of reserpine-rescinnamine group alkaloids, calculated as reserpine, equivalent to not less than 0.15 percent and not more than 0.20 percent of the labeled amount of powdered rauwolfia serpentina.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Rauwolfia Serpentina RS
USP Reserpine RS
Identification—The powdered rauwolfia serpentina in the Tablets conforms to the requirements for *Ground Rauwolfia Serpentina root* under *Botanic characteristics* and meets the requirements of the test for *Chemical identification* under *Rauwolfia Serpentina*.
Microbial enumeration tests ⟨61⟩ **and *Tests for specified microorganisms*** ⟨62⟩—Tablets meet the requirements of the test for absence of *Salmonella* species.
Disintegration ⟨701⟩: 1 hour, with disks using simulated gastric fluid TS, without enzyme.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Assay—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of this powder, equivalent to 2.5 g of powdered rauwolfia serpentina, and proceed as directed for *Procedure* in the *Assay* under *Rauwolfia Serpentina*.

Purified Rayon

» Purified Rayon is a fibrous form of bleached, regenerated cellulose.

Alkalinity or acidity—Immerse about 10 g in 100 mL of recently boiled and cooled water, and decant 25-mL portions of the water, with the aid of a glass rod, into each of two dishes. To one portion add 3 drops of phenolphthalein TS, and to the other portion add 1 drop of methyl orange TS: neither portion appears pink when viewed against a white background.
Residue on ignition ⟨281⟩: not more than 1.50%, determined on a 5.0-g test specimen.
Acid-insoluble ash—To the residue obtained in the test for *Residue on ignition*, add 25 mL of 3 N hydrochloric acid, and boil for 5 minutes. Collect the insoluble matter on a tared filtering crucible, wash with hot water, ignite, and weigh: the residue weighs not more than 63.0 mg (1.25%).
Water-soluble substances—Proceed as directed in the test for *Water-soluble substances* under *Purified Cotton:* the residue weighs not more than 100 mg (1.0%).
Fiber length and absorbency—Remove it from its wrappings, and condition it for not less than 4 hours in a standard atmosphere of 65 ± 2% relative humidity at 21 ± 1.1°. Determine the *Fiber length* and *Absorbency* as follows.
Fiber length—Determine the fiber length of Purified Rayon as directed for *Fiber Length* under *Cotton* ⟨691⟩: not less than 70.0%, by weight, of the fibers are 19 mm or greater in length, and not more than 5.0%, by weight, of the fibers are 6.3 mm or less in length.
Absorbency—Proceed as directed for the *Absorbency Test* under *Cotton* ⟨691⟩: submersion is complete in 5 seconds, and the rayon retains not less than 16 times its weight of water.
Other requirements—It meets the requirements of the tests for *Dyes* and *Other foreign matter* under *Purified Cotton*.

Oral Rehydration Salts

DEFINITION
Oral Rehydration Salts is a dry mixture of Sodium Chloride, Potassium Chloride, Sodium Bicarbonate, and Dextrose (anhydrous). Alternatively, it may contain Sodium Citrate (anhydrous or dihydrate) instead of Sodium Bicarbonate. It may contain Dextrose (monohydrate) instead of Dextrose (anhydrous), provided that the Sodium Bicarbonate or Sodium Citrate is packaged in a separate, accompanying container. It contains the equivalent of NLT 90.0% and NMT 110.0% of the amounts of sodium (Na), potassium (K), chloride (Cl), and bicarbonate (HCO_3) or citrate ($C_6H_5O_7$) calculated from the labeled amounts of Sodium Chloride, Potassium Chloride, and Sodium Bicarbonate [or Sodium Citrate (anhydrous or dihydrate)]. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of anhydrous dextrose ($C_6H_{12}O_6$) or dextrose monohydrate ($C_6H_{12}O_6 \cdot H_2O$). It may contain suitable flavors.

IDENTIFICATION
- **A. Sodium:** The sample imparts an intense yellow color to a nonluminous flame.
- **B. Potassium:** The sample imparts a violet color to a nonluminous flame. Since the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent

www.webofpharma.com

to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

• **C. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chloride*: Meets the requirements

• **D. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Bicarbonate*

Analysis: Collect the gas that evolves upon dissolution.

Acceptance criteria: Where it contains Sodium Bicarbonate, it dissolves with effervescence, and the collected gas so obtained meets the requirements in test *A*.

• **E. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Citrate*

Sample solution: Constitute the Oral Rehydration Salts as directed in the labeling.

Analysis: Add 3–5 drops of the *Sample solution* to 20 mL of the mixture of pyridine and acetic anhydride.

Acceptance criteria: Where it contains Sodium Citrate, it meets the requirements.

• **F.**

Sample solution: Constitute the Oral Rehydration Salts as directed in the labeling.

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: Where it contains Dextrose, a copious red precipitate of cuprous oxide is formed (presence of dextrose).

ASSAY

• **DEXTROSE**

Sample stock solution: Nominally 200 mg/mL of dextrose from Oral Rehydration Salts prepared as follows. Transfer the contents of 1 or more unit-dose containers of Oral Rehydration Salts, or a portion of the contents of 1 multiple-unit container equivalent to 20 g of dextrose, to a 100-mL volumetric flask. Dilute with water to volume.

Sample solution: Nominally 100 mg/mL of dextrose from the *Sample stock solution* prepared as follows. Transfer 50.0 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

[NOTE—Reserve the remaining *Sample stock solution* for the *Assay* procedures for *Sodium and Potassium*, *Chloride*, *Bicarbonate*, and *Citrate*.]

Analysis: Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781A⟩, *Angular Rotation*).

Sample: *Sample solution*

Where Oral Rehydration Salts is labeled to contain anhydrous dextrose, calculate the observed concentration (g/100 mL) of anhydrous dextrose ($C_6H_{12}O_6$) in the portion of Oral Rehydration Salts taken:

$$\text{Result} = (100 \times a)/(l \times \alpha)$$

a = observed angular rotation of the *Sample solution* (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

Where Oral Rehydration Salts is labeled to contain dextrose monohydrate, calculate the observed concentration (g/100 mL) of dextrose monohydrate ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Oral Rehydration Salts taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (M_{r1}/M_{r2})$$

a = observed angular rotation of the *Sample solution* (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
M_{r1} = molecular weight of dextrose monohydrate, 198.17
M_{r2} = molecular weight of anhydrous dextrose, 180.16

Calculate the percentage of the labeled amount of anhydrous dextrose ($C_6H_{12}O_6$) or dextrose monohydrate ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Oral Rehydration Salts taken:

$$\text{Result} = (C_{U1}/C_{U2}) \times 100$$

C_{U1} = observed concentration of the *Sample solution* (g/100 mL)
C_{U2} = nominal concentration of the *Sample solution* (g/100 mL)

Acceptance criteria: 90.0%–110.0%

• **SODIUM AND POTASSIUM**

Sodium stock solution: 58.44 mg/mL of sodium chloride prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Diluent: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Add a suitable nonionic surfactant, then add water to volume.

Standard stock solution: 0.5844 mg/mL of sodium chloride and 0.7456 mg/mL of potassium chloride in water from the *Sodium stock solution* and the *Potassium stock solution*, respectively

Standard solution: 0.01150 mg/mL of sodium and 0.01955 mg/mL of potassium from the *Standard stock solution* in *Diluent*

Sample stock solution A: Nominally 0.23 mg/mL of sodium from the *Sample stock solution* remaining from the *Assay* for *Dextrose* in water

Sample solution A: Nominally 0.0115 mg/mL of sodium from *Sample stock solution A* in *Diluent*

Sample stock solution B: Nominally 0.39 mg/mL of potassium from the *Sample stock solution* remaining from the *Assay* for *Dextrose* in water

Sample solution B: Nominally 0.01955 mg/mL of potassium from *Sample stock solution B* in *Diluent*

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: 766 nm

Sodium: 589 nm

Blank: *Diluent*

Analysis

Samples: *Standard solution*, *Sample solution A*, *Sample solution B*, and *Blank*

Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution*, *Sample solution A*, and *Sample solution B*.

Calculate the percentage of the labeled amount of sodium (Na) in the unit-dose container or containers taken or in the portion of Oral Rehydration Salts taken from the multiple-unit container:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

www.webofpharma.com

r_U = photometer reading of sodium from *Sample solution A*
r_S = photometer reading of sodium from the *Standard solution*
C_S = concentration of sodium in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium in *Sample solution A* (mg/mL)

Calculate the percentage of the labeled amount of potassium (K) in the unit-dose container or containers taken or in the portion of Oral Rehydration Salts taken from the multiple-unit container:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = photometer reading of potassium from *Sample solution B*
r_S = photometer reading of potassium from the *Standard solution*
C_S = concentration of potassium in the *Standard solution* (mg/mL)
C_U = nominal concentration of potassium in *Sample solution B* (mg/mL)

Acceptance criteria
Potassium: 90.0%–110.0%
Sodium: 90.0%–110.0%

• **CHLORIDE**
Sample solution: Transfer a volume of the *Sample stock solution* remaining from the *Assay* for *Dextrose*, containing nominally 55 mg of chloride (Cl), to a suitable container.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N silver nitrate VS
Endpoint detection: Visual
Analysis
Sample: *Sample solution*
Titrate with *Titrant* until the silver chloride flocculates and the mixture acquires a faint pink color, using potassium chromate TS as the indicator.
Calculate the percentage of the labeled amount of chloride (Cl) in the unit-dose container or containers taken or in the portion of Oral Rehydration Salts taken from the multiple-unit container:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = volume of *Titrant* consumed (mL)
N = normality of *Titrant* (mEq/mL)
F = equivalent weight of chloride, 35.45 mg/mEq
W = nominal amount of chloride in the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%

• **BICARBONATE** (if present)
Sample solution: Transfer a volume of the *Sample stock solution* remaining from the *Assay* for *Dextrose*, containing nominally 100 mg of bicarbonate, to a suitable beaker.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N hydrochloric acid VS
Endpoint detection: Visual
Analysis
Sample: *Sample solution*
Add 25 mL of water and 3 drops of methyl orange TS to the *Sample solution*. Titrate the resulting solution with *Titrant*.
Calculate the percentage of the labeled amount of bicarbonate (HCO_3) in the unit-dose container or containers taken or in the portion of Oral Rehydration Salts taken from the multiple-unit container:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = volume of *Titrant* consumed (mL)
N = normality of *Titrant* (mEq/mL)
F = equivalent weight of bicarbonate, 61.02 mg/mEq
W = nominal amount of bicarbonate in the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%

• **CITRATE** (if present)
Mobile phase, Standard solution 1, and **Chromatographic system:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.
Sample solution: Transfer a volume of the *Sample stock solution* remaining from the *Assay* for *Dextrose*, containing nominally 180 mg of citrate, to a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩, *Procedure*.
Analysis
Samples: *Standard solution 1* and *Sample solution*
Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩, *Procedure*.
Calculate the percentage of the labeled amount of citrate ($C_6H_5O_7$) in the portion of Oral Rehydration Salts taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of citrate from the *Sample solution*
r_S = peak response of citrate from *Standard solution 1*
C_S = concentration of citrate in *Standard solution 1* (µg/mL)
C_U = nominal concentration of citrate in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **MINIMUM FILL** ⟨755⟩: Proceed as directed, except the average net weight of the contents of the 10 containers is NLT the labeled amount, and the net weight of the contents of any single container is NLT 95% and NMT 105% of the labeled amount. If the contents of NMT 1 container are less than 95% but NLT 90% of the labeled amount, or more than 105% but NMT 110% of the labeled amount, determine the net weight of the contents of 20 additional containers. The average net weight of the contents of 30 containers is NLT the labeled amount, and the net weight of the contents of NMT 1 of the 30 containers is less than 95% but NLT 90% of the labeled amount, or more than 105% but NMT 110% of the labeled amount.
[NOTE—In performing the *Assay* procedures for *Sodium and Potassium*, *Chloride*, and *Bicarbonate* or *Citrate*, calculate from the labeled amounts of sodium chloride, potassium chloride, and sodium bicarbonate or sodium citrate the total equivalent amounts of sodium (Na), potassium (K), chloride (Cl), and bicarbonate (HCO_3) or citrate ($C_6H_5O_7$) contained therein (see *Table 1*).]

Table 1. mg Equivalent of Each g of Component

Component	Na	K	Cl	HCO_3	$C_6H_5O_7$
Sodium chloride	393.4	—	606.6	—	—
Potassium chloride	—	524.4	475.6	—	—

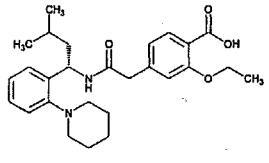
Anhydrous sodium citrate	267.2	—	—	—	732.8
Sodium citrate dihydrate	234.5	—	—	—	643.0



SPECIFIC TESTS

- **pH** ⟨791⟩
  Sample solution: Constitute the Oral Rehydration Salts as directed in the labeling.
  Acceptance criteria: 7.0–8.8
- **Loss on Drying** ⟨731⟩
  Analysis: Dry at 50° to constant weight.
  Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and avoid exposure to temperatures in excess of 30°. The Sodium Bicarbonate or Sodium Citrate component may be omitted from the mixture and packaged in a separate, accompanying container.
- **Labeling:** The label indicates prominently whether Sodium Bicarbonate or Sodium Citrate is a component by the placement of the word "Bicarbonate" or "Citrate", as appropriate, in juxtaposition to the official title. The label states the name and quantity, in g, of each component in each unit-dose container, or in a stated quantity, in g, of Oral Rehydration Salts in a multiple-unit container. The label states the net weight in each container and provides directions for constitution. Where packaged in individual unit-dose pouches, the label instructs the user not to open the pouch until the time of use. The label also states that any solution that remains unused 24 h after constitution is to be discarded.

Repaglinide

$C_{27}H_{36}N_2O_4$ 452.59

(*S*)-2-Ethoxy-4-[2-{methyl-1-[2-(1-piperidinyl)phenyl] butylamino}-2-oxoethyl]-benzoic acid;
(+)-2-Ethoxy-α-[[(*S*)-α-isobutyl-*o*-piperidinobenzyl] carbamoyl]-*p*-toluic acid [135062-02-1].

DEFINITION

Repaglinide contains NLT 98.0% and NMT 102.0% of repaglinide ($C_{27}H_{36}N_2O_4$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A.** ▲**Spectroscopic Identification Tests** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the test for *Enantiomeric Purity*.

ASSAY

- **Procedure**
  Buffer: 1 g/L of monobasic potassium phosphate solution, adjusted with phosphoric acid to a pH of 2.5
  Mobile phase: Methanol and *Buffer* (8:2)
  Standard solution: 0.5 mg/mL of USP Repaglinide RS in methanol
  Sample solution: 0.5 mg/mL of Repaglinide in methanol
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 240 nm
  Column: 4.6-mm × 12.5-cm; 5-µm packing L1

Repaglinide Tablets

DEFINITION
Repaglinide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of repaglinide ($C_{27}H_{36}N_2O_4$).

IDENTIFICATION
• **A. Thin-Layer Chromatographic Identification Test** ⟨201⟩
Sample solution: To a quantity of powdered Tablets, equivalent to 10 mg of repaglinide, add 10 mL of a mixture of methanol and methylene chloride (1:1), shake for 15 min, and centrifuge.
Developing solvent system: Toluene, methylene chloride, and methanol (2:2:1)
Acceptance criteria: Meet the requirements
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **C.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Buffer pH 4.0: 2 g/L of monobasic ammonium phosphate solution. Adjust with phosphoric acid to a pH of 4.0.
Buffer pH 2.5: 2 g/L of monobasic ammonium phosphate solution. Adjust with phosphoric acid to a pH of 2.5.
Mobile phase: Methanol and *Buffer pH 2.5* (7:3)
Diluent: Methanol and *Buffer pH 4.0* (7:3)
Standard solution 1: 800 µg/mL of USP Repaglinide RS in methanol
Standard solution 2: 80 µg/mL of USP Repaglinide RS, prepared by diluting 5.0 mL of *Standard solution 1* with *Diluent* to 50.0 mL
System suitability stock solution: 80 µg/mL of USP Repaglinide Related Compound A RS in methanol
System suitability solution: 80 µg/mL of USP Repaglinide RS and 1.6 µg/mL of USP Repaglinide Related Compound A RS prepared as follows. Transfer 1.0 mL of *System suitability stock solution* to a 50-mL volumetric flask, add 5.0 mL of *Standard solution 1*, and dilute with *Diluent* to volume.
Sample solution: Transfer 8 whole Tablets to a suitable volumetric flask, and dissolve in and dilute with *Diluent* to volume to obtain a solution containing 80 µg/mL. Stir for 20 min, and filter or centrifuge a portion of the solution.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 245 nm or diode array. [Note—Use diode array detector to perform *Identification* test C.]
Column: 4.0-mm × 6-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *Standard solution 2* and *System suitability solution*
[Note—The typical relative retention times for repaglinide related compound A and repaglinide are about 0.4 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 7.0 between repaglinide related compound A and repaglinide, *System suitability solution*
Tailing factor: 0.8–2.0 for the repaglinide peak, *System suitability solution*
Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution 2*
Analysis
Samples: *Standard solution 2* and *Sample solution*
Calculate the percentage of the labeled amount of repaglinide ($C_{27}H_{36}N_2O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from *Standard solution 2*
C_S = concentration of USP Repaglinide RS in *Standard solution 2* (µg/mL)
C_U = nominal concentration of repaglinide in the *Sample solution* (µg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS
• **Dissolution** ⟨711⟩
Medium: pH 5.0 buffer, prepared by mixing 10.2 g of citric acid monohydrate and 18.16 g of dibasic sodium phosphate dihydrate with 1 L of water; 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Buffer: 1.5 g/L of monobasic potassium phosphate in water, adjusted with phosphoric acid to a pH of 2.3
Mobile phase: Acetonitrile, *Buffer*, and methanol (49:40:11)
Standard stock solution: 44 µg/mL of USP Repaglinide RS in methanol
Sample solution: Pass a portion of the solution under test through a suitable filter.
Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, add 25 mL of methanol, and dilute with *Medium* to volume. Further dilute with *Medium*, if needed, to a concentration that is similar to that of the *Sample solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Fluorometric detector; excitation wavelength of 244 nm and emission wavelength of 348 nm

Acceptance criteria: NMT 0.5% of total impurities

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Repaglinide RS
USP Repaglinide Related Compound A RS
(*S*)-3-Methyl-1-[2-(1-piperidinyl)phenyl]butylamine, *N*-acetyl-L-glutamate salt.
$C_{16}H_{26}N_2 \cdot C_7H_{11}NO_5$ 435.6

Reserpine

$C_{33}H_{40}N_2O_9$ 608.68

Yohimban-16-carboxylic acid, 11,17-dimethoxy-18-[(3,4,5-trimethoxybenzoyl)oxy]-, methyl ester, (3β,16β,17α,18β,20α)-.

Methyl 18β-hydroxy-11,17α-dimethoxy-3β,20α-yohimban-16β-carboxylate 3,4,5-trimethoxybenzoate (ester) [50-55-5].

» Reserpine contains not less than 97.0 percent and not more than 101.0 percent of $C_{33}H_{40}N_2O_9$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—
USP Reserpine RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: [NOTE—Conduct this test promptly, with a minimum exposure to light.] Dissolve 25.0 mg of it, previously dried, in 0.25 mL of chloroform; mix with about 30 mL of methanol previously warmed to 50°; transfer the mixture with the aid of warm methanol to a 250-mL volumetric flask; cool the solution to room temperature; dilute with methanol to volume; and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask, add 36 mL of chloroform, dilute with methanol to volume, and mix: the UV absorption spectrum of a 1 in 50,000 solution so obtained exhibits the same maxima in the range of 255 nm to 350 nm as that of a similar solution of USP Reserpine RS, concomitantly measured; and the respective absorptivities, determined with reference to a mixture of 36 volumes of chloroform and 14 volumes of methanol as the blank, at the wavelength of maximum absorbance at about 268 nm, do not differ by more than 3.0%.

Loss on drying ⟨731⟩—Dry it at 60° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Assay—

Mobile phase—Prepare a filtered and degassed 1:1 mixture of acetonitrile and ammonium chloride solution (1 in 100). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). The pH is about 5.6.

Standard preparation—Dissolve an accurately weighed quantity of USP Reserpine RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to

USP Monographs

www.webofpharma.com

obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer about 10 mg of Reserpine, accurately weighed, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Dilute 1.0 mL of this solution with 9.0 mL of *Mobile phase*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 268-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{33}H_{40}N_2O_9$ in the portion of Reserpine taken by the formula:

$$C(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Reserpine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Reserpine Tablets

DEFINITION

Reserpine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of reserpine ($C_{33}H_{40}N_2O_9$).

IDENTIFICATION

• **A.**

Sample solution: Evaporate about 2 mL of *Sample solution 2*, obtained from the test for *Other Alkaloids*, in a test tube to dryness. Add to the residue 0.5 mL of glacial acetic acid, and swirl for 1–2 min.

Analysis: Add 1 mL of a 20 mg/mL of vanillin in hydrochloric acid.

Acceptance criteria: A pink color is produced that turns to deep violet-red within a few min or as a result of warming the solution for 10–20 s.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and ammonium chloride solution (10 mg/mL) (1:1). The pH of the resulting solution is about 5.6.

Standard solution: 10 µg/mL of USP Reserpine RS in *Mobile phase*

Sample solution: 10 µg/mL of reserpine in *Mobile phase* from powdered Tablets (NLT 20). Pass through a suitable filter of 0.8-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 268 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of reserpine ($C_{33}H_{40}N_2O_9$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of reserpine from the *Sample solution*

r_S = peak response of reserpine from the *Standard solution*

C_S = concentration of USP Reserpine RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of reserpine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

[NOTE—Do not substitute membrane filters for filter paper where the filtration of reserpine-containing solutions is indicated. Reserpine has been shown to be adsorbed onto membranes.]

Test 1

Medium: 0.1 N acetic acid; 500 mL

Apparatus 1: 100 rpm

Time: 45 min

***p*-Toluenesulfonic acid solution:** 10 mg/mL of *p*-toluenesulfonic acid in glacial acetic acid

Standard solution: 0.1 µg/mL of USP Reserpine RS in glacial acetic acid

Sample solution: Pipet an aliquot of the filtered solution under test, containing about 11 µg of reserpine, into a 125-mL separatory funnel. Extract with three 10-mL portions of chloroform, collecting the extracts in a 100-mL volumetric flask, dilute with glacial acetic acid to volume, and mix.

Analysis: Pipet 10 mL each of the *Standard solution*, the *Sample solution*, and glacial acetic acid into three individual 50-mL test tubes. To each tube, add 10 mL of *p-Toluenesulfonic acid solution*, insert a stopper, and mix gently. Place in a steam bath for 10 min. Remove from the steam bath, and cool. Determine the amount of reserpine ($C_{33}H_{40}N_2O_9$) dissolved from the fluorescences of the *Standard solution* and *Sample solution* using a suitable spectrophotometer arranged to deliver activation radiation at 390 nm and to measure the resultant fluorescence at the emission wavelength of about 480 nm.

Tolerances: NLT 75% (*Q*) of the labeled amount of reserpine ($C_{33}H_{40}N_2O_9$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus 1, *p*-Toluenesulfonic acid solution, Standard solution, Sample solution, and Analysis: Proceed as directed for *Test 1.*

Time: 30 min

Tolerances: NLT 80% (*Q*) of the labeled amount of reserpine ($C_{33}H_{40}N_2O_9$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

USP Monographs

www.webofpharma.com

SPECIFIC TESTS

• **OTHER ALKALOIDS**

Adsorbent: Use acid-washed chromatographic siliceous earth.

Chromatographic tube: Chromatographic tube of 20 cm length and 22 mm internal diameter with an outlet at the bottom. Insert at the constriction a small pledget of glass wool previously washed with chloroform and air dried.

Chromatographic column: Mix 1 g of *Adsorbent* with 0.5 mL of freshly prepared sodium bicarbonate solution (20 mg/mL) in a 100-mL beaker until the mixture appears fluffy and uniformly moistened, transfer to the *Chromatographic tube*, and tamp lightly with a packing rod to a thickness of about 7–9 mm. Mix uniformly 1 g of *Adsorbent* with 0.5 mL of freshly prepared citric acid solution (5 mg/mL), transfer to the *Chromatographic tube*, and tamp lightly with a packing rod. Mix uniformly 1 g of *Adsorbent* with 0.5 mL of water, transfer to the *Chromatographic tube*, and tamp lightly with a packing rod.

Blank mixture: 1 mL of dimethyl sulfoxide and 2 g of *Adsorbent* in a suitable container. Stir until the mass is uniformly wetted and free from lumps.

Blank solution: Transfer the *Blank mixture* through a powder funnel to a prepared *Chromatographic column*. Scrub the beaker with about 1 g of *Adsorbent*, and add it through the funnel to the tube. Wipe the spatula, beaker, and funnel with a tuft of glass wool, previously washed with chloroform and air-dried. Place the glass wool in the tube, and press it down on the column with the packing rod, so that the overall height of the column is between 55 mm and 65 mm. Rinse the spatula, beaker, and funnel with the first portion of the chloroform used to elute the specimen. Elute the reserpine with 45 mL of chloroform. [NOTE—A properly packed column elutes in 4–8 min.] Collect the eluate in a 50-mL volumetric flask containing 14 mL of methanol. Rinse the tip of the column with chloroform, add chloroform to volume, and mix.

Standard stock solution: [NOTE—Use actinic glassware for this solution.] 0.1 mg/mL of USP Reserpine RS in methanol prepared as follows: Dissolve USP Reserpine RS in chloroform (0.01 mL/mg of USP Reserpine RS), and mix with previously warmed to 50° methanol (1.2 mL/mg of USP Reserpine RS). Transfer the mixture to a suitable volumetric flask with the aid of warm methanol, cool the solution to room temperature, dilute with methanol to volume, and mix.

Standard solution: [NOTE—Use actinic glassware for this solution.] 0.02 mg/mL of USP Reserpine RS from the *Standard stock solution* in chloroform and methanol. Initially add chloroform to about 72% of the volume of the flask, and then dilute with methanol to volume.

Sample solution 1: Weigh a portion of the finely powdered (powder should be able to pass through a 60-mesh sieve) Tablets (NLT 20), equivalent to about 1 mg of reserpine, but NMT 1 g of the powder, and transfer to a 150-mL beaker. Dry-mix the powder with about 500 mg of *Adsorbent*, then mix with 1 mL of dimethyl sulfoxide (immobile solvent). Stir thoroughly until the mass is uniformly wetted and free from lumps, and allow the mixture to stand for 5 min. Add another 500 mg of *Adsorbent*, and thoroughly work it into the mass. Again add an amount of *Adsorbent* so that the total amount added is 2 g, and disperse it completely in the mass.

Sample solution 2: Transfer *Sample solution 1* through a powder funnel to a prepared *Chromatographic column*. Proceed as directed for *Blank solution* beginning with "Scrub the beaker with about 1 g of *Adsorbent*."

Analysis: Determine the UV absorption spectrum of *Sample solution 2*, between 255 and 350 nm, using the *Blank solution* in the reference cell. Similarly, determine the UV absorption spectrum of the *Standard solution*, using a solution of 3.6 volumes of chloroform and 1.4 volumes of methanol as the blank. The two spectra are similar, and the ratio, A_{268}/A_{295}, for *Sample solution 2* does not differ by more than 4.0% from the corresponding ratio for the *Standard solution*.

Calculate the percentage of reserpine ($C_{33}H_{40}N_2O_9$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times 100$$

A_U = absorbance of *Sample solution 2* at the absorption maximum at about 268 nm

A_S = absorbance of the *Standard solution* at the absorption maximum at about 268 nm

Acceptance criteria: The result does not differ more than 6.0% from that obtained in the *Assay*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light resistant containers.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Reserpine RS

Reserpine and Chlorothiazide Tablets

» Reserpine and Chlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of reserpine ($C_{33}H_{40}N_2O_9$) and not less than 93.0 percent and not more than 107.0 percent of the labeled amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—

USP Reserpine RS

USP Chlorothiazide RS

Identification—

A: Transfer a quantity of powdered Tablets, equivalent to about 1 mg of reserpine, to a stoppered, 50-mL centrifuge tube. Add 20 mL of citric acid solution (1 in 50), and shake until the powder is suspended. Extract the mixture with two 20-mL portions of chloroform, centrifuge, and withdraw the chloroform, filtering each extract through a pledget of cotton into a 50-mL volumetric flask. Dilute with chloroform to volume, and mix: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Reserpine RS, concomitantly measured (*presence of reserpine*).

B: Transfer a quantity of powdered Tablets, equivalent to about 50 mg of chlorothiazide, to a test tube containing 10 mL of acetone, agitate for 5 minutes, and centrifuge. Use the clear supernatant as the Test solution. Separately apply 10 µL each of the Test solution and a Standard solution of USP Chlorothiazide RS in acetone containing 5 mg per mL to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture and previously washed with methanol. Develop the chromatogram in a solvent system consisting of a mixture of

www.webofpharma.com

ethyl acetate and isopropyl alcohol (17:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and examine under short-wavelength UV light: the R_F value of the principal spot in the chromatogram of the Test solution corresponds to that obtained from the Standard solution (*presence of chlorothiazide*).

Dissolution ⟨711⟩—

Medium: mixture of pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) and *n*-propyl alcohol (3:2); 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determination of dissolved reserpine—

STANDARD PREPARATION—Dissolve about 34 mg of USP Reserpine RS, accurately weighed, in a 50-mL volumetric flask containing 5 mL of chloroform, dilute with *n*-propyl alcohol to volume (*Solution 1*), and mix. Pipet 1 mL of *Solution 1* into a 50-mL volumetric flask, dilute with *n*-propyl alcohol to volume (*Solution 2*), and mix. Pipet 1 mL of *Solution 2* into a 100-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix to obtain the *Standard preparation*.

PROCEDURE—Filter a portion of the solution under test through paper, and transfer 5.0 mL of the clear filtrate to a 25-mL volumetric flask. Pipet 5 mL of the *Standard preparation* into a separate 25-mL volumetric flask. Treat each flask as follows: Add 5 drops of hydrochloric acid and 5 mL of a mixture of water, alcohol, and sulfuric acid (29:20:1), and mix. Add by pipet 5 mL of sodium nitrite solution (3 in 1000), dilute with alcohol to volume, mix, and allow to stand for 30 minutes. Concomitantly determine the fluorescences of the solution under test and the *Standard preparation* in a suitable spectrophotometer arranged to deliver activation radiation at 405 nm and to measure the resultant fluorescence at the emission wavelength of about 500 nm. Calculate the amount of reserpine ($C_{33}H_{40}N_2O_9$) dissolved.

Determination of dissolved chlorothiazide—

STANDARD PREPARATION—Transfer about 27 mg of USP Chlorothiazide RS, accurately weighed, to a 50-mL volumetric flask containing 5 mL of methanol, swirl to dissolve, dilute with *Dissolution Medium* to volume, and mix. Pipet 2 mL of this solution into a 100-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

PROCEDURE—Determine the amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 292 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with the *Standard preparation*.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{33}H_{40}N_2O_9$ is dissolved in 60 minutes, and not less than 75% *(Q)* of the labeled amount of $C_7H_6ClN_3O_4S_2$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements with respect to chlorothiazide and to reserpine.

Procedure for content uniformity for reserpine—

Standard preparation—Prepare as directed for *Standard preparation* in the *Assay for reserpine*.

Test preparation—Weigh 1 Tablet, grind to a fine powder, and transfer to a stoppered, 50-mL centrifuge tube. Add 25.0 mL of chloroform and methanol solution (1:1), shake by mechanical means for 15 minutes, and centrifuge. Pipet 4 mL of the clear supernatant into a 100-mL volumetric flask, dilute with the chloroform and methanol solution to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay for reserpine*. Calculate the quantity, in mg, of $C_{33}H_{40}N_2O_9$, in the Tablet taken by the formula:

$$(W_t/W_U)(TC/D)(I_U/I_S)$$

in which W_t is the weight, in mg, of the Tablet, W_U is the weight, in mg, of the portion of Tablet taken, T is the labeled quantity, in mg, of reserpine in the Tablet, C is the concentration, in µg per mL, of USP Reserpine RS in the *Standard preparation*, D is the concentration, in µg per mL, of reserpine in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution, and I_U and I_S are the fluorescence intensities of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

Procedure for content uniformity for chlorothiazide—

Standard preparation—Prepare as directed for *Standard preparation* under *Assay for chlorothiazide*.

Test preparation—Transfer 1 Tablet to a 500-mL volumetric flask, add 300 mL of 0.1 N sodium hydroxide, and sonicate, swirling the flask intermittently, until the Tablet is dissolved. Dilute with 0.1 N sodium hydroxide to volume, mix, and filter, discarding the first 15 mL of the filtrate. Dilute a portion of the clear filtrate quantitatively with 0.1 N sodium hydroxide to obtain a solution having a concentration of about 10 µg of chlorothiazide per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay for chlorothiazide*. Calculate the quantity, in mg, of $C_7H_6ClN_3O_4S_2$, in the Tablet taken by the formula:

$$(TC/D)(A_U/A_S)$$

in which T is the labeled quantity, in mg, of chlorothiazide in the Tablet, C is the concentration, in µg per mL, of USP Chlorothiazide RS in the *Standard preparation*, D is the concentration, in µg per mL, of chlorothiazide in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution, and A_U and A_S are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

Assay for reserpine—

Standard preparation—Dissolve about 25 mg of USP Reserpine RS, accurately weighed, in 1 mL of chloroform contained in a 50-mL volumetric flask, dilute with methanol to volume, and mix. Dilute a portion of this solution quantitatively and stepwise with chloroform and methanol solution (1:1) to obtain a solution having a known concentration of about 0.2 µg of reserpine per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 mg of reserpine, to a stoppered, 50-mL centrifuge tube, add 25.0 mL of chloroform and methanol solution (1:1), shake by mechanical means for 15 minutes, and centrifuge. Dilute a portion of the clear supernatant quantitatively and stepwise with chloroform and methanol solution (1:1) to obtain a solution having a concentration of about 0.2 µg of reserpine per mL.

Procedure—Separately transfer 5.0 mL of the *Assay preparation*, 5.0 mL of the *Standard preparation*, and 5.0 mL of chloroform and methanol solution (1:1) to provide the reagent blank, respectively, to three 25-mL volumetric flasks. To each flask add 0.5 mL of hydrochloric acid, 1.0 mL of a 3 in 1000 solution of sodium nitrite in dilute methanol (1 in 2), mix, and allow to stand for 30 minutes. Add 1 mL of ammonium sulfamate solution (1 in 20) to each flask, add chloroform and methanol solution (1:1) to volume, mix, and allow to stand for 10 minutes. Concomitantly determine the fluorescence intensities of the solutions in a suitable spectrophotometer arranged to deliver activation radiation at 405 nm and to measure the resultant fluorescence at the emission wavelength of about 500 nm. Calculate the quantity,

USP Monographs

www.webofpharma.com

in mg, of $C_{33}H_{40}N_2O_9$ in the portion of Tablets taken by the formula:

$$5C(I_U/I_S)$$

in which C is the concentration, in µg per mL, of USP Reserpine RS in the *Standard preparation*, and I_U and I_S are the fluorescence intensities of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for chlorothiazide—

Standard preparation—Dissolve an accurately weighed quantity of USP Chlorothiazide RS in 0.1 N sodium hydroxide, and dilute quantitatively and stepwise with 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 10 µg per mL. Use a freshly prepared solution.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of chlorothiazide, to a 500-mL volumetric flask, add about 300 mL of 0.1 N sodium hydroxide, and shake by mechanical means for 15 minutes. Dilute with 0.1 N sodium hydroxide to volume, and mix. Filter through paper, discarding the first 15 mL of the filtrate. Pipet 2 mL of the clear filtrate into a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg, of $C_7H_6ClN_3O_4S_2$, in the portion of Tablets taken by the formula:

$$25C(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Chlorothiazide RS in the *Standard preparation*, and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Resorcinol

$C_6H_6O_2$ 110.11
1,3-Benzenediol
Resorcinol [108-46-3].

» Resorcinol contains not less than 99.0 percent and not more than 100.5 percent of $C_6H_6O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Resorcinol RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020)— [NOTE—If necessary to recrystallize, dissolve in dehydrated alcohol.]

B: Dissolve 100 mg in 2 mL of 1 N sodium hydroxide, add 1 drop of chloroform, and heat the mixture: an intense crimson color is produced. Then add a slight excess of hydrochloric acid: the color changes to pale yellow.

C: To 10 mL of a solution (1 in 100) add 1 drop of ferric chloride TS: a blue-violet color is produced, and it fades slowly.

Melting range ⟨741⟩: between 109° and 111°.

Loss on drying ⟨731⟩—Dry it over silica gel for 4 hours: it loses not more than 1.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.05%.

Phenol—Heat gently a solution (1 in 20): the odor of phenol is not perceptible.

Catechol—To 10 mL of a solution (1 in 20) previously mixed with 2 drops of 1 N acetic acid add 0.5 mL of lead acetate TS: no turbidity is produced.

Ordinary impurities ⟨466⟩—
Test solution: methanol.
Standard solution: methanol.
Eluant: a mixture of hexanes and ethyl acetate (70:30).
Visualization: 17 and then 1.
Application volume: 10 µL.
Limits: not more than 1.0%.

Assay—Dissolve about 1.5 g of Resorcinol, accurately weighed, in water to make 500.0 mL. Transfer to an iodine flask 25.0 mL of the resulting solution, add 50.0 mL of 0.1 N bromine VS, dilute with 50 mL of water, add 5 mL of hydrochloric acid, and at once insert the stopper in the flask. Shake for 1 minute, allow to stand for 2 minutes, and add 10 mL of potassium iodide TS while slightly loosening the stopper. Shake thoroughly, allow to stand for 5 minutes, remove the stopper, and rinse it and the neck of the flask with 20 mL of water into the flask. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding starch TS as the endpoint is approached. Perform a blank determination. From the volume of 0.1 N sodium thiosulfate VS used, calculate the volume, in mL, of 0.1 N bromine VS consumed by the resorcinol. Each mL of 0.1 N bromine is equivalent to 1.835 mg of $C_6H_6O_2$.

Compound Resorcinol Ointment

DEFINITION
Prepare Compound Resorcinol Ointment as follows.

Resorcinol	60 g
Zinc Oxide	60 g
Bismuth Subnitrate	60 g
Juniper Tar	20 g
Yellow Wax	100 g
Petrolatum	290 g
Lanolin	280 g
Glycerin	130 g
To make	1000 g

Melt the *Yellow Wax* and the *Lanolin* in a dish on a steam bath. Triturate the *Zinc Oxide* and the *Bismuth Subnitrate* with the *Petrolatum* until smooth, and add it to the melted mixture. Dissolve the *Resorcinol* in the *Glycerin*, incorporate the solution with the warm mixture just prepared, then add the *Juniper Tar*, and stir the Ointment until it congeals.

www.webofpharma.com

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, and avoid prolonged exposure to temperatures exceeding 30°.

Resorcinol and Sulfur Topical Suspension

» Resorcinol and Sulfur Topical Suspension is Resorcinol and Sulfur in a suitable hydroalcoholic vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of resorcinol ($C_6H_6O_2$) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of sulfur (S).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Resorcinol RS

Identification—

A: Transfer a quantity of Topical Suspension, equivalent to about 20 mg of resorcinol, to a 15-mL centrifuge tube, add 5 mL of 5 N sodium hydroxide, mix, and centrifuge the mixture for 5 minutes. Decant the supernatant into a test tube, and retain the residue for *Identification* test *B*. Add 0.5 mL of chloroform, mix, and heat on a steam bath: an intense crimson color is produced. Add a slight excess of hydrochloric acid: the color changes to pale yellow *(presence of resorcinol).*

B: Place a small portion of the residue from the centrifuge tube in *Identification* test *A* on the tip of a spatula, and burn it: sulfur dioxide, which turns moistened starch-iodate paper blue, is formed *(presence of sulfur).*

Alcohol Determination ⟨611⟩ —Determine by the gas-liquid chromatographic method, acetone being used as the internal standard: it contains between 90.0% and 110.0% of the labeled amount of C_2H_5OH.

Assay for resorcinol—

Mobile phase—Prepare a suitable degassed solution of water, acetonitrile, and methanol (about 55:7:6) such that the retention times of resorcinol and caffeine are about 3 minutes and 4 minutes, respectively.

Internal standard solution—Dissolve about 140 mg of caffeine in 2 mL of chloroform, add methanol to make 100 mL, and mix.

Standard preparation—Transfer 50 mg of USP Resorcinol RS, accurately weighed, to a 25-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Assay preparation—Transfer an accurately weighed portion of Topical Suspension, equivalent to about 20 mg of resorcinol, to a 150-mL beaker. Add 40 mL of methanol and 5.0 mL of *Internal standard solution,* and heat on a steam bath for 5 minutes. Cool the mixture to room temperature, and decant the liquid into a 100-mL volumetric flask. Wash the residue in the beaker by adding 20 mL of methanol to the beaker. Heat on a steam bath for 5 minutes, cool the mixture to room temperature, and decant the liquid into the volumetric flask. Repeat the washing, heating, cooling, and decanting. Dilute the contents of the volumetric flask with methanol to volume, and mix.

Procedure—Introduce equal volumes (about 10 µL) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* ⟨621⟩), operated at room temperature, by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained from the *Standard preparation* is about 0.6 full scale. Typically, the apparatus is fitted with a 4-mm × 30-cm column containing packing L1 and is equipped with an UV detector capable of monitoring absorption at 280 nm, and a suitable recorder. In a suitable chromatogram the coefficient of variation for five replicate injections of the *Standard preparation* is not more than 3.0%. Measure the peak responses at equivalent retention times, obtained from the *Assay preparation* and the *Standard preparation,* and calculate the quantity, in mg, of resorcinol ($C_6H_6O_2$) in the portion of Topical Suspension taken by the formula:

$$(100C)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Resorcinol RS in the *Standard preparation;* and R_U and R_S are the ratios of the responses of the resorcinol and caffeine peaks obtained from the *Assay preparation* and the *Standard preparation,* respectively.

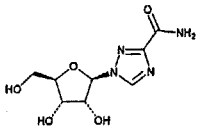
Assay for sulfur—Transfer an accurately weighed portion of Topical Suspension, equivalent to about 85 mg of sulfur, to a suitable flask, add 40 mL of sodium sulfite solution (1 in 20), a few drops of antifoam, and a few boiling chips, and boil under a reflux condenser for 1 hour. Cool to room temperature, add 10 mL of formaldehyde solution and 6 mL of 6 N acetic acid, and dilute with water to 150 mL. Add 3 mL of starch TS, and titrate with 0.1 N iodine VS until a permanent blue color is produced. Each mL of 0.1 N iodine is equivalent to 3.206 mg of sulfur (S).

Resorcinol Monoacetate

$C_8H_8O_3$ 152.15
1,3-Benzenediol, monoacetate.
Resorcinol monoacetate [102-29-4].
Packaging and storage—Preserve in tight, light-resistant containers.

Identification—

A: Fuse 3 drops with about 300 mg of phthalic anhydride and about 50 mg of zinc chloride: a small portion of the fused mixture when dissolved in 10 mL of 1 N sodium hydroxide produces an intense yellow-green fluorescence typical of fluorescein.



B: Dissolve 0.5 mL in 3 mL of alcohol, add 3 drops of sulfuric acid, and boil: ethyl acetate, recognizable by its odor, is evolved.

Specific gravity ⟨841⟩: between 1.203 and 1.207.
Acidity—A solution of 10 mL of Resorcinol Monoacetate in 20 mL of benzene, when shaken with 100 mL of water, requires not more than 0.50 mL of 0.10 N sodium hydroxide for neutralization, methyl orange TS being used as the indicator.
Loss on drying ⟨731⟩—Dry it on a steam bath for 1 hour: it loses not more than 2.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.1%.

USP Monographs

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Test 1
Medium: Water; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Determine the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) dissolved by using one of the following procedures.
Procedure 1
Mobile phase: Proceed as directed in the *Assay.*
Standard solution: 22.5 µg/mL of USP Ribavirin RS in *Medium*
Sample solution: Pass the solution through a suitable filter of 0.45-µm pore size. Transfer 5.0 mL of the filtrate to a 50.0-mL volumetric flask, and dilute with *Medium* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 207 nm
Column: 7.8-mm × 30-cm; 9-µm packing L17
Column temperature: 65°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL
D = dilution factor of the solution under test

Procedure 2
Sulfuric acid solution: 3% sulfuric acid
Mobile phase: Water. Adjust with *Sulfuric acid solution* to a pH of 2.5.
Standard solution: 0.02 mg/mL of USP Ribavirin RS in *Medium*
Sample solution: Pass the solution through a suitable filter of 0.8-µm pore size. Transfer 5.0 mL of the filtrate to a 50.0-mL volumetric flask, and dilute with water to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 207 nm
Column: 7.8-mm × 10-cm; 9-µm packing L17
Column temperature: 40 ± 2°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL
D = dilution factor of the solution under test

Tolerances: NLT 80% (Q) of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) is dissolved.
Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2.*
Medium: Water; 900 mL, deaerated
Apparatus 1: 100 rpm
Time: 15 min
Buffer: 4 g/L of sodium dihydrogen orthophosphate dihydrate in water. Adjust with 5% (v/v) sodium hydroxide solution to a pH of 5.0. Pass through a suitable filter of 0.45-µm or finer pore size.
Mobile phase: Acetonitrile and *Buffer* (2:98)
Standard solution: 0.22 mg/mL of USP Ribavirin RS in *Medium.* Sonicate, if necessary, to dissolve.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
Run time: NLT 1.9 times the retention time of ribavirin
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

USP Monographs

www.webofpharma.com

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

Tolerances: NLT 80% (Q) of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Standard solution: 0.22 mg/mL of USP Ribavirin RS in *Medium*. Sonicate, if necessary, to dissolve.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm or finer pore size.
Capsule blank solution: Dissolve 6 empty Capsule shells in 900 mL of *Medium*. Pass through a suitable filter of 0.45-µm or finer pore size.
Instrumental conditions
Mode: UV
Analytical wavelength: UV 225 nm
Cell: 0.1 cm
Blank: *Medium*
Analysis
Samples: *Standard solution*, *Sample solution*, and *Capsule blank solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) dissolved:

$$\text{Result} = \{[A_U - (A_B/6)]/A_S\} \times C_S \times (1/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_B = absorbance of the *Capsule blank solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
L = label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES
• **ORGANIC IMPURITIES**
Mobile phase, Standard solution, and Chromatographic system: Proceed as directed in the *Assay*.
Sample solution: Nominally 0.5 mg/mL of ribavirin in *Mobile phase* prepared as follows. Transfer an amount equivalent to 50 mg of ribavirin, from contents of Capsules (NLT 20), to a 100-mL volumetric flask. Add about 50 mL of *Mobile phase*, and sonicate with occasional shaking for about 20 min. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Pass the solution through a suitable filter of 0.45-µm pore size.
Analysis
Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ribose triazolole carboxylic acid and any other unknown impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of ribose triazolole carboxylic acid or any other unknown impurity from the *Sample solution*
r_S = peak response of ribavirin from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Ribose triazolole carboxylic acid[a]	0.7	0.7	0.25
Ribavirin	1.0	—	—
Any individual unknown impurity	—	1.0	0.10
Total impurities	—	—	1.0

[a] 1-β-D-Ribofuranosyl-1*H*-1,2,4-triazole-3-carboxylic acid.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store between 15° and 30°.
• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Ribavirin RS

Ribavirin for Inhalation Solution

DEFINITION
Ribavirin for Inhalation Solution is a sterile, freeze-dried form of ribavirin. When constituted as directed in the labeling, the inhalation solution so obtained contains NLT 95.0% and NMT 105.0% of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨201⟩
Sample solution: 10 mg/mL
Chromatographic system
Developing solvent system: Acetonitrile and 0.1 M ammonium chloride (9:2)
Spray reagent: Anisaldehyde, alcohol, glacial acetic acid, and sulfuric acid (5:90:1:5)
Analysis: Proceed as directed in the chapter. Allow the plate to air-dry for about 15 min, spray with *Spray reagent*, heat

www.webofpharma.com

the plate at 110° for 30 min, and locate the spots on the plate by examining the plate in daylight.
Acceptance criteria: Meets the requirements

ASSAY
• **PROCEDURE**
Mobile phase: Adjust water with sulfuric acid to a pH of 2.5 ± 0.1. Filter through a suitable filter of 0.5-µm or finer pore size.
Standard solution: 0.025 mg/mL of USP Ribavirin RS in *Mobile phase*
Sample stock solution: Constitute Ribavirin for Inhalation Solution as directed in the labeling, using a suitable volume of diluent. Transfer an aliquot of constituted solution, equivalent to 100 mg of ribavirin, to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume.
Sample solution: Nominally 0.025 mg/mL of ribavirin in *Mobile phase* from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 207 nm
Column: 7.8-mm × 10-cm; packing L17
Column temperature: 65 ± 0.5°
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.7–1.5
Relative standard deviation: NMT 0.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) in the portion of Ribavirin for Inhalation Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

IMPURITIES
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.25%
• **ORGANIC IMPURITIES**
Mobile phase, Standard solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Sample solution: Prepare as directed for the *Sample stock solution* in the *Assay*.
Analysis
Sample: *Sample stock solution*
Calculate the percentage of each peak, other than that of the solvent peak and the ribavirin peak, in the portion of Ribavirin for Inhalation Solution taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of the individual peak
r_T = sum of all the peak responses

Acceptance criteria
Individual impurity: NMT 0.25%
Total impurities: NMT 1.0%

SPECIFIC TESTS
• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
• **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
Sample solution: 10 mg/mL
Acceptance criteria: −33.5° to −37.0° (t = 20°)
• **pH** ⟨791⟩
Sample solution: A solution constituted as directed in the labeling. To each 50 mL of reconstituted solution add 0.2 mL of a saturated potassium chloride solution.
Acceptance criteria: 4.0–6.5
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry a sample at 105° for 5 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers, in a dry place at controlled room temperature.
• **LABELING:** The labeling indicates that Ribavirin for Inhalation Solution must be constituted with a measured volume of Sterile Water for Injection or with Sterile Water for Inhalation containing no preservatives, and that the constituted solution is to be administered only by a small-particle aerosol generator.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Ribavirin RS

Ribavirin Tablets

DEFINITION
Ribavirin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$).

IDENTIFICATION
• **A.** The retention time of the ribavirin peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 4.0 g/L of sodium dihydrogen phosphate dihydrate in water. Adjust with 5% sodium hydroxide solution to a pH of 5.0 ± 0.05. Pass the solution through a suitable filter of 0.45-µm pore size.
Mobile phase: Acetonitrile and *Buffer* (1:49)
Diluent: Acetonitrile and water (3:7)
Standard stock solution: 0.6 mg/mL of USP Ribavirin RS in *Diluent*
Standard solution: 0.03 mg/mL of USP Ribavirin RS in *Mobile phase* from the *Standard stock solution*
Sample stock solution: Transfer a portion of ribavirin, equivalent to 1000 mg of ribavirin from finely powdered Tablets (NLT 10), to a 1000-mL volumetric flask. Add about 750 mL of *Diluent*, and sonicate with occasional shaking for 30 min. Cool to room temperature, dilute with *Diluent* to volume, and mix. Centrifuge, and decant the supernatant.
Sample solution: 0.03 mg/mL of ribavirin in *Mobile phase* from the *Sample stock solution*. Pass the solution through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 207 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
Run time: 10 min

Calculate the percentage of ribavirin ($C_8H_{12}N_4O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ribavirin from the *Sample solution*
r_S = peak response of ribavirin from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: Water; 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Buffer and **Mobile phase:** Proceed as directed in the *Assay*.
Standard solution: 0.22 mg/mL of USP Ribavirin RS in *Medium*
Sample solution: Pass the solution through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 2000 theoretical plates
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Calculate the percentage of ribavirin ($C_8H_{12}N_4O_5$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of ribavirin from the *Sample solution*
r_S = peak response of ribavirin from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES: PROCEDURE 1**
If uracil and/or uridine are known impurities, *Procedure 2* is recommended.
Solution A: 3.4 g/L of potassium dihydrogen phosphate in water. Adjust with 5% potassium hydroxide solution to a pH of 5.00 ± 0.05. Pass the solution through a suitable filter of 0.45-µm pore size.
Solution B: Acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	90	10
40	75	25
50	50	50
55	50	50
56	100	0
70	100	0

Standard stock solution: 0.4 mg/mL of USP Ribavirin RS in *Solution A*
Standard solution: 1 µg/mL of USP Ribavirin RS in *Solution A* from the *Standard stock solution*
Sample solution: Transfer a portion of ribavirin, equivalent to 100 mg of ribavirin from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask. Add about 150 mL of *Solution A*, and sonicate with occasional shaking for 15 min. Cool to room temperature, dilute with *Solution A* to volume, and mix. Pass the solution through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
Run time: 70 min. [NOTE—Data collection is only for the first 55 min. The remaining gradient steps re-equilibrate the column.]
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 5.0%
Analysis
Samples: *Standard solution* and *Sample solution*
[NOTE—Impurities are listed in *Table 2*.]
Calculate the percentage of any unknown impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unknown impurity from the *Sample solution*
r_S = peak response of ribavirin from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard any peak area less than 0.05%.

Riboflavin

$C_{17}H_{20}N_4O_6$ 376.36
Riboflavine [83-88-5].

DEFINITION
Riboflavin contains NLT 98.0% and NMT 102.0% of riboflavin ($C_{17}H_{20}N_4O_6$), calculated on the dried basis.

IDENTIFICATION
• **A. Color and Fluorescence of Solution**
Sample solution: 0.01 mg/mL in water
Analysis: Alternately expose to transmitted light and long-wavelength UV light.
Acceptance criteria: The *Sample solution* is pale greenish yellow by transmitted light. By reflected light, it exhibits an intense yellowish-green fluorescence that disappears upon the addition of mineral acids or alkalies.

ASSAY
• **Procedure**
[Note—Conduct the entire *Analysis* without exposure to direct sunlight.]
Standard solution: Transfer 50 mg of USP Riboflavin RS to a 1000-mL volumetric flask containing 50 mL of water. Add 5 mL of 6 N acetic acid and sufficient water to make 800 mL. Heat on a steam bath, protected from light, with frequent agitation until dissolved. Cool to 25°, and dilute with water to volume. Dilute this solution with water to bring it within the operating sensitivity of the fluorometer used.
Sample solution: Transfer 50 mg of Riboflavin to a 1000-mL volumetric flask containing 50 mL of water. Add 5 mL of 6 N acetic acid and sufficient water to make 800 mL. Heat on a steam bath, protected from light, with frequent agitation until dissolved. Cool to 25°, and dilute with water to volume. Dilute this solution with water to bring it to the same concentration as that of the *Standard solution*.
Blank: Prepare as directed for the *Sample solution*, except omit the test specimen.
Instrumental conditions
(See *Fluorescence Spectroscopy* ⟨853⟩.)
Mode: Fluorescence
Excitation wavelength: 444 nm
Emission wavelength: 530 nm
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Measure the fluorescence intensity of the *Standard solution*. Immediately after the reading, add to the solution 10 mg of sodium hydrosulfite, stirring with a glass rod until dissolved, and at once measure the fluorescence again. [Note—Depending on the final concentration of riboflavin in the solution, it may be necessary to increase the amount of sodium hydrosulfite to suppress the fluorescence activity completely.] The difference between the two readings represents the fluorescence intensity (I_S) due to the *Standard solution*. Similarly, measure the fluorescence intensity (I_U) due to the *Sample solution*. Perform the *Blank* determination, and make any necessary correction.
Calculate the percentage of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Riboflavin taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence of the *Sample solution*
I_S = fluorescence of the *Standard solution*
C_S = concentration of USP Riboflavin RS in the *Standard solution* (µg/mL)
C_U = concentration of Riboflavin in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
• **Residue on Ignition** ⟨281⟩: NMT 0.3%
• **Limit of Lumiflavin**
Alcohol-free chloroform: Shake 20 mL of chloroform gently but thoroughly with 20 mL of water for 3 min, draw off the chloroform layer, and wash twice more with 20-mL portions of water. Finally, pass the chloroform through a dry filter paper, and shake it for 5 min with 5 g of powdered anhydrous sodium sulfate. Allow the mixture to stand for 2 h, and decant or filter the clear chloroform.
Sample solution: Shake 25 mg of Riboflavin with 10 mL of *Alcohol-free chloroform* for 5 min, and filter.
Blank: Alcohol-free chloroform
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Analytical wavelength: 440 nm
Cell: 1 cm
Analysis
Samples: *Sample solution* and *Blank*
Measure the absorbances of the *Sample solution* and *Blank*. Correct the absorbance of the *Sample solution* with that of the *Blank*.
Acceptance criteria: Absorbance is NMT 0.025.

SPECIFIC TESTS
• **Optical Rotation,** *Specific Rotation* ⟨781S⟩
Sample solution: 5 mg/mL in 0.05 M carbonate-free sodium hydroxide
Analysis: Measure the specific rotation within 30 min of preparation.
Acceptance criteria: −115° to −135°
• **Loss on Drying** ⟨731⟩: Dry 500 mg at 105° for 2 h. It loses NMT 1.5% of its weight.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight, light-resistant containers.
• **USP Reference Standards** ⟨11⟩
USP Riboflavin RS

Riboflavin Injection

» Riboflavin Injection is a sterile solution of Riboflavin in Water for Injection. It contains not less than 95.0 percent and not more than 120.0 percent of the labeled amount of $C_{17}H_{20}N_4O_6$. It may contain niacinamide or other suitable solubilizers.

Packaging and storage—Preserve in light-resistant, in single-dose or in multiple-dose containers, preferably of Type I glass.
USP Reference standards ⟨11⟩—
USP Riboflavin RS

www.webofpharma.com

Identification—It responds to the *Identification* test under *Riboflavin*.
Bacterial Endotoxins Test ⟨85⟩—It contains not more than 7.1 USP Endotoxin Units per mg of riboflavin.
pH ⟨791⟩: between 4.5 and 7.0.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Dilute an accurately measured volume of not less than 1 mL of Injection to make a solution containing approximately 0.1 µg of riboflavin per mL. Using this as the *Assay Preparation*, proceed as directed under *Riboflavin Assay* ⟨481⟩, *Chemical Methods, Procedure 1*. Calculate the quantity, in mg, of $C_{17}H_{20}N_4O_6$ in each mL of the Injection taken by the formula:

$$C(A/B)$$

in which C is the concentration, in mg per mL, of $C_{17}H_{20}N_4O_6$ obtained for the *Assay Preparation*, A is the test specimen dilution volume, in mL, and B is the volume, in mL, of Injection taken.

Riboflavin Tablets

DEFINITION
Riboflavin Tablets contain NLT 95.0% and NMT 115.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$).

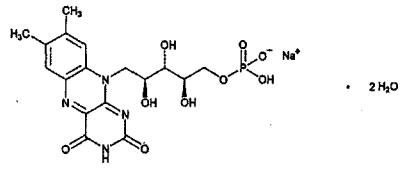
ASSAY
• **Riboflavin Assay** ⟨481⟩, *Chemical Methods, Procedure 1*
Sample solution: Transfer a portion of the powder from NLT 20 finely powdered Tablets, equivalent to 20 mg of riboflavin, to a 250-mL flask, and add 150 mL of 0.1 N hydrochloric acid. Shake vigorously, and wash down the sides of the flask with sufficient 0.1 N hydrochloric acid to ensure that the pH remains below 1.5 during the subsequent period of heating. Heat the mixture on a steam bath, with frequent agitation, until the riboflavin has dissolved, or in an autoclave at 121° for 30 min. Cool, and with vigorous agitation, adjust the mixture with 1 N sodium hydroxide to a pH of 5–6. Transfer to a 1000-mL volumetric flask, and dilute with water to volume. If the solution is not clear, filter through paper known not to adsorb riboflavin. Dilute an aliquot of the clear solution with water to a final volume that contains 0.1 µg/mL of riboflavin.
Analysis: Proceed as directed in the chapter.
Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Tablets taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = corrected fluorescence value from the *Sample solution*
I_S = corrected fluorescence value from the *Standard solution*
C_S = concentration of USP Riboflavin RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of riboflavin in the *Sample solution* (µg/mL)

Acceptance criteria: 95.0%–115.0%

PERFORMANCE TESTS
• **Dissolution** ⟨711⟩
Medium: Water; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: Known concentration of USP Riboflavin RS in *Medium*
Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary
Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 1.40 mg/mL of sodium 1-hexanesulfonate
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 3.9-mm × 30-cm; packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) dissolved:



$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak area of riboflavin from the *Sample solution*
r_S = peak area of riboflavin from the *Standard solution*
C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) is dissolved.
• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight, light-resistant containers.
• **USP Reference Standards** ⟨11⟩
USP Riboflavin RS

Riboflavin 5′-Phosphate Sodium

$C_{17}H_{20}N_4NaO_9P \cdot 2H_2O$ 514.36
$C_{17}H_{20}N_4NaO_9P$ 478.33
Riboflavin 5′-(dihydrogen phosphate), monosodium salt, dihydrate;
Riboflavine 5′-(sodium hydrogen phosphate), dihydrate
Anhydrous [130-40-5].

DEFINITION
Riboflavin 5′-Phosphate Sodium contains NLT the equivalent of 73.0% and NMT the equivalent of 79.0% of riboflavin ($C_{17}H_{20}N_4O_6$), calculated on the dried basis.

USP Monographs

www.webofpharma.com

IDENTIFICATION

• **A. Color and Fluorescence of Solution**

Sample solution: 0.01 mg/mL in water

Analysis: Alternately expose to transmitted light and long-wavelength UV light.

Acceptance criteria: The solution is pale greenish yellow by transmitted light, and it exhibits an intense yellowish green fluorescence by reflected light under long-wavelength UV light that disappears upon the addition of mineral acids or alkalies.

• **B. Identification Tests—General,** *Sodium* ⟨191⟩ and *Phosphate* ⟨191⟩

Sample solution: To 0.5 g add 10 mL of nitric acid. Evaporate the mixture on a water bath to dryness, and ignite the residue until the carbon is removed. Dissolve the residue in 5 mL of water, and filter.

Acceptance criteria: The *Sample solution* meets the requirements.

ASSAY

• **Procedure**

[Note—Conduct the assay so that all solutions are protected from actinic light at all stages, preferably by using low-actinic glassware.]

Standard solution: 0.35 µg/mL prepared as follows. Transfer 35 mg of USP Riboflavin RS to a 250-mL conical flask. Add 20 mL of pyridine and 75 mL of water, and dissolve the riboflavin by frequent shaking. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 1000-mL volumetric flask, add sufficient 0.1 N sulfuric acid (about 4 mL) so that the final pH of the solution is between 5.9 and 6.1, and dilute with water to volume.

Sample solution: Transfer 50 mg of Riboflavin 5′-Phosphate Sodium to a 250-mL conical flask. Add 20 mL of pyridine and 75 mL of water, and dissolve the riboflavin by frequent shaking. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 1000-mL volumetric flask, add sufficient 0.1 N sulfuric acid (about 4 mL) so that the final pH of the solution is between 5.9 and 6.1, and dilute with water to volume.

Blank: Proceed as directed in the *Analysis*, omitting the test specimen.

Instrumental conditions

(See *Fluorescence Spectroscopy* ⟨853⟩.)

Mode: Fluorescence

Excitation wavelength: 440 nm

Emission wavelength: 530 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Determine the maximum fluorescence intensities of the solutions against the *Blank*.

Calculate the percentage of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Riboflavin 5′-Phosphate Sodium taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence intensity from the *Sample solution*

I_S = fluorescence intensity from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (µg/mL)

C_U = concentration of Riboflavin 5′-Phosphate Sodium in the *Sample solution* (µg/mL)

Acceptance criteria: 73.0%–79.0% on the dried basis

IMPURITIES

• **Free Phosphate**

Acid molybdate solution: Prepare a 70-mg/mL solution of ammonium molybdate in water. Dilute 25 mL of this solution with water to 200 mL. To this dilution slowly add 25 mL of 7.5 N sulfuric acid.

Ferrous sulfate solution: 100 mg/mL of ferrous sulfate in 0.15 N sulfuric acid, prepared just before use

Standard solution: 44.0 µg/mL of monobasic potassium phosphate in water.

Sample solution: 3 mg/mL of Riboflavin 5′-Phosphate Sodium in water

Blank: Water

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: UV-Vis

Analytical wavelength: 700 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Transfer 10.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to separate 50-mL conical flasks. Add 10.0 mL of *Acid molybdate solution* and 5.0 mL of *Ferrous sulfate solution* to each flask, and mix. Determine the absorbances of the solutions against that of the *Blank*.

Acceptance criteria: NMT 1% as PO_4. The absorbance of the *Sample solution* is NMT that of the *Standard solution*.

• **Free Riboflavin and Riboflavin Diphosphates**

[Note—Conduct this test so that all solutions are protected from actinic light at all stages, preferably by using low-actinic glassware.]

Mobile phase: Methanol and 0.054 M monobasic potassium phosphate (15:85)

System suitability solution: Prepare a 2-mg/mL solution of USP Phosphated Riboflavin RS in water. Dilute this solution with *Mobile phase* to 160 µg/mL.

Standard solution: Transfer 60 mg of USP Riboflavin RS to a 250-mL volumetric flask. Dissolve carefully in 1 mL of hydrochloric acid, and dilute with water to volume. Dilute with *Mobile phase* to 9.6 µg/mL.

Sample solution: Prepare a 2-mg/mL solution of Riboflavin 5′-Phosphate Sodium in water. Dilute this solution with *Mobile phase* to 160 µg/mL.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: Fluorometer

Excitation wavelength: 440 nm

Emission wavelength: 530 nm (monochromator-based detector) or 470 nm (filtered-type detector)

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Sample: *System suitability solution*

The retention time of riboflavin 5′-monophosphate is 20–25 min. The approximate relative retention times for the components are listed in *Table 1*.

Table 1

Name	Relative Retention Time
Riboflavin 3′4′-diphosphate	0.23
Riboflavin 3′5′-diphosphate	0.39
Riboflavin 4′5′-diphosphate	0.58
Riboflavin 3′-monophosphate	0.70

USP Monographs

www.webofpharma.com

Table 1 *(continued)*

Name	Relative Retention Time
Riboflavin 4′-monophosphate	0.87
Riboflavin 5′-monophosphate	1.00
Riboflavin	1.63

Suitability requirements
Resolution: NLT 1.0 between riboflavin 4′-monophosphate and riboflavin 5′-monophosphate
Relative standard deviation: NMT 1.5% for riboflavin 5′-monophosphate
Analysis
Samples: *Standard solution* and *Sample solution*
Measure the peak areas of the solutions. Identify the peaks to be measured in the *Sample solution* by comparison with the chromatogram obtained from the *System suitability solution*.
Calculate the percentage of free riboflavin in the portion of Riboflavin 5′-Phosphate Sodium taken:

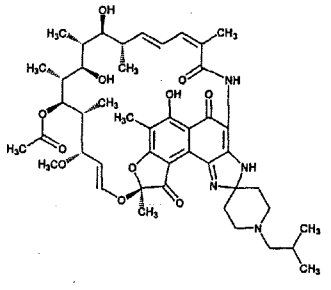
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of free riboflavin from the *Sample solution*
r_S = peak area of riboflavin from the *Standard solution*
C_S = concentration of USP Riboflavin RS in the *Standard solution* (µg/mL)
C_U = concentration of Riboflavin 5′-Phosphate Sodium in the *Sample solution* (µg/mL)

Calculate the percentage of riboflavin diphosphates in the portion of Riboflavin 5′-Phosphate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = sum of the peak areas for any of the 3 riboflavin diphosphates from the *Sample solution*
r_S = peak area of riboflavin from the *Standard solution*
C_S = concentration of USP Riboflavin RS in the *Standard solution* (µg/mL)
C_U = concentration of Riboflavin 5′-Phosphate Sodium in the *Sample solution* (µg/mL)



Acceptance criteria
Free riboflavin: NMT 6.0% on the dried basis
Riboflavin diphosphates, as riboflavin: NMT 6.0% on the dried basis

• **LIMIT OF LUMIFLAVIN**
Alcohol-free chloroform: Shake 20 mL of chloroform gently but thoroughly with 20 mL of water for 3 min, draw off the chloroform layer, and wash twice more with 20-mL portions of water. Finally, pass the chloroform through a dry filter paper, shake it for 5 min with 5 g of powdered anhydrous sodium sulfate, allow the mixture to stand for 2 h, and decant or filter the clear chloroform.
Sample solution: Shake 35 mg of Riboflavin 5′-Phosphate Sodium with 10 mL of *Alcohol-free chloroform* for 5 min, and filter.
Blank: Alcohol-free chloroform
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Analytical wavelength: 440 nm
Cell: 1 cm
Analysis
Samples: *Sample solution* and *Blank*
Measure the absorbances of the *Sample solution* and *Blank*. Correct the absorbance of the *Sample solution* with the *Blank*.
Acceptance criteria: The absorbance is NMT 0.025.

SPECIFIC TESTS
• **RESIDUE ON IGNITION** ⟨281⟩: NMT 25.0%
• **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
Sample solution: 15 mg/mL in 5 N hydrochloric acid. Use the solution within 15 min.
Acceptance criteria: +37.0° to +42.0°
• **pH** ⟨791⟩
Sample solution: 10 mg/mL solution
Acceptance criteria: 5.0–6.5
• **LOSS ON DRYING** ⟨731⟩: Dry a sample under vacuum over phosphorus pentoxide at 100° for 5 h: it loses NMT 7.5% of its weight.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Phosphated Riboflavin RS
USP Riboflavin RS

Rifabutin

$C_{46}H_{62}N_4O_{11}$ 847.00
(9*S*,12*E*,14*S*,15*R*,16*S*,17*R*,18*R*,19*R*,20*S*,21*S*,22*E*,24*Z*)-6,16,18,20-Tetrahydroxy-1′-isobutyl-14-methoxy-7,9,15,17,19,21,25-heptamethylspiro[9,4-(epoxypentadeca[1,11,13]trienimino)-2*H*-furo [2′,3′:7,8] naphth[1,2-*d*]imidazole-2,4′-piperidine]-5,10,26-(3*H*,9*H*)-trione-16-acetate [72559-06-9].

» Rifabutin contains not less than 950 µg and not more than 1020 µg of $C_{46}H_{62}N_4O_{11}$ per mg, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, protected from light and from excessive heat.
USP Reference standards ⟨11⟩—
USP Rifabutin RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

www.webofpharma.com

Water Determination, *Method I* ⟨921⟩: not more than 2.5%.

Limit of *N*-isobutylpiperidone—Prepare a test solution of Rifabutin in a mixture of chloroform and methanol (1:1) containing 10 mg per mL. Prepare a series of Standard solutions of *N*-isobutylpiperidone in a mixture of chloroform and methanol (1:1) containing 0.005, 0.01, 0.02, 0.05, and 0.1 mg per mL, respectively. Separately apply 10-µL spots of the test solution and the Standard solutions to the starting line of a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Develop the chromatograms in a solvent system consisting of a mixture of hexanes and acetone (100:30) in an equilibrated unlined chromatographic chamber until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, allow the plate to air-dry, and place it in an iodine vapor chamber until the spots are visible (about 5 minutes). Remove the plate from the chamber, spray the plate with starch TS, and examine the plate: no spot in the chromatogram of the test solution at an R_F value corresponding to that of *N*-isobutylpiperidone is more intense than that of the principal spot observed in the chromatogram obtained from the Standard solution containing 0.05 mg of *N*-isobutylpiperidone per mL (0.5%).

Chromatographic purity—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of impurities by the formula:

$$100(r_i/r_S)$$

in which r_i is the response of an individual impurity and r_S is the sum of the responses of all peaks: any impurity peak detected at a retention time of about 0.5, 0.6, 0.8, or 1.4 relative to the retention time of the rifabutin peak does not exceed 1.0%, not more than 0.5% of any other impurity is detected, and the total of all impurity peaks is not more than 3.0%.

Assay—

0.1 M Monobasic potassium phosphate—Prepare a solution containing 13.6 g of monobasic potassium phosphate per L.

Mobile phase—Prepare a mixture of acetonitrile and *0.1 M Monobasic potassium phosphate* (50:50). Adjust by dropwise addition of 2 N sodium hydroxide to a pH of 6.5 ± 0.1. Filter through a 0.5-µm or finer porosity filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 25 mg of USP Rifabutin RS, accurately weighed, to a 50-mL volumetric flask. Add 5 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 25 mg of Rifabutin, accurately weighed, to a 50-mL volumetric flask. Add 5 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix.

Resolution solution—Dissolve about 10 mg of Rifabutin and 2 mL of methanol, add 1 mL of 2 N sodium hydroxide, and allow to stand for about 4 minutes. Add 1 mL of 2 N hydrochloric acid, and dilute with *Mobile phase* to 50 mL. [NOTE—Portions of this solution may be stored in the frozen state for future use.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 12.5-cm column that contains 5-µm diameter packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the chromatogram exhibits a major peak for a degradant, two minor peaks for degradants, and a major peak for rifabutin at relative retention times of about 0.5, 0.6, 0.8, and 1.0, respectively. The resolution, *R*, between the rifabutin peak and the degradant peak eluting at a relative retention time of about 0.8 is not less than 1.3. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for a period of time that is twice the retention time of the major rifabutin peak, and measure the area responses for the major peaks. Calculate the quantity, in µg, of $C_{46}H_{62}N_4O_{11}$ in each mg of Rifabutin taken by the formula:

$$50(CP/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Rifabutin RS in the *Standard preparation*, *P* is the designated potency, in µg per mg, of USP Rifabutin RS, *W* is the weight, in mg, of Rifabutin taken to prepare the *Assay preparation*, and r_U and r_S are the rifabutin peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Rifabutin Capsules

» Rifabutin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{46}H_{62}N_4O_{11}$.

Packaging and storage—Preserve in well-closed containers, protected from light and from excessive heat.

USP Reference standards ⟨11⟩—
USP Rifabutin RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—

Solution—Prepare the test solution as follows. Suspend a quantity of Capsule contents, equivalent to about 200 mg of rifabutin, in 20 mL of methanol, sonicate for about 5 minutes, and filter through a 0.5-µm or finer porosity filter. Dilute a portion of the filtrate quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 20 µg per mL. Prepare a Standard solution by dissolving a quantity of USP Rifabutin RS in methanol, with the aid of sonication, to obtain a solution having a concentration of about 20 µg per mL, and filter through a 0.5-µm or finer porosity filter.

Medium: methanol.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Dissolution—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{46}H_{62}N_4O_{11}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 280 nm of filtered portions of the solution under test, suitably diluted with *Dissolution*

USP Monographs

www.webofpharma.com

Medium, in comparison with a Standard solution having a known concentration of USP Rifabutin RS in the same medium, taking into account its designated potency.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{46}H_{62}N_4O_{11}$ is dissolved in 45 minutes.

Chromatographic purity—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of impurities by the formula:

$$100(r_i/r_S)$$

in which r_i is the response of an individual impurity and r_S is the sum of the responses of all peaks: any impurity peak detected at a retention time of about 0.5, 0.6, 0.8, or 1.4 relative to the retention time of the rifabutin peak does not exceed 1.0%, not more than 0.5% of any other impurity is detected, and the total of all impurity peaks is not more than 4.5%.

Assay—

0.1 M Monobasic potassium phosphate, *Mobile phase*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Rifabutin*.

Assay preparation—Remove as completely as possible the contents of not less than 20 Capsules, weigh accurately, and determine the average weight of the Capsule contents. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of rifabutin, to a 50-mL volumetric flask. Add 5 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix. Filter through a 0.5-µm or finer porosity filter, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Rifabutin*. Calculate the quantity, in mg, of $C_{46}H_{62}N_4O_{11}$ in the portion of Capsules taken by the formula:

$$0.05CP(r_U/r_S)$$

in which the terms are as defined therein.

Rifabutin Compounded Oral Suspension

DEFINITION

Rifabutin Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of rifabutin ($C_{46}H_{62}N_4O_{11}$).

Prepare Rifabutin Compounded Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Rifabutin capsules[a] equivalent to	3 g of rifabutin
Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus,[b] a sufficient quantity to make	150 mL

[a] Mycobutin 150-mg capsules, Pfizer Inc., New York, NY.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Empty the required number of *Rifabutin capsules* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a rifabutin liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Solution A: 100 mM monobasic potassium phosphate buffer, adjusted with 2 N sodium hydroxide to a pH of 6.5

Mobile phase: Acetonitrile and *Solution A* (50:50). Filter and degas.

Standard stock solution: 2.0 mg/mL of USP Rifabutin RS in *Mobile phase*

Standard solution: Transfer 10 mL of *Standard stock solution* to a 100-mL volumetric flask. Immediately rinse the volumetric apparatus with 10 mL of acetonitrile and 10 mL of *Mobile phase*. Dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.2 mg/mL of rifabutin. Pass through a filter of 0.45-µm pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension into a 100-mL volumetric flask. Immediately rinse the pipette with 10 mL of acetonitrile and 10 mL of *Mobile phase*. Dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.2 mg/mL of rifabutin. Pass through a filter of 0.45-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Flow rate: 1.0 mL/min
Injection volume: 10 µL

System suitability
Sample: *Standard solution*
[NOTE—The retention time for the rifabutin is about 14.0 min.]
Suitability requirements
Column efficiency: NLT 4500 theoretical plates
Tailing factor: NMT 3.0
Relative standard deviation: NMT 2.0% for replicate injections

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rifabutin ($C_{46}H_{62}N_4O_{11}$) in the portion of Oral Suspension taken:

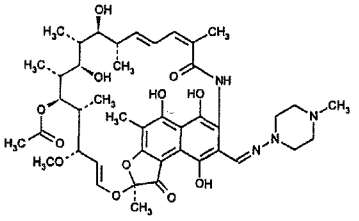
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rifabutin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of rifabutin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 4.5–5.5



ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
• **BEYOND-USE DATE:** NMT 84 days after the date on which it was compounded, when stored in a refrigerator or at controlled room temperature
• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
• **USP REFERENCE STANDARDS** ⟨11⟩

Rifampin

$C_{43}H_{58}N_4O_{12}$ 822.94

Rifamycin, 3-[[(4-methyl-1-piperazinyl)imino]methyl]-. 5,6,9,17,19,21-Hexahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-[*N*-(4-methyl-1-piperazinyl)formimidoyl]-2,7-(epoxypentadeca[1,11,13]trienimino)naphtho[2,1-*b*]furan-1,11-(2*H*)-dione 21-acetate [13292-46-1].

» Rifampin contains not less than 95.0 percent and not more than 103.0 percent of $C_{43}H_{58}N_4O_{12}$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, protected from excessive heat.

USP Reference standards ⟨11⟩—
USP Rifampin RS
USP Rifampin Quinone RS

Change to read:

Identification, ▲***Spectroscopic Identification Tests*** ⟨197⟩, *Infrared Spectroscopy*: 197M▲ (CN 1-May-2020)

Crystallinity ⟨695⟩: meets the requirements.

pH ⟨791⟩: between 4.5 and 6.5, in a suspension (1 in 100).

Loss on drying ⟨731⟩—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 4 hours: it loses not more than 2.0% of its weight.

Related substances—

Phosphate buffer , *Mobile phase*, *Solvent mixture*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

Stock test preparation—Transfer about 200 mg of Rifampin to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Sonicate for about 30 seconds, if necessary, to ensure dissolution. [NOTE—Use this solution within 2 hours.]

Test preparation—Transfer 5.0 mL of *Stock test* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. [NOTE—Prepare this solution immediately prior to injection into the chromatograph.]

Dilute test preparation—Transfer 10.0 mL of *Stock test preparation* to a 100-mL volumetric flask, dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution to another 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. [NOTE—Prepare this final dilution immediately prior to injection into the chromatograph.]

Procedure—Separately inject equal volumes (about 50 µL) of the *Test preparation* and the *Dilute test preparation* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks. Calculate the percentage of each related substance by the formula:

$$r_{Ti}/(r_D + 0.01\Sigma r_{Ti})$$

in which r_{Ti} is the area of the peak of the individual related substance in the chromatogram obtained from the *Test preparation*, r_D is the area of the rifampin peak in the chromatogram obtained from the *Dilute test preparation*, and Σr_{Ti} is the sum of the areas of all of the peaks of the related substances obtained in the chromatogram of the *Test preparation:* not more than 1.5% of rifampin quinone is found, not more than 1.0% of any other individual related substance is found, and a total of not more than 3.5% of all individual related substances, other than rifampin quinone, having retention times of up to 3 in relation to the retention time of rifampin is found.

Assay—

Phosphate buffer—Dissolve 136.1 g of monobasic potassium phosphate in about 500 mL of water, add 6.3 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a suitable mixture of water, acetonitrile, *Phosphate buffer*, 1.0 M citric acid, and 0.5 M sodium perchlorate (510:350:100:20:20), filter through a suitable filter of 0.7 µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solvent mixture—Prepare a mixture of water, acetonitrile, 1.0 M dibasic potassium phosphate, 1.0 M monobasic potassium phosphate, and 1.0 M citric acid (640:250:77:23:10).

Standard preparation—Transfer about 40 mg of USP Rifampin RS, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with acetonitrile to volume, and mix. Sonicate for about 30 seconds, if necessary, to ensure dissolution. [NOTE—Use this solution within 5 hours.] Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. [NOTE—Prepare this final dilution immediately prior to injection into the chromatograph.]

Assay preparation—Using Rifampin, proceed as directed for *Standard preparation*.

Resolution solution—Dissolve suitable quantities of USP Rifampin RS and USP Rifampin Quinone RS in acetonitrile to obtain a solution containing about 0.1 mg of each per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the rifampin quinone and rifampin peaks is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency determined from the rifampin peak is not less than 1000 theoretical plates, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. The relative retention times are about 0.6 for rifampin quinone and 1.0 for rifampin. Calculate the quantity, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$) in the portion of Rifampin taken to prepare the *Assay preparation* by the formula:

$$2000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, calculated on the dried basis, of USP Rifampin RS in the *Standard preparation*, and r_U and r_S are the area responses of the

www.webofpharma.com

rifampin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Rifampin Capsules

» Rifampin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{43}H_{58}N_4O_{12}$.

Packaging and storage—Preserve in tight, light-resistant containers, protected from excessive heat.
USP Reference standards ⟨11⟩—
USP Rifampin RS
USP Rifampin Quinone RS

Identification—
A: Triturate a quantity of Capsule contents, equivalent to about 50 mg of rifampin, with 5 mL of chloroform, and filter. Apply 3 µL each of the filtrate (test solution) and of a solution of USP Rifampin RS in chloroform containing 10 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in an equilibrated chromatographic chamber containing a solvent system consisting of a mixture of chloroform and methanol (90:10) until the solvent front has moved about one-half of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the red spots on the plate: the R_F value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.
B: The chromatogram of the *Assay preparation* exhibits a major peak for rifampin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_{43}H_{58}N_4O_{12}$ dissolved from absorbances at the wavelength of maximum absorbance at about 475 nm on filtered portions of the solution under test, suitably diluted, if necessary, with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Rifampin RS, calculated on the dried basis, in the same *Medium*, prepared concomitantly and held in the water bath for the *Time* specified.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{43}H_{58}N_4O_{12}$ is dissolved in 45 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Procedure for content uniformity—
Phosphate buffer, Mobile phase, Solvent mixture, Diluent, Standard preparation, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay*.
Test preparation—Transfer the contents of 1 Capsule to a suitable volumetric flask so that when diluted to volume as directed below, each mL of solution contains about 1.5 mg of rifampin. Rinse the Capsule shell with a small quantity of *Solvent mixture*, and add the washing to the volumetric flask. Add *Solvent mixture* until the flask is about four-fifths full. Proceed as directed for *Assay preparation* in the *Assay*, beginning with "Sonicate for about 5 minutes."
Procedure—Proceed as directed for *Procedure* in the *Assay*. Calculate the quantity, in mg, of $C_{43}H_{58}N_4O_{12}$ in the Capsule content by the formula:

$$(LC/D)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of rifampin in the Capsule, C is the concentration, in mg per mL, of USP Rifampin RS, calculated on the dried basis, in the *Standard preparation*, D is the concentration, in mg per mL, of rifampin in the *Test preparation*, based on the labeled quantity per Capsule and the extent of dilution, and r_U and r_S are the rifampin peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.
Loss on drying ⟨731⟩—Dry about 100 mg of Capsule contents in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 3.0% of its weight.

Assay—
Phosphate buffer—Dissolve 136.1 g of monobasic potassium phosphate in about 500 mL of water, add 6.3 mL of phosphoric acid, dilute with water to 1000 mL, and mix (pH 3.1 ± 0.1).
Mobile phase—Prepare a suitable mixture of water, acetonitrile, *Phosphate buffer*, 1.0 M citric acid, and 0.5 M sodium perchlorate (510:350:100:20:20), filter through a suitable filter of 0.7 µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Solvent mixture—Prepare a mixture of acetonitrile and methanol (1:1).
Diluent—Prepare a suitable mixture of water, acetonitrile, 1.0 M dibasic sodium phosphate, 1.0 M monobasic potassium phosphate, and 1.0 M citric acid (640:250:77:23:10).
Standard preparation—Dissolve an accurately weighed quantity of USP Rifampin RS in *Solvent mixture* to obtain a solution having a known concentration of about 1.5 mg per mL, sonicating for about 30 seconds, if necessary, to ensure dissolution. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. [NOTE—Use this working solution within 5 hours.] Transfer 5.0 mL of the working solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Each mL of this solution contains about 0.03 mg of USP Rifampin RS. [NOTE—Inject this *Standard preparation* into the chromatograph within 30 to 60 seconds after preparation.]
Assay preparation—Remove, as completely as possible, the contents of not less than 20 Capsules, and weigh accurately. Mix the Capsule contents, and transfer an accurately weighed portion of the powder, equivalent to about 300 mg of rifampin, to a 200-mL volumetric flask, and add about 180 mL of *Solvent mixture*. Sonicate for about 5 minutes, allow to equilibrate to room temperature, dilute with *Solvent mixture* to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. [NOTE—Use this solution within 5 hours.] Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. [NOTE—Inject this *Assay preparation* into the chromatograph within 30 to 60 seconds after preparation.]
Resolution solution—Dissolve USP Rifampin Quinone RS in *Solvent mixture* to obtain a solution containing about 0.1 mg per mL. Transfer 1.5 mL of this solution and 5.0 mL of the working solution used to prepare the *Standard preparation* to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak

USP Monographs

www.webofpharma.com

responses as directed for *Procedure:* the relative retention times are about 0.6 for rifampin quinone and 1.0 for rifampin, and the resolution, *R*, between the rifampin quinone and rifampin peaks is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{43}H_{58}N_4O_{12}$ in the portion of Capsules taken by the formula:

$$10{,}000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Rifampin RS, calculated on the dried basis, in the *Standard preparation*, and r_U and r_S are the rifampin peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Rifampin for Injection

» Rifampin for Injection contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* ⟨659⟩, *Injection Packaging, Packaging for constitution.*

USP Reference standards ⟨11⟩—
USP Rifampin RS
USP Rifampin Quinone RS

Identification—

A: It responds to *Identification* test *A* under *Rifampin Capsules*, the test solution being prepared by dissolving the contents of a container in chloroform to obtain a solution containing about 10 mg of rifampin per mL.

B: The retention time of the rifampin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

Bacterial Endotoxins Test ⟨85⟩ —Dissolve Rifampin for Injection in endotoxin-free water to obtain a stock solution containing 10 mg of rifampin per mL. Dilute the stock solution quantitatively, and stepwise if necessary, with endotoxin-free water to obtain a solution containing 0.12 mg of rifampin per mL: it contains not more than 0.5 USP Endotoxin Unit per mg of rifampin.

Sterility Tests ⟨71⟩ —It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

pH ⟨791⟩: between 7.8 and 8.8, in a solution containing 60 mg of rifampin per mL.

Water Determination, *Method I* ⟨921⟩: not more than 1.0%.

Particulate Matter in Injections ⟨788⟩: meets the requirements for small-volume injections.

Assay—

Phosphate buffer, Mobile phase, Solvent mixture, Standard preparation, Resolution solution, and *Chromatographic system* —Prepare as directed in the *Assay* under *Rifampin.*

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute a container of Rifampin for Injection in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. [NOTE—Use this solution within 2 hours.] Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and transfer to a suitable volumetric flask of such capacity that when diluted with acetonitrile to volume, a solution is obtained containing about 6 mg of rifampin ($C_{43}H_{58}N_4O_{12}$) per mL. [NOTE—Use this stock solution within 5 hours.] Dilute an accurately measured volume of this stock solution quantitatively and stepwise with *Solvent mixture* to obtain a solution having a concentration of about 0.02 mg of rifampin per mL. [NOTE—Prepare this final dilution immediately prior to injection into the chromatograph.]

Assay preparation 2 (where the label states the quantity of rifampin in a given volume of constituted solution)—Constitute a container of Rifampin for Injection in a volume of water, accurately measured, equivalent to the volume of diluent specified in the labeling. [NOTE—Use this solution within 2 hours.] Dilute an accurately measured volume of the constituted solution quantitatively and stepwise with acetonitrile to obtain a solution having a concentration of about 0.2 mg of rifampin ($C_{43}H_{58}N_4O_{12}$) per mL. [NOTE—Use this stock solution within 5 hours.] Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. [NOTE—Prepare this final dilution immediately prior to the injection into the chromatogram.]

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Rifampin.* Calculate the quantity, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$) withdrawn from the container of constituted Rifampin for Injection, or in the volume of constituted Rifampin for Injection taken by the formula:

$$(L/D)(C)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of rifampin in the container, or in the volume of constituted solution taken, D is the concentration, in mg per mL, of rifampin in *Assay preparation 1* or in *Assay preparation 2*, on the basis of the labeled quantity in the container, or in the volume of constituted solution taken, and the extent of dilution, C is the concentration, in mg per mL, calculated on the dried basis, of USP Rifampin RS in the *Standard preparation,* and r_U and r_S are the rifampin peak responses obtained from *Assay preparation 1*, or *Assay preparation 2*, and the *Standard preparation,* respectively.

Rifampin Compounded Oral Suspension

DEFINITION

Rifampin Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$).

Prepare Rifampin Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Rifampin	1.20 g
Citric Acid or Sodium Citrate	To adjust pH
Syrup, a sufficient quantity to make	120 mL

Empty the required number of capsules into a suitable mortar, or use *Rifampin* powder. If necessary, gently crush the capsule contents with a pestle to produce a fine powder. Add 2 mL of *Syrup* to the mortar, and triturate until a smooth paste is formed. Add 10 mL of *Syrup*, and triturate to form a

www.webofpharma.com

suspension. Continue to add *Syrup* until 80 mL has been added. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add *Syrup* in portions to rinse the mortar, and add the rinses to the bottle. If necessary, add *Citric Acid* or *Sodium Citrate* to adjust to a pH of 5.0. Add a suitable flavor if desired. Add sufficient *Syrup* to bring the preparation to final volume. Shake vigorously.

ASSAY

• **PROCEDURE**

Solution A: 1.0 M monobasic potassium phosphate containing 6.3 mL/L of phosphoric acid

Solution B: Acetonitrile, 1.0 M dibasic potassium phosphate, 1.0 M monobasic potassium phosphate, 1.0 M citric acid, and water (25: 7.7: 2.3: 1: 64)

Mobile phase: Acetonitrile, *Solution A*, 1.0 M citric acid, 0.5 M sodium perchlorate, and water (36:10:2:2:50). Pass through a suitable filter of 0.7-µm or finer pore size, and degas.

Diluent: Acetonitrile and water (50:50)

System suitability solution: 0.1 mg/mL of USP Rifampin RS and 0.1 mg/mL of USP Rifampin Quinone RS in acetonitrile. Transfer 1.0 mL of the solution into a 10-mL volumetric flask, and dilute with *Solution B* to volume.

Standard solution: 0.5 mg/mL of USP Rifampin RS in *Diluent*. If necessary, sonicate for 30 s to dissolve. Transfer 5.0 mL of the solution to a 50-mL, low-actinic volumetric flask, and dilute with *Diluent* to volume. Use the solution within 1 h.

Sample solution: Transfer 5.0 mL of Oral Suspension, freshly mixed and free of air bubbles, to a 100-mL, low-actinic volumetric flask, and dissolve in and dilute with *Diluent* to volume. Transfer 5.0 mL of the resulting solution to a 50-mL, low-actinic volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 10-cm; 5-µm packing L7

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for rifampin quinone and rifampin are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between rifampin quinone and rifampin, *System suitability solution*

Relative standard deviation: NMT 1.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Rifampin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of rifampin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **PH** ⟨791⟩: 4.5–5.5

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in a tight, light-resistant container. Store at controlled room temperature.

• **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded when stored at controlled room temperature

• **LABELING:** Label it to state that it is to be well shaken and to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Rifampin RS

USP Rifampin Quinone RS

Rifampin and Isoniazid Capsules

» Rifampin and Isoniazid Capsules contain not less than 90.0 percent and not more than 130.0 percent of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isoniazid ($C_6H_7N_3O$).

[NOTE—Where Rifampin and Isoniazid Capsules are prescribed without reference to the quantity of rifampin or isoniazid contained therein, a product containing 300 mg of rifampin and 150 mg of isoniazid shall be dispensed.]

Packaging and storage—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

USP Reference standards ⟨11⟩—

USP Rifampin RS

USP Isoniazid RS

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—*Test solution*—Transfer a portion of Capsule contents, equivalent to about 120 mg of rifampin, to a suitable flask, add 20 mL of methanol, and shake for several minutes. Pass this suspension through a filter having a 1-µm or finer porosity, discarding the first few mL of the filtrate. Dilute a volume of the filtrate with an equal volume of acetone, and mix. *Standard solutions*—Dissolve a quantity of USP Rifampin RS in methanol to obtain a solution containing 6 mg per mL. Add an equal volume of acetone, and mix. Dissolve a quantity of USP Isoniazid RS in methanol to obtain a solution containing 2.5 mg per mL. Add an equal volume of acetone, and mix. *Application volume:* 2 µL.

Developing solvent solution: a mixture of acetone and glacial acetic acid (100:1).

B: The retention times of the rifampin and isoniazid peaks in the chromatogram of the *Assay preparation* correspond to those of rifampin and isoniazid in the chromatogram of the *Standard preparation*, as obtained in the *Assay for rifampin and isoniazid*.

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Determine the amount of rifampin ($C_{43}H_{58}N_4O_{12}$) dissolved by employing the following method.

Phosphate buffer solution—Dissolve 15.3 g of dibasic potassium phosphate and 80.0 g of monobasic potassium phosphate into a 1-L volumetric flask, mix, dilute with water to volume, and mix.

USP Monographs

www.webofpharma.com

Isoniazid standard solution—Accurately weigh about 66 mg of USP Isoniazid RS into a 100-mL volumetric flask. Dissolve in and dilute with 0.1 N hydrochloric acid to volume, and mix.

Standard stock solution—Accurately weigh about 66 mg of USP Rifampin RS into a 200-mL volumetric flask, dissolve in 10 mL of 0.1 N hydrochloric acid, and mix. Add 50.0 mL of *Isoniazid standard solution,* dilute with 0.1 N hydrochloric acid to volume, and mix. [NOTE—Prepare this solution immediately before the test is performed, and place in the dissolution bath at the start of the test.]

Standard solution—At the end of the test run, transfer a 5.0-mL aliquot of the *Standard stock solution* and 10.0 mL of *Phosphate buffer solution* to a 50-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Analyze the solution immediately, if possible, and if not, within 3 hours after final dilution.]

Test solution—At the end of the test run, withdraw a 25-mL aliquot, and filter, discarding the first 10 mL of the filtrate. Allow to cool for about 10 minutes, and transfer 5.0 mL of the filtrate and 10.0 mL of the *Phosphate buffer solution* to a 50-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Analyze the solution immediately, if possible, and if not, within 3 hours after final dilution.]

Determine the amount of rifampin ($C_{43}H_{58}N_4O_{12}$) dissolved from absorbances at the wavelength of maximum absorbance at about 475 nm of the *Standard solution* and the *Test solution.*

Determine the amount of isoniazid ($C_6H_7N_3O$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, *Phosphate buffer solution,* and methanol (850:100:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the isoniazid peaks.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{43}H_{58}N_4O_{12}$ and not less than 80% *(Q)* of the labeled amount of $C_6H_7N_3O$ are dissolved in 45 minutes.

Loss on drying ⟨731⟩—Dry about 100 mg of Capsule contents in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 3.0% of its weight.

Assay for rifampin and isoniazid—

Buffer solution—Dissolve 1.4 g of dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (96:4).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (55:45).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Rifampin RS and USP Isoniazid RS in a mixture of *Buffer solution* and methanol (96:4) to obtain a solution having known concentrations of about 0.16 mg per mL and 0.08 mg per mL, respectively.

[NOTE—Use this solution within 10 minutes.]

Assay preparation—Weigh the contents of not fewer than 10 Capsules, mix, and transfer an accurately weighed portion of the powder, equivalent to about 8 mg of isoniazid, to a 100-mL volumetric flask, and add about 90 mL of *Buffer solution.* Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with *Buffer solution* to volume, and mix.

[NOTE—Use this solution within 2 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 25-cm column that contains 5-µm base-deactivated packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–6	100→0	0→100	linear gradient
6–15	0	100	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 2.6 and 1.0 for rifampin and isoniazid, respectively; the column efficiency is not less than 50,000 and not less than 6,000 theoretical plates for rifampin and isoniazid, respectively; the tailing factors are not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$) and isoniazid ($C_6H_7N_3O$) in the portion of Capsules taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Rifampin RS, calculated on the dried basis, or of USP Isoniazid RS, as appropriate, in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the corresponding analytes obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Rifampin, Isoniazid, and Pyrazinamide Tablets

» Rifampin, Isoniazid, and Pyrazinamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$), and pyrazinamide ($C_5H_5N_3O$).

Packaging and storage—Preserve in tight, light-resistant containers at controlled room temperature.

USP Reference standards ⟨11⟩—
USP Isoniazid RS
USP Pyrazinamide RS
USP Rifampin RS

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—*Test solution*—Transfer an accurately weighed portion of ground Tablets, equivalent to about 120 mg of rifampin, to a suitable flask, add 20 mL of methanol, and shake for several minutes. Pass this suspension through a filter having a 1-µm

USP Monographs

www.webofpharma.com

or finer porosity, discarding the first few mL of the filtrate. Dilute a volume of the filtrate with an equal volume of acetone, and mix.

Standard solutions—Dissolve a quantity of USP Rifampin RS in methanol to obtain a solution containing 6 mg per mL. Add an equal volume of acetone, and mix. Dissolve a quantity of USP Isoniazid RS in methanol to obtain a solution containing 2.5 mg per mL. Add an equal volume of acetone, and mix. Dissolve a quantity of USP Pyrazinamide RS in methanol to obtain a solution containing 15 mg per mL. Add an equal volume of acetone, and mix.

Application volume: 2 µL.

Developing solvent system: a mixture of acetone and glacial acetic acid (100:1).

B: The retention times of the rifampin, isoniazid, and pyrazinamide peaks in the chromatogram of the *Assay preparation* correspond to those of rifampin, isoniazid, and pyrazinamide in the chromatogram of the *Standard preparation,* as obtained in the *Assay for rifampin, isoniazid, and pyrazinamide.*

Dissolution ⟨711⟩—

Medium: simulated gastric fluid TS, without pepsin; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Standard stock solution—Prepare a solution in *Medium* having known concentrations of about 0.22 mg of USP Isoniazid RS and 1.3 mg of USP Pyrazinamide RS per mL. Use this solution on the day prepared.

Intermediate standard solution—Transfer about 27 mg of USP Rifampin RS, accurately weighed, to a 200-mL volumetric flask, add 50.0 mL of the *Standard stock solution,* and swirl to dissolve. Dilute with *Medium* to volume, and mix. Place this flask into the dissolution bath immediately prior to starting the tablet dissolution. Withdraw the flask from the dissolution bath at the same time that the solutions under test are withdrawn.

Determine the amount of $C_{43}H_{58}N_4O_{12}$ dissolved by employing the following method.

Standard solution—Transfer 10.0 mL of the *Intermediate standard solution* to a 50-mL volumetric flask, dilute with *Medium* to volume, and mix.

Procedure—Transfer 10.0 mL of the filtered solution under test to a separate 50-mL volumetric flask, dilute with *Medium* to volume, and mix. Concomitantly determine the UV absorbances at 475 nm of the solution obtained and the *Standard solution,* using the *Medium* as the blank. Calculate the quantity, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$) dissolved by the formula:

$$4500C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Rifampin RS in the *Standard solution;* and A_U and A_S are the absorbances of the solution under test and the *Standard solution,* respectively.

Tolerances—Not less than 80% *(Q)* of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$) is dissolved in 30 minutes.

Determine the amount of $C_6H_7N_3O$ and $C_5H_5N_3O$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, 1 M monobasic potassium phosphate, and acetonitrile (860:100:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of isonicotinic acid in *Medium* containing about 0.125 mg per mL. Transfer 10 mL of this solution and 4 mL of the *Standard stock solution* to a 100-mL volumetric flask containing 15 mL of 1 M dibasic potassium phosphate and 30 mL of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix.

Standard solution—Transfer 15.0 mL of the *Intermediate standard solution* to a 100-mL volumetric flask containing 15 mL of 1 M dibasic potassium phosphate and 30 mL of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix. This solution may be used for 20 hours.

Test solution—Withdraw 60 mL of the solution under test, and filter, discarding the first 20 mL of the filtrate. Centrifuge the filtrate for 5 minutes. Transfer 15.0 mL of this solution to a 100-mL volumetric flask containing 15 mL of 1 M dibasic potassium phosphate and 30 mL of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix. This solution may be used for 20 hours.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 30-cm column that contains packing L44. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for isonicotinic acid, 1.0 for pyrazinamide, and 1.8 for isoniazid; and the resolution, *R,* between isonicotinic acid and pyrazinamide is not less than 2.5 and between pyrazinamide and isoniazid not less than 4.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviations determined from the pyrazinamide and isoniazid responses for replicate injections are not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of isoniazid ($C_6H_7N_3O$) dissolved by the formula:

$$6000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Isoniazid RS in the *Standard solution;* and r_U and r_S are the isoniazid peak areas obtained from the *Test solution* and the *Standard solution,* respectively. Calculate the quantity, in mg, of pyrazinamide ($C_5H_5N_3O$) dissolved by the same formula, except to read "USP Pyrazinamide RS" where "USP Isoniazid RS" is specified, and "pyrazinamide" where "isoniazid" is specified.

Tolerances—Not less than 80% *(Q)* of the labeled amount of isoniazid ($C_6H_7N_3O$) and not less than 75% of the labeled amount of pyrazinamide ($C_5H_5N_3O$) are dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Loss on drying—Dry about 100 mg of powdered Tablets, accurately weighed, in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 3.0% of its weight.

Assay for rifampin, isoniazid, and pyrazinamide—

Buffer solution—Dissolve 1.4 g of dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (96:4).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (55:45).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Rifampin RS, USP Isoniazid RS, and USP Pyrazinamide RS in a mixture of *Buffer solution* and methanol (96:4) to obtain a solution having known concentrations of

www.webofpharma.com

about 0.16 mg per mL, 0.08 mg per mL, and 0.43 mg per mL, respectively.

[NOTE—Use this solution within 10 minutes.]

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 8 mg of isoniazid, to a 100-mL volumetric flask, and add about 90 mL of *Buffer solution*. Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with *Buffer solution* to volume, and mix.

[NOTE—Use this solution within 2 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 25-cm column that contains 5-µm base-deactivated packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–6	100→0	0→100	linear gradient
6–15	0	100	isocratic

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 1.8, 0.7, and 1.0 for rifampin, isoniazid, and pyrazinamide, respectively; the resolution, *R*, between isoniazid and pyrazinamide is not less than 4; the column efficiency is not less than 50,000, not less than 6,000, and not less than 10,000 theoretical plates for rifampin, isoniazid, and pyrazinamide, respectively; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantities, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$), and pyrazinamide ($C_5H_5N_3O$) in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Rifampin RS, calculated on the dried basis, or of USP Isoniazid RS or of USP Pyrazinamide RS, as appropriate, in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the corresponding analytes obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets

» Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$), pyrazinamide ($C_5H_5N_3O$), and ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—
USP Ethambutol Hydrochloride RS
USP Isoniazid RS
USP Pyrazinamide RS
USP Rifampin RS

Identification—

A: The retention times of the rifampin, isoniazid, and pyrazinamide peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay for rifampin, isoniazid, and pyrazinamide.*

B: The retention time of the ethambutol peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for ethambutol hydrochloride.*

Dissolution ⟨711⟩—

Medium: 10 mM pH 6.8 sodium phosphate buffer, prepared by dissolving 7 g of anhydrous dibasic sodium phosphate in 5 L of water, and adjusting with phosphoric acid to a pH of 6.8; 900 mL.

Apparatus 2: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amounts of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$), pyrazinamide ($C_5H_5N_3O$), and ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$) dissolved using filtered portions of the solution under test and by employing the procedures set forth in the *Assay for rifampin, isoniazid, and pyrazinamide* and the *Assay for ethambutol hydrochloride.*

Tolerances—Not less than 75% (*Q*) of the labeled amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$, $C_5H_5N_3O$, and $C_{10}H_{24}N_2O_2 \cdot 2HCl$ is dissolved in 45 minutes.

Loss on drying—Dry about 100 mg of powdered Tablets in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 3.0% of its weight.

Assay for rifampin, isoniazid, and pyrazinamide—

Buffer solution—Dissolve 1.4 g of anhydrous dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (96:4).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (55:45).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Rifampin RS, USP Isoniazid RS, and USP Pyrazinamide RS in a mixture of *Buffer solution* and methanol (96:4) to obtain a solution having known concentrations of about 0.16 mg per mL, 0.08 mg per mL, and 0.43 mg per mL, respectively. [NOTE—Use this solution within 10 minutes.]

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 8 mg of isoniazid, to a 100-mL volumetric flask, and add about 90 mL of *Buffer solution.* Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with *Buffer solution* to volume, and mix. [NOTE—Use this solution within 2 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 25-cm column that contains a 5-µm base-deactivated packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

www.webofpharma.com

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–6	100→0	0→100	linear gradient
6–15	0	100	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times for rifampin, isoniazid, and pyrazinamide are about 1.8, 0.7, and 1.0, respectively; the resolution, *R,* between isoniazid and pyrazinamide is not less than 4; the column efficiencies, determined from the rifampin, isoniazid, and pyrazinamide peaks are not less than 50,000 theoretical plates, 6000 theoretical plates, and 10,000 theoretical plates, respectively; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantities, in mg, of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$), and pyrazinamide ($C_5H_5N_3O$) in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* and r_U and r_S are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for ethambutol hydrochloride—

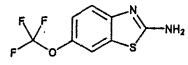
Diluent—Dissolve 1.4 g of anhydrous dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8.

Buffer solution—Mix 1.0 mL of triethylamine and 1 L of water, and adjust with phosphoric acid to a pH of 7.0.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ethambutol Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.3 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 30 mg of ethambutol hydrochloride, to a 100-mL volumetric flask, and add about 90 mL of *Diluent.* Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter, discarding the first 10 mL of the filtrate.



Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 15-cm column that contains a 5-µm base-deactivated packing L10. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 3; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$) in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Ethambutol Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the ethambutol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Riluzole

$C_8H_5F_3N_2OS$ 234.20

2-Benzothiazolamine, 6-(trifluoromethoxy)-;
2-Amino-6-(trifluoromethoxy)benzothiazole [1744-22-5].

DEFINITION

Riluzole contains NLT 98.0% and NMT 102.0% of the labeled amount of $C_8H_5F_3N_2OS$, calculated on the anhydrous basis.

Rimantadine Hydrochloride

$C_{12}H_{21}N \cdot HCl$ 215.76
Tricyclo[3.3.1.1^{3,7}]-decane-1-methanamine, α-methyl-, hydrochloride.
α-Methyl-1-adamantanemethylamine hydrochloride [1501-84-4].

» Rimantadine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{21}N \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store between 15° to 30°.
USP Reference standards ⟨11⟩—
USP Rimantadine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

B: The retention time of the rimantadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

X-ray diffraction ⟨941⟩—The X-ray diffraction pattern conforms to that of USP Rimantadine Hydrochloride RS, similarly determined.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Ordinary impurities ⟨466⟩—
Test solution—Transfer 100 mg of Rimantadine Hydrochloride to a 10-mL centrifuge tube, add 2 mL of 1 N sodium hydroxide, and mix. Add 2 mL of chloroform, and mix on a vortex mixer for 1 minute. Allow the layers to separate, and apply 10 µL of the organic layer.

USP Monographs

www.webofpharma.com

Standard solution—Proceed as directed for the *Test solution,* using USP Rimantadine Hydrochloride RS in place of the test specimen.

Eluant: a mixture of ethyl acetate, methanol, and ammonium hydroxide (80:10:4).

Procedure—Use a low-actinic glass tank. Dry the plate in a stream of hot air, then heat in an oven at 105° for 30 minutes. Allow the plate to cool to room temperature.

Visualization—Place the plate in an atmosphere of chlorine, prepared by mixing 1.5% potassium permanganate solution and diluted hydrochloric acid (1:1), for about 90 minutes. Allow to air-dry for 60 minutes, and follow with visualization technique 20.

Limit of toluene—

Standard solution—Transfer 10 µL of toluene to a 100-mL volumetric flask, dilute with chloroform to volume, and mix.

Test solution—Transfer about 750 mg of Rimantadine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dilute with chloroform to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 2-m column that contains 80- to 100-mesh support S1A. The column temperature is maintained at about 200°, and nitrogen is used as the carrier gas. The injection port and detector temperatures are maintained at about 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5 for toluene; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 9 minutes, and measure the responses for the toluene peaks. Calculate the percentage of toluene in the portion of Rimantadine Hydrochloride taken by the formula:

$$0.867(100/W_U)(r_U/r_S)$$

in which 0.867 is the specific gravity of toluene; W_U is the weight, in mg, of Rimantadine Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the toluene peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% is found.

Assay—

Internal standard solution—Transfer about 400 mg of *n*-eicosane to a 250-mL volumetric flask, dilute with hexane to volume, and mix.

Standard preparation—Transfer about 40 mg of USP Rimantadine Hydrochloride RS, accurately weighed, to a 50-mL centrifuge tube, add 15 mL of 1 N sodium hydroxide, and mix. Add 25.0 mL of *Internal standard solution,* and shake by mechanical means for about 15 minutes. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Assay preparation—Using about 40 mg of Rimantadine Hydrochloride, accurately weighed, proceed as directed for *Standard preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.8-m glass column that is packed with 3% phase G19 on 100- to 200-mesh support S1A. The column temperature is maintained at about 160°, and the injection port and detector temperatures are maintained at about 250°. Nitrogen is used as the carrier gas. Adjust the carrier flow rate and temperature so that the *n*-eicosane elutes at about 8 minutes. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0 for rimantadine; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{21}N \cdot HCl$ in the portion of Rimantadine Hydrochloride taken by the formula:

$$25C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Rimantadine Hydrochloride in the *Standard preparation;* and R_U and R_S are the ratios of the rimantadine peak response to the *n*-eicosane peak response obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Rimantadine Hydrochloride Tablets

» Rimantadine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of rimantadine hydrochloride ($C_{12}H_{21}N \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, and store between 15° to 30°.

USP Reference standards ⟨11⟩—
USP Rimantadine Hydrochloride RS

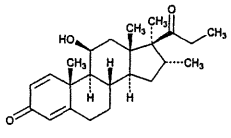
Identification—

A: The retention time of the rimantadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: [**CAUTION**—Avoid contact with o-tolidine when performing this test, and conduct the test in a well-ventilated hood.] Weigh and finely powder not fewer than 5 Tablets. Transfer a portion of the powder, equivalent to 100 mg of riman tadine hydrochloride, to a 10-mL centrifuge tube, add 2 mL of 1 N sodium hydroxide, and mix. Add 2 mL of chloroform, and mix on a vortex mixer for 1 minute. Allow the layers to separate, and use the organic layer as the test solution. Separately apply 10 µL of the test solution and 10 µL of a Standard solution of USP Rimantadine Hydrochloride RS, similarly prepared, to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a low-actinic glass chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (80:10:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, dry it in a stream of hot air, and then heat in an oven at 105° for 30 minutes. Allow the plate to cool to room temperature. Place the dried plate in an atmosphere of chlorine, prepared from a mixture of 1.5% potassium permanganate solution and 3 N hydrochloric acid (1:1), for about 90 minutes. Remove the plate, and allow it to air-dry for 60 minutes. Prepare a spray reagent as follows. Dissolve 160 mg of *o*-tolidine in 30 mL of glacial acetic acid, dilute with water to 500 mL, add 1 g of potassium iodide, and mix until the potassium iodide is dissolved. Locate the spots on the plate by spraying with the spray reagent: the R_F value of the principal

www.webofpharma.com

spot in the chromatogram of the test solution corresponds to that of the principal spot obtained from the Standard solution.
Uniformity of dosage units ⟨905⟩: meet the requirements.



Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{12}H_{21}N \cdot HCl$ dissolved, employing the procedure set forth in the *Assay*.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{12}H_{21}N \cdot HCl$ is dissolved in 30 minutes.

Assay—
Internal standard solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Rimantadine Hydrochloride.*
Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of rimantadine hydrochloride, to a 50-mL centrifuge tube, add 15 mL of 1 N sodium hydroxide, and mix. Add 25.0 mL of *Internal standard solution*, and shake by mechanical means for about 15 minutes. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate as the *Assay preparation.*
Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of rimantadine hydrochloride ($C_{12}H_{21}N \cdot HCl$) in the portion of Tablets taken by the formula:

$$25C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Rimantadine Hydrochloride RS in the *Standard preparation;* and R_U and R_S are the ratios of the rimantadine peak response to the *n*-eicosane peak response obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Rimexolone

$C_{24}H_{34}O_3$ 370.52
Androsta-1,4-diene-3-one, 11-hydroxy-16,17-dimethyl-17-(1-oxopropyl)-, (11β,16α,17β)-;
11β-Hydroxy-16α,17α-dimethyl-17-propionylandrosta-1,4-diene-3-one [49697-38-3].

DEFINITION
Rimexolone contains NLT 97.0% and NMT 102.0% of rimexolone ($C_{24}H_{34}O_3$), calculated on the dried basis.

Ringer's Injection

DEFINITION
Ringer's Injection is a sterile solution of Sodium Chloride, Potassium Chloride, and Calcium Chloride in Water for Injection. It contains, in each 100 mL, NLT 323.0 mg and NMT 354.0 mg of sodium (Na) [equivalent to NLT 820.0 mg and NMT 900.0 mg of sodium chloride (NaCl)]; NLT 14.9 mg and NMT 16.5 mg of potassium (K) [equivalent to NLT 28.5 mg and NMT 31.5 mg of potassium chloride (KCl)] ; NLT 8.20 mg and NMT 9.80 mg of calcium (Ca) [equivalent to NLT 30.0 mg and NMT 36.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)]; and NLT 523.0 mg and NMT 580.0 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)]. It contains no antimicrobial agents.

[1] Brookfield cone-and-plate rheometer, with spindle CP-42 (#42), is operated at 3 rpm. Any other equivalent rheometer is suitable as well.

www.webofpharma.com

[NOTE—The calcium, chloride, potassium, and sodium ion contents of Ringer's Injection are approximately 4.5, 156, 4, and 147.5 mEq/L, respectively.]

Sodium Chloride	8.6 g
Potassium Chloride	0.3 g
Calcium Chloride	0.33 g
Water for Injection, a sufficient quantity to make	1000 mL

Dissolve the three salts in the *Water for Injection*, filter until clear, place in suitable containers, and sterilize.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests*, *Calcium* and *Chloride*: Meets the requirements of test *A* for *Calcium*, and test *A* for *Chloride*
- **B. SODIUM:** A sample imparts an intense yellow color to a nonluminous flame.
- **C. POTASSIUM:** A sample imparts a violet color to a nonluminous flame. The presence of small quantities of sodium masks the color unless the yellow color produced by sodium is screened out by viewing through a blue filter that blocks the emission at 589 nm (sodium). It is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

ASSAY

- **CALCIUM**

[NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Lanthanum chloride solution: Transfer 17.69 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.

Calcium stock solution: 1 mg/mL of calcium (Ca) prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of diluted hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium (Ca) prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 20.0 mL of Injection, equivalent to 1.8 mg of calcium (Ca), to a 100-mL volumetric flask containing 5.0 mL of *Lanthanum chloride solution*. Dilute with water to volume.

Blank: Transfer 5.0 mL of *Lanthanum chloride solution* to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Emission wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Plot the absorbances of the *Standard solutions* versus the concentration, in mg/mL, of calcium, and draw the straight line best fitting the three plotted points. From the graph, determine the concentration (*C*), in mg/mL, of calcium in the *Sample solution*.

Calculate the quantity (mg) of calcium (Ca) in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of calcium in the *Sample solution*, as determined from the graph (mg/mL)
D = dilution factor of the *Sample solution*, 5
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 8.20–9.80 mg of calcium (Ca) in each 100 mL

- **POTASSIUM**

Solution A: Suitable nonionic wetting agent (1 in 500)

Solution B: 10.93 mg/mL of sodium chloride in water

Standard stock solution: 100 µg/mL of potassium prepared as follows. Dissolve 190.7 mg of potassium chloride, previously dried at 105° for 2 h, in 50 mL of water, transfer to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.01, 0.015, and 0.020 mg/mL of potassium prepared as follows. Transfer 10 mL of *Solution B* to each of four 100-mL volumetric flasks containing 10.0 mL of *Solution A*. To each flask add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 10 mL of Injection to a 100-mL volumetric flask. Add 10.0 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution B* to a 100-mL volumetric flask containing 10.0 mL of *Solution A*. Dilute with water to volume.

Instrumental conditions

Mode: Atomic emission spectrophotometry

Emission wavelength: 766 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set the flame photometer for maximum transmittance at a wavelength of 766 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of potassium. Read the percentage transmittance of the *Sample solution*. Calculate the quantity (mg) of potassium (K) in each 100 mL of Injection.

Acceptance criteria: 14.9–16.5 mg of potassium (K) in each 100 mL

- **SODIUM**

Solution A: Suitable nonionic wetting agent (1 in 500)

Standard stock solution: 100 µg/mL of sodium in water prepared as follows. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium prepared as follows. Transfer 10 mL of *Solution A* to each of four 100-mL volumetric flasks. To each flask add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 5 mL of Injection into a 1-L volumetric flask containing 100 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution A* to a 100-mL volumetric flask. Dilute with water to volume.

Acceptance criteria: 523.0–580.0 mg of chloride (Cl) in each 100 mL

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: It contains NMT 0.5 USP Endotoxin Units/mL
- **pH** ⟨791⟩: 5.0–7.5
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.

Ringer's and Dextrose Injection

DEFINITION

Ringer's and Dextrose Injection is a sterile solution of Sodium Chloride, Potassium Chloride, Calcium Chloride, and Dextrose in Water for Injection. It contains, in each 100 mL, NLT 323.0 mg and NMT 354.0 mg of sodium (Na) [equivalent to NLT 820.0 mg and NMT 900.0 mg of sodium chloride (NaCl)], NLT 14.9 mg and NMT 16.5 mg of potassium (K) [equivalent to NLT 28.5 mg and NMT 31.5 mg of potassium chloride (KCl)], NLT 8.20 mg and NMT 9.80 mg of calcium (Ca) [equivalent to NLT 30.0 mg and NMT 36.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], and NLT 523.0 mg and NMT 608.5 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)]. It contains NLT 95.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It contains no antimicrobial agents.

[NOTE—The potassium, calcium, sodium, and chloride ion contents of Ringer's and Dextrose Injection are approximately 4, 4.5, 147.5, and 156 mEq/L, respectively.]

IDENTIFICATION

- **A.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection in water
Analysis: Add a few drops of *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.
Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

- **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩: Meets the requirements of test *A* under *Calcium*, and test *A* under *Chloride*.
- **C. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.
- **D. POTASSIUM:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium).
[NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

ASSAY

- **CALCIUM**

[NOTE—Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]
Lanthanum chloride solution: 88.45 g/L of lanthanum chloride prepared as follows. Transfer a suitable quantity of lanthanum chloride to an appropriate volumetric flask. Add 50% of the final flask volume of water. Carefully add 25% of the final flask volume of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.
Calcium stock solution: 1 mg/mL of calcium (Ca) prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of diluted hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.
Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium (Ca) prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with water to volume.
Sample solution: Transfer 20.0 mL of Injection to a 100-mL volumetric flask containing 5.0 mL of *Lanthanum chloride solution*. Dilute with water to volume.
Blank: Transfer 5.0 mL of *Lanthanum chloride solution* to a 100-mL volumetric flask and dilute with water to volume.
Instrumental conditions
(See *Atomic Absorption Spectroscopy* ⟨852⟩.)
Mode: Atomic absorption spectrophotometry
Analytical wavelength: Calcium emission line at 422.7 nm
Lamp: Calcium hollow-cathode
Flame: Air–acetylene
Analysis
Samples: *Standard solutions*, *Sample solution*, and *Blank*
Plot the absorbances of the *Standard solutions* versus the concentration, in mg/mL, of calcium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration (*C*), in mg/mL, of calcium in the *Sample solution*.

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint. Calculate the amount, in mg, of chloride (Cl) in each 100 mL of Injection taken:

$$\text{Result} = V \times N \times D \times F$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)
N = actual normality of the *Titrant* (mEq/mL)
D = dilution factor of the *Sample solution*, 10
F = equivalency factor, 35.45 mg/mEq

Acceptance criteria: 523.0–608.5 mg of chloride (Cl) in each 100 mL

• **DEXTROSE**

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis

Sample: *Sample solution*

Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)
M_{r1} = molecular weight of dextrose monohydrate, 198.17
M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 95.0%–105.0%

• **POTASSIUM**

Solution A: Suitable nonionic wetting agent (1 in 500)

Solution B: 10.93 mg/mL of sodium chloride in water

Standard stock solution: 100 µg/mL of potassium in water prepared as follows. Dissolve 190.7 mg of potassium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of potassium prepared as follows. Transfer 10 mL of *Solution B* to each of four 100-mL volumetric flasks containing 10.0 mL of *Solution A*. To each flask add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 10 mL of Injection to a 100-mL volumetric flask. Add 10.0 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution B* to a 100-mL volumetric flask containing 10.0 mL of *Solution A*. Dilute with water to volume.

Instrumental conditions

Mode: Atomic emission spectrophotometry

Emission wavelength: 766 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set a suitable flame photometer for maximum transmittance at a wavelength of 766 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of potassium. From the graph so obtained, read the percentage transmittance of the *Sample solution*.

Calculate the quantity (mg) of potassium (K) in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of potassium in the *Sample solution*, as determined from the graph (mg/mL)
D = dilution factor of the *Sample solution*, 10
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 14.9–16.5 mg of potassium (K) in each 100 mL

• **SODIUM**

Solution A: Suitable nonionic wetting agent (1 in 500)

Standard stock solution: 100 µg/mL of sodium in water prepared as follows. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium prepared as follows. Transfer 10 mL of *Solution A* to each of four 100-mL volumetric flasks. To each flask add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 5 mL of Injection to a 1-L volumetric flask containing 100 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution A* to a 100-mL volumetric flask. Dilute with water to volume.

Instrumental conditions

Mode: Atomic emission spectrophotometry

Emission wavelength: 589 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set a suitable flame photometer for maximum transmittance at a wavelength of 589 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the

USP Monographs

www.webofpharma.com

percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of sodium. From the graph so obtained, read the percentage transmittance of the *Sample solution*.

Calculate the quantity (mg) of sodium (Na) in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of sodium in the *Sample solution*, as determined from the graph (mg/mL)
D = dilution factor of the *Sample solution*, 200
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 323.0–354.0 mg of sodium (Na) in each 100 mL

IMPURITIES

- **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally 2.0 mg/mL of dextrose ($C_6H_{12}O_6 \cdot H_2O$) from Injection in water

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 284 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Sample solution* and *Blank*

Determine the absorbance of the *Sample solution* with a suitable spectrophotometer.

Acceptance criteria: The absorbance is NMT 0.25

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.5 USP Endotoxin Units/mL
- **pH** ⟨791⟩: 3.5–6.5
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.

Lactated Ringer's Injection

DEFINITION

Lactated Ringer's Injection is a sterile solution of Calcium Chloride, Potassium Chloride, Sodium Chloride, and Sodium Lactate in Water for Injection. It contains, in each 100 mL, NLT 285.0 and NMT 315.0 mg of sodium [as sodium chloride (NaCl) and sodium lactate ($C_3H_5NaO_3$)], NLT 14.2 and NMT 17.3 mg of potassium (K) [equivalent to NLT 27.0 and NMT 33.0 mg of potassium chloride (KCl)], NLT 4.90 and NMT 6.00 mg of calcium (Ca) [equivalent to NLT 18.0 and NMT 22.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], NLT 368.0 and NMT 428.0 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)], and NLT 231.0 and NMT 261.0 mg of lactate ($C_3H_5O_3$) [equivalent to NLT 290.0 and NMT 330.0 mg of sodium lactate ($C_3H_5NaO_3$)]. It contains no antimicrobial agents.

[NOTE—The calcium, potassium, and sodium contents of Lactated Ringer's Injection are approximately 2.7, 4, and 130 mEq/L, respectively.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL** ⟨191⟩: Meets the requirements of test *A* under *Chloride* and test *A* under *Calcium*
- **B. POTASSIUM:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]
- **C. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.
- **D.** The retention time of the lactate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Lactate*.

ASSAY

- **CALCIUM**

[NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Solution A: Transfer 17.69 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, carefully add 50 mL of hydrochloric acid, and allow to cool. Dilute with water to volume.

Calcium stock solution: 1 mg/mL of calcium prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask and add 10 mL of water. Carefully add 5 mL of dilute hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium (Ca), prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Solution A*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Dilute with water, 20.0 mL of Injection, equivalent to 1 mg of calcium (Ca), in a 100-mL volumetric flask containing 5.0 mL of *Solution A* to volume, and mix.

Blank: 5.0 mL of *Solution A* diluted with water to 100.0 mL

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Concomitantly determine the absorbance of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* versus concentration in mg/mL, of calcium, and draw the straight line best fitting the three plotted points. From this graph, determine the concentration (C) in mg/mL, of calcium in the *Sample solution*.

Calculate the quantity of calcium in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

USP Monographs

www.webofpharma.com

C = concentration of calcium in the *Sample solution* (mg/mL)
D = dilution factor of the *Sample solution*, 5
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 4.90–6.00 mg of calcium per 100 mL of Injection

• **POTASSIUM**

Solution A: Suitable nonionic wetting solution (1 in 500)
Solution B: 10.93 mg/mL of sodium chloride in water

Lactated Ringer's and Dextrose Injection

DEFINITION
Lactated Ringer's and Dextrose Injection is a sterile solution of Calcium Chloride, Potassium Chloride, Sodium Chloride, Sodium Lactate, and Dextrose in Water for Injection. It contains, in each 100 mL, NLT 285.0 and NMT 315.0 mg of sodium (Na) [as sodium chloride (NaCl) and sodium lactate ($C_3H_5NaO_3$)], NLT 14.2 and NMT 17.3 mg of potassium (K) [equivalent to NLT 27.0 and NMT 33.0 mg of potassium chloride (KCl)], NLT 4.90 and NMT 6.00 mg of calcium (Ca) [equivalent to NLT 18.0 and NMT 22.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], NLT 368.0 and NMT 428.0 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)], and NLT 231.0 and NMT 261.0 mg of lactate ($C_3H_5O_3$) [equivalent to NLT 290.0 mg and NMT 330.0 mg of sodium lactate ($C_3H_5NaO_3$)]. It contains NLT 90.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It contains no antimicrobial agents.
[NOTE—The calcium, potassium, and sodium contents of Lactated Ringer's and Dextrose Injection are approximately 2.7, 4, and 130 mEq/L, respectively.]

IDENTIFICATION
- **A.**
Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection
Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.
Acceptance criteria: A copious red precipitate of cuprous oxide is formed.
- **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩: Meets the requirements of the test *A under Chloride* and the test *A under Calcium*
- **C. POTASSIUM:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium).
[NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]
- **D. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.
- **E.** The retention time of the lactate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Lactate*.

ASSAY
- **CALCIUM**
[NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Mobile phase: Dicyclohexylamine, formic acid, and water (1:1:998)

System suitability solution: 3 mg/mL each of anhydrous sodium acetate and USP Sodium Lactate RS, in water

Standard solution: 3 mg/mL of USP Sodium Lactate RS in water

Sample solution: Use undiluted Injection.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2 between the acetate and lactate peaks, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of lactate ($C_3H_5O_3$) in each 100 mL of Injection:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sodium Lactate RS in the *Standard solution* (mg/mL)

M_{r1} = molecular weight of lactate, 89.07

M_{r2} = molecular weight of anhydrous sodium lactate, 112.06

Acceptance criteria: 231.0–261.0 mg of lactate ($C_3H_5O_3$) per 100 mL of Injection

• **DEXTROSE**

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis: Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times \alpha)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

α = observed angular rotation of the *Sample solution* (°)

l = length of the polarimeter tube (dm)

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–105.0%

IMPURITIES

• **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally equivalent to 2.0 mg/mL of dextrose ($C_6H_{12}O_6 \cdot H_2O$) from a suitable volume of Injection, in water

Instrumental conditions

Analytical wavelength: 284 nm

Cell: 1 cm

Blank: Water

Acceptance criteria: The absorbance is NMT 0.25.

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 0.5 USP Endotoxin Units/mL

• **pH** ⟨791⟩**:** 4.0–6.5

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

• **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL. The label also includes the warning: "Not for use in the treatment of lactic acidosis".

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Lactate RS

Half-Strength Lactated Ringer's and Dextrose Injection

DEFINITION

Half-Strength Lactated Ringer's and Dextrose Injection is a sterile solution of Calcium Chloride, Potassium Chloride, Sodium Chloride, Sodium Lactate, and Dextrose in Water for Injection. It contains, in each 100 mL, NLT 142.5 and NMT 157.5 mg of sodium (Na) [as sodium chloride (NaCl) and sodium lactate ($C_3H_5NaO_3$)], NLT 7.08 and NMT 8.65 mg of potassium (K) [equivalent to NLT 13.5 and NMT 16.5 mg of potassium chloride (KCl)], NLT 2.45 and NMT 3.00 mg of calcium (Ca) [equivalent to NLT 9.0 and NMT 11.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], NLT 184.0 and NMT 214.0 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)], and NLT 115.5 and NMT 130.5 mg of lactate ($C_3H_5O_3$) [equivalent to NLT 145.0 and NMT 165.0 mg of sodium lactate ($C_3H_5NaO_3$)]. It contains NLT 90.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It contains no antimicrobial agents.

[NOTE—The calcium, potassium, and sodium contents of Half-Strength Lactated Ringer's and Dextrose Injection are approximately 1.4, 2, and 65 mEq/L, respectively.]

IDENTIFICATION

• **A.**

Sample solution: Nominally 50 mg/mL of dextrose from Injection in water

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

www.webofpharma.com

- **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩: Meets the requirements of the test *A* under *Chloride* and the test *A* under *Calcium*
- **C. POTASSIUM:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]
- **D. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.
- **E.** The retention time of the lactate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay* for *Lactate*.

ASSAY

- **CALCIUM**

[NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Solution A: 88.45 g/L of lanthanum chloride prepared as follows. Transfer a suitable quantity of lanthanum chloride to an appropriate volumetric flask. Add 50% of the final flask volume of water. Carefully add 25% of the final flask volume of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.

Calcium stock solution: 1000 µg/mL of calcium, prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask and add 10 mL of water. Carefully add 5 mL of dilute hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium (Ca), prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Solution A*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Nominally 0.014 mg/mL of calcium, prepared as follows. Transfer 50.0 mL of Injection, equivalent to 1.4 mg of calcium, to a 100-mL volumetric flask containing 5.0 mL of *Solution A*, and dilute with water to volume.

Blank: 5.0 mL of *Solution A* diluted with water to 100.0 mL

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Concomitantly determine the absorbance of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* versus concentration, in mg/mL, of calcium, and draw the straight line best fitting the three plotted points.

From this graph, calculate the concentration of calcium in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of calcium in the *Sample solution* (mg/mL)

D = dilution factor of the *Sample solution*, 2

F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 2.45–3.00 mg of calcium (Ca) in each 100 mL

- **POTASSIUM**

Solution A: Suitable nonionic wetting solution (1 in 500)

Solution B: 10.93 mg/mL of sodium chloride

Standard stock solution: 0.100 mg/mL of potassium, prepared as follows. Transfer 190.7 mg of potassium chloride, previously dried at 105° for 2 h, to a 1-L volumetric flask and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of potassium, prepared as follows. To four separate 100-mL volumetric flasks, each containing 10.0 mL of *Solution A* and 10 mL of *Solution B*, add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 20.0 mL of Injection to a 100-mL volumetric flask, add 10.0 mL of *Solution A*, and dilute with water to volume.

Blank: Transfer 10.0 mL of *Solution A* and 10 mL of *Solution B* to a 100-mL volumetric flask. Dilute with water to volume.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: Maximum transmittance at 766 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set the flame photometer for maximum transmittance. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances of the *Standard solutions* versus the concentration, in mg/mL, of potassium. Draw the straight line best fitting the four plotted points.

From this graph, calculate the concentration of potassium in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of potassium in the *Sample solution* (mg/mL)

D = dilution factor of the *Sample solution*, 5

F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 7.08–8.65 mg of potassium (K) in each 100 mL

- **SODIUM**

Solution A: Suitable nonionic wetting solution (1 in 500)

Standard stock solution: 0.100 mg/mL of sodium, prepared as follows. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer this solution to a 100-mL volumetric flask and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium, prepared as follows. To four separate 100-mL volumetric flasks, each containing 10.0 mL of *Solution A* add 5.0, 10.0, 15.0, and 20.0 mL, respectively, of *Standard stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 10 mL of Injection to a 1-L volumetric flask containing 100.0 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10.0 mL of *Solution A* to a 100-mL volumetric flask. Dilute with water to volume.

Modified Lactated Ringer's and Dextrose Injection

DEFINITION

Modified Lactated Ringer's and Dextrose Injection is a sterile solution of Calcium Chloride, Potassium Chloride, Sodium Chloride, Sodium Lactate, and Dextrose in Water for Injection. It contains, in each 100 mL, NLT 57.0 and NMT 63.0 mg of sodium (Na) [as sodium chloride (NaCl) and sodium lactate, ($C_3H_5NaO_3$)], NLT 2.82 and NMT 3.46 mg of potassium (K) [equivalent to NLT 5.4 and NMT 6.6 mg of potassium chloride (KCl)], NLT 0.98 and NMT 1.20 mg of calcium (Ca) [equivalent to NLT 3.6 and NMT 4.4 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], NLT 73.6 and NMT 85.6 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)], NLT 46.2 and NMT 52.20 mg of lactate ($C_3H_5O_3$) [equivalent to NLT 58.0 and NMT 66.0 mg of sodium lactate ($C_3H_5NaO_3$)]. It contains NLT 90.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It contains no antimicrobial agents.

[NOTE—The calcium, potassium, and sodium contents of Modified Lactated Ringer's and Dextrose Injection are approximately 0.5, 0.8, and 26 mEq/L, respectively.]

IDENTIFICATION

- **A.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection

graph, calculate the concentration of potassium in the *Sample solution*.

Calculate the quantity of potassium in each 100 mL of Injection:

$$\text{Result} = C \times D \times F$$

C = concentration of potassium in the *Sample solution* (mg/mL)
D = dilution factor of the *Sample solution*, 2
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 2.82–3.46 mg of potassium per 100 mL of Injection

• **SODIUM**

Solution A: Suitable nonionic wetting solution (1 in 500)

Standard stock solution: 0.100 mg/mL of sodium, prepared as follows. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer this solution to a 1-L volumetric flask and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium, prepared as follows. To four separate 100-mL volumetric flasks, each containing 10.0 mL of *Solution A*, add 5.0, 10.0, 15.0, and 20.0 mL, respectively, of *Standard stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 25.0 mL of Injection in a 1-L volumetric flask containing 100.0 mL of *Solution A* and dilute with water to volume.

Blank: Transfer 10.0 mL of *Solution A* to a 100-mL volumetric flask. Dilute with water to volume.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: Maximum transmittance at 589 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set the flame photometer for maximum transmittance. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances of the *Standard solutions* versus concentration, in mg/mL, of sodium, and draw the straight line best fitting the four plotted points. From the graph, calculate the concentration of sodium in the *Sample solution*.

Calculate the quantity of sodium in each 100 mL of Injection:

$$\text{Result} = C \times D \times F$$

C = concentration of sodium in the *Sample solution* (mg/mL)
D = dilution factor of the *Sample solution*, 40
F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 57.0–63.0 mg of sodium per 100 mL of Injection

• **CHLORIDE**

Sample solution: Transfer a volume of Injection equivalent to 55 mg of chloride (1.55 mEq) to a suitable conical flask, and add water, if necessary, to bring the volume to 10 mL. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS.

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate the *Sample solution*, with shaking, with *Titrant* to a pink endpoint, using 3 drops of eosin Y TS.

Calculate the labeled amount of chloride (Cl) in 100 mL of Injection:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = *Titrant* volume consumed by the *Sample solution* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 35.45 mg/mEq
W = nominal amount of chloride in the *Sample solution* (mg)

Acceptance criteria: 73.6–85.6 mg of chloride per 100 mL

• **LACTATE**

Mobile phase: Dicyclohexylamine, formic acid, and water (1:1:998)

System suitability solution: 3 mg/mL each of anhydrous sodium acetate and USP Sodium Lactate RS in water

Standard solution: 0.6 mg/mL of USP Sodium Lactate RS, in water

Sample solution: Use undiluted Injection.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Suitability requirements

Resolution: NLT 2 between the acetate and lactate peaks, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of lactate ($C_3H_5O_3$) in each 100 mL of Injection:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sodium Lactate RS in the *Standard solution* (mg/mL)
M_{r1} = molecular weight of lactate, 89.07
M_{r2} = molecular weight of anhydrous sodium lactate, 112.06

Acceptance criteria: 46.2–52.20 mg of lactate ($C_3H_5O_3$) per 100 mL of Injection

• **DEXTROSE**

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis: Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

www.webofpharma.com

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* (°)
l = length of the polarimeter tube (dm)
α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)
M_{r1} = molecular weight of dextrose monohydrate, 198.17
M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–105.0%

IMPURITIES

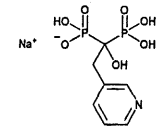
- **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally 2.0 mg/mL of dextrose ($C_6H_{12}O_6 \cdot H_2O$) from a suitable volume of Injection, in water
Instrumental conditions
Analytical wavelength: Maximum transmittance at 284 nm
Cell: 1 cm
Blank: Water
Analysis
Samples: *Sample solution* and *Blank*
Acceptance criteria: The absorbance is NMT 0.25.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.5 USP Endotoxin Units/mL
- **pH** ⟨791⟩: 4.0–6.5
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS



- **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL. The label also includes the warning: "Not for use in the treatment of lactic acidosis".
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Sodium Lactate RS

Ringer's Irrigation

» Ringer's Irrigation is Ringer's Injection that has been suitably packaged, and it contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass. The container may be designed to empty rapidly and may contain a volume of more than 1 L.
Labeling—The designation "not for injection" appears prominently on the label.
Bacterial Endotoxins Test ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.
Sterility Tests ⟨71⟩: meets the requirements.
Other requirements—It responds to the *Identification* tests, and meets the requirements for *pH*, *Assay for calcium*, *Assay for potassium*, *Assay for sodium*, and *Assay for chloride* under *Ringer's Injection*.

Risedronate Sodium

$C_7H_{10}NNaO_7P_2$ 305.09
$C_7H_{10}NNaO_7P_2 \cdot H_2O$ 323.12
$C_7H_{10}NNaO_7P_2 \cdot 2.5\ H_2O$ 350.13
Phosphonic acid, [1-hydroxy-2-(3-pyridinyl)ethylidene]bis-, monosodium salt;
Sodium trihydrogen [1-hydroxy-2-(3-pyridyl) ethylidene] diphosphonate;
Hemi-pentahydrate [329003-65-8].
Monohydrate [353228-19-0].

DEFINITION

Risedronate Sodium contains one or two-and-one-half molecules of hydration. The monohydrate form contains NLT 98.0% and NMT 102.0% of risedronate sodium ($C_7H_{10}NNaO_7P_2$), calculated on the dried basis. The hemi-pentahydrate form contains NLT 98.0% and NMT 102.0% of risedronate sodium ($C_7H_{10}NNaO_7P_2$), calculated on the anhydrous basis.

Risedronate Sodium Tablets

DEFINITION
Risedronate Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of risedronate sodium ($C_7H_{10}NNaO_7P_2$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Sample: Transfer a quantity of Tablets, equivalent to 50–75 mg of risedronate sodium, to a suitable flask. Add 10 mL of water, and shake. Pass first through a suitable paper filter, and then through a nylon filter of 0.45-µm pore size. Add 10 mL of 0.2 M cupric chloride solution, mix well, and allow the solution to stand for about 10 min. Add 2 mL of dehydrated alcohol, mix well, and allow the solution to stand for a minimum of 1 h, to form a blue precipitate of the copper complex. Collect the precipitate using a nylon filter of 0.45-µm pore size, wash it with 10 mL of dehydrated alcohol, and allow it to dry on the filter. [NOTE—Dry the precipitate under ambient conditions; do not heat the precipitate. A modest change of color (from blue to green) may be observed upon drying.]
Standard: Dissolve 50 mg of USP Risedronate Sodium RS in 10 mL of water, and pass the solution through a nylon filter of 0.45-µm pore size. Proceed as directed for the *Sample*, beginning with "Add 10 mL of 0.2 M cupric chloride solution..."
Acceptance criteria: Meet the requirements
- **B.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
For Tablets labeled to contain 5–35 mg of risedronate sodium
Mobile phase: 1.8 g/L of edetate disodium in water. Adjust with 1 N sodium hydroxide to a pH of 9.5 ± 0.1.
System suitability solution: 0.15 mg/mL of anhydrous USP Risedronate Sodium RS and 7.5 µg/mL of USP Risedronate Related Compound C RS in *Mobile phase*
Standard solution: 0.1–0.15 mg/mL of anhydrous USP Risedronate Sodium RS in *Mobile phase*
Sample stock solution: Transfer 10 Tablets to a suitable volumetric flask, add *Mobile phase* to about 60% of the volume of the flask, shake for about 10 min, then sonicate for a minimum of 5 min. Cool the solution to room temperature, and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.5–1.5 mg/mL.
Sample solution: Nominally 0.1–0.15 mg/mL of risedronate sodium in *Mobile phase*, dilute from the *Sample stock solution*. Pass a portion of this solution through a nylon filter of 0.22-µm pore size, discarding the first 3 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 263 nm
Column: 4.0-mm × 25-cm; 10-µm packing L48
Flow rate: 0.8 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*

www.webofpharma.com

Suitability requirements
Resolution: NLT 2.5 between risedronate related compound C and risedronate, *System suitability solution*
Relative standard deviation: NMT 2.0% for three replicate injections, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of risedronate sodium ($C_7H_{10}NNaO_7P_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of risedronate from the *Sample solution*
r_S = peak response of risedronate from the *Standard solution*
C_S = concentration of USP Risedronate Sodium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of risedronate sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

For Tablets labeled to contain at least 75 mg of risedronate sodium
Mobile phase: 1.8 g/L of edetate disodium in water. Adjust with 1 N sodium hydroxide to a pH of 9.5 ± 0.1.
Standard solution: 0.25 mg/mL of anhydrous USP Risedronate Sodium RS and 4 µg/mL of USP Risedronate Related Compound A RS in *Mobile phase*
Sample stock solution: Transfer 10 Tablets to a suitable container. Add 400 mL of *Mobile phase,* cap, and mechanically shake for 5–15 min, using an orbital or other suitable shaker. [NOTE—Additional sonication for 5–15 min may be performed if necessary.]
Sample solution: Nominally 0.2–0.3 mg/mL of risedronate sodium in *Mobile phase,* dilute from the *Sample stock solution.* Pass a portion of this solution through a nylon filter of 0.45-µm pore size, discarding the first few mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 263 nm
Column: 4.0-mm × 25-cm; 10-µm packing L48
Flow rate: 1.0 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between risedronate related compound A and risedronate peaks
Tailing factor: NMT 1.5 for risedronate peak
Relative standard deviation: NMT 1.5% for the risedronate peak from three replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of risedronate sodium ($C_7H_{10}NNaO_7P_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of risedronate from the *Sample solution*
r_S = peak response of risedronate from the *Standard solution*
C_S = concentration of USP Risedronate Sodium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of risedronate sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
For Tablets labeled to contain 5, 30, or 35 mg
Medium: Water; 500 mL, deaerated
Apparatus 2: 50 rpm, paddles coated with Teflon
Time: 30 min
Mobile phase: Prepare as directed in the *Assay.*
Standard stock solution: 1 mg/mL of anhydrous USP Risedronate Sodium RS in *Medium*
Standard solution: (0.002 × *L*) mg/mL of USP Risedronate Sodium RS in *Medium* from the *Standard stock solution,* where *L* is the Tablet label claim in mg
Sample solution: Use a portion of the solution under test, filter if necessary.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 263 nm

Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of risedronate sodium ($C_7H_{10}NNaO_7P_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of risedronate from the *Sample solution*
r_S = peak response of risedronate from the *Standard solution*
C_S = concentration USP Risedronate Sodium RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium,* 500 mL

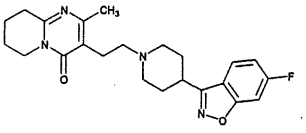
Tolerances: NLT 80% (*Q*) of the labeled amount of risedronate sodium is dissolved.
For Tablets labeled to contain at least 75 mg
Medium: Water; 900 mL, deaerated
Apparatus 2: 50 rpm, paddles coated with Teflon
Time: 45 min
Standard solution: 0.12 mg/mL of anhydrous USP Risedronate Sodium RS in *Medium*
Sample solution: Use a portion of the solution under test. Dilute with *Medium,* if necessary.
Instrumental conditions
Mode: UV
Analytical wavelength: Wavelength of maximum absorption at about 263 nm, with a background correction at 400 nm
Cell: 5 mm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of risedronate sodium ($C_7H_{10}NNaO_7P_2$) dissolved:

www.webofpharma.com

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
D = dilution factor of the *Sample solution*
V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of risedronate sodium is dissolved.



• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

System suitability solution: 20 µg/mL of USP Risperidone Related Compound G RS and 10 mg/mL of USP Risperidone RS in methanol. Sonication may be used to aid in dissolution.
Standard solution: 20 µg/mL of USP Risperidone RS in methanol. Sonication may be used to aid in dissolution.
Sample solution: 10 mg/mL of Risperidone in methanol. Sonication may be used to aid in dissolution.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 260 nm
Column: 4.6-mm × 25-cm; 5-µm packing L7
Column temperature: 50°
Flow rate: 2 mL/min
Injection volume: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—Identify the peaks using *Table 2*.]
Suitability requirements
Resolution: NLT 1.5 between risperidone and risperidone related compound G, *System suitability solution*
Tailing factor: NMT 2.0 for risperidone, *Standard solution*
Relative standard deviation: NMT 5.0% for risperidone, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Risperidone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each impurity from the *Sample solution*
r_S = peak area of risperidone from the *Standard solution*
C_S = concentration of USP Risperidone RS in the *Standard solution* (mg/mL)
C_U = concentration of Risperidone in the *Sample solution* (mg/mL)
F = relative response factor for each impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.
[NOTE—Disregard the impurity peaks less than 0.05%.]

Table 2

[a] 3-(2-[4-[(*E*)-(2,4-Difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl)-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.
[b] 3-[2-[4-[(*Z*)-(2,4-Difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.
[c] (9*RS*)-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-9-hydroxy-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.
[d] 3-[2-[4-(Benzisoxazol-3-yl)piperidin-1-yl]ethyl)-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.
[e] This impurity may not be relevant to all manufacturing processes.
[f] 3-[2-[4-(2,4-Difluorobenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.
[g] 3-[2-[4-(5-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one (also known as 5-fluororisperidone).
[h] (6*RS*)-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2,6-dimethyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry under vacuum at 80° for 4 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Risperidone RS
USP Risperidone Related Compound G RS
3-[2-[4-(4-Fluoro-2-hydroxybenzoyl)piperidin-1-yl] ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-α] pyrimidin-4-one hydrochloride.
$C_{23}H_{28}FN_3O_3 \cdot HCl$ 448.94

Risperidone Oral Solution

DEFINITION
Risperidone Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$). It may contain a suitable preservative.

IDENTIFICATION
The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 5.0 g/L of *ammonium* acetate in *water*
Mobile phase: *Acetonitrile* and *Buffer* (11:39)
System suitability solution: 0.25 mg/mL of USP Risperidone Related Compounds Mixture RS prepared as follows. Weigh USP Risperidone Related Compounds

www.webofpharma.com

Mixture RS into a suitable volumetric flask. Dissolve first in 20% of the flask volume of *methanol*. Add 20% of the flask volume of *water* followed by 50% of the flask volume of *Buffer*, and allow to cool to room temperature. Dilute with *methanol* to volume.

Standard stock solution: 1 mg/mL of USP Risperidone RS in methanol

Standard solution: 0.2 mg/mL of USP Risperidone RS prepared from the *Standard stock solution* as follows. Transfer 5.0 mL of the *Standard stock solution* to a 25-mL volumetric flask. Add 5.0 mL of *water* followed by 12.5 mL of *Buffer*, and allow to cool to room temperature. Dilute with *methanol* to volume.

Sample solution: Nominal concentration of 0.2 mg/mL of risperidone prepared from Oral Solution as follows. Transfer an amount of Oral Solution, equivalent to 5 mg of risperidone to a 25-mL volumetric flask, add 12.5 mL of *Buffer*, fill with methanol almost to volume, and mix well. Allow to cool to room temperature, and dilute with *methanol* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 10-cm; 3-µm packing *L1*

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: 2 times the retention time of risperidone

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between bicyclorisperidone and *Z*-oxime, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of risperidone from the *Sample solution*

r_S = peak response of risperidone from the *Standard solution*

C_S = concentration of USP Risperidone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of risperidone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DELIVERABLE VOLUME** ⟨698⟩**:** Meets the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer, Mobile phase, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard stock solution: 5 µg/mL of USP Risperidone RS in methanol

Standard solution: 1 µg/mL of USP Risperidone RS from the *Standard stock solution* prepared as follows. Transfer 5.0 mL of the *Standard stock solution* to a 25-mL volumetric flask. Add 5.0 mL of *water* followed by 12.5 mL of *Buffer*, and allow to cool to room temperature. Dilute with *methanol* to volume.

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between bicyclorisperidone and *Z*-oxime, *System suitability solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of risperidone from the *Standard solution*

C_S = concentration of USP Risperidone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of risperidone in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Risperidone *cis*-*N*-oxide[a]	0.33	0.97	0.50
Bicyclorisperidone[b]	0.43	0.67	0.50
Z-Oxime[c]	0.53	—	—
Risperidone	1.0	—	—
Any unspecified degradation product	—	1.0	0.20
Total impurities	—	—	1.0

[NOTE—Process impurity, not to be quantified in the drug product. It is used to establish system suitability only.]

[a] *cis*-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-a]pyrimidin-4-one,*N*-oxide monohydrate.

[b] 3-(4-Fluoro-2-hydroxyphenyl)-1-[2-(6,7,8,9-tetrahydro-2-methyl-4-oxo-4*H*-pyrido-[1,2-a]pyrimidin-3-yl)ethyl]-1-aza-2-azoniabicyclo[2.2.2]oct-2-ene salt.

[c] (*Z*)-3-[2-[4-(2,4-Difluorophenyl)(hydroxyimino)methyl]-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-a]pyrimidin-4-one.

SPECIFIC TESTS

• **pH** ⟨791⟩**:** 2.0–4.0

• **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^2 cfu/mL. The total yeasts and molds count does not exceed 10^1 cfu/mL. It meets the requirements of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in light-resistant containers. Store at controlled room temperature. Do not freeze.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Risperidone RS

USP Risperidone Related Compounds Mixture RS

Contains a mixture of the following four compounds: Risperidone.

USP Monographs

www.webofpharma.com

Risperidone *cis*-*N*-oxide: *cis*-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one, *N*-oxide.
Bicyclorisperidone: 3-(4-Fluoro-2-hydroxyphenyl)-1-[2-(6,7,8,9-tetrahydro-2-methyl-4-oxo-4*H*-pyrido-[1,2-*a*]pyrimidin-3-yl)ethyl]-2-aza-1-azoniabicyclo[2.2.2]oct-2-ene iodide.
Z-Oxime: (*Z*)-3-[2-[4-(2,4-Difluorophenyl)(hydroxyimino)methyl]-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Risperidone Tablets

» Risperidone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$).

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.
USP Reference standards ⟨11⟩—
USP Risperidone RS
3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidino]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one [CAS-106266-06-2]. 410.48

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197K⟩, *Infrared Spectroscopy*▲ (CN 1-May-2020)—
Test solution—Grind an appropriate number of Tablets to prepare a 550 ± 50 µg per mL solution of risperidone in ethyl acetate. Shake the solution for 30 minutes, and centrifuge for 20 minutes. Evaporate 5 mL of the supernatant with the aid of a stream of nitrogen to 2 mL on a warm water bath. Add 150 ± 50 mg of KBr powder, mix well, and evaporate to dryness. Grind the dried mixture, and press a small amount into a transparent pellet ⟨197K⟩.
Standard solution—Grind about 2 mg of USP Risperidone RS with about 200 mg of KBr powder, and press into a transparent pellet.
B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: 0.1 N hydrochloric acid; 500 mL.
Apparatus 2: 50 rpm.
Time: 45 minutes.
Determine the amount of $C_{23}H_{27}FN_4O_2$ dissolved by employing the following method.
Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65:35), and add 1 mL of trifluoroacetic acid to each 1 L of the mixture. Adjust with ammonium hydroxide to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Dissolve an accurately weighed quantity of USP Risperidone RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.006 mg per mL.
Test solution—Use portions of the solution under test, and pass through a suitable filter having a porosity of 35 µm.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 237-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute.
Chromatograph the *Standard solution* as directed for *Procedure:* the retention time of risperidone is about 2.1 minutes, and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of $C_{23}H_{27}FN_4O_2$ dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times L}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Risperidone RS in the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{23}H_{27}FN_4O_2$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩—
Mobile phase and *Chromatographic system*—Proceed as directed for *Dissolution.*
Standard solution—Dissolve an accurately weighed quantity of USP Risperidone RS in a suitable volumetric flask, and dilute quantitatively with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.03 mg of risperidone per mL.
Test solution—Transfer one Tablet into a 100-mL volumetric flask, add 50 mL of 0.1 N hydrochloric acid, and shake mechanically for about 30 minutes. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter having a 0.2-µm or finer porosity, and use the filtrate.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the risperidone peak. Calculate the quantitiy, in mg, of risperidone ($C_{23}H_{27}FN_4O_2$) in the portion of Tablets taken by the formula:

$$C(r_U/r_S)100$$

in which C is the concentration, in mg per mL, of USP Risperidone RS in the *Standard solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—
Mobile phase and *Diluent*—Proceed as directed in the *Assay.*
Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*
Diluted sodium hydroxide—To 1 L of water in a beaker, add 0.1 N sodium hydroxide dropwise to obtain a pH of about 8.5.
Diluted hydrogen peroxide—Dilute 1 mL of hydrogen peroxide with water to 500 mL.
Peak identification solution—Suspend 10 mg of USP Risperidone RS in 10 mL of *Diluted sodium hydroxide* in a 100-mL volumetric flask. Store the flask at 90° for 24 hours. Cool the solution to room temperature. Add 10 mL of aqueous *Diluted hydrogen peroxide* to the flask, and store at 90° for an additional two hours. Cool the mixture to room temperature, and dilute with methanol to volume.

www.webofpharma.com

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph about 20 µL of the *Peak identification solution,* record the peak responses as directed for *Procedure,* and identify the peaks using the relative retention times given in *Table 1:* the resolution, *R,* between the *trans-N*-oxide and *cis-N*-oxide is not less than 1.2.

[NOTE—The approximate relative retention times given in *Table 1* are for identification purposes only.]

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(1/R)(r_i/r_S)$$

in which R is the appropriate relative response factor as listed in *Table 1;* r_i is the peak response for each impurity in the *Test solution;* and r_S is the peak response of risperidone in the *Test solution:* not more than 0.3% of any individual unidentified impurity is found, not more than 0.5% of any individual specified impurity is found, and not more than 1.0% of total impurities is found.

Assay—

Diluent—Prepare a degassed mixture of methanol and water (80:20).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluroacetic acid (80: 19.5: 0.1). Adjust with ammonium hydroxide to a pH of 3.0.

Solution B—Prepare a filtered and degassed mixture of water, methanol, and trifluoroacetic acid (61: 39: 0.1). Adjust with ammonium hydroxide to a pH of 3.0.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP Risperidone RS to a suitable volumetric flask, and dissolve in and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Transfer an accurately weighed portion of not fewer than 10 Tablets to a volumetric flask that can accommodate a final concentration of 0.1 mg of risperidone per mL. Add an appropriate amount of water equivalent to 20% of the total volume of the volumetric flask, and mechanically shake for about 30 minutes. Add a volume of methanol equivalent to 60% of the total volume of the volumetric flask, and mechanically shake for about 30 minutes. Dilute with methanol to volume, and mix to obtain the final 0.1 mg per mL concentration. Pass a portion of this solution through a suitable filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 2.5 mL per minute. The column is maintained at room temperature. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	100	0	isocratic
8–16	100→0	0→100	linear gradient
16–20	0	100	isocratic
20–21	0→100	100→0	linear gradient
21–30	100	0	re-equilbration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor of risperidone is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the risperidone peak. Calculate the percentage of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$) in the portion of Tablets taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Risperidone RS in the *Standard preparation;* C_U is the concentration, in mg per mL, of risperidone in the *Assay preparation;* and r_U and r_S are the peak responses of risperidone obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Risperidone Orally Disintegrating Tablets

DEFINITION

Risperidone Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$).

IDENTIFICATION

Apparatus 2: 50 rpm
Time: 10 min
Buffer: 8.7 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 7.8.
Mobile phase: Acetonitrile and *Buffer* (45:55)
Standard solution: (*L*/500) mg/mL of USP Risperidone RS in *Medium*, where *L* is the label claim in mg/Tablet
Sample solution: Pass 10 mL of the solution under test through a suitable ▲▲ (USP 1-May-2019) filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 10-cm; 5-µm packing L1
Column temperature: 28 ± 3°
Flow rate: 2 mL/min
Injection volume: 20 µL. [NOTE—Use 40 µL for Tablets labeled to contain 0.5 mg of risperidone.]
Run time: ▲NLT▲ (USP 1-May-2019) 2 times the retention time of risperidone
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ▲the labeled amount of risperidone▲ (USP 1-May-2019) ($C_{23}H_{27}FN_4O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of risperidone is dissolved.

▲Ritodrine Hydrochloride

$C_{17}H_{21}NO_3 \cdot HCl$ 323.81

Benzenemethanol, 4-hydroxy-α-[1-[[2-(4-hydroxyphenyl) ethyl]amino]ethyl]-, hydrochloride, (*R**, *S**)-.

erythro-*p*-Hydroxy-α-[1-[(*p*-hydroxyphenethyl)amino]ethyl] benzyl alcohol hydrochloride [23239-51-2].

» Ritodrine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{17}H_{21}NO_3 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨ 11 ⟩ —

USP Ritodrine Hydrochloride RS

Identification—

A: The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Ritodrine Hydrochloride RS.

B: The retention time of the ritodrine hydrochloride in the *Assay preparation* obtained in the *Assay* corresponds to that of the *Standard preparation* obtained in the *Assay*.

C: A solution (1 in 100) responds to the tests for *Identification Tests—General* ⟨191⟩, *Chloride*.

pH ⟨ 791 ⟩ : between 4.5 and 6.0, in a solution (1 in 50).

Loss on drying ⟨ 731 ⟩ : Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

Residue on ignition ⟨ 281 ⟩ : not more than 0.2%.

Related compounds—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay*.

Test preparation—Prepare a solution containing about 1 mg of Ritodrine Hydrochloride in each mL of *Mobile phase*.

Diluted test preparation—Quantitatively dilute a suitable volume of the *Test preparation* with *Mobile phase* to obtain a solution having a known concentration of 0.01 mg per mL of ritodrine hydrochloride.

Procedure—Chromatograph the *Test preparation* and the *Diluted test preparation*, as directed in the *Assay*. The relative retention times are about 0.3 for tyramine, 0.65 for *erythro*-1-(4-ketocyclohexyl)-2-[(1-hydroxyphenethyl)amino] propanol-1, 0.85 for

www.webofpharma.com

erythro-p-hydroxy-[1-(4-ketocyclohexyleth yl)amino]ethyl benzyl alcohol, 1.0 for ritodrine, 1.15 for *threo* diastereomer of ritodrine, and 2.3 for *p*-hydroxy-β-(*p*-hydroxyphenethyl) amino]propiophenone. Determine the peak responses for ritodrine and for the related compounds from the chromatograms obtained from the *Diluted test preparation* and the *Test preparation*, respectively. Calculate the percentage of related compounds found: not more than 0.5% of any individual impurity and not more than 2.0% of total impurities is found.

Assay—

Mobile phase—Dissolve 6.6 g of dibasic ammonium phosphate and 1.1 g of sodium 1-heptanesulfonate in 700 mL of water, and mix with 300 mL of methanol. Adjust by the addition of phosphoric acid to a pH of 3.0, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ritodrine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer about 200 mg of Ritodrine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

System suitability preparation—Dissolve about 20 mg of Ritodrine Hydrochloride in about 50 mL of *Mobile phase*. Add 5.6 mL of sulfuric acid, dilute with *Mobile phase* to 100 mL, and mix. Heat a portion of this solution for about 2 hours at about 85°, and then cool to room temperature. Cautiously mix 10.0 mL of the cooled solution with 8.0 mL of sodium hydroxide solution (1 in 10), and allow to cool. This solution contains ritodrine and its *threo* diastereomer.

Chromatographic system—The chromatograph is equipped with a 4.6-mm × 25-cm stainless steel column that contains packing L7 and an UV detector that monitors absorption at 214 nm. Chromatograph about 50 µL of the *System suitability preparation:* the resolution between ritodrine and its *threo* diastereomer is not less than 1.0. [NOTE—Chromatograms obtained as directed for this test, exhibit relative retention times of 1.0 for ritodrine and approximately 1.2 for the *threo* diastereomer.]

Procedure—Separately inject equal volumes (20 to 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph (see *Chromatography* ⟨621⟩) by means of a suitable sampling valve. Record the chromatograms and measure the peak responses. Calculate the quantity, in mg, of $C_{17}H_{21}NO_3 \cdot HCl$ in the portion of Ritodrine Hydrochloride taken by the formula:

$$1000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Ritodrine Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak responses for Ritodrine Hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively. ▲ (USP 1-May-2020)

Delete the following:

▲Ritodrine Hydrochloride Injection

» Ritodrine Hydrochloride Injection is a sterile solution of Ritodrine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{21}NO_3 \cdot HCl$.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass. Store at room temperature, preferably below 30°.

USP Reference standards ⟨ 11 ⟩ —
USP Ritodrine Hydrochloride RS

Identification—The retention time of the ritodrine hydrochloride in the *Assay preparation* obtained in the *Assay* corresponds to that of the *Standard preparation* obtained in the *Assay*.

Bacterial Endotoxins Test ⟨ 85 ⟩ —It contains not more than 0.5 USP Endotoxin Unit per mg.

pH ⟨ 791 ⟩ : between 4.8 and 5.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

Mobile phase, *Standard preparation*, and *System suitability preparation*—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride*.

Assay preparation—Dilute an accurately measured volume of Injection, equivalent to about 20 mg of ritodrine hydrochloride, with *Mobile phase* to 100.0 mL, and mix.

Chromatographic system—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride* except that the liquid chromatograph is equipped with a 275-nm detector.

Procedure—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride*. Calculate the quantity, in mg, of $C_{17}H_{21}NO_3 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(100C/V)(r_U/r_S)$$

in which V is the volume, in mL, of Injection taken, and the other terms are as defined therein. ▲ (USP 1-May-2020)

Delete the following:

▲Ritodrine Hydrochloride Tablets

» Ritodrine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{21}NO_3 \cdot HCl$.

Packaging and storage—Preserve in tight containers. Store at room temperature, preferably below 30°.

USP Reference standards ⟨ 11 ⟩ —
USP Ritodrine Hydrochloride RS

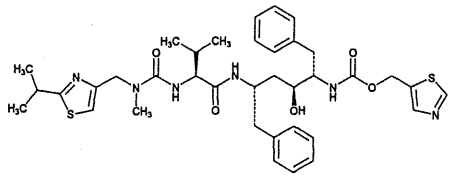
Identification—The retention time of the Tablets in the *Assay preparation* obtained in the *Assay* corresponds to that of the *Standard preparation* obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: 0.01 N hydrochloric acid; 900 mL.

www.webofpharma.com

Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{17}H_{21}NO_3 \cdot HCl$ dissolved by employing the procedure set forth in the *Assay*, using a filtered portion of the solution under test as the *Assay preparation* in comparison with a Standard solution having a known concentration of USP Ritodrine Hydrochloride RS in the same *Medium*.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{17}H_{21}NO_3 \cdot HCl$ is dissolved in 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Procedure for content uniformity—Transfer 1 Tablet to a 200-mL volumetric flask, add about 5 mL of water, and stir until disintegration is complete. Add about 150 mL of methanolic sulfuric acid solution (0.005 M sulfuric acid in methanol), continue stirring for an additional 15 minutes, dilute with methanolic sulfuric acid solution to volume, and mix. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Dissolve an accurately weighed quantity of USP Ritodrine Hydrochloride RS in methanolic sulfuric acid solution, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 50 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 276 nm, with a suitable spectrophotometer, using methanolic sulfuric acid solution as the blank. Calculate the quantity, in mg, of $C_{17}H_{21}NO_3 \cdot HCl$ in the Tablet taken by the formula:

$$(TC/D)(A_U/A_S)$$



in which T is the labeled quantity, in mg, of ritodrine hydrochloride in the Tablet, C is the concentration, in µg per mL, of USP Ritodrine Hydrochloride RS in the Standard solution, D is the concentration, in µg per mL, of ritodrine hydrochloride in the solution from the Tablet based upon the labeled quantity per Tablet and the extent of dilution, and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—
Mobile phase, *Standard preparation*, and *System suitability preparation*—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride*.
Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of ritodrine hydrochloride, to a 100-mL volumetric flask. Add about 70 mL of *Mobile phase*, stir for about 15 minutes, dilute with *Mobile phase* to volume, mix, and filter a portion to remove any particulate matter.
Chromatographic system—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride Injection*.
Procedure—Proceed as directed in the *Assay* under *Ritodrine Hydrochloride*. Calculate the quantity, in mg, of $C_{17}H_{21}NO_3 \cdot HCl$ in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which the terms are as defined therein. ▲ (USP 1-May-2020)

Ritonavir

$C_{37}H_{48}N_6O_5S_2$ 720.94
2,4,7,12-Tetraazatridecan-13-oic acid, 10-hydroxy-2-methyl-5-(1-methylethyl)-1-[2-(1-methylethyl)-4-thiazolyl]-3,6-dioxo-8,11-bis(phenylmethyl)-5-thiazolylmethyl ester [5*S*-(5*R**,8*R**,10*R**,11*R**)]-;
5-Thiazolylmethyl [(α*S*)-α-[(1*S*,3*S*)-1-hydroxy-3-[(2*S*)-2-[3-[(2-isopropyl-4-thiazolyl)methyl]-3-methylureido]3-methylbutyramido]-4-phenylbutyl]phenethyl]carbamate [155213-67-5].

DEFINITION
Ritonavir contains NLT 97.0% and NMT 102.0% of ritonavir ($C_{37}H_{48}N_6O_5S_2$), calculated on the anhydrous basis.

[r] (2*S*,2′*S*)-*N*,*N*′-[(2*S*,3*S*,5*S*)-3-Hydroxy-1,6-diphenylhexane-2,5-diyl]bis(2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamide).
[s] (*S*)-[(5*S*,8*S*,10*S*,11*S*)-8,11-Dibenzyl-5-isopropyl-1-(2-isopropylthiazol-4-yl)-2-methyl-3,6,13-trioxo-15-(thiazol-5-yl)-14-oxa-2,4,7,12-tetraazapentadecan-10-yl] 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.

SPECIFIC TESTS
- **WATER DETERMINATION** ⟨921⟩, *Method I*: NMT 0.5%, determined on 0.500 g

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store between 5° and 30°.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Ritonavir RS
  USP Ritonavir Related Compounds Mixture RS

Ritonavir Capsules

DEFINITION
Ritonavir Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$).

IDENTIFICATION
- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Buffer: 4.1 g/L of monobasic potassium phosphate
Diluent: Acetonitrile and *Buffer* (50:50)
Mobile phase: Acetonitrile, methanol, tetrahydrofuran (stabilizer-free), and *Buffer* (7:4:4:25). Separately filter the *Buffer* and the pre-mixed solvents before combining to make the *Mobile phase*.
Standard solution: 25 µg/mL of USP Ritonavir RS in *Diluent*
Sample stock solution: Nominally 1 mg/mL of ritonavir prepared as follows. Transfer Capsules (NLT 5) equivalent to 500 mg of ritonavir into a 500-mL volumetric flask, add about 250 mL of *Diluent*, and shake for at least 30 min or until the Capsules have visually disintegrated. Add 150 mL of acetonitrile, allow to cool to room temperature, and dilute to volume with *Diluent*.
Sample solution: Nominally 25 µg/mL of ritonavir in *Diluent* from the *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Capacity factor: NLT 15
Tailing factor: 0.8–1.2
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ritonavir in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

- **DISSOLUTION** ⟨711⟩

▲Test 1▲ (RB 1-Apr-2018)
Medium: 0.1 N hydrochloric acid with 25 mM polyoxyethylene 10 lauryl ether, 900 mL
Apparatus 2: 50 rpm, with sinkers
Time: 30 min
Buffer: 4.1 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile and *Buffer* (55:45). Adjust with phosphoric acid to a pH of 4.0 ± 0.1.
Standard stock solution: 5.2 mg/mL of USP Ritonavir RS in methanol
Standard working solution: 104 µg/mL of USP Ritonavir RS in *Medium*

www.webofpharma.com

Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 25 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
L = ritonavir label claim (mg/Capsule)
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) is dissolved.

▲**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid with 25 mM polyoxyethylene 10 lauryl ether; 900 mL, degassed
Apparatus 2: 50 rpm, with sinker
Time: 20 and 120 min
Solution A: Water and phosphoric acid (98:2)
Buffer: Water adjusted with *Solution A* to a pH of 3.5
Mobile phase: Acetonitrile, methanol, and *Buffer* (500:100:400).
Standard stock solution: 0.56 mg/mL of USP Ritonavir RS in methanol
Standard solution: 0.11 mg/mL of USP Ritonavir RS in *Medium* from *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 30°
Flow rate: 1.8 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of ritonavir from the *Sample solution*
r_S = peak response of ritonavir from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$
$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

C_i = concentration of ritonavir in the portion of sample withdrawn at the specified time point i (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim of ritonavir (mg/Capsule)
V_S = volume of the *Sample solution* withdrawn at each time point i (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (*i*)	Time (min)	Tolerances ▲▲ (ERR 1-Nov-2018)

IMPURITIES

Change to read:

• **Organic Impurities**
[Note—Ritonavir is alkali sensitive. All glassware should be pre-rinsed with distilled water before use to remove residual detergent contamination.]
Buffer A: 4.1 g/L of monobasic potassium phosphate
Buffer B: 3.8 g/L of monobasic potassium phosphate and 0.25 g/L of dibasic potassium phosphate
Solution A: Acetonitrile and *Buffer A* (50:50)
Solution B: Acetonitrile and *Buffer A* (65:35)
Solution C: Butyl alcohol and *Buffer A* (8:92)
Mobile phase: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer B* (18:5:8:69). Adjust apparent pH to 6.3 ± 0.1 with 1 M phosphoric acid or 1 M potassium hydroxide if necessary.
Cleaning solution: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer A* (30:8:13:49)
Standard stock solution: 0.1 mg/mL of USP Ritonavir RS in *Solution A*
Standard solution: 10 µg/mL of USP Ritonavir RS in *Solution C* from *Standard stock solution*
Peak identification solution: Transfer 5–10 g from contents of Capsules into a suitable sealed container. Add an amount of citric acid equivalent to 1% of the Capsule weight taken, and mix until dissolved. Seal the container, and heat at 60° for about 24 h. Transfer about 2 g to a 100-mL volumetric flask, and dilute with *Solution B* to volume. Transfer 5.0 mL of the solution to a 50-mL centrifuge tube that has been previously rinsed with methanol and dried. Add 20.0 mL of heptane, and seal the tube with a stopper. Shake vigorously until a uniform emulsion is obtained, making sure to vent periodically. The emulsion formed yields distinct layers when centrifuged.

www.webofpharma.com

The top layer (clear heptane) and the bottom layer (clear sample solution) are separated by a viscous white cloudy layer. The middle layer is part of the heptane layer. Carefully remove the clear heptane layer and the middle layer. Pass the bottom layer through a solid phase extraction cartridge containing strong anion-exchange packing in acetate form as described below.

Sample stock solution: Nominally 2 mg/mL of ritonavir prepared as follows. Empty the contents of Capsules (NLT 6) into a suitable container, and accurately weigh and transfer an equivalent to 200 mg of ritonavir to a 100-mL volumetric flask. Dissolve and dilute with *Solution B* to volume.

Sample solution: Nominally 1 mg/mL of ritonavir prepared as follows. Transfer 25.0 mL of *Sample stock solution* into a 50-mL volumetric flask, and dilute with *Solution C* to volume. Add 15.0 mL of this solution into a 50-mL centrifuge tube that has been previously rinsed with methanol and dried. Add 20.0 mL of heptane, and seal the tube with a stopper. Shake vigorously until a uniform emulsion is obtained, making sure to vent periodically. The emulsion formed yields distinct layers when centrifuged. The top layer (clear heptane) and the bottom layer (clear sample solution) are separated by a viscous white cloudy layer. The middle layer is part of the heptane layer. Carefully remove the clear heptane layer and the middle layer. Pass the bottom layer through a solid phase extraction cartridge containing strong anion-exchange packing in acetate form as described below.

Condition a solid phase extraction cartridge with methanol and *Solution B* two separate times, and dry for 10 min under low vacuum. Add 5.0 mL of the clear sample solution into the reservoir. Collect the sample solution at a slow rate into a 5-mL volumetric flask using low vacuum. Dilute with *Solution B* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 15-cm; 3-µm packing L26. Wash the column after each injection of the *Peak identification solution* and each injection of the *Sample solution* with *Cleaning solution* for about 26 min, and equilibrate with *Mobile phase* for about 30 min. Store in *Cleaning solution* after the analysis is completed.

Column temperature: 60°

Flow rate: 1 mL/min

Injection volume: 50 µL

Run time: 1.8 times the retention time of ritonavir

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor: NLT 13

Tailing factor: 0.8–1.2

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Peak identification solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of ritonavir from the *Standard solution*

C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ritonavir in the *Sample solution* (mg/mL)

F = relative response factor (see ▲*Table 2*▲ (RB 1-Apr-2018))

Acceptance criteria: See ▲*Table 2*. Reporting threshold is▲ (RB 1-Apr-2018) 0.05%.

Ritonavir Oral Solution

DEFINITION

Ritonavir Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: 4.1 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile, methanol, tetrahydrofuran (stabilizer-free), and *Buffer* (17.5: 10: 10: 62.5). Filter the required solutions individually prior to use.
Diluent: Acetonitrile and *Buffer* (50:50)
Standard solution: 25 µg/mL of USP Ritonavir RS in *Diluent*
Sample solution: Nominally 25 µg/mL of ritonavir in *Diluent* from a measured volume of Oral Solution
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.8–1.2
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of ritonavir in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME** ⟨698⟩
For multiple-unit containers
Acceptance criteria: Meets the requirements

IMPURITIES

- **ORGANIC IMPURITIES**

[NOTE—Ritonavir is alkali sensitive. All glassware should be prerinsed with distilled water before use to remove residual detergent contamination.]
Buffer A: 4.1 g/L of monobasic potassium phosphate
Buffer B: 3.8 g/L of monobasic potassium phosphate and 0.25 g/L of dibasic potassium phosphate
Solution A: Acetonitrile and *Buffer A* (50:50)
Solution B: Acetonitrile and *Buffer A* (65:35)

www.webofpharma.com

Solution C: Butyl alcohol and *Buffer A* (8:92)
Mobile phase: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer B* (18:5:8:69). Adjust with 1 M phosphoric acid or 1 M potassium hydroxide to a pH of 6.3 ± 0.1, if necessary.
Cleaning solution: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer A* (30:8:13:49)
Peak identification solution: Transfer 5–10 g of Oral Solution to a suitable sealed container. Add an amount of citric acid equivalent to 1% by weight of Oral Solution taken, and mix until dissolved. Seal the container, and heat at 70° for 24 h. Transfer 5.0 mL of the thermally degraded sample to a 200-mL volumetric flask. Dissolve and dilute with *Solution B* to volume.
Standard stock solution: 0.1 mg/mL of USP Ritonavir RS in *Solution A*
Standard solution: 10 µg/mL of USP Ritonavir RS in *Solution C* from the *Standard stock solution*
Sample stock solution: Nominally 2 mg/mL of ritonavir in *Solution B* prepared as follows. Transfer a measured volume of Oral Solution equivalent to 400 mg of ritonavir to a 200-mL volumetric flask, and dilute with *Solution B* to volume.
Sample solution: Nominally 1 mg/mL of ritonavir prepared as follows. Transfer 25.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with *Solution C* to volume. Transfer 15.0 mL of the solution to a 50-mL centrifuge tube that has been previously rinsed with methanol and dried. Add 20.0 mL of heptane, then stopper the tube. Shake the tube vigorously until a uniform emulsion is obtained, making sure to vent periodically. Centrifuge the resulting emulsion for about 5 min. Carefully aspirate off the top layer (heptane), leaving the clear bottom layer (*Sample solution*) in the tube. The centrifuged emulsion will have three distinct layers. The top layer (clear heptane) and the bottom layer (*Sample solution*) are separated by a viscous white cloudy layer. The middle layer should be considered part of the top layer for removal by aspiration. Repeat the extraction steps, and analyze the *Sample solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 3-µm packing L26. Wash the column with the *Cleaning solution* after each injection of the *Peak identification solution* and each injection of the *Sample solution* for about 26 min, and equilibrate with *Mobile phase* for about 30 min. Store in the *Cleaning solution* after the analysis is completed.
Column temperature: 60°
Flow rate: 1 mL/min
Injection volume: 50 µL
Run time: 1.8 times the retention time of ritonavir
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.8–1.2
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Peak identification solution*, *Standard solution*, and *Sample solution*
[NOTE—Determine the relative retention value (r) for the components listed in *Table 1* as directed in *Chromatography* ⟨621⟩, using the time measured at the baseline deflection of the *Standard solution* chromatogram as the void volume (t_M).]
Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of ritonavir from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ritonavir in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Disregard peaks less than 0.05%.

Table 1

Name	Relative Retention (r)	Relative Response Factor	Acceptance Criteria, NMT (%)
Ureidovaline[a, b]	0.03	—	—
N-Deacylvaline ritonavir[c, d]	0.11	1.0	0.7
Acetamidoalcohol[b, e]	0.15	1.0	0.1

Table 1 *(continued)*

Name	Relative Retention (*r*)	Relative Response Factor	Acceptance Criteria, NMT (%)
Total impurities	—	—	3.0

[a] {*N*-Methyl[(2-isopropyl-4-thiazolyl)methyl]amino}carbonyl-L-valine (not quantified by this method due to solvent front and placebo interferences; controlled as a synthetic impurity in the drug substance).
[b] Process impurity.
[c] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-amino-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[d] Degradation product.
[e] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-acetamido-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[f] Bis(thiazol-5-ylmethyl) (2*S*,3*S*,5*S*)-3-hydroxy-1,6-diphenylhexane-2,5-diyldicarbamate. (If two peaks appear with a relative retention of 0.24, the second peak is identified as the 2,5-thiazolylmethyl dicarbamate impurity. If a single peak with a relative retention of 0.24 appears, report as *Hydroxypropyl carbamate analog*.)
[g] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-3-hydroxy-5-[(*S*)-2-(3-{[2-(2-hydroxypropan-2-yl)thiazol-4-yl]methyl}-3-methylureido)-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[h] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-3-hydroxy-5-[(*S*)-4-isopropyl-2,5-dioxoimidazolidin-1-yl]-1,6-diphenylhexan-2-ylcarbamate.
[i] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-(3-{[2-(2-hydroperoxypropan-2-yl)thiazol-4-yl]methyl}-3-methylureido)-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate (unspecified degradant; report as *Ethyl carbamate analog* due to possible coelution).
[j] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-ethoxycarbonylamino-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate (possible coelution with ritonavir hydroperoxide).
[k] (4*S*,5*S*)-Thiazol-5-ylmethyl 4-benzyl-5-{(*S*)-2-[(*S*)-4-isopropyl-2,5-dioxoimidazolidin-1-yl]-3-phenylpropyl}-2-oxooxazolidine-3-carboxylate.
[l] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-{3-[(2-ethylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[m] (*S*)-{(2*S*,3*S*,5*S*)-5-Amino-1,6-diphenyl-2-[(thiazol-5-ylmethoxy)carbonylamino]hexan-3-yl} 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate (unspecified degradant).
[n] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-(5-*t*-butoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate (may coelute with isobutoxycarbonyl aminoalcohol; report as isobutoxycarbonyl aminoalcohol using a relative response factor of 0.74).
[o] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-(5-isobutoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[p] (*S*)-*N*-[(*S*)-1-[(4*S*,5*S*)-4-Benzyl-2-oxooxazolidin-5-yl]-3-phenylpropan-2-yl]-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamide (unspecified degradant).
[q] (*S*)-Isobutyl 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.
[r] Thiazol-5-ylmethyl (2*S*,4*S*,5*S*)-4-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[s] Thiazol-5-ylmethyl (2*S*,3*R*,5*S*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[t] Bis(thiazol-5-ylmethyl) (2*S*,2′*S*,3*S*,3′*S*,5*S*,5′*S*)-5,5′-carbonylbis(azanediyl) bis(3-hydroxy-1,6-diphenylhexane-5,2-diyl)dicarbamate.
[u] Thiazol-5-ylmethyl (2*S*,3*R*,5*R*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[v] Thiazol-5-ylmethyl (2*S*,3*S*,5*R*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[w] (3*S*,4*S*,6*S*,10*S*,13*S*,15*S*,16*S*)-Bis(thiazol-5-ylmethyl)-4,15-dihydroxy-10-isopropyl-8,11-dioxo-3,6,13,16-tetrabenzyl-2,7,9,12,17-pentaazaoctadecanedioate.

SPECIFIC TESTS

- **ALCOHOL CONTENT**

Internal standard solution: Transfer 10.0 mL of butyl alcohol to a 200-mL volumetric flask and dilute with methanol to volume.
Internal standard identity solution: Dilute 5.0 mL of the *Internal standard solution* with methanol to 100 mL.
Standard stock solution: 4.0% (v/v) of dehydrated alcohol in methanol
Standard solution: 0.4% (v/v) of dehydrated alcohol prepared as follows. Transfer 10.0 mL of the *Standard stock solution* and 5 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with methanol to volume.
Sample stock solution: Transfer 5.0 mL of Oral Solution to a 50-mL volumetric flask with the aid of several portions of methanol, and dilute with methanol to volume.
Sample solution: Transfer 10.0 mL of the *Sample stock solution* and 5.0 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with methanol to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.53-mm × 30-m fused silica capillary; 1-µm layer of phase G16
Temperatures
Injection port: 185°
Detector: 220°
Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	10	145	6
145	20	200	9.75

Carrier gas: Helium
Flow rate: 4.5 mL/min
Makeup gas flow: 30 mL/min
Injection volume: 1 µL
Injection type: Split injection with a split ratio, 4:1
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.8–1.2 for the alcohol peak
Relative standard deviation: NMT 3.0% for the peak area ratio of alcohol to butyl alcohol
Analysis
Samples: *Internal standard identity solution*, *Standard solution*, and *Sample solution*
Calculate the percentage of alcohol in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times C \times D$$

R_U = peak area ratio of alcohol to butyl alcohol from the *Sample solution*
R_S = average peak area ratio of alcohol to butyl alcohol from the *Standard solution*
C = concentration of dehydrated alcohol in the *Standard solution* (% v/v)
D = dilution factor used to prepare the *Sample solution*, 100

Acceptance criteria: 40%–47% (v/v) of alcohol (C_2H_6O)

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^2 cfu/mL.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

USP Monographs

www.webofpharma.com

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Ritonavir RS

Ritonavir Tablets

DEFINITION
Ritonavir Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 4.1 g/L of monobasic potassium phosphate
Solution A: Acetonitrile and *Buffer* (50:50)
Solution B: Acetonitrile, butyl alcohol, water, and *Buffer* (65:15:10:10)
Mobile phase: Acetonitrile, methanol, tetrahydrofuran (stabilizer-free), and *Buffer* (17.5: 10: 10: 62.5). Filter the required solutions individually before use.
Standard solution: 0.1 mg/mL of USP Ritonavir RS in *Solution A*
Sample stock solution: Nominally 1 mg/mL of ritonavir prepared as follows. Transfer Tablets (NLT 5) equivalent to 500 mg of ritonavir into a 500-mL volumetric flask. Fill the flask half full with *Solution B*, and mechanically shake for at least 60 min or until the Tablets have visually disintegrated. Dilute with *Solution B* to volume, and stir for 30 min. Transfer a sufficient quantity of this solution to a centrifuge tube, and centrifuge for about 15 min. Use the supernatant to prepare the *Sample solution*.
Sample solution: Nominally 0.1 mg/mL of ritonavir in *Solution A* from the supernatant of *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Capacity factor: 15–24
Tailing factor: 0.8–1.2
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ritonavir in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION** ⟨711⟩
Medium: 0.06 M polyoxyethylene 10 lauryl ether; 900 mL
Apparatus 2: 75 rpm
Time: 120 min
Buffer: 4.1 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile and *Buffer* (55:45). Adjust with phosphoric acid to a pH of 4.0 ± 0.1.
Standard stock solution: 1.11 mg/mL of USP Ritonavir RS in methanol
Standard working solution: 111 µg/mL of USP Ritonavir RS in *Medium* from *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection volume: 25 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: 0.9–1.5
Capacity factor: Greater than 3.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
L = label claim for ritonavir (mg/Tablet)
V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of ritonavir ($C_{37}H_{48}N_6O_5S_2$) is dissolved.
• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES
• **ORGANIC IMPURITIES**
Ritonavir is alkali sensitive. All glassware should be pre-rinsed with distilled water before use to remove residual detergent contamination.
Buffer A: 4.1 g/L of monobasic potassium phosphate
Buffer B: 3.8 g/L of monobasic potassium phosphate and 0.25 g/L of dibasic potassium phosphate
Solution A: Acetonitrile and *Buffer A* (50:50)
Solution B: Acetonitrile, butyl alcohol, water, and *Buffer A* (65:15:10:10)
Solution C: Acetonitrile, butyl alcohol, and *Buffer A* (15:5:80)
Mobile phase: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer B* (18:5:8:69) adjusted with 1 M phosphoric acid or 1 M potassium hydroxide, if necessary, to an apparent pH of 6.3 ± 0.1
Cleaning solution: Acetonitrile, butyl alcohol, tetrahydrofuran (stabilizer-free), and *Buffer A* (30:8:13:49)
Standard stock solution: 0.05 mg/mL of USP Ritonavir RS in *Solution A*
Standard solution: 2.5 µg/mL of USP Ritonavir RS in *Solution C* from *Standard stock solution*

www.webofpharma.com

System suitability stock solution: 1 mg/mL of USP Ritonavir Related Compounds Mixture RS in *Solution B*
System suitability solution: 0.5 mg/mL of USP Ritonavir Related Compounds Mixture RS in *Solution C* from *System suitability stock solution*
Sample stock solution: Nominally 1 mg/mL prepared as follows. Transfer Tablets (NLT 5) equivalent to 500 mg of ritonavir into a 500-mL volumetric flask. Fill the flask half full with *Solution B*, and mechanically shake for at least 60 min or until the Tablets have visually disintegrated. Dilute with *Solution B* to volume, and stir for 30 min. Transfer a sufficient quantity of this solution to a centrifuge tube, and centrifuge for 15 min. Use the supernatant to prepare the *Sample solution*.
Sample solution: Nominally 0.5 mg/mL of ritonavir in *Solution C* from the supernatant of *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 15-cm; 3-µm packing L26. Wash the column after each injection of the *Sample solution* with *Cleaning solution* for about 26 min, and equilibrate with *Mobile phase* for about 30 min. Store in *Cleaning solution* after the analysis is completed.
Column temperature: 60°
Flow rate: 1 mL/min
Injection volume: 50 µL
Run time: 2.4 times the retention time of ritonavir
System suitability
Samples: *Standard solution* and *System suitability solution*
See *Table 1* for relative retention values. Disregard all peaks occurring before the *N*-deacylvaline ritonavir peak.
Suitability requirements
Resolution: Greater than 0.7 between the hydroxyritonavir and hydantoin aminoalcohol peaks, *System suitability solution*
Capacity factor: Greater than 10.8, *Standard solution*
Tailing factor: 0.8–1.2, *Standard solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response of ritonavir from the *Standard solution*
C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ritonavir in the *Sample solution* (mg/mL)
F = relative response factor *(See Table 1)*

Acceptance criteria: See *Table 1*. Disregard peaks less than 0.05%.

Table 1

Name	Relative Retention	Relative Response Factor	Acceptance Criteria, NMT (%)
N-Deacylvaline ritonavir[a, b]	0.11	1.0	0.2
Acetamidoalcohol[c, d]	0.15	—	—

Table 1 *(continued)*

Name	Relative Retention	Relative Response Factor	Acceptance Criteria, NMT (%)
2,5-Thiazolylmethyldicarbamate[d, e]	0.24	—	—
Hydroxyritonavir[b, f]	0.36	1.0	0.3
Hydantoin aminoalcohol[b, g]	0.39	0.73	2.6
Ritonavir hydroperoxide[b, h]	0.44	1.0	0.2
Hydantoin-oxazolidinone derivative[d, i]	0.50	—	—

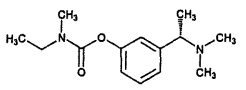
Table 1 *(continued)*



Name	Relative Retention	Relative Response Factor	Acceptance Criteria, NMT (%)
Total impurities	—	—	3.5

[a] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-amino-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[b] Degradation product.
[c] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-acetamido-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[d] Process impurity included in this table for peak identification only. This impurity is controlled in the drug substance. It is not to be reported for the drug product nor included in the total impurities.
[e] Bis(thiazol-5-ylmethyl) (2*S*,3*S*,5*S*)-3-hydroxy-1,6-diphenylhexane-2,5-diyldicarbamate. (Two peaks may be detected with a relative retention value of 0.24. The first peak is considered as an unknown impurity and the second as 2,5-thiazolylmethyldicarbamate.)
[f] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-3-hydroxy-5-[(*S*)-2-(3-{[2-(2-hydroxypropan-2-yl)thiazol-4-yl]methyl}-3-methylureido)-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[g] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-3-hydroxy-5-[(*S*)-4-isopropyl-2,5-dioxoimidazolidin-1-yl]-1,6-diphenylhexan-2-ylcarbamate.
[h] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-(3-{[2-(2-hydroperoxypropan-2-yl)thiazol-4-yl]methyl}-3-methylureido)-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[i] (4*S*,5*S*)-Thiazol-5-ylmethyl 4-benzyl-5-((*S*)-2-[(*S*)-4-isopropyl-2,5-dioxoimidazolidin-1-yl]-3-phenylpropyl)-2-oxooxazolidine-3-carboxylate.
[j] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-5-[(*S*)-2-{3-[(2-ethylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.
[k] (*S*)-((2*S*,3*S*,5*S*)-5-Amino-1,6-diphenyl-2-[(thiazol-5-ylmethoxy) carbonylamino]hexan-3-yl} 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.
[l] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-(5-*t*-butoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate (may co-elute with isobutoxycarbonyl aminoalcohol).
[m] Thiazol-5-ylmethyl (2*S*,3*S*,5*S*)-(5-isobutoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate (may co-elute with BOC-aminoalcohol).
[n] (*S*)-*N*-[(*S*)-1-[(4*S*,5*S*)-4-Benzyl-2-oxooxazolidin-5-yl]-3-phenylpropan-2-yl]-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamide.
[o] (*S*)-Isobutyl 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.
[p] Thiazol-5-ylmethyl (2*S*,4*S*,5*S*)-4-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[q] Thiazol-5-ylmethyl (2*S*,3*R*,5*S*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[r] Bis(thiazol-5-ylmethyl) (2*S*,2′*S*,3*S*,3′*S*,5*S*,5′*S*)-5,5′-carbonylbis(azanediyl) bis(3-hydroxy-1,6-diphenylhexane-5,2-diyl)dicarbamate.
[s] Thiazol-5-ylmethyl (2*S*,3*R*,5*R*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl) methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[t] Thiazol-5-ylmethyl (2*S*,3*S*,5*R*)-3-hydroxy-5-[(*S*)-2-{3-[(2-isopropylthiazol-4-yl) methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.
[u] (3*S*,4*S*,6*S*,10*S*,13*S*,15*S*,16*S*)-Bis(thiazol-5-ylmethyl)-4,15-dihydroxy-10-isopropyl-8,11-dioxo-3,6,13,16-tetrabenzyl-2,7,9,12,17-pentaazaoctadecanedioate.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at or below 30°.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Ritonavir RS
  USP Ritonavir Related Compounds Mixture RS

Rivastigmine

$C_{14}H_{22}N_2O_2$ 250.34

ASSAY

- **PROCEDURE**

[NOTE—Protect solutions containing rivastigmine from light.]

Buffer: 8.9 g/L of dibasic sodium phosphate dihydrate in water (0.05 M)

Mobile phase: Methanol and *Buffer* (58:42), adjusted with phosphoric acid to a pH of 8.45. [NOTE—Let the solution cool to room temperature before pH adjustment.]

System suitability solution: 1 mg/mL of USP Rivastigmine Tartrate RS, and 1 µg/mL each of USP Rivastigmine Related Compound B RS, USP Rivastigmine Related Compound C RS, and USP Rivastigmine Related Compound D RS in *Mobile phase*

Standard solution: 1.0 mg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*

Sample solution: 0.625 mg/mL of Rivastigmine in *Mobile phase*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 214 nm
Column: 4.0-mm × 25-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.0 mL/min
Injection volume: 20 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for rivastigmine related compound C, rivastigmine related compound D, rivastigmine related compound B, and rivastigmine are 0.37, 0.56, 0.68, and 1.0, respectively.]
Suitability requirements
Resolution: NLT 1.5 between rivastigmine related compound D and rivastigmine related compound B, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of rivastigmine ($C_{14}H_{22}N_2O_2$) in the portion of Rivastigmine taken:

www.webofpharma.com

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rivastigmine Tartrate RS in the *Standard solution* (mg/mL)
C_U = concentration of Rivastigmine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
- **ORGANIC IMPURITIES**

[NOTE—Protect solutions containing rivastigmine from light.]

Buffer, Mobile phase, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard solution: 0.0025 mg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*

Sensitivity solution: 0.5 µg/mL of USP Rivastigmine Tartrate RS in *Mobile phase* from the *Standard solution*

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[NOTE—The relative retention times for rivastigmine related compound C, rivastigmine related compound D, rivastigmine related compound B, and rivastigmine are 0.37, 0.56, 0.68, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between rivastigmine related compound D and rivastigmine related compound B, *System suitability solution*

Signal-to-noise ratio: NLT 10 for rivastigmine, *Sensitivity solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any impurity in the portion of Rivastigmine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any impurity from the *Sample solution*
r_S = peak response of rivastigmine from the *Standard solution*
C_S = concentration of USP Rivastigmine Tartrate RS in the *Standard solution* (mg/mL)
C_U = concentration of Rivastigmine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42
F = relative response factor, see *Table 1*

Acceptance criteria: See *Table 1*. Disregard the system peak eluting at the relative retention time of about 0.45.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenol impurity (rivastigmine related compound C)	0.37	1.7	0.3
Nor impurity[a]	0.68	1.0	0.1
Rivastigmine	1.0	—	—
Any other individual impurity	—	1.0	0.10
Total impurities	—	—	0.5

[a] (*S*)-3-[1-(Dimethylamino)ethyl]phenyl dimethylcarbamate (racemic mixture is rivastigmine related compound B).

- **ENANTIOMERIC PURITY**

[NOTE—Protect solutions containing rivastigmine from light.]

Buffer: Dissolve 1.78 g of dibasic sodium phosphate dihydrate and 1.38 g of monobasic sodium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Transfer 20.0 mL of acetonitrile and 205 µL of *N,N*-dimethyloctylamine into a 1000-mL volumetric flask, and dilute with *Buffer* to volume.

System suitability solution: 0.1 mg/mL of USP Rivastigmine Tartrate RS and 0.1 µg/mL of USP Rivastigmine Tartrate R-Isomer RS in *Mobile phase*

Standard solution: 0.1 µg/mL of USP Rivastigmine Tartrate R-Isomer RS in *Mobile phase*

Sample solution: 0.0625 mg/mL of Rivastigmine in *Mobile phase*

Sensitivity solution: 0.05 µg/mL of USP Rivastigmine Tartrate R-Isomer RS in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.0-mm × 10-cm; 5-µm packing L41

Flow rate: 0.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[NOTE—The relative retention times for rivastigmine *R*-isomer and rivastigmine are 0.85 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 10%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Resolution: NLT 0.8 between rivastigmine *R*-isomer and rivastigmine, *System suitability solution*

Analysis

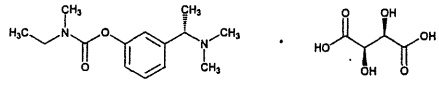
Samples: *Standard solution* and *Sample solution*

Calculate the percentage of rivastigmine *R*-isomer in the portion of Rivastigmine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of rivastigmine *R*-isomer from the *Sample solution*
r_S = peak response of rivastigmine *R*-isomer from the *Standard solution*
C_S = concentration of USP Rivastigmine Tartrate R-Isomer RS in the *Standard solution* (mg/mL)

www.webofpharma.com



C_U = concentration of Rivastigmine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42

Acceptance criteria: NMT 0.3%

Rivastigmine Tartrate Capsules

DEFINITION
Rivastigmine Tartrate Capsules contain an amount of Rivastigmine Tartrate equivalent to NLT 94.0% and NMT 105.0% of the labeled amount of rivastigmine ($C_{14}H_{22}N_2O_2$).

IDENTIFICATION
• The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• PROCEDURE
Buffer: 8.6 mg/mL of monobasic ammonium phosphate in water. Adjust with ammonia solution to a pH of 7.0.
Mobile phase: Methanol, acetonitrile, and *Buffer* (15:15:70)
Standard solution: 0.064 mg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*. [NOTE—Use a small amount of methanol (about 2% of the final volume) to facilitate dissolution before diluting with *Mobile phase* to volume, and use sonication if necessary.]

USP Monographs

www.webofpharma.com

System suitability solution: 0.01 mg/mL each of USP Rivastigmine Related Compound A RS and USP Rivastigmine Related Compound B RS in *Mobile phase*

Sample solution: Remove as completely as possible the contents of NLT 20 Capsules, and mix. Transfer a weighed portion of the combined contents, equivalent to about 48 mg of rivastigmine, to a 250-mL volumetric flask. Add 25 mL of methanol and 60 mL of *Mobile phase*, and sonicate for 15 min to disperse the contents. Dilute with *Mobile phase* to volume, mix well, and centrifuge. Dilute a portion of the supernatant with *Mobile phase* to obtain a solution having a concentration of 0.038 mg/mL of rivastigmine, based on the label claim.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 25-cm; 5-µm packing L7
Flow rate: 1.5 mL/min
Injection size: 20 µL

System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times for rivastigmine related compound A, rivastigmine related compound B, and rivastigmine are 0.46, 0.57, and 1.0, respectively.]
Suitability requirements
Resolution: NLT 1.5 between rivastigmine related compound A and rivastigmine related compound B, *System suitability solution*
Column efficiency: NLT 5000 theoretical plates, *Standard solution*
Tailing factor: NMT 2.3, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{22}N_2O_2$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of rivastigmine from the *Sample solution*
r_S = peak response of rivastigmine from the *Standard solution*
C_S = concentration of USP Rivastigmine Tartrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of rivastigmine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42

Acceptance criteria: 94.0%–105.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Test 1
Medium: Water; 500 mL, deaerated
Apparatus 2: 50 rpm, with sinkers, if necessary
Time: 30 min
Buffer, Mobile phase, and **System suitability solution:** Prepare as directed in the *Assay*.
Standard solution: 0.192 mg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*. Further dilute with *Medium* to obtain a solution having a concentration similar to that expected in the *Sample solution*.
Sample solutions: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, discarding the first few mL.
Chromatographic system and **System suitability:** Proceed as directed in the *Assay*.
[NOTE—Use an injection size of 100 µL.]
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{22}N_2O_2$ dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times (V/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42
V = volume of *Medium* (mL), 500
L = Capsule label claim (mg)

Tolerances: NLT 75% (Q) of the labeled amount of $C_{14}H_{22}N_2O_2$ is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.
Medium: Deaerated water; 500 mL
Apparatus 2: 75 rpm
Time: 15 min
Buffer and **Mobile phase:** Proceed as directed in the *Assay*.
Standard solution: 0.192 mg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*. Further dilute with *Medium* to obtain a solution having a concentration similar to that expected in the *Sample solution*.
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, discarding the first few milliliters.
Chromatographic system: Proceed as directed in the *Assay*. [NOTE—Use an injection volume of 100 µL.]
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Tailing factor: NMT 2.3
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rivastigmine ($C_{14}H_{22}N_2O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times (V/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
M_{r1} = molecular weight of rivastigmine, 250.34
M_{r2} = molecular weight of rivastigmine tartrate, 400.42
V = volume of *Medium* (mL), 500
L = label claim (mg/Capsule)

Tolerances: NLT 80% (Q) of the labeled amount of rivastigmine ($C_{14}H_{22}N_2O_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

ORGANIC IMPURITIES

• **Procedure**

Buffer, Mobile phase, and **System suitability solution:** Prepare as directed in the *Assay*.
Standard solution: 1.6 µg/mL of USP Rivastigmine Tartrate RS in *Mobile phase*
Sample solution: Remove as completely as possible the contents of NLT 20 Capsules, and mix. Transfer a weighed

www.webofpharma.com

portion of the combined contents, equivalent to 25 mg of rivastigmine, to a 25-mL volumetric flask. Disperse in 10 mL of *Mobile phase*, and sonicate for 15 min. Dilute with *Mobile phase* to volume, mix well, and centrifuge. Use the supernatant.

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between rivastigmine related compound A and rivastigmine related compound B, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Identify the peaks using the relative retention times provided in *Impurity Table 1*.]

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of rivastigmine from the *Standard solution*

C_S = concentration of USP Rivastigmine Tartrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of rivastigmine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of rivastigmine, 250.34

M_{r2} = molecular weight of rivastigmine tartrate, 400.42

F = relative response factor (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 1.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenol impurity[a]	0.28	1.6	0.6
Rivastigmine	1.0	1.0	—
Any other individual impurity	—	1.0	0.2
Total impurities	—	—	1.0

[a] (*S*)-3-[1-(Dimethylamino)ethyl]phenol.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Rizatriptan Benzoate System Suitability Mixture RS
Mixture of rizatriptan benzoate and at least 0.1% of rizatriptan impurity C. Rizatriptan impurity C is 2-{5-[(1*H*-1,2,4-triazol-1-yl)methyl]-1*H*-indol-2-yl}-*N*,*N*-dimethylethanamine.
($C_{15}H_{19}N_5$ 269.35)

Rizatriptan Benzoate Tablets

DEFINITION

Rizatriptan Benzoate Tablets contain an amount of rizatriptan benzoate ($C_{15}H_{19}N_5 \cdot C_7H_6O_2$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of rizatriptan ($C_{15}H_{19}N_5$).

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M▲** (CN 1-May-2020)
Sample: Grind a suitable number of Tablets containing NLT 125 mg of rizatriptan. Transfer a suitable amount of powder equivalent to NLT 100 mg of rizatriptan to a suitable flask to obtain a 5 mg/mL solution. Add 75% of the flask volume of methanol. Shake vigorously to disperse the powder. Dilute with methanol to volume. Pass a portion through a suitable filter. Evaporate the filtrate under a stream of nitrogen. Prepare a mull of the residue with mineral oil.
Acceptance criteria: The spectrum of the *Sample* corresponds to that of a similarly prepared Standard.
• **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**
Buffer: Dissolve 1.7 g of monobasic potassium phosphate and 0.9 g of sodium 1-hexanesulfonate to a 1-L volumetric flask. Add 900 mL of water. Adjust with 50% (w/w) sodium hydroxide solution to a pH of 6.8. Dilute with water to volume.
Mobile phase: Acetonitrile and *Buffer* (15:85)
Diluent: Acetonitrile and 0.05 M ammonium acetate (20:80)
Standard solution: 0.06 mg/mL of USP Rizatriptan Benzoate RS in *Diluent*
Sample stock solution: Nominally 0.2 mg/mL of rizatriptan in *Diluent* prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask. Add 10%–20% of the flask volume of *Diluent*. Swirl until the Tablets have disintegrated completely. Dilute with *Diluent* to volume. Stir the solution for 90–150 min. Centrifuge a portion of the resulting solution. Use the supernatant to prepare the *Sample solution*.
Sample solution: Nominally 0.04 mg/mL of rizatriptan from the supernatant of the *Sample stock solution* and *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 226 nm

  Injection volume: 5 µL
  System suitability
  [NOTE—The system may need equilibration for 4 h.]
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 2.0
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of rocuronium bromide ($C_{32}H_{53}BrN_2O_4$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rocuronium Bromide RS in the *Standard solution* (mg/mL)
C_U = concentration of Rocuronium Bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and 2-propanol-free or acetic acid-free basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **ORGANIC IMPURITIES**
  Diluent, Mobile phase, and **Chromatographic system:** Proceed as directed in the *Assay*.
  Peak identification solution: 1 mg/mL of USP Rocuronium Peak Identification Mixture RS in *Diluent*
  Standard solution: 0.01 mg/mL of USP Rocuronium Bromide RS in *Diluent*
  Sample solution: 10 mg/mL of Rocuronium Bromide in *Diluent*
  Run time: 2.5 times the retention time for rocuronium
  System suitability
  [NOTE—The system may need equilibration for 4 h.]
  Sample: *Peak identification solution*
  Suitability requirements
  Peak-to-valley ratio: The ratio of the height of the rocuronium related compound H peak to the height of the valley between the rocuronium related compound H peak and the rocuronium peak is NLT 1.5.
  Resolution: NLT 3.5 between rocuronium and rocuronium related compound C
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of each impurity in the portion of Rocuronium Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of any impurity from the *Sample solution*
r_S = peak response of rocuronium bromide from the *Standard solution*

www.webofpharma.com

C_S = concentration of USP Rocuronium Bromide RS in the *Standard solution* (mg/mL)
C_U = concentration of Rocuronium Bromide in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.
[NOTE—Disregard any peak eluting before rocuronium bromide related compound A, and any peak with an area less than 0.5 times that of the principal peak from the *Standard solution*.]

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Rocuronium related compound A[a]	0.20	2.1	0.2
Rocuronium related compound G[b]	0.44	2.3	0.1
Rocuronium related compound F[c]	0.75	0.79	0.1
Rocuronium related compound B[d]	0.80	1.0	0.3
Rocuronium related compound D[e]	0.90	1.0	0.1
Rocuronium related compound H[f]	0.95	2.9	0.1
Rocuronium bromide	1.0	—	—
Rocuronium related compound C[g]	1.20	1.0	0.3
Rocuronium related compound E[h]	1.53	1.0	0.1
Any individual unspecified impurity	—	—	0.10
Total impurities	—	—	1.5

[a] 3α-Hydroxy-2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstan-17β-yl acetate.
[b] 2β-(Morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstan-3α,17β-diol.
[c] 1-[3α,17β-Bis(acetyloxy)-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.
[d] 1-[3α,17β-Bis(acetyloxy)-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.
[e] 1-[3α-(Acetyloxy)-17β-hydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.
[f] 1-[17β-(Acetyloxy)-2-(morpholin-4-yl)-3-oxo-5α-androst-1-en-16β-yl]-1-(prop-2-enyl)pyrrolidinium.
[g] 1-[3α,17β-Dihydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.
[h] 1-[17β-(Acetyloxy)-3α-hydroxy-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.

• **LIMIT OF 2-PROPANOL**
[NOTE—Perform this test only if 2-propanol is a known organic manufacturing process impurity.]
Standard stock solution: Transfer 35.0 µL of ethyl ether, 32.0 µL of 2-propanol, and 19.0 µL of methylene chloride to a 100-mL volumetric flask containing 90 mL of dimethylformamide (DMF), and dilute with DMF to volume.
Standard solution: Transfer 2.5 mL of the *Standard stock solution* to a 25-mL volumetric flask containing 20 mL of DMF, and dilute with DMF to volume.
Dilute standard solution: Transfer 1.0 mL of the *Standard solution* and 4.0 mL of water to a 20-mL headspace vial. Immediately close the vial with a cap, and mix.
Sample solution: Transfer 50 mg of Rocuronium Bromide to a 20-mL headspace vial. Dissolve in 1.0 mL of DMF. Add 4 mL of water, immediately close the vial with a cap, and mix.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.32-mm × 60-m fused silica; coated with a 1.8-µm layer of liquid phase G43
Temperatures
Injector: 140°
Detector: 280°
Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	0	50	8
50	20	250	8

Carrier gas: Helium with a linear velocity of 55 cm/s or nitrogen with a linear velocity of 25 cm/s
Injection type: Split ratio, 1:6
Head space autosampler
Sample equilibration temperature: 90°
Sample equilibration time: 15 min
Transfer line temperature: 140°
System suitability
Sample: *Dilute standard solution*
[NOTE—The relative retention times for ethyl ether, 2-propanol, and methylene chloride are 0.87, 1.0, and 1.08, respectively.]
Suitability requirements
Resolution: NLT 1.0 between ethyl ether and 2-propanol; NLT 1.0 between 2-propanol and methylene chloride
Relative standard deviation: NMT 10.0% for the 2-propanol peak
Analysis
Samples: *Dilute standard solution* and *Sample solution*
Calculate the percentage of 2-propanol in the portion of Rocuronium Bromide taken:

$$\text{Result} = [(r_U/r_S) \times (V \times D/W) \times 100]/F$$

r_U = peak response of 2-propanol from the *Sample solution*
r_S = peak response of 2-propanol from the *Dilute standard solution*
V = volume of 2-propanol taken to prepare the *Standard stock solution* (µL)
D = relative density of 2-propanol, 0.786 mg/µL
W = weight of Rocuronium Bromide taken to prepare the *Sample solution* (mg)
F = dilution factor for the *Standard solution*, 1000

Acceptance criteria: NMT 1.0%
• **LIMIT OF ACETIC ACID**
[NOTE—Perform this test only if acetic acid is a known organic manufacturing process impurity.]
Mobile phase: 6.1 g of sodium perchlorate in 800 mL of water. Adjust with 1 N sulfuric acid to a pH of 2.0. Dilute to 1 L.
Standard solution: 0.2 mg/mL of glacial acetic acid in *Mobile phase*

www.webofpharma.com

Sample solution: 6.0 mg/mL of Rocuronium Bromide in *Mobile phase*. [NOTE—Sonication may be necessary to completely dissolve the rocuronium bromide.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: 4.6-mm × 15-cm; packing L1
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time of acetic acid is about 3.8 min.]
Suitability requirements
Column efficiency: NLT 5000 theoretical plates
Tailing factor: NMT 1.8
Relative standard deviation: NMT 5.0% for three injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of acetic acid in the portion of Rocuronium Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for acetic acid from the *Sample solution*
r_S = peak response for acetic acid from the *Standard solution*
C_S = concentration of acetic acid in the *Standard solution* (mg/mL)
C_U = concentration of Rocuronium Bromide in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method Ic* ⟨921⟩**:** NMT 4.0%
• **PH** ⟨791⟩
Sample solution: 10 mg/mL
Acceptance criteria: 7.0–9.5
• **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
Sample solution: 10 mg/mL in 0.05 M hydrochloric acid
Acceptance criteria: 28.5°–32.0°, measured on the anhydrous and solvent-free basis at 20°
• **COLOR AND ACHROMICITY** ⟨631⟩
Reference solution: Mix 33 mL of *Matching Fluid G* and 67 mL of water.
Sample solution: 10 mg/mL of Rocuronium Bromide in water
Analysis: Proceed as directed for *Color and Achromicity* ⟨631⟩.
Acceptance criteria: The *Sample solution* is not more intensely colored than the *Reference solution*.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store in the freezer. If the article contains acetic acid, store it between 2° and 8°.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Rocuronium Bromide RS
USP Rocuronium Peak Identification Mixture RS
Mixture of approximately 0.2% to 0.4% each of rocuronium related compound A, rocuronium related compound B, rocuronium related compound C, rocuronium related compound D, rocuronium related compound E, rocuronium related compound F, rocuronium related compound G, and rocuronium related compound H in a matrix of rocuronium bromide.

Ropinirole Tablets

DEFINITION
Ropinirole Tablets contain ropinirole hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ropinirole free base ($C_{16}H_{24}N_2O$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

▲• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.▲ (USP 1-Dec-2019)

ASSAY

Change to read:

• **PROCEDURE**
Buffer: 3.85 g/L of ammonium acetate. Adjust with phosphoric acid to a pH of 2.5.
Mobile phase: Acetonitrile, methanol, and *Buffer* (7:3:40)
System suitability solution: 0.1 mg/mL of USP Ropinirole Hydrochloride RS and 0.5 µg/mL of USP Ropinirole Related Compound B RS in *Buffer*
Standard solution: 0.1 mg/mL of USP Ropinirole Hydrochloride RS in *Buffer*
Sample solution: Nominally 0.1 mg/mL of ropinirole in *Buffer* ▲▲ (USP 1-Dec-2019) prepared as follows. ▲Transfer NLT 5 Tablets into a suitable volumetric flask and▲ (USP 1-Dec-2019) add 50% of the flask volume with *Buffer*. Shake mechanically for 30 min. Dilute with *Buffer* to volume. Pass a portion of the supernatant through a suitable membrane filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm. ▲For *Identification B*, use a diode array detector in the range of 200–400 nm.▲ (USP 1-Dec-2019)
Column: 4.6-mm × 25-cm; 5-µm packing L7
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: ▲NLT▲ (USP 1-Dec-2019) 2 times the retention time of ropinirole
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between ropinirole and ropinirole related compound B, *System suitability solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*

USP Monographs

www.webofpharma.com

Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the *Sample solution*
r_S = peak response of the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ropinirole in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of ropinirole, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84

Acceptance criteria: 90.0%–110.0% of ropinirole free base

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨711⟩

Test 1
Medium: 2.9 g/L of sodium citrate dihydrate and 3.3 g/L of anhydrous citric acid in water, pH 4.0; 500 mL
Apparatus 1: 50 rpm
Time: 15 min
Mobile phase: Acetonitrile and *Medium* (1:4)
Standard solution: ▲0.0045 mg/mL▲ (USP 1-Dec-2019) of USP Ropinirole Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution through a suitable filter of 0.45-µm pore size, discarding the first few milliliters. Dilute with *Medium* to a concentration similar to the *Standard solution*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 3.0-mm × 7-cm; 5-µm packing L1
Flow rate: 0.6 mL/min
Injection volume: 50 µL
Run time: ▲NLT▲ (USP 1-Dec-2019) 3 times the retention time of ropinirole
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times (M_{r1}/M_{r2}) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
D = dilution factor for the *Sample solution*
M_{r1} = molecular weight of ropinirole, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84
V = volume of *Medium*, 500 mL

Tolerances: NLT 85% (*Q*) of the labeled amount of ropinirole is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 2.1 g/L of citric acid in water. Adjust with a solution containing 121.2 g/L of tris (hydroxymethyl) methylamine in water to a pH of 4.0▲ (USP 1-Dec-2019); 500 mL, deaerated.
Apparatus 1: 50 rpm
Time: 15 min
Standard solution: (*L*/500) ▲mg/mL▲ (USP 1-Dec-2019) of USP Ropinirole Hydrochloride RS in *Medium*, in which *L* is the label claim in mg/Tablet
Buffer and **Mobile phase:** Prepare as directed in the *Assay*.
Sample solution: Pass a portion of the solution through a ▲suitable▲ (USP 1-Dec-2019) filter of 15- to 20-µm pore size, discarding the first few milliliters. ▲[NOTE—A polyethylene filter may be suitable.]▲ (USP 1-Dec-2019)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 25-cm; 5-µm packing L7
Flow rate: ▲1 mL/min▲ (USP 1-Dec-2019)
Injection volume: 200 µL for Tablets with a label claim of 0.25, 0.5, 1.0, and 2.0 mg/Tablet; 100 µL for all other strengths
▲Run time: NLT 1.3 times the retention time of ropinirole▲ (USP 1-Dec-2019)
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 1.5%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

r_U = peak response of the *Sample solution*
r_S = peak response of the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
M_{r1} = molecular weight of ropinirole, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84
V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of ropinirole is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

Change to read:

- **ORGANIC IMPURITIES**

Buffer: 1.8 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 7.4.
Solution A: Methanol and *Buffer* (20:80)
Solution B: Methanol and *Buffer* (80:20)
Diluent: Dissolve 5 g of sodium dodecyl sulfate in 800 mL of water. Adjust with phosphoric acid or sodium hydroxide to a pH of 6.8. Add 200 mL of methanol, and mix.
Mobile phase: See *Table 1*.

www.webofpharma.com

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
8	85	15
30	30	70
40	10	90
60	10	90
60.1	85	15
70	85	15

System suitability solution: 0.3 µg/mL of USP Ropinirole Hydrochloride RS in *Diluent* and 0.5 µg/mL of USP Ropinirole Related Compound B RS in *Diluent*

Standard solution: 0.2 µg/mL of ropinirole prepared from USP Ropinirole Hydrochloride RS in *Diluent*

Sample solution: Nominally 100 µg/mL of ropinirole from ▲NLT 20 Tablets▲ (USP 1-Dec-2019) prepared as follows. ▲Finely powder the Tablets and▲ (USP 1-Dec-2019) transfer a portion to a suitable volumetric flask. Add 70% of the flask volume with *Diluent*. Shake mechanically for 30 min. Dilute with *Diluent* to volume. Pass a portion of the supernatant through a suitable membrane filter of 0.45-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 50°
Flow rate: 1 mL/min
Injection volume: 100 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between ropinirole and ropinirole related compound B, *System suitability solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each individual impurity from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of ropinirole in the *Standard solution* (µg/mL)
C_U = nominal concentration of ropinirole in the *Sample solution* (µg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Monopropyl ropinirole[a]	0.24	1.1	0.6
Ropinirole *N*-oxide[b]	0.27	1.0	0.5

[a] 4-[2-(Propylamino)ethyl]indolin-2-one.
[b] *N*-[2-(2-Oxoindolin-4-yl)ethyl]-*N*-propylpropan-1-amine oxide.
[c] 1,2a,3,4-Tetrahydro-2*H*-cyclopenta(cd)indol-2-one.
[d] 4-[2-(Dipropylamino)ethyl]-1-hydroxy-1,3-dihydro-2*H*-indol-2-one.
[e] 4-[2-(Dipropylamino)ethyl]-1-ethyl-1,3-dihydro-2*H*-indol-2-one; process impurity included for identification only.
[f] (*Z*)-4-[2-(Dipropylamino)ethyl]-3-propylideneindolin-2-one.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Ropinirole Hydrochloride RS
  USP Ropinirole Related Compound B RS
  4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride.
  $C_{16}H_{22}N_2O_2 \cdot HCl$ 310.82

Ropinirole Extended-Release Tablets

DEFINITION
Ropinirole Extended-Release Tablets contain ropinirole hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ropinirole free base ($C_{16}H_{24}N_2O$).

IDENTIFICATION
- **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
  Buffer: Dissolve 4.5 g of dibasic sodium phosphate dihydrate in 900 mL of water. Adjust with phosphoric acid to a pH of 7.0. Dilute with water to 1 L.
  Mobile phase: Methanol and *Buffer* (75:25)
  Dilute phosphoric acid: Dissolve 0.7 mL of phosphoric acid in 1 L of water.
  Diluent: Acetonitrile and *Dilute phosphoric acid* (80:20)

www.webofpharma.com

System suitability solution: 0.1 mg/mL of USP Ropinirole Hydrochloride RS and 0.003 mg/mL of USP Ropinirole Related Compound B RS in *Diluent*. Sonication may be used to aid dissolution.
Standard solution: 0.11 mg/mL of USP Ropinirole Hydrochloride RS in *Diluent*. Sonication may be used to aid dissolution.
Sample solution: 0.05–0.2 mg/mL of ropinirole prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask containing 75% of the flask volume of *Diluent*. Sonicate for NLT 30 min. Allow to cool to room temperature. Dilute with *Diluent* to volume. Pass a portion of the solution through a nylon filter of 0.45-µm pore size and use the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm. For *Identification A*, use a diode array detector in the range of 200–400 nm.
Column: 4.6-mm × 12.5-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 10 µL
Run time: NLT 1.5 times the retention time of ropinirole
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between ropinirole related compound B and ropinirole, *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 1.5%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ropinirole from the *Sample solution*
r_S = peak response of ropinirole from the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ropinirole in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of ropinirole free base, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩
Test 1
Solution A: 121.2 g/L of trishydroxymethylaminomethane in water
Buffer 1: Dissolve 2.1 g of citric acid monohydrate in 900 mL of water. Adjust with *Solution A* to a pH of 4.0. Dilute with water to 1 L.
Buffer 2: Dissolve 3.9 g of ammonium acetate in 900 mL of water. Adjust with phosphoric acid to a pH of 2.5. Dilute with water to 1 L.
Medium: *Buffer 1*; 500 mL. Deaerate as appropriate.
Apparatus 2: 100 rpm with tablet holder. See *Figure 1*.

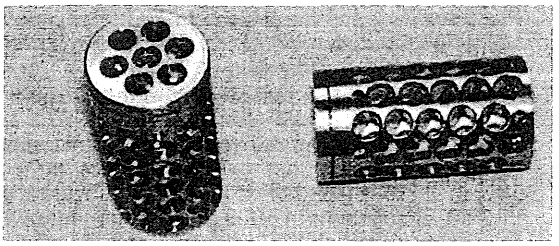

Figure 1. 37-mm(l) × 19-mm(d) stainless steel sinker; screw cap drilled with seven 4-mm holes, bottom drilled with seven 5-mm holes, 12 longitudinal series of 5-mm holes alternately starting and ending with one 3-mm hole, polished electrochemically or with a suitably validated alternative

Times: 2, 12, and 24 h
Mobile phase: Acetonitrile, methanol, and *Buffer 2* (14:6:80)
Standard solution: (*L*/400) mg/mL of USP Ropinirole Hydrochloride RS in *Medium* where *L* is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 10-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 12.5-cm; 5-µm packing L7
Flow rate: 1 mL/min
Injection volume: 20 µL for 12-mg Tablets; 100 µL for all other strengths
Run time: NLT 2 times the retention time of ropinirole
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at each time point (*i*):

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 500 mL
L = label claim, mg/Tablet
M_{r1} = molecular weight of ropinirole free base, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84

Tolerances: See *Table 1*.

Table 1

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	2	NMT 20
2	12	45–65
3	24	NLT 80

USP Monographs

www.webofpharma.com

The percentages of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Solution A: 121.2 g/L of trishydroxymethylaminomethane in water

Buffer 1: Dissolve 2.1 g of citric acid monohydrate and 11.7 mL of *Solution A* in 1000 mL of water. Adjust with *Solution A* to a pH of 4.0.

Buffer 2: Dissolve 4.2 g/L of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 6.5.

Medium: *Buffer 1*; 500 mL

Apparatus 2: 100 rpm

Times: 2, 6, 12, and 24 h

Mobile phase: Acetonitrile and *Buffer 2* (20:80)

Standard solution: (*L*/500) mg/mL of USP Ropinirole Hydrochloride RS in *Medium* where *L* is the label claim in mg/Tablet

Sample solution: Centrifuge a portion of the solution under test.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm; 5-µm packing L7
Flow rate: 1 mL/min
Injection volume: 50 µL
Run time: NLT 2 times the retention time of ropinirole

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of ropinirole ($C_{16}H_{24}N_2O$) in the sample withdrawn from the vessel at each time point (*i*):

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of ropinirole from the *Sample solution*
r_S = peak response of ropinirole from the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at each time point (*i*):

$$\text{Result}_1 = C_1 \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

C_i = concentration of ropinirole in the *Sample solution* at the specified time point (mg/mL)
L = label claim, mg/Tablet
M_{r1} = molecular weight of ropinirole free base, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84
V = volume of *Medium*, 500 mL
V_S = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 2*.

Table 2

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	2	14–34
2	6	42–62
3	12	68–88
4	24	NLT 85

The percentages of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Buffer: 1.4 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Medium: 0.1 N hydrochloric acid VS; 500 mL

Apparatus 2: 100 rpm, with sinkers

Times: 1, 6, 12, and 24 h

Mobile phase: Acetonitrile and *Buffer* (10:90)

Standard solution: (*L*/500) mg/mL of USP Ropinirole Hydrochloride RS in *Medium* where *L* is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 10-µm pore size.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 7.5-cm; 3.5-µm packing L1
Column temperature: 35°
Flow rate: 1.5 mL/min
Injection volume: 50 µL
Run time: NLT 2 times the retention time of ropinirole

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of ropinirole ($C_{16}H_{24}N_2O$) in the sample withdrawn from the vessel at each time point (*i*):

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of ropinirole and 3-oxo ropinirole from the *Sample solution*. [NOTE—The relative retention times for ropinirole and 3-oxo ropinirole are 1.0 and 1.21, respectively.]
r_S = peak response of ropinirole from the *Standard solution*
C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at each time point (*i*):

www.webofpharma.com

$$Result_1 = C_1 \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$Result_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$Result_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$$Result_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

C_i = concentration of ropinirole in the *Sample solution* at the specified time point (mg/mL)
L = label claim, mg/Tablet
M_{r1} = molecular weight of ropinirole free base, 260.37
M_{r2} = molecular weight of ropinirole hydrochloride, 296.84
V = volume of *Medium*, 500 mL
V_S = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 3*.

Table 3

Time Point (*i*)	Time (h)	Amount Dissolved (%)
1	1	NMT 25
2	6	40–60
3	12	65–85
4	24	NLT 80

The percentages of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) dissolved at the times specified conform to *Dissolution* ⟨711⟩, *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A: 0.05% (v/v) trifluoroacetic acid in water
Solution B: Acetonitrile and methanol (80:20)
Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	84	16
23	84	16
36	40	60
36.1	84	16
50	84	16

Diluent 1: Acetonitrile and *Solution A* (80:20)
Diluent 2: *Diluent 1* and *Solution A* (20:80)
System suitability solution: 0.03 mg/mL of USP Ropinirole Hydrochloride RS and 0.001 mg/mL of USP Ropinirole Related Compound B RS in *Diluent 2*. Sonication may be used to aid dissolution.
Sensitivity solution: 0.015 µg/mL of USP Ropinirole Hydrochloride RS in *Diluent 2*
Standard solution: 0.15 µg/mL of USP Ropinirole Related Compound B RS in *Diluent 2*
Sample stock solution: Nominally 0.13–0.14 mg/mL of ropinirole from a suitable number of Tablets containing 20–50 mg of ropinirole prepared as follows. Homogenize an appropriate number of Tablets in a suitable volume of *Diluent 1*. Pass a portion of the solution through a nylon filter of 0.45-µm pore size and use the filtrate.
Sample solution: Nominally 26–28 µg/mL of ropinirole from the *Sample stock solution* and *Solution A*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 25-cm; 5-µm packing L7
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 100 µL
System suitability
Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between ropinirole related compound B and ropinirole, *System suitability solution*
Relative standard deviation: NMT 10% for ropinirole related compound B, *Standard solution*
Signal-to-noise ratio: NLT 10 for ropinirole, *Sensitivity solution*
Analysis
Samples: *Standard solution and Sample solution*
Calculate the percentage of ropinirole related compound B in the portion of Tablets taken:

$$Result = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ropinirole related compound B from the *Sample solution*
r_S = peak response of ropinirole related compound B from the *Standard solution*
C_S = concentration of USP Ropinirole Related Compound B RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of ropinirole in the *Sample solution* (µg/mL)
M_{r1} = molecular weight of ropinirole related compound B free base, 274.36
M_{r2} = molecular weight of ropinirole related compound B hydrochloride, 310.82

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$Result = (r_U/F)/[\Sigma(r_U/F) + r_R] \times 100$$

r_U = peak response of each degradation product from the *Sample solution*
F = relative response factor for the corresponding degradation product from *Table 5*
r_R = peak response of ropinirole from the *Sample solution*

Acceptance criteria: See *Table 5*. Disregard peaks less than 0.05%.

Table 5

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

[b] 4-[2-(Dipropylamino)ethyl]-1-(hydroxymethyl)indolin-2-one.
[c] *N*-[2-(2-Oxoindolin-4-yl)ethyl]-*N*-propylpropan-1-amine oxide.
[d] 4-[2-(Dipropylamino)ethyl]-3-({4-[2-(dipropylamino)ethyl]-2-oxo-2,3-dihydro-1*H*-indol-3-yl}methyl)-2,3-dihydro-1*H*-indol-2-one.
[e] (*Z*)-4-[2-(Dipropylamino)ethyl]-3-propylideneindolin-2-one.
[f] Process impurity included in the table for identification only. Process impurities are controlled in the drug substance and are not to be reported or included in the total impurities for the drug product.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Ropinirole Hydrochloride RS
  USP Ropinirole Related Compound B RS
  4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride.
  $C_{16}H_{22}N_2O_2 \cdot HCl$ 310.82

Ropinirole Hydrochloride

$C_{16}H_{24}N_2O \cdot HCl$ 296.84
2*H*-Indol-2-one, 4-[2-(dipropylamino)ethyl]-1,3-dihydro-, monohydrochloride;
4-[2-(Dipropylamino)ethyl]-2-indolinone monohydrochloride [91374-20-8].

DEFINITION

Ropinirole Hydrochloride contains NLT 98.0% and NMT 102.0% of ropinirole hydrochloride ($C_{16}H_{24}N_2O \cdot HCl$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K▲** (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩
  Sample: 20 mg/mL
  Acceptance criteria: Meets the requirements of test *A*

ASSAY

- **PROCEDURE**
  Buffer: 1.88 g of sodium 1-hexanesulfonate and 1 g of phosphoric acid in 1 L of water. Adjust with dilute triethylamine solution (1 mL/10 mL) to a pH of 6.5.
  Diluent: Acetonitrile and water (20:80)
  Mobile phase: Acetonitrile and *Buffer* (20:80)
  Standard solution: 0.1 mg/mL of USP Ropinirole Hydrochloride RS in *Diluent*. Sonication may be used to aid dissolution.
  Sample solution: 0.1 mg/mL of Ropinirole Hydrochloride in *Diluent*. Sonication may be used to aid dissolution.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 215 nm
  Column: 4.6-mm × 25-cm; 5-µm packing L7
  Column temperature: 30°
  Flow rate: 1.0 mL/min
  Injection volume: 10 µL
  Run time: 2.5 times the retention time of ropinirole
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 1.6
  Relative standard deviation: NMT 1.5%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of ropinirole hydrochloride ($C_{16}H_{24}N_2O \cdot HCl$) in the portion of Ropinirole Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **LIMIT OF Pd**
  [NOTE—Perform this test if Pd is a known inorganic impurity.]
  Solution A: Dissolve 2.4 g of sodium hydroxide in 20 mL of water, and dilute with glycerol to 100 mL.
  Solution B: 40 mg/mL of thioacetamide in water. [NOTE—The solution may be filtered if necessary.]
  Buffer: Carefully add 27 mL of hydrochloric acid to 25 g of ammonium acetate, and dilute with water to 100 mL.
  Pd standard solution: 10 ppm of Pd from commercially available ICP grade 1000 ppm Pd stock solution
  Standard solution: Pipet 1.0 mL of *Pd standard solution* into a platinum crucible, and gently evaporate to dryness.

www.webofpharma.com

Moisten the residue with 0.5 mL of sulfuric acid, and heat with a Bunsen burner until fumes are no longer emitted. Place the crucible in a muffle furnace at 700°, and heat for 5 additional min. Cool, add 5 mL of hydrochloric acid to the residue, and evaporate to dryness. Add 1 mL of 2 M hydrochloric acid and, if necessary, dissolve the residue with gentle heating. When cool, transfer the contents to a 50-mL beaker. Wash the crucible twice with 1-mL aliquots of water, and add the washings to the beaker. Pass the solution through a membrane filter of 2-µm pore size into a centrifuge tube.

Sample solution: Transfer 1 g of Ropinirole Hydrochloride to a platinum crucible, and heat over a Bunsen burner until the material is completely carbonized. Moisten the contents with 0.5 mL of sulfuric acid, and heat over a Bunsen burner until fumes are no longer emitted. Place the crucible in a muffle furnace at 700°, and heat until all the organic material has been destroyed. When cool, add 5 mL of hydrochloric acid to the residue, and evaporate to dryness. Add 1 mL of 2 M hydrochloric acid and, if necessary, dissolve the residue with gentle heating. When cool, transfer the contents to a 50-mL beaker. Wash the crucible twice with 1-mL aliquots of water, and add the washings to the beaker. Pass the solution through a membrane filter of 2-µm pore size into a centrifuge tube.

Analysis: To the filtered *Standard solution* and *Sample solution* add 1 mL of *Solution A*, 0.2 mL of *Solution B*, and 2 mL of *Buffer*. Cap the centrifuge tubes securely, and incubate at 37° for 2 h. Pass the *Sample solution* and *Standard solution* through a membrane filter of 2-µm pore size, wash the membrane with 2-mL aliquots of water, and allow the membrane to dry.

Acceptance criteria: The intensity of the spot due to the sample is not more intense than the spot due to the standard (10 ppm).

• **ORGANIC IMPURITIES, PROCEDURE 1**

If methylene ropinirole and propylidene ropinirole are known process impurities, *Organic Impurities, Procedure 2* is recommended. If ropinirole indole derivative and ropinirole oxime are known process impurities, *Organic Impurities, Procedure 3* is recommended.

Buffer and **Diluent:** Proceed as directed in the *Assay*.

Solution A: Acetonitrile and *Buffer* (15:85)

Solution B: Acetonitrile and water (60:40)

Mobile phase: See *Table 1*.

Table 1

• **ORGANIC IMPURITIES, PROCEDURE 3**
Solution A: Dissolve 3.95 g of ammonium bicarbonate in 990 mL of water. Add 4 mL of 25% ammonia, and dilute with water to 1000 mL. The pH is 9.2–9.3.
Solution B: Acetonitrile
Diluent: Acetonitrile and water (32:68)
Mobile phase: See *Table 5*.

Table 5

Time (min)	Solution A (%)	Solution B (%)
0	68	32
12	68	32
28	20	80
34	20	80
34.1	68	32
40	68	32

System suitability solution: 1 mg/mL of USP Ropinirole Hydrochloride RS and 0.01 mg/mL of USP Ropinirole Related Compound B RS in *Diluent*
Standard solution: 1.2 µg/mL of USP Ropinirole Hydrochloride RS in *Diluent*
Sample solution: 1.2 mg/mL of Ropinirole Hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability.*)
Mode: LC
Detector: UV 220 nm
Column: 3.9-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 1.5 between ropinirole and ropinirole related compound B, *System suitability solution*
Tailing factor: 0.8–1.5 for ropinirole, *Standard solution*
Relative standard deviation: NMT 5.0% for ropinirole, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual impurity in the portion of Ropinirole Hydrochloride taken:

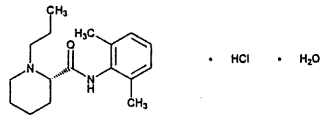
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)
F = relative response factor (see *Table 6*)

www.webofpharma.com

Acceptance criteria: See *Table 6*.

Table 6



Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Ropinirole oxime[a]	0.69	1.0	0.15
Ropinirole	1.0	—	—
Ropinirole related compound B	1.2	1.0	0.15
Ropinirole indole derivative[b]	2.0	4.0	0.10
Any individual unspecified impurity	—	—	0.10
Total impurities	—	—	0.50

[a] 4-[2-(Dipropylamino)ethyl]-3-(hydroxyimino)indolin-2-one.
[b] *N,N*-Dipropyl-*N*-(2-indol-4-ylethyl)amine.

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method Ic* ⟨921⟩: NMT 0.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.
• **LABELING:** The label states with which *Organic Impurities* procedure the article complies if *Organic Impurities, Procedure 1* is not used.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Ropinirole Hydrochloride RS
USP Ropinirole Related Compound A RS
4-(2-Hydroxyethyl)indolin-2-one.
$C_{10}H_{11}NO_2$ 177.20
USP Ropinirole Related Compound B RS
4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride.
$C_{16}H_{22}N_2O_2 \cdot HCl$ 310.82

Ropivacaine Hydrochloride

$C_{17}H_{26}N_2O \cdot HCl \cdot H_2O$ 328.88
(*S*)-(−)-1-Propylpiperidine-2-carboxylic acid (2,6-dimethylphenyl)amide hydrochloride monohydrate;
(*S*)-(−)-1-Propyl-2′,6′-pipecoloxylidine hydrochloride monohydrate [132112-35-7].

DEFINITION
Ropivacaine Hydrochloride contains NLT 98.5% and NMT 101.0% of $C_{17}H_{26}N_2O \cdot HCl$, calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
• **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩
Sample solution: 10 mg/mL

ASSAY
• **PROCEDURE**
Sample solution: Dissolve 1000 mg of Ropivacaine Hydrochloride in 10 mL of water and 40 mL of alcohol. Add 1.0 mL of 1 N hydrochloric acid.
Analysis: Titrate with 1 N sodium hydroxide VS. Two equivalence points are obtained; the difference in titrant volume corresponds to the amount of ropivacaine hydrochloride (see *Titrimetry* ⟨541⟩). Each mL of 1 N sodium hydroxide is equivalent to 310.9 mg of anhydrous ropivacaine hydrochloride ($C_{17}H_{26}N_2O \cdot HCl$).
Acceptance criteria: 98.5%–101.0% on the anhydrous basis

IMPURITIES
ORGANIC IMPURITIES
• **Procedure 1**
Buffer solution: Combine 1.3 mL of monobasic sodium phosphate solution (138 g/L) and 32.5 mL of disodium hydrogen phosphate dihydrate solution (89 g/L), and dilute with water to 1 L. The pH of this solution is 8.0. Make adjustments if necessary.
Mobile phase: Acetonitrile and *Buffer solution* (1:1)
System suitability solution: 10 µg/mL of each of USP Ropivacaine Hydrochloride RS and USP Bupivacaine Hydrochloride RS in *Mobile phase*
Sample solution 1: 2.75 mg/mL of Ropivacaine Hydrochloride in *Mobile phase*
Sample solution 2: 2.75 µg/mL of Ropivacaine Hydrochloride from *Sample solution 1* diluted with *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 3.9-mm × 15-cm; 4-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
[NOTE—Check the stability of the baseline by injecting *Mobile phase*. Run the chromatogram for at least 15 min.]
Samples: *System suitability solution* and *Sample solution 2*
[NOTE—The relative retention times for ropivacaine and bupivacaine are about 1.0 and 1.6, respectively.]
Suitability requirements
Resolution: NLT 6 between ropivacaine and bupivacaine, *System suitability solution*
Signal-to-noise ratio: NLT 10 for ropivacaine, *Sample solution 2*
Analysis
Samples: *System suitability solution* and *Sample solution 1*
Calculate the percentage of each impurity in the portion of Ropivacaine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity from the *Sample solution*
r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria
Bupivacaine: NMT 0.2%
Any other individual impurity: Less than 0.1%
Total impurities: NMT 0.5%
• **Procedure 2: Limit of Ropivacaine Related Compound A**
Buffer solution, Mobile phase, and **Chromatographic system:** Prepare as directed in *Procedure 1*.

USP Monographs

www.webofpharma.com

Standard solution: 0.13 µg/mL of USP Ropivacaine Related Compound A RS in *Mobile phase*
Sample solution: 10 mg/mL of Ropivacaine Hydrochloride in *Mobile phase*
System suitability
Sample: *Standard solution*
Suitability requirements
Signal-to-noise ratio: NLT 10 for ropivacaine related compound A
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria: The response for any peak corresponding to ropivacaine related compound A (2,6-dimethylaniline) in the *Sample solution* is not greater than the response of the major peak in the *Standard solution* (NMT 10 ppm).

• **Procedure 3: Enantiomeric Purity**

Background electrolyte solution: 9.31–10.29 mg/mL of phosphoric acid in water. The pH is between 2.9 and 3.1. If necessary, adjust the pH with triethanolamine to 2.9–3.1.
Run buffer: 13.3 mg/mL of heptakis-(2,6-di-*O*-methyl)-β-cyclodextrin in *Background electrolyte solution*. [NOTE—This solution is freshly prepared and passed through a 0.45-µm filter.]
System suitability solution: 15 µg/mL of each USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound B RS in water
Sample solution 1: 2 mg/mL of Ropivacaine Hydrochloride in water
Sample solution 2: 0.01 mg/mL of ropivacaine hydrochloride from *Sample solution 1* diluted with water
Capillary rinsing procedure: Use separate *Run buffer* vials for capillary rinse and sample analysis. Rinse the capillary with water for 1 min, with 0.1 N sodium hydroxide for 10 min, and with water for 3 min. If a new or dry capillary is being used, increase the sodium hydroxide rinse time to 30 min. Rinse the capillary between injections as follows: water for 1 min, 0.1 N sodium hydroxide for 4 min, and water for 1 min, then *Run buffer* for 4 min. Rinse times are based on a rinse pressure of 1 bar.
Capillary electrophoresis system
Detector: UV 206 nm
Column: 50-µm × 72-cm fused silica
Column temperature: 30°
Applied voltage: 375 V/cm
Initial ramping: 500 V/s, positive polarity, and a resulting current of 40–45 µA
Injection size: Equal volumes
System suitability
Samples: *System suitability solution* and *Sample solution 2*
[NOTE—The relative migration times for ropivacaine related compound B (R enantiomer) and ropivacaine (S enantiomer) are about 0.96 and 1.0, respectively.]
Suitability requirements
Signal-to-noise ratio: NLT 10, *Sample solution 2*
Resolution: NLT 3.7 between ropivacaine related compound B and ropivacaine, *System suitability solution*
[NOTE—The analysis run time is about 30 min. If needed, increase the resolution by increasing the concentration of heptakis-(2,6-di-*O*-methyl)-β-cyclodextrin or by lowering the system temperature.]
Analysis
Samples: *Run buffer*, water, and *Sample solution 1*
Inject *Run buffer* and water to ensure there are no interfering peaks (50 mbar for 5.0 s followed by injection of *Run buffer* at 50 mbar for 1.0 s). Inject *Sample solution 1* into the electrophoresis system, record the electropherograms, and measure the peak responses for ropivacaine and ropivacaine related compound B.
Calculate the percentage of ropivacaine related compound B in the portion of Ropivacaine Hydrochloride taken:

$$\text{Result} = (r_R/M_R)/(r_S/M_S) \times 100$$

r_R = peak response of ropivacaine related compound B from *Sample solution 1*
M_R = migration time of ropivacaine related compound B (min)
r_S = peak response of ropivacaine from *Sample solution 1*
M_S = migration time of ropivacaine (min)

[NOTE—After the analysis, rinse the capillary for 10 min with 0.1 N sodium hydroxide, then for 10 min with water. Dry the capillary before storage.]
Acceptance criteria: NMT 0.5% of ropivacaine related compound B

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** The level of bacterial endotoxins is such that the requirements under the relevant dosage form monograph(s) in which Ropivacaine Hydrochloride is used can be met. Where the label states that Ropivacaine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirements under the relevant dosage form monograph(s) in which Ropivacaine Hydrochloride is used can be met.

• **COLOR**
Sample solution: Transfer an aliquot of Ropivacaine Hydrochloride, 480–500 mg, into a 25-mL volumetric flask, and dissolve in and dilute with water to volume. Pass the solution through a 5-µm polyvinylidene filter (PVDF).
Spectrometric conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV-Vis
Analytical wavelengths: 405 and 436 nm
Cell: 5 cm
Analysis
Sample: *Sample solution*
Immediately measure the absorbance of the *Sample solution*, using water as the reference.
Acceptance criteria: NMT 0.030 at 405 nm, and NMT 0.025 at 436 nm

• **CLARITY**
Hydrazine sulfate solution: 10 mg/mL of hydrazine sulfate in water. Allow to stand 4–6 h.
Hexamethylenetetramine solution: Transfer 2.5 g of hexamethylenetetramine to a 100-mL glass-stoppered flask, and dissolve in 25 mL of water.
Opalescence standard stock suspension: To the flask containing the *Hexamethylenetetramine solution*, add 25.0 mL of *Hydrazine sulfate solution*, mix, and allow to stand for 24 h. This suspension is stable for up to 2 months when stored in a glass container free from surface defects. The suspension must not adhere to the flask and must be well mixed before use.
Opalescence standard suspension: Dilute 15.0 mL of the *Opalescence standard stock suspension* with water to 1000 mL. This suspension should be freshly prepared and may be stored for NMT 24 h.
Standard suspension 1: *Opalescence standard suspension* and water (5:95). Shake before use.
Standard suspension 2: *Opalescence standard suspension* and water (10:90). Shake before use.

www.webofpharma.com

Sample solution: 480–500 mg of Ropivacaine Hydrochloride in a 25-mL volumetric flask. Dilute with water to volume.

Analysis:

Samples: *Standard suspension 1*, *Standard suspension 2*, and *Sample solution*

Use identical tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm. The depth of the layer is 40 mm. Compare the solutions in diffused daylight 5 min after the preparation of *Standard suspension 1* and *Standard suspension 2*, viewing vertically against a black background. The diffusion of light must be such that *Standard suspension 1* can readily be distinguished from water, and *Standard suspension 2* can readily be distinguished from *Standard suspension 1*.

Acceptance criteria: The *Sample solution* is considered clear if its clarity is the same as that of water or if its opalescence is not more pronounced than that of *Standard suspension 1*.

- **pH** ⟨791⟩: 4.5–6.0, in a solution (10 mg/mL)
- **Water Determination,** *Method Ia* ⟨921⟩: 5.0%–6.0%. Perform the determination on 0.0900–0.1100 g of sample.
- **Sterility Tests** ⟨71⟩: Where the label states that Ropivacaine Hydrochloride is sterile, it meets the requirements.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at room temperature.
- **Labeling:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP Reference Standards** ⟨11⟩

USP Bupivacaine Hydrochloride RS
USP Ropivacaine Hydrochloride RS
USP Ropivacaine Related Compound A RS
2,6-Dimethylaniline hydrochloride.
$C_8H_{12}ClN$ 157.64
[CAS-21436-98-6].
USP Ropivacaine Related Compound B RS
(*R*)-Ropivacaine hydrochloride monohydrate; (*R*)-(+)-1-propylpiperidine-2-carboxylic acid (2,6-dimethylphenyl)-amide hydrochloride monohydrate.
$C_{17}H_{26}N_2O$ 328.89

Ropivacaine Hydrochloride Injection

» Ropivacaine Hydrochloride Injection is a sterile solution of Ropivacaine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ropivacaine hydrochloride ($C_{17}H_{26}N_2O \cdot HCl$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type 1 glass or of suitable plastic.

USP Reference standards ⟨11⟩—

USP Ropivacaine Hydrochloride RS
USP Ropivacaine Related Compound A RS
2,6-Dimethylaniline hydrochloride.
$C_8H_{12}ClN$ 157.64
[CAS-21436-98-6].
USP Ropivacaine Related Compound B RS
(*R*)-Ropivacaine hydrochloride monohydrate; (*R*)-(+)-1-propylpiperidine-2-carboxylic acid (2,6-dimethylphenyl)-amide hydrochloride monohydrate.
$C_{17}H_{26}N_2O$ 328.89

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *System suitability solution*, as obtained in the test for *Enantiomeric purity*.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 60 USP Endotoxin Units per g of ropivacaine hydrochloride.

Particulate Matter in Injections ⟨788⟩: meets the requirements for injections.

Sterility Tests ⟨71⟩: It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩: between 4.0 and 6.0.

Limit of 2,6-dimethylaniline (ropivacaine related compound A, base)—

pH 8.0 Buffer solution and *Mobile phase*—Prepare as directed in the *Assay*.

Standard solution—Prepare as directed for *Standard preparation* in the *Assay*.

Test solution—Dilute accurately the Injection with *Mobile phase* to obtain a concentration of 2.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between ropivacaine related compound A and ropivacaine is not less than 5; and the signal-to-noise ratio for ropivacaine related compound A is not less than 10.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The peak response of ropivacaine related compound A obtained from the *Test solution* is not greater than the corresponding response obtained from the *Standard solution* (not more than 0.01% of ropivacaine related compound A base is found).

Enantiomeric purity—

pH 7.2 Buffer solution—Transfer 7.5 mL of 1 M monobasic sodium phosphate solution and 28.5 mL of 0.5 M dibasic sodium phosphate dihydrate solution into a 1-L volumetric flask, and dilute with water to volume. Adjust the resulting solution to a pH of 7.2, if necessary.

Mobile phase—Transfer 35 mL of isopropyl alcohol into a 500-mL volumetric flask, dilute with *pH 7.2 Buffer solution* to volume, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve suitable quantities of USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound B RS in water, and dilute quantitatively, and stepwise, with water to obtain a solution containing about 75 µg per mL and 0.75 µg per mL, respectively.

Test solution—Dilute the Injection with *Mobile phase* to a concentration of about 75 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 10-cm column that contains packing L41. The

www.webofpharma.com

flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ropivacaine related compound B (*R* enantiomer) and ropivacaine (*S* enantiomer) is not less than 1.5. [NOTE—For the purpose of identification, the relative retention times are about 0.75 for ropivacaine related compound B and 1.0 for ropivacaine.]

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of ropivacaine related compound B (*R* enantiomer) in the portion of Injection taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response of ropivacaine related compound B (*R* enantiomer); and r_s is the sum of the peak responses of ropivacaine (*S* enantiomer) and ropivacaine related compound B (*R* enantiomer) obtained from the *Test solution:* not more than 2.0% of ropivacaine related compound B (*R* enantiomer) is found.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

pH 8.0 Buffer solution—Transfer 1.3 mL of 1 M monobasic sodium phosphate solution and 32.5 mL of 0.5 M dibasic sodium phosphate dihydrate solution to a 1-L volumetric flask. Dilute with water to volume, and mix. Adjust the resulting solution to a pH of 8.0, if necessary.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *pH 8.0 Buffer solution* (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise, with *Mobile phase* to obtain a solution having known concentrations of about 0.25 mg per mL of USP Ropivacaine Hydrochloride RS and about 0.26 µg per mL of USP Ropivacaine Related Compound A RS.

Assay preparation—Dilute accurately the Injection with *Mobile phase* to obtain a concentration of about 0.25 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 5- or 10-µm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections, calculated for the ropivacaine peak, is not more than 1.0%; and the resolution, *R,* between ropivacaine related compound A and ropivacaine is not less than 5.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ropivacaine hydrochloride ($C_{17}H_{26}N_2O \cdot HCl$) in each mL of Injection taken by the formula:

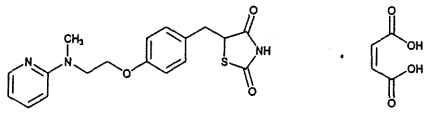
$$C\,D(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ropivacaine Hydrochloride RS in the *Standard preparation; D* is the dilution factor, in mL, for the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Rose Water Ointment

DEFINITION

Prepare Rose Water Ointment as follows.



Cetyl Esters Wax	125 g
White Wax	120 g
Almond Oil	560 g
Sodium Borate	5 g
Stronger Rose Water	25 mL
Purified Water	165 mL
Rose Oil	200 µL
To make about	1000 g

Reduce the *Cetyl Esters Wax* and the *White Wax* to small pieces, melt them on a steam bath, add the *Almond Oil,* and continue heating until the temperature of the mixture reaches 70°. Dissolve the *Sodium Borate* in the *Purified Water* and the *Stronger Rose Water,* warmed to 70°, and gradually add the warm aqueous phase to the melted oil phase, stirring rapidly and continuously until it has cooled to about 45°. Then incorporate the *Rose Oil.* [NOTE—Rose Water Ointment is free from rancidity. If the Ointment has been chilled, warm it slightly before attempting to incorporate other ingredients (see *5.20.20. Added Substances, Excipients, and Ingredients in Official Products* in the *General Notices and Requirements.*]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers.

Rosiglitazone Maleate

$C_{18}H_{19}N_3O_3S \cdot C_4H_4O_4$ 473.50

(±)-5-[*p*-[2-(Methyl-2-pyridylamino)ethoxy]benzyl]-2,4-thiazolidinedione maleate (1:1);

(*RS*)-5-{[4-({2-[Methyl(2-pyridinyl)amino]ethyl}oxy) phenyl] methyl}-1,3-thiazolidine-2,4-dione (*Z*)-2-butenedioate [155141-29-0].

DEFINITION

Rosiglitazone Maleate contains NLT 98.0% and NMT 102.0% of $C_{18}H_{19}N_3O_3S \cdot C_4H_4O_4$, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

Change to read:

USP Monographs

www.webofpharma.com

ASSAY

• **PROCEDURE**

Buffer: Dissolve 5.75 g of phosphoric acid in 800 mL water, adjust with 4 N sodium hydroxide to a pH of 3.0, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (25:75)

System suitability solution: Transfer 2.5 mg of USP Rosiglitazone Maleate RS and 1 mg of USP Rosiglitazone Related Compound A RS to a 50-mL volumetric flask, dissolve in 1 mL of stabilizer-free tetrahydofuran, and dilute with *Mobile phase* to volume.

Standard solution: 0.05 mg/mL of USP Rosiglitazone Maleate RS in *Mobile phase*

Sample solution: 0.05 mg/mL of Rosiglitazone Maleate in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: Greater than 2.0 between rosiglitazone and rosiglitazone related compound A, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of rosiglitazone maleate ($C_{18}H_{19}N_3O_3S \cdot C_4H_4O_4$) in the portion of Rosiglitazone Maleate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Rosiglitazone Maleate RS in the *Standard solution* (mg/mL)

C_U = concentration of Rosiglitazone Maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

OTHER COMPONENTS

• **CONTENT OF MALEIC ACID**

Buffer: Prepare 0.1 M sodium phosphate buffer as follows. Add 11.5 g of phosphoric acid to 800 mL of water, adjust with 2 N sodium hydroxide to a pH of 3.0, and dilute with water to 1 L.

Mobile phase: Methanol and *Buffer* (50:50)

Diluent: Methanol and water (50:50)

System suitability solution: 0.1 µg/mL of USP Fumaric Acid RS and 0.04 mg/mL of USP Rosiglitazone Maleate RS in *Diluent*

Standard solution: 0.01 mg/mL of USP Maleic Acid RS in *Diluent*

Sample solution: 0.04 mg/mL of Rosiglitazone Maleate in *Diluent*

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 212 nm

Column: 4.6-mm × 15-cm; 5-µm packing L14

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for rosiglitazone, maleic acid, and fumaric acid are 0.5, 1.0, and 1.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between maleic acid and fumaric acid, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of maleic acid in the portion of Rosiglitazone Maleate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of maleic acid from the *Sample solution*

r_S = peak response of maleic acid from the *Standard solution*

C_S = concentration of USP Maleic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Rosiglitazone Maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 23.5%–26.0%

IMPURITIES

• **RESIDUE ON IGNITION,** ⟨281⟩: NMT 0.2%, using an ignition temperature of 800 ± 25°

• **ORGANIC IMPURITIES**

[NOTE—Protect the *System suitability solution* and *Sample solution* from light.]

Buffer 1: Prepare 0.05 M dibasic potassium phosphate buffer as follows. Dissolve 11.4 g of dibasic potassium phosphate trihydrate in 800 mL of water, adjust with a mixture of phosphoric acid and water (1:1) to a pH of 7.0, and dilute with water to 1 L.

Solution A: Acetonitrile and *Buffer 1* (30:70)

Solution B: Acetonitrile and *Buffer 1* (70:30)

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
25.0	100	0
50.0	0	100

Buffer 2: Prepare 0.05 M monobasic potassium phosphate buffer by dissolving 6.8 g of monobasic potassium phosphate in 1 L of water.

Diluent: Acetonitrile and *Buffer 2* (30:70)

System suitability solution: 0.5 mg/mL of USP Rosiglitazone Maleate RS in *Diluent*, using sonication, if necessary, to dissolve. [NOTE—USP Rosiglitazone Maleate RS contains rosiglitazone related compound A as a minor component.]

Sample solution: 0.5 mg/mL of Rosiglitazone Maleate in *Diluent*, using sonication, if necessary, to dissolve

Chromatographic system

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Enantiomeric Purity*.
- **C. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests, Calcium*
Sample solution: 8 mg/mL of Rosuvastatin Calcium in a mixture of methanol and water (1:1)
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Protect all solutions containing rosuvastatin calcium and its related compounds from light.
Solution A: Acetonitrile, 1% (v/v) aqueous trifluoroacetic acid, and water (290:10:700)
Solution B: Acetonitrile, 1% (v/v) aqueous trifluoroacetic acid, and water (750:10:240)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	100	0
50	60	40
60	0	100
70	0	100
71	100	0
80	100	0

Diluent: Acetonitrile and water (25:75)
System suitability solution A: Dissolve 10 mg of Rosuvastatin Calcium in 10 mL of 1% trifluoroacetic acid in ethyl acetate. Heat at 40° for 1 h. Cool, and transfer to a

USP Monographs

www.webofpharma.com

separatory funnel. Add 2 mL of 1 M sodium hydroxide, and shake for 30 s. Allow the layers to separate, and discard the lower aqueous layer. Add 2 mL of water, and shake for 10 s. Allow the layers to separate, and discard the aqueous layer. Transfer 2 mL of the retained organic layer to a 50-mL standard flask, add 12 mL of acetonitrile, and dilute with water to volume. This solution contains predominantly rosuvastatin lactone.

System suitability solution B: Dissolve 10 mg of Rosuvastatin Calcium in a 50-mL volumetric flask in 10 mL of 1% trifluoroacetic acid in acetonitrile. Stopper, and heat at 40° for 1 h. Cool, add 20 mL of water, and neutralize with 1 M sodium hydroxide to a pH of 6–8. Dilute with water to volume. This solution contains predominantly rosuvastatin diastereomers.

System suitability solution C: 0.25 mg/mL each of USP Rosuvastatin Related Compound A RS and USP Rosuvastatin Related Compound B RS in a mixture of acetonitrile and water (1:1)

System suitability solution D: 0.04 mg/mL of USP Rosuvastatin Related Compound C RS in a mixture of acetonitrile and water (1:1)

System suitability solution E: Heat 250 mg of Rosuvastatin Calcium at 50° for 7 days in suitable glassware with a porous cover. Dissolve 50 mg of the heated rosuvastatin calcium in 11 mL of acetonitrile in a 50-mL standard flask. Add 5 mL of *System suitability solution A*, 3 mL of *System suitability solution B*, 1 mL of *System suitability solution C*, and 1 mL of *System suitability solution D*. Dilute with water to volume.

Standard solution: 0.7 mg/mL of USP Rosuvastatin Calcium RS in *Diluent*

Sample solution: 0.7 mg/mL of Rosuvastatin Calcium in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 3.0-mm × 15-cm; 3-µm packing L1

Column temperature: 40°

Flow rate: 0.75 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution E* and *Standard solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between the rosuvastatin and rosuvastatin diastereomer peaks, *System suitability solution E*

Tailing factor: NMT 1.5 for the rosuvastatin peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of rosuvastatin calcium $[Ca(C_{22}H_{27}FN_3O_6S)_2]$ in the portion of Rosuvastatin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of rosuvastatin from the *Sample solution*

r_S = peak response of rosuvastatin from the *Standard solution*

C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (mg/mL)

C_U = concentration of Rosuvastatin Calcium in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the anhydrous and solvent-free basis

IMPURITIES

• ORGANIC IMPURITIES

Protect all solutions containing rosuvastatin calcium and its related compounds from light.

Mobile phase, Diluent, System suitability solution E, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.

Standard solution: 0.0014 mg/mL of USP Rosuvastatin Calcium RS in *Diluent*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Rosuvastatin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of rosuvastatin from the *Standard solution*

C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (mg/mL)

C_U = concentration of Rosuvastatin Calcium in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Rosuvastatin Tablets

DEFINITION
Rosuvastatin Tablets contain NLT 90% and NMT 110% of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$).

IDENTIFICATION
• **A.** The UV absorption spectra of the rosuvastatin peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Protect all solutions containing rosuvastatin from light.
Solution A: 1% trifluoroacetic acid in water
Mobile phase: Acetonitrile, *Solution A*, and water (37:1:62)
Diluent: Acetonitrile and water (25:75)
Standard stock solution: 1 mg/mL of USP Rosuvastatin Calcium RS prepared as follows. To a suitable amount of USP Rosuvastatin Calcium RS in a suitable volumetric flask, add water equal to about 50% of the flask volume. Vigorously mix or sonicate the flask to dissolve the material. Add acetonitrile equal to about 25% of the total volume and then dilute with water to volume.
Standard solution: 25 µg/mL of USP Rosuvastatin Calcium RS in *Diluent* from the *Standard stock solution*
Sample solution: Nominally 25 µg/mL of rosuvastatin prepared as follows. Transfer a suitable number of Tablets, NLT 5 Tablets for 80-mg Tablet strength and NLT 10 Tablets for all other Tablet strengths, into a suitable extraction flask. Add water and vigorously mix to disintegrate the Tablets. Add acetonitrile and mix

www.webofpharma.com

vigorously. Add more water to obtain a 25:75 composition of acetonitrile and water. Pass the solution through a suitable filter. Dilute the filtrate with *Diluent*, if necessary, to the desired concentration.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 242 nm. For *Identification A*, use a diode array detector in the range of 200–440 nm.
Column: 3.2-mm × 25-cm; 5-µm packing L1. [NOTE—A suitable guard column may be used.]
Column temperature: 40°
Flow rate: 0.75 mL/min
Injection volume: 10 µL
Run time: NLT 1.3 times the retention time of rosuvastatin

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.8
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [M \times (M_{r1}/M_{r2})] \times 100$$

r_U = peak response of rosuvastatin from the *Sample solution*
r_S = peak response of rosuvastatin from the *Standard solution*
C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of rosuvastatin in the *Sample solution* (µg/mL)
M = number of moles of rosuvastatin per mole of rosuvastatin calcium, 2
M_{r1} = molecular weight of rosuvastatin, 481.54
M_{r2} = molecular weight of rosuvastatin calcium, 1001.14

Acceptance criteria: 90%–110%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩
Protect all solutions containing rosuvastatin from light.
Test 1
Medium: Citrate buffer, pH 6.6 (prepare a solution of 14.7 g/L of sodium citrate dihydrate and 0.33 g/L of anhydrous citric acid; adjust if necessary with sodium citrate or citric acid to a pH of 6.6); 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Diluent: Acetonitrile and water (25:75)
Mobile phase: Acetonitrile, water, and phosphoric acid (400:600:1)
Standard stock solution: 1 mg/mL of USP Rosuvastatin Calcium RS in *Diluent*
Standard solution: A solution of concentration similar to the *Sample solution* in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 242 nm
Column: 4.6-mm × 5-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 2.5 times the retention time of rosuvastatin

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times [M \times (M_{r1}/M_{r2})] \times 100$$

r_U = peak response of rosuvastatin from the *Sample solution*
r_S = peak response of rosuvastatin from the *Standard solution*
C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
M = number of moles of rosuvastatin per mole of rosuvastatin calcium, 2
M_{r1} = molecular weight of rosuvastatin, 481.54
M_{r2} = molecular weight of rosuvastatin calcium, 1001.14

Tolerances: NLT 75% (Q) of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) is dissolved.
Test 2: If the product complies with this test, the labeling indicates that it meets *Dissolution Test 2*.
Medium: 0.05 M citrate buffer pH 6.6 (to a solution of 10.5 g/L of citric acid monohydrate, add 5.9 g/L of sodium hydroxide and mix; adjust with 0.2 M sodium hydroxide or 0.2 M hydrochloric acid to a pH of 6.6); 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Buffer: Dissolve 2.72 g of potassium dihydrogen phosphate in 1 L of water and add 2 mL of triethylamine. Adjust with phosphoric acid to a pH of 2.5.
Mobile phase: Acetonitrile and *Buffer* (30:70)
Standard stock solution: 0.5 mg/mL of USP Rosuvastatin Calcium RS in *Medium*. Sonication may be necessary for complete dissolution.
Standard solution: (L/900) mg/mL of USP Rosuvastatin Calcium RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 240 nm
Column: 4.6-mm × 10-cm; 5-µm packing L1

Tolerances: NLT 80% (Q) of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) is dissolved.

Test 4: If the product complies with this test, the labeling indicates that it meets *Dissolution Test 4*.
Medium: 0.05 M sodium citrate buffer pH 6.6 (prepare a solution of 14.7 g/L of sodium citrate dihydrate and 0.33 g/L of anhydrous citric acid; adjust if necessary with 10% w/v sodium citrate dihydrate solution or 10% w/v anhydrous citric acid solution to a pH of 6.6); 900 mL
Apparatus 1: 100 rpm
Time: 30 min
Solution A: Acetonitrile and water (25:75)
Mobile phase: Acetonitrile, phosphoric acid, and water (40: 0.1: 60)
Standard stock solution: 1.04 mg/mL of USP Rosuvastatin Calcium RS in *Solution A*. Sonication may be necessary for complete dissolution.
Standard solution: (L/900) mg/mL of USP Rosuvastatin Calcium RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 242 nm
Column: 4.6-mm × 5-cm; 3.5-µm packing L1
Flow rate: 1.0 mL/min
Injection volume: 20 µL
Run time: NLT 3.5 times the retention time of rosuvastatin
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times [M \times (M_{r1}/M_{r2})] \times 100$$

r_U = peak response of rosuvastatin from the *Sample solution*
r_S = peak response of rosuvastatin from the *Standard solution*
C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (mg/mL)
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
M = number of moles of rosuvastatin per mole of rosuvastatin calcium, 2
M_{r1} = molecular weight of rosuvastatin, 481.54
M_{r2} = molecular weight of rosuvastatin calcium, 1001.14

Tolerances: NLT 80% (Q) of the labeled amount of rosuvastatin ($C_{22}H_{28}FN_3O_6S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Protect all solutions containing rosuvastatin calcium from light.
Mobile phase and **Diluent:** Prepare as directed in the *Assay*.
System suitability stock solution: 50 µg/mL each of USP Rosuvastatin Calcium RS and rosuvastatin diastereomers in acidic water prepared as follows. To a suitable amount of USP Rosuvastatin Calcium RS in a suitable volumetric flask, add water equal to about 50% of the flask volume. Add 1 M hydrochloric acid equal to about 10% of the total volume. Heat in a water bath at 60° for 2 h and neutralize by adding

USP Monographs

www.webofpharma.com

1 M sodium hydroxide. Cool to room temperature and add acetonitrile equal to about 25% of the total volume. Dilute with water to volume.

System suitability solution: 25 µg/mL each of USP Rosuvastatin Calcium RS and rosuvastatin diastereomers prepared by mixing *System suitability stock solution* and *Diluent* (1:1)

Standard solution: 10 µg/mL of USP Rosuvastatin Calcium RS in *Diluent*

Sample solution: Nominally 1 mg/mL of rosuvastatin prepared as follows. Transfer a number of Tablets per *Table 1* into a suitable extraction flask. Add water, and mix vigorously to disintegrate the Tablets. Add acetonitrile and mix vigorously followed by an additional amount of water to obtain a final composition of acetonitrile and water (1:3). Pass the solution through a suitable filter.

Table 1

Tablet Strength (mg)	Number of Tablets	Volumetric Flask Size (mL)	Water (mL)	Acetonitrile (mL)
2.5	40	100	50	25
5	20	100	50	25
10	10	100	50	25
20	10	200	100	50
40	12	500	250	125
80	6	500	250	125

Chromatographic system: Proceed as directed in the *Assay*, except for *Run time*.

Run time: NLT 2.5 times the retention time of rosuvastatin

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between rosuvastatin and rosuvastatin diastereomers, *System suitability solution*

Tailing factor: NMT 1.8, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [M \times (M_{r1}/M_{r2})] \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of rosuvastatin from the *Standard solution*

C_S = concentration of USP Rosuvastatin Calcium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of rosuvastatin in the *Sample solution* (mg/mL)

M = number of moles of rosuvastatin per mole of rosuvastatin calcium, 2

M_{r1} = molecular weight of rosuvastatin, 481.54

M_{r2} = molecular weight of rosuvastatin calcium, 1001.14

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

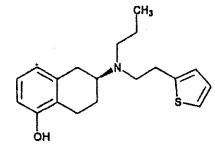
Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Rosuvastatin related compound A	0.9	—	—
Rosuvastatin	1.0	—	—
Rosuvastatin diastereomers[a, b]	1.1	—	—
Rosuvastatin ketone[c]	1.6	0.71	2.1
Rosuvastatin lactone[d]	2.3	1.0	1.5
Rosuvastatin ethyl ester (if present)[e]	3.8	1.0	0.5
Any unspecified degradation product	—	1.0	0.2
Total degradation products	—	—	3.6

[a] (3*RS*,5*RS*,*E*)-7-[4-(4-Fluorophenyl)-6-isopropyl-2-(*N*-methylmethylsulfonamido)pyrimidin-5-yl]-3,5-dihydroxyhept-6-enoic acid.

[b] Process impurity controlled in the drug substance monograph. Provided for information only; the content is not calculated, not reported, and not included in the total impurities.

[c] (*R*,*E*)-7-[4-(4-Fluorophenyl)-6-isopropyl-2-(*N*-methylmethylsulfonamido) pyrimidin-5-yl]-3-hydroxy-5-oxohept-6-enoic acid.



[d] *N*-[4-(4-Fluorophenyl)-5-{(*E*)-2-[(2*S*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]vinyl}-6-isopropylpyrimidin-2-yl]-*N*-methylmethanesulfonamide.

[e] Ethyl (3*R*,5*S*,*E*)-7-[4-(4-fluorophenyl)-6-isopropyl-2-(*N*-methylmethylsulfonamido)pyrimidin-5-yl]-3,5-dihydroxyhept-6-enoate.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Rosuvastatin Calcium RS

Rotigotine

$C_{19}H_{25}NOS$ 315.47

1-Naphthalenol, 5,6,7,8-tetrahydro-6-[propyl[2-(2-thienyl) ethyl]amino-(6*S*)-;
(-)-(*S*)-5,6,7,8-Tetrahydro-6-[propyl[2-(2-thienyl)ethyl] amino]-1-naphthol;
(6*S*)-6-[Propyl(2-(2-thienyl)ethyl)amino]-5,6,7,8-tetrahydro-1-naphthalenol [99755-59-6].

DEFINITION

Rotigotine contains NLT 98.0% and NMT 102.0% of rotigotine ($C_{19}H_{25}NOS$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197A or 197K▲ (CN 1-May-2020)
  Standard: USP Rotigotine RS
  Acceptance criteria: Meets the requirements

www.webofpharma.com

• **B.** The retention time of the major peak of the *Identification solution* corresponds to the rotigotine–*S* isomer peak of the *System suitability solution*, as obtained in the *Limit of Rotigotine R-Enantiomer* test.

ASSAY

• **PROCEDURE**

Solution A: 0.3 mL of trifluoroacetic acid in 1 L of water
Solution B: 0.2 mL of trifluoroacetic acid in 1 L of acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	82	18
2	82	18
24	50	50
24.1	82	18
27	82	18

Diluent A: 1 mL of trifluoroacetic acid in 1 L of water
Diluent B: 1 mL of trifluoroacetic acid in 1 L of acetonitrile
Standard stock solution: 1.3 mg/mL of prepared as follows. Transfer a suitable amount of to a suitable volumetric flask. Add 5% of the flask volume of *Diluent B* and 40% of the flask volume of *Diluent A*. Sonicate to promote dissolution. [NOTE—A sonication time of NLT 20 min with shaking at 5-min intervals may be suitable.] Dilute with *Diluent A* to volume.
Standard solution: 650 µg/mL of from *Standard stock solution* in *Diluent A*
System suitability solution: 0.005 mg/mL each of USP Rotigotine Related Compound G RS and USP Rotigotine Related Compound H RS in *Standard solution*
Sample solution: 600 µg/mL of Rotigotine in *Diluent A* prepared as follows. Transfer a suitable amount of Rotigotine to a suitable volumetric flask. Add 5% of the flask volume of *Diluent B* followed by 40% of the flask volume of *Diluent A*. Sonicate to promote dissolution. [NOTE—A sonication time of NLT 20 min with shaking at 5-min intervals may be suitable.] Dilute with *Diluent A* to volume.
Chromatographic system

Add the following:

▲Rotigotine Transdermal System

DEFINITION
Rotigotine Transdermal System contains NLT 90.0% and NMT 110.0% of the labeled amount of rotigotine ($C_{19}H_{25}NOS$).

IDENTIFICATION
- **A.** The UV spectrum of the rotigotine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Extraction solvent: Prepare a mixture of 2-propanol and *tert*-butylmethylether (80:20). Add 1 mL of methanesulfonic acid to 1 L of the solvent mixture.
Solution A: 0.5 mL of methanesulfonic acid in 1 L of water
Solution B: 0.5 mL of methanesulfonic acid in 1 L of acetonitrile
Mobile phase: *Solution A* and *Solution B* (65:35)
Diluent: 1 mL of methanesulfonic acid in 1 L of water
Standard stock solution: 0.5 mg/mL of USP Rotigotine Hydrochloride RS in *Extraction solvent*. [NOTE—Sonication in a cooled ultrasonic bath may be used to aid in dissolution.]
Standard solution: Mix 3 mL of the *Standard stock solution* with 7 mL of *Diluent*.
Sample stock solution: Nominally 0.45 mg/mL of rotigotine from NLT 10 Transdermal Systems prepared as follows. Transfer the required number of Transdermal Systems without the release liner to a suitable flask containing *N* mL of *Extraction solvent*, where *N* is the total area of the Transdermal Systems taken. Close the flask and sonicate the solution for NLT 10 min in a sonicator maintained at 20°, shaking the flask intermittently to ensure the silicone matrix is completely dissolved. [NOTE—Sonication time may be extended if needed to enable complete dissolution of the silicone matrix.]
Sample solution: Mix 3 mL of *Sample stock solution* with 7 mL of *Diluent*. Centrifuge the solution and use the clear supernatant. [NOTE—A centrifuge speed of NLT 4000 rpm for NLT 15 min may be used.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

USP Monographs

www.webofpharma.com

Mode: LC
Detector: UV 272 nm. For *Identification A*, use a diode array detector in the range of 200–400 nm.
Column: 4.0-mm × 7.5-cm; 4-µm packing L7
Column temperature: 30°
Flow rate: 2 mL/min
Injection volume: 10 µL
Run time: NLT 4 times the retention time of rotigotine

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.2
Relative standard deviation: NMT 1.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of rotigotine ($C_{19}H_{25}NOS$) in each Transdermal System taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/N) \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rotigotine Hydrochloride RS in the *Standard stock solution* (mg/mL)
V = volume of the *Sample stock solution* (mL)
N = number of Transdermal System units used to prepare the *Sample stock solution*
M_{r1} = molecular weight of rotigotine, 315.47
M_{r2} = molecular weight of rotigotine hydrochloride, 351.93
L = label claim (nominal content) of rotigotine in each Transdermal System (mg/unit)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DRUG RELEASE** ⟨724⟩
Medium: Dissolve 6.9 g of monobasic sodium phosphate in 1 L of water. Adjust with a suitable concentration of sodium hydroxide or phosphoric acid to a pH of 4.5; 900 mL, deaerated.
Apparatus 5: 50 rpm; Transdermal System on metal disk
Times: 15, 30, 60, and 180 min
Solution A, Solution B, and **Mobile phase:** Prepare as directed in the *Assay*.
Standard solution: (L/800) mg/mL of USP Rotigotine Hydrochloride RS in *Medium*, where L is the label claim in mg/unit
Sample solution: Withdraw 2 mL from the vessel at the specified times.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 272 nm
Column: 4.0-mm × 7.5-cm; 4-µm packing L7
Column temperature: 30°
Flow rate: 2 mL/min
Injection volume: 50 µL
Run time: NLT 2.5 times the retention time of rotigotine

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.2 for rotigotine
Relative standard deviation: NMT 2.0% for rotigotine

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount (nominal content) of rotigotine ($C_{19}H_{25}NOS$) released at each time point *i*:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rotigotine Hydrochloride RS in the *Standard solution* (mg/mL)
V = volume of the *Medium*, 900 mL
L = label claim (nominal content) of rotigotine in the Transdermal System (mg/unit)
M_{r1} = molecular weight of rotigotine, 315.47
M_{r2} = molecular weight of rotigotine hydrochloride, 351.93

Acceptance criteria: See *Table 1*.

Table 1

Time Point (*i*)	Time (min)	Rotigotine Released (%)
1	15	14–34
2	30	27–47
3	60	45–65
4	180	NLT 85

The percentages of the labeled amount of rotigotine ($C_{19}H_{25}NOS$) released at the times specified conform to *Drug Release* ⟨724⟩, *Acceptance Table 1*.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meets the requirements

IMPURITIES

• **ORGANIC IMPURITIES**
Extraction solvent, Solution A, Solution B, Diluent, and **Standard stock solution:** Prepare as directed in the *Assay*.
Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	95	5
2.0	95	5
35	40	60
38	40	60
39	95	5

Impurities stock solution: 0.1 mg/mL each of USP Rotigotine Related Compound C RS and USP Rotigotine Related Compound K RS in 2-propanol
System suitability stock solution: 0.15 mg/mL of USP Rotigotine Hydrochloride RS and 0.0025 mg/mL each of USP Rotigotine Related Compound C RS and USP Rotigotine Related Compound K RS from suitable volumes of *Standard stock solution* and *Impurities stock solution* in *Extraction solvent*
System suitability solution: Mix 3 mL of *System suitability stock solution* with 7 mL of *Diluent*.

www.webofpharma.com

Sensitivity stock solution: 0.25 µg/mL of USP Rotigotine Hydrochloride RS from *Standard stock solution* in *Extraction solvent*

Sensitivity solution: Mix 3 mL of *Sensitivity stock solution* with 7 mL of *Diluent*.

Sample stock solution: [NOTE—Lacquer removal is recommended to minimize the interferences from the lacquer with the degradation product peaks as follows. Remove the lacquer from the backing foil of each Transdermal System with 4% (v/v) glacial acetic acid in methanol. Dry the lacquer-removed Transdermal Systems for NLT 1 h at room temperature.] Nominally 0.45 mg/mL of rotigotine from NLT 3 Transdermal Systems prepared as follows. Transfer the required number of (lacquer removed, if necessary) Transdermal Systems without the release liner to a suitable flask containing *n* mL of *Extraction solvent*, where *n* is the total area (cm^2) of the Transdermal Systems taken. Close the flask and sonicate the solution for NLT 10 min in a sonicator maintained at 20°, shaking the flask intermittently to ensure the silicone matrix is completely dissolved. [NOTE—Sonication time may be extended if needed to enable complete dissolution of the silicone matrix.]

Sample solution: Mix 3 mL of *Sample stock solution* with 7 mL of *Diluent*. Centrifuge the solution and use the clear supernatant. [NOTE—A centrifuge speed of NLT 4000 rpm for NLT 15 min may be used.]

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 12.5-cm; 5-µm packing L10. [NOTE—A guard column with dimensions 4-mm × 1-cm with 5-µm L3 packing is recommended to minimize interference from the adhesive.]
Column temperature: 40°
Flow rate: 1 mL/min
Injection volume: 80 µL

System suitability
Samples: *System suitability solution* and *Sensitivity solution*
[NOTE—See *Table 3* for relative retention times.]
Suitability requirements
Resolution: NLT 2.0 between rotigotine related compound K and rotigotine related compound C, *System suitability solution*
Signal-to-noise ratio: NLT 10 for rotigotine, *Sensitivity solution*

Analysis
Sample: *Sample solution*
Calculate the percentage of each specified or unspecified degradation product in the portion of the Transdermal System taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response of each specified or unspecified degradation product from the *Sample solution*
r_T = sum of all the peak responses (including the rotigotine peak) from the *Sample solution*
F = relative response factor (see *Table 3*)

Acceptance criteria: See *Table 3*.

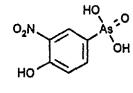

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Desthienylethyl rotigotine[a]	0.36	1.0	0.40
Rotigotine related compound K	0.6	3.5	0.20
Rotigotine related compound C	0.7	1.0	0.60
Rotigotine	1.0	—	—
Any individual unspecified degradation product	—	1.0	0.20
Total degradation products	—	—	1.0

[a] (*S*)-6-(Propylamino)-5,6,7,8-tetrahydronaphthalen-1-ol.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** The label states the total amount of rotigotine in the Transdermal System and the release rate, in mg/day, for the duration of the application of one system.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Rotigotine Hydrochloride RS
  (6*S*)-6-[Propyl(2-(2-thienyl)ethyl)amino]-5,6,7,8-tetrahydro-1-naphthalenol hydrochloride.
  $C_{19}H_{25}NOS \cdot HCl$ 351.93
  USP Rotigotine Related Compound C RS
  (*S*)-6-{[2-(Thiophen-2-yl)ethyl]amino}-5,6,7,8-tetrahydronaphthalen-1-ol.
  $C_{16}H_{19}NOS$ 273.39
  USP Rotigotine Related Compound K RS
  7,8-Dihydronaphthalen-1-ol.
  $C_{10}H_{10}O$ 146.19 ▲(USP 1-May-2020)

Roxarsone

$C_6H_6AsNO_6$ 263.04
Arsonic acid, (4-hydroxy-3-nitrophenyl)-.
4-Hydroxy-3-nitrobenzenearsonic acid [121-19-7].

» Roxarsone contains not less than 98.0 percent and not more than 101.0 percent of $C_6H_6AsNO_6$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.
Labeling—Label it to indicate that it is for veterinary use only.
USP Reference standards ⟨11⟩—
USP Roxarsone RS

www.webofpharma.com

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests ⟨197⟩, Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests ⟨197⟩, Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)—
Solution: 8 µg per mL.
Medium: 0.1 N hydrochloric acid in methanol.

Loss on drying ⟨731⟩—Dry it at 100° for 6 hours: it loses not more than 1.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.5%.

Limit of trivalent arsenic—Transfer 2.50 g of Roxarsone to a 250-mL conical flask, add 5.0 mL of a solution containing 0.1237 mg of anhydrous arsenic trioxide per mL, 10 mL of water, and 4.0 mL of 5 N sodium hydroxide, and swirl to dissolve. Add 5.0 mL of glacial acetic acid, and a stirring bar, and titrate with 0.0025 N iodine VS, determining the endpoint potentiometrically. Perform the same procedure on a second 2.50-g portion of Roxarsone, except to replace the 5.0 mL of arsenic trioxide solution with 5.0 mL of water. Calculate the percentage of trivalent arsenic (As^{+++}) in the Roxarsone taken by the formula:

$$(0.4623/25)[V_B/(V_A - V_B)]$$

in which 0.4623 is the arsenic equivalent of the 5.0 mL of arsenic trioxide solution, and V_A and V_B are the volumes, in mL, of 0.0025 N iodine consumed in the first and second titrations, respectively. Not more than 0.05% is found.

Content of total arsenic—Transfer about 200 mg of Roxarsone, accurately weighed, to a clean, dry 300-mL Kjeldahl flask, and clamp the flask at an angle of 45°. Add 5 mL of sulfuric acid, 10 mL of nitric acid, 5 mL of a saturated solution of sodium sulfate, and several glass beads. Heat to boiling, heat strongly until dense white fumes are produced, and continue heating until the volume is reduced to a few mL. Allow to cool, and cautiously rinse the neck of the flask with about 5 mL of water. Boil again, and continue heating for 30 minutes after the water has boiled away. Allow to cool, add 100 mL of water and 4 mL of 50% potassium iodide solution, and boil to expel the iodine vapors. Continue boiling until the solution becomes colorless, occasionally adding water to maintain the volume at about 60 mL. Add 60 mL of water, and immediately cool the solution. Add 2 drops of phenolphthalein TS, neutralize with 5 N sodium hydroxide, and then make slightly acidic (pH 6.5 to 7.0) by adding a small quantity of 18 N sulfuric acid. Transfer this solution to a beaker with the aid of a water rinse, add 4 g of sodium bicarbonate, and stir with a stirring bar. Titrate with 0.05 N iodine VS, determining the endpoint potentiometrically. Each mL of 0.05 N iodine is equivalent to 1.873 mg of arsenic (As): between 28.0% and 28.8% is found, calculated on the dried basis.

Assay—

Mobile phase—Prepare a degassed mixture of water, methanol, and 0.17% (v/v) phosphoric acid (700:300:60). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 50 mg of USP Roxarsone RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with 1.2 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.1 mg of USP Roxarsone RS per mL.

Assay preparation—Transfer about 50 mg of Roxarsone, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with 1.2 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_6H_6AsNO_6$ in the portion of Roxarsone taken by the formula:

$$500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Roxarsone RS in the *Standard preparation*, and r_U and r_S are the roxarsone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Rubidium Chloride Rb 82 Injection

» Rubidium Chloride Rb 82 Injection is a sterile solution, suitable for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{82}Rb expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. It is obtained by elution from a strontium 82-rubidium 82 generator system. ^{82}Rb, with a half-life of 76 seconds, is a short-lived positron-emitting radionuclide formed by the radioactive decay of the parent nuclide ^{82}Sr. Strontium Sr 82 with a half-life of 25.5 days is produced by the proton irradiation of rubidium or spallation of molybdenum. The chemical form of the Injection is ^{82}RbCl. [NOTE—Elute with additive-free Sodium Chloride Injection only. Discard the first 50 mL of the eluate each day the generator is eluted.]

Packaging, storage, and labeling—Requirements for packaging, storage, and labeling do not apply; Rubidium Chloride Rb 82 Injection is obtained by elution from the generator and is administered by direct infusion.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than $175/V$ USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

Radionuclide identification (see *Radioactivity* ⟨821⟩)—[NOTE—Perform this test quickly, because of the rapid decay of the ^{82}Rb.] The gamma-ray spectrum of eluted ^{82}Rb exhibits photopeaks at 511 and 777 keV.

USP Monographs

www.webofpharma.com

pH ⟨791⟩: between 4.0 and 8.0.

Radionuclidic purity—Using a suitable counting assembly, determine the radioactivity of each radionuclidic impurity, in kBq per MBq (or µCi per mCi), of Rb 82 in the generator eluate by use of a calibrated system as directed under *Radioactivity* ⟨821⟩. [NOTE—For the following tests, use the generator eluate containing ^{82} Rb that has been allowed to decay for 1 hour after the end of elution.]

Sr 82 and *Rb 83*—Obtain a gamma-ray spectrum of the hour-old eluate, and measure the activities of the radionuclidic impurities directly from the spectrum. Sr 82 exhibits photopeaks at 511 and 777 keV and decays with a radioactive half-life of 25.5 days. Rb 83 exhibits a photopeak at 530 keV and decays with a radioactive half-life of 86.2 days. The activity levels of Sr 82 and Rb 83 are not more than 0.02 kBq per MBq (0.02 µCi per mCi) and not more than 0.05 kBq per MBq (0.05 µCi per mCi) of Rb 82 at the end of elution, respectively.

Sr 85—Obtain a gamma spectrum of the hour-old eluate, and, using the same system and geometry, obtain a gamma spectrum of a pure Rb 82 specimen (generator eluate containing ^{82} Rb taken within 10 minutes of elution). Sr 85 exhibits a major photopeak at 514 keV and decays with a radioactive half-life of 64.8 days. Sr 85 may be determined by subtraction of the 511 and 777 keV peaks in the pure Rb 82, from the 511–514 keV and 777 keV peaks in the hour-old eluate. The activity level of Sr 85 is not more than 0.2 kBq per MBq (0.2 µCi per mCi) of Rb 82 at the end of elution.

Other gamma-ray emitters—The total of other gamma-ray emitting radionuclidic impurities does not exceed 0.005 kBq per MBq (0.005 µCi per mCi) of Rb 82 at the end of elution.

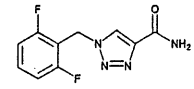
Chemical purity—

Electrolyte solution—Transfer 107 g of ammonium chloride, 25 g of gelatin, and 42 mL of hydrochloric acid to a 500-mL volumetric flask. Add about 450 mL of water, and sonicate until a clear solution is obtained. Dilute with water to volume, and mix.

Tin stock standard solution—Dissolve 100 mg of metallic tin (Sn), accurately weighed, in 10 mL of dilute hydrochloric acid (1 in 2), and dilute with water to 100 mL.

Tin standard solution A—Transfer 0.5 mL of *Tin stock standard solution* to a 50-mL volumetric flask and dilute with 0.1 N hydrochloric acid to volume.

Tin standard solution B—Transfer 1.0 mL of *Tin standard solution A* to a 50-mL volumetric flask. Add 10.0 mL of 0.9% sodium chloride solution, dilute with *Electrolyte solution* to volume, and mix.



Test solution—Obtain a 50-mL eluate from the generator, and allow to stand for at least 1 hour to allow for the complete decay of ^{82} Rb. Transfer 10.0 mL of the eluate to a 50-mL volumetric flask, dilute with the *Electrolyte solution* to volume, and mix.

Procedure—Transfer a portion of the *Test solution* to a polarographic cell, and deaerate by bubbling nitrogen through the solution for 5 minutes. Insert the dropping mercury electrode of a suitable polarograph, and obtain the differential pulse polarogram from –0.15 to –0.75 volts, at a current range of 0.5 µA, using a saturated calomel electrode as the reference electrode and a platinum wire as the auxiliary electrode (see *Polarography* ⟨801⟩). Similarly, transfer a portion of the *Tin standard solution B* to a polarographic cell and obtain the polarogram. A peak at –0.52 volts indicates the presence of tin. The peak height of the *Test solution* is not greater than that of the *Tin standard solution B* (1 µg per mL).

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩, except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation for *Container Content* ⟨697⟩.

Assay for radioactivity—Using a suitable counting assembly , determine the radioactivity, in MBq (or in µCi) per mL, of the Injection by use of a calibrated system as directed under *Radioactivity* ⟨821⟩.

Rufinamide

$C_{10}H_8F_2N_4O$ 238.19

1*H*-1,2,3-Triazole-4-carboxamide, 1-[(2,6-difluorophenyl) methyl]-;

1-(2,6-Difluorobenzyl)-1*H*-1,2,3-triazole-4-carboxamide [106308-44-5].

DEFINITION

Rufinamide contains NLT 98.0% and NMT 102.0% of $C_{10}H_8F_2N_4O$, calculated on the as-is basis.

IDENTIFICATION

Change to read:

- **A.** **▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

ASSAY

- **PROCEDURE**

Use amber glassware for all volumetric solutions.

Diluent: Methanol and tetrahydrofuran (50:50)

Mobile phase: Methanol, tetrahydrofuran, and water (12:5:83)

System suitability stock solution: 0.8 mg/mL of USP Rufinamide RS and 4 µg/mL each of USP Rufinamide Related Compound A RS and USP Rufinamide Related Compound B RS in *Diluent*. [NOTE—USP Rufinamide Related Compound B RS is used for peak identification purposes only.]

System suitability solution: 0.2 mg/mL of USP Rufinamide RS and 0.8 µg/mL each of USP Rufinamide Related Compound A RS and USP Rufinamide Related Compound B RS in water from the *System suitability stock solution*

Standard stock solution: 0.8 mg/mL of USP Rufinamide RS in *Diluent*

Standard solution: 0.2 mg/mL of USP Rufinamide RS in water from the *Standard stock solution*

Sample stock solution: 0.8 mg/mL of Rufinamide in *Diluent*

Sample solution: 0.2 mg/mL of Rufinamide in water from the *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 12.5-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 2.6 times the retention time of the rufinamide peak

System suitability

[NOTE—For relative retention times refer to *Table 1* in *Organic Impurities*.]

USP Monographs

www.webofpharma.com

Sample: *System suitability solution*
Suitability requirements
Tailing factor: NMT 1.2 for rufinamide
Resolution: NLT 2.5 between rufinamide and rufinamide related compound A
Relative standard deviation: NMT 1.0% for rufinamide and NMT 5.0% for rufinamide related compound A
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of rufinamide ($C_{10}H_8F_2N_4O$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Rufinamide RS in the *Standard solution* (mg/mL)
C_U = concentration of Rufinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the as-is basis

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 10-µm packing L1
Flow rate: 1.2 mL/min
Injection volume: 20 µL
Run time: 1.4 times the retention time of the rufinamide peak
System suitability
Sample: *Standard solution 1*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Calculate the percentage of the labeled amount of rufinamide ($C_{10}H_8F_2N_4O$) [$f(S_i)$] dissolved in the *Sample solution* (S_i) by the following steps:
Calculate the regression line for the *Standard solutions*:

$$y = ax + b$$

y = peak area of rufinamide from the *Standard solution*
x = concentration of rufinamide in the *Standard solution* (µg/mL)

$$f(S_i) = [(y - b)/a] \times [(V_i)/(1000 \times L)] \times 100$$

y = peak area of rufinamide from the *Sample solution*
b = y-intercept
a = slope
L = label claim (mg/Tablet)
V_i = volume of *Sample solution* (mL)

Cumulative percentage of the Tablet label claim dissolved:

$$F(I_j) = \sum_{i=1}^{j} f(S_i)$$

i,j = indices of test interval

Tolerances
For Tablets labeled to contain 200 mg: See *Table 7*.

Table 7

Time (h)	Amount Released
5	NLT 60%
12	NLT 80%

For Tablets labeled to contain 400 mg: See *Table 8*.

Table 8

Time (h)	Amount Released
6	NLT 60%
16	NLT 80%

The percentages of the labeled amount of rufinamide dissolved in the times specified conform to *Acceptance Table 2* in *Dissolution* ⟨711⟩.
• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES
• **Organic Impurities**
Buffer, Diluent, Mobile phase, Sample stock solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
System suitability stock solution: 0.8 mg/mL of USP Rufinamide RS, and 0.02 mg/mL each of USP Rufinamide Related Compound A RS and USP Rufinamide Related Compound B RS in *Diluent*. [Note—USP Rufinamide Related Compound B RS is used for identification purposes.]
System suitability solution: 0.08 mg/mL of USP Rufinamide RS, and 2 µg/mL each of USP Rufinamide Related Compound A RS and USP Rufinamide Related Compound B RS, in *Buffer* from the *System suitability stock solution*
Standard stock solution: 0.8 mg/mL of USP Rufinamide RS in *Diluent*
Standard solution: 0.4 µg/mL of USP Rufinamide RS from the *Standard stock solution* prepared as follows. Pipet a suitable volume of *Standard stock solution* to a volumetric flask. Add *Diluent* to fill 10% of final volume, and dilute with *Buffer* to volume.
System suitability
Samples: *System suitability solution* and *Standard solution*

Anhydrous [6485-34-3].

DEFINITION

Change to read:

Saccharin Calcium contains ▲NLT 98.0% and NMT 102.0%▲ (USP 1-May-2020) of saccharin calcium ($C_{14}H_8CaN_2O_6S_2$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: 197K▲ (CN 1-May-2020)
  Sample: Dry at 105° to constant weight.
  Acceptance criteria: Meets the requirements
- **B.**
  Sample solution: 100 mg/mL
  Analysis: To the *Sample solution* add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid, dropwise, until the solution is acid to the indicator. Add ammonium oxalate TS.
  Acceptance criteria: A white precipitate is formed when the ammonium oxalate is added. This precipitate is insoluble in 6 N acetic acid but dissolves in hydrochloric acid.
- **C.** Calcium salts moistened with hydrochloric acid impart a transient yellowish-red color to a nonluminous flame.

ASSAY

Change to read:

- **PROCEDURE**
  ▲Solution A: 50 mM dibasic potassium phosphate (K_2HPO_4) buffer in 0.1% (v/v) phosphoric acid solution
  Solution B: Methanol

Standard solution: 0.1 mg/mL of USP Saccharin Calcium RS in *Diluent*
Sample solution: 0.1 mg/mL of Saccharin Calcium in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L1
Column temperature: 20 ± 5°
Flow rate: 1.0 mL/min
Injection volume: 10 µL
Run time: 15 min
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The retention times for phthalic anhydride and saccharin calcium are about 6.3 and 7.3 min, respectively. Phthalic anhydride is a potential impurity.]
Suitability requirements
Resolution: NLT 1.5 between the phthalic anhydride and saccharin calcium peaks, *System suitability solution*
Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 0.73% for five replicate injections, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of saccharin calcium in the portion of Saccharin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of saccharin calcium from the *Sample solution*
r_S = peak area of saccharin calcium from the *Standard solution*
C_S = concentration of USP Saccharin Calcium RS in the *Standard solution* (mg/mL)
C_U = concentration of Saccharin Calcium in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis▲ (USP 1-May-2020)

IMPURITIES

- **LIMIT OF TOLUENESULFONAMIDES**
  Internal standard solution: 0.25 mg/mL of caffeine in methylene chloride
  Standard stock solution: 20.0 µg/mL of USP *o*-Toluenesulfonamide RS and 20.0 µg/mL of USP *p*-Toluenesulfonamide RS in methylene chloride

www.webofpharma.com

Standard solution: Evaporate 5.0 mL of *Standard stock solution* to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution*.
Sample stock solution: 200 mg/mL in water. If necessary, adjust with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7–8 before final dilution.
Sample solution: Shake 50 mL of the *Sample stock solution* with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution*.
Blank solution: Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.53-mm × 10-m fused silica; coated with a 2-µm film of phase G3
Temperatures
Injector: 250°
Column: 180°
Detector: 250°
Carrier gas: Nitrogen
Flow rate: 10 mL/min
Injection volume: 1 µL
Injection type: Split ratio, 2:1
System suitability
Samples: *Standard solution* and *Blank solution*
[NOTE—The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine.]
Suitability requirements: There are no peaks present in the *Blank solution* at the retention times of the *Internal standard solution*, *o*-toluenesulfonamide, and *p*-toluenesulfonamide; *Blank solution*
Resolution: NLT 1.5 between *o*-toluenesulfonamide and *p*-toluenesulfonamide, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria: See *Table 2*. If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Sample solution*, the ratio of their areas to that of the *Internal standard solution* is NMT the corresponding ratio in the chromatogram obtained with the *Standard solution*.

Table 2

Name	Acceptance Criteria, NMT (ppm)
o-Toluenesulfonamide	10
p-Toluenesulfonamide	10

• **LIMIT OF BENZOATE AND SALICYLATE**
Sample solution: 50 mg/mL
Analysis: To 10 mL of the *Sample solution* add 5 drops of 6 N acetic acid and 3 drops of ferric chloride TS.
Acceptance criteria: No precipitate or violet color appears.

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method I* ⟨921⟩**:** NMT 15.0%

Change to read:

• **READILY CARBONIZABLE SUBSTANCES TEST** ⟨271⟩
▲Matching fluid A: Cobaltous chloride CS, ferric chloride CS, cupric sulfate CS, and water (0.1: 0.4: 0.1: 4.4)▲ (USP 1-May-2020)
Sample solution: 40 mg/mL in sulfuric acid
▲maintained at**▲** (USP 1-May-2020) 48°–50° for 10 min
Acceptance criteria: The *Sample solution* has no more color than *Matching fluid A*, when viewed against a white background.
• **CLARITY OF SOLUTION**
[NOTE—The *Sample solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 min after preparation of *Reference suspension A*.]
Diluent: 200-g/L solution of sodium acetate
Hydrazine solution: 10.0 mg/mL of hydrazine sulfate. [NOTE—Allow to stand for 4–6 h.]
Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.
Primary opalescent suspension: Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]
Opalescence standard: Transfer 15.0 mL of the *Primary opalescent suspension* and dilute to 1000 mL. [NOTE—This suspension should not be used beyond 24 h after preparation.]
Reference suspension A: *Opalescence standard* and water (1 in 20)
Reference suspension B: *Opalescence standard* and water (1 in 10)
Sample solution: 200 mg/mL in *Diluent*
Analysis
Samples: *Diluent*, *Reference suspension A*, *Reference suspension B*, *Sample solution*, and water
Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A*, *Reference suspension B*, water, and *Diluent* to separate matching test tubes. Compare solutions in diffused daylight, viewing vertically against a black background (see *Visual Comparison* ⟨630⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A*.]
Acceptance criteria: The *Sample solution* shows the same clarity as that of water, or *Diluent*, or its opalescence is NMT that of *Reference suspension A*.

Change to read:

• **COLOR OF SOLUTION**
Diluent A: 200-g/L solution of sodium acetate

Saccharin Sodium Oral Solution

» Saccharin Sodium Oral Solution contains the equivalent of not less than 95.0 percent and not more than 105.0 percent of the labeled amount of saccharin ($C_7H_5NO_3S$).

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Saccharin RS

Identification—
A: Transfer a volume of Oral Solution, equivalent to about 100 mg of saccharin, to a small dish, evaporate to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve in 20 mL of water, neutralize the solution with 3 N hydrochloric acid, and filter: the addition of 1 drop of ferric chloride TS to the filtrate produces a violet color.
B: It responds to the tests for *Sodium* ⟨191⟩.
pH ⟨791⟩: between 3.0 and 5.0.

Assay—
Mobile phase—Mix 5 mL of 10 percent tetramethylammonium hydroxide solution and 400 mL of water in a 500-mL volumetric flask, adjust with phosphoric acid to a pH of 4.0, and mix. Add 50 mL of methanol to the solution, dilute with water to volume, mix, and degas the solution.
Standard preparation—Add to an accurately weighed quantity of USP Saccharin RS an amount of 0.1 N sodium hydroxide sufficient to dissolve the solid, and dilute quantitatively with water to obtain a solution having a known concentration of about 1.2 mg of saccharin per mL.
Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 120 mg of saccharin, to a 100-mL volumetric flask, dilute with water to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 257-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation is not more than 2.0%.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph using a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses

www.webofpharma.com

for the major peaks. Calculate the quantity, in mg, of saccharin ($C_7H_5NO_3S$) in each mL of the Oral Solution taken by the formula:

$$(100C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Saccharin RS in the *Standard preparation*, V is the volume, in mL, of Oral Solution taken, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Saccharin Sodium Tablets

» Saccharin Sodium Tablets contain the equivalent of not less than 95.0 percent and not more than 110.0 percent of the labeled amount of saccharin ($C_7H_5NO_3S$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—
USP Saccharin RS

Completeness of solution—Place 5 Tablets in a 250-mL beaker containing 150 mL of water at 25°. Stir for 5 minutes: all of the Tablets dissolve to give a clear or practically clear solution.

Identification—

A: Dissolve a quantity of Tablets, equivalent to about 1 g of saccharin, in 10 mL of water, filter if necessary, and to the solution add 5 mL of 3 N hydrochloric acid: a white precipitate of saccharin is formed. Collect the precipitate on a filter, wash with small portions of cold water until the last washing is practically free from chloride, and dry it at 105° for 2 hours: the saccharin so obtained melts between 226° and 230°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩).

[NOTE—Use the saccharin obtained in *Identification* test *A* for *Identification* tests *B* and *C*.]

B: Dissolve about 100 mg in 5 mL of sodium hydroxide solution (1 in 20), evaporate to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve in 20 mL of water, neutralize with 3 N hydrochloric acid, and filter: the addition of a drop of ferric chloride TS to the filtrate produces a violet color.

C: Mix 20 mg with 40 mg of resorcinol, add 10 drops of sulfuric acid, and heat the mixture in a suitable liquid bath of 200° for 3 minutes. Allow it to cool, and add 10 mL of water and an excess of 1 N sodium hydroxide: a fluorescent green liquid results.

Limit of ammonium salts—Dissolve a quantity of powdered Tablets, equivalent to about 300 mg of saccharin, in 5 mL of water, and warm with 3 mL of 1 N sodium hydroxide: the odor of ammonia is not perceptible.

Assay—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of saccharin, to a 100-mL volumetric flask, add about 50 mL of water, agitate until the Tablet material is dissolved or evenly dispersed, dilute with water to volume, and mix. Transfer 10.0 mL to a separator, add 2 mL of 3 N hydrochloric acid, and extract with five 20-mL portions of a solvent composed of chloroform and alcohol (9:1). Collect the combined extracts in a beaker, and evaporate on a steam bath to dryness with the aid of a current of air. Dissolve the residue in 10 mL of sodium hydroxide solution (1 in 250), transfer the solution with the aid of water to a 200-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Saccharin RS in the same medium having a known concentration of about 50 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 269 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of saccharin ($C_7H_5NO_3S$) in the portion of Tablets taken by the formula:

$$(2C)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Saccharin RS in the Standard solution; and A_U and A_S are the absorbances of the solution from the Tablets and the Standard solution, respectively.

Safflower Oil

[8001-23-8].

DEFINITION

Safflower Oil is the refined fixed oil yielded by the seed of *Carthamus tinctorius* L. (Fam. Compositae). A suitable antioxidant may be added.

IDENTIFICATION

- **A. IDENTITY BY FATTY ACID COMPOSITION**

Analysis: Proceed as directed in the test for *Fats and Fixed Oils* ⟨401⟩, *Fatty Acid Composition*.

Acceptance criteria: Meets the composition profile of fatty acids in *Table 1*

- **B. IDENTITY BY TRIGLYCERIDE PROFILE**

Analysis: Proceed as directed in *Identification of Fixed Oils by Thin-Layer Chromatography* ⟨202⟩.

Acceptance criteria: Meets the requirements in the chapter

IMPURITIES

- **ALKALINE IMPURITIES**

Sample: 10 mL of Safflower Oil

Analysis: Mix 10 mL of freshly opened acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS,** *Acid Value (Free Fatty Acids)* ⟨401⟩**:** The free fatty acids in 10 g require for neutralization NMT 2.5 mL of 0.020 N sodium hydroxide.
- **FATS AND FIXED OILS,** *Fatty Acid Composition* ⟨401⟩

Standard solution, System suitability solution, Chromatographic system, and **System suitability:** Proceed as directed in *Fats and Fixed Oils* ⟨401⟩, *Fatty Acid Composition*.

1 N methanolic potassium hydroxide solution: Dissolve 34 g of potassium hydroxide in sufficient methanol to produce 500 mL. Allow to settle for 24 h, and decant the clear solution.

Sample solution: Place 1 g of Safflower Oil in a small conical flask fitted with a reflux attachment. Add 10 mL of methanol and 0.5 mL of *1 N methanolic potassium hydroxide solution*. Reflux the mixture for 10 min, cool, and transfer to a separator with the aid of 15 mL of *n*-heptane. Shake

USP Monographs

www.webofpharma.com

with 10 mL of saturated sodium chloride solution, and allow to separate. Transfer the lower layer to another separator, and shake it with 10 mL of *n*-heptane. Wash the combined organic layers with 10 mL of water, dry over anhydrous sodium sulfate, and filter. Use a suitable portion of the filtrate.

Analysis: Inject a suitable volume into the chromatograph, and measure the nine main peak areas of the methyl esters of the fatty acids. The order of elution is myristate, palmitate, stearate, oleate, linoleate, linolenate, arachidate, eicosenoate, and behenate.

Calculate the percentage of myristate, palmitate, stearate, oleate, linoleate, linolenate, arachidate, eicosenoate, or behenate in the portion of Safflower Oil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of myristate, palmitate, stearate, oleate, linoleate, linolenate, arachidate, eicosenoate, or behenate

r_T = total area of the nine peaks

Acceptance criteria: It exhibits the composition profiles of fatty acids shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	≤1.0
16	0	2–10
18	0	1–10
18	1	8–21
18	2	68–83
18	3	≤1.5
20	0	≤0.5
20	1	≤0.5
22	0	≤1.0

- **FATS AND FIXED OILS,** *Unsaponifiable Matter* ⟨401⟩: NMT 1.5%
- **LIMIT OF PEROXIDE**

Solvent A: Chloroform and glacial acetic acid (40:60)

Potassium iodide solution: Prepare a saturated solution of potassium iodide in freshly boiled and cooled water, and store it protected from light. Discard the solution if it gives a color on the addition of *Solvent A* and starch TS.

Sample: 10 g of Safflower Oil

Analysis: Transfer the *Sample* to a conical flask, add 30 mL of *Solvent A*, and swirl to dissolve. Add 0.5 mL of *Potassium iodide solution*, and swirl the flask for 1 min, accurately timed. Add 30 mL of water, and titrate with 0.01 N sodium thiosulfate VS, with vigorous agitation, to a light yellow color. Add 0.5 mL of starch TS, and continue the titration until the blue color has disappeared. Perform a blank test, and make any necessary correction.

Calculate the peroxide content, in mEq/kg, in the portion of Safflower Oil taken:

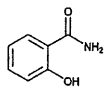
$$\text{Result} = [(V \times N)/W] \times F$$

V = volume of sodium thiosulfate required in the titration (mL)

N = normality of the sodium thiosulfate VS

W = weight of Safflower Oil taken (g)

F = conversion factor, 1000 g/kg



Acceptance criteria: NMT 10.0 mEq/kg

- **WATER DETERMINATION,** *Method Ic* ⟨921⟩: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and prevent exposure to excessive heat.
- **LABELING:** Label it to indicate the name and concentration of any additive.

Salicylamide

$C_7H_7NO_2$ 137.14

Benzamide, 2-hydroxy-;
2-Hydroxybenzamide [65-45-2].

DEFINITION

Salicylamide contains NLT 98.0% and NMT 102.0% of salicylamide ($C_7H_7NO_2$), calculated on the anhydrous basis.

Salicylic Acid Collodion

DEFINITION
Salicylic Acid Collodion contains NLT 9.5% and NMT 11.5% of salicylic acid ($C_7H_6O_3$).
Salicylic Acid Collodion is prepared as follows.

Salicylic Acid	100 g
Flexible Collodion, a sufficient quantity to make	1000 mL

Dissolve the *Salicylic Acid* in about 750 mL of *Flexible Collodion*. Add a sufficient quantity of the *Flexible Collodion* to bring the preparation to final volume, and mix.

ASSAY
• **PROCEDURE**
Sample: 5 mL
Solution A: Ether and alcohol (3:1) neutralized to bromothymol blue TS
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N sodium hydroxide VS
Endpoint detection: Visual
Analysis: Transfer the *Sample* to a 400-mL beaker, rinse the measuring device with three 10-mL portions of *Solution A*, and add the rinsings to the beaker. Add, with stirring, 5 mL of 100 mg/mL sodium lauryl sulfate solution that was previously neutralized with 0.1 N hydrochloric acid to the distinct yellow color of bromothymol blue TS, and add 20 mL of water. Mix, add 5 drops of bromothymol blue TS, and titrate with the *Titrant*. Each mL of *Titrant* is equivalent to 13.81 mg of salicylic acid ($C_7H_6O_3$).
Acceptance criteria: 9.5%–11.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Package in tight containers. Store at controlled room temperature, remote from fire.

Salicylic Acid Topical Foam

» Salicylic Acid Topical Foam contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_7H_6O_3$.

Packaging and storage—Preserve in tight containers.
USP Reference standards ⟨11⟩—
USP Salicylic Acid RS
Identification—The retention time of the salicylic acid peak of the *Assay preparation* observed in the chromatogram obtained in the *Assay* corresponds to the retention time of the salicylic acid peak of the *Standard preparation*.
pH ⟨791⟩: between 5.0 and 6.0.

Assay—
Mobile phase—To 225 mg of tetramethylammonium hydroxide pentahydrate add 700 mL of water, 150 mL of methanol, 150 mL of acetonitrile, and 1.0 mL of glacial acetic acid, mix, filter, and degas.

Internal standard solution—Dissolve benzoic acid in methanol to obtain a solution having a concentration of about 8 mg per mL.

Standard preparation—Transfer about 20 mg of USP Salicylic Acid RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer an accurately weighed portion of Topical Foam, equivalent to about 20 mg of salicylic acid, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix. Cool in an ice bath to below room temperature and filter, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph four replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation is not more than 3.0%, the resolution factor between salicylic acid and benzoic acid is not less than 3.0, and the tailing factors for the salicylic acid and benzoic acid peaks are not more than 2.0.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention times are about 2.5 minutes for salicylic acid and 5.5 minutes for benzoic acid. Calculate the quantity, in mg, of $C_7H_6O_3$ in the portion of Topical Foam taken by the formula:

$$(100C)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*, and R_U and R_S are the ratios of the peak responses for salicylic acid to the peak responses for benzoic acid obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Salicylic Acid Gel

» Salicylic Acid Gel is Salicylic Acid in a suitable viscous hydrophilic vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_7H_6O_3$. It may contain alcohol.

Packaging and storage—Preserve in collapsible tubes or in tight containers, preferably at controlled room temperature.
Identification—Filter 5 mL of the solution obtained by titration in the *Assay*. Add 1 mL of ferric chloride TS to the filtrate: a violet color is produced. Add 1 mL of 6 N acetic acid: the violet color does not change. Add 1 mL of 6 N hydrochloric acid: the violet color is discharged. A small amount of white precipitate may appear.
Alcohol Determination ⟨611⟩ ***(if present)*:** from 90.0% to 110.0% of the labeled amount of C_2H_5OH.
Assay—To 25 mL of diluted alcohol add 1 drop of phenolphthalein TS and sufficient 0.1 N sodium hydroxide to produce a faint pink color. Add 5.0 g of Gel, accurately weighed, and stir. Titrate the dispersion with 0.1 N sodium hydroxide VS until a pink color is produced. [NOTE—Reserve this solution for the *Identification* test.] Each mL of 0.1 N sodium hydroxide is equivalent to 13.81 mg of $C_7H_6O_3$.

www.webofpharma.com

Salicylic Acid Plaster

DEFINITION

Salicylic Acid Plaster is a uniform mixture of Salicylic Acid in a suitable base, spread on paper, cotton cloth, or other suitable backing material. The plaster mass contains NLT 90.0% and NMT 110.0% of the labeled amount of salicylic acid ($C_7H_6O_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: Methanol and 2% (v/v) phosphoric acid in water (1:1)
Solution B: Methanol
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	100	0	1.0
5.5	100	0	1.0
5.6	0	100	2.0
7.1	0	100	2.0
7.2	100	0	2.0
9.4	100	0	2.0
9.5	100	0	1.0
10.0	100	0	1.0

Diluent: Tetrahydrofuran and hydrochloric acid (99:1)
Standard solution: 0.2 mg/mL of USP Salicylic Acid RS prepared as follows. Transfer USP Salicylic Acid RS to a suitable volumetric flask, and add *Diluent* equivalent to 12.5% of the final volume to dissolve. Dilute with *Solution A* to volume. Protect from light.
Sample solution: Transfer Plaster (scrape it from the fabric if needed), equivalent to 40 mg of salicylic acid, to a 200-mL volumetric flask, and add 25 mL of *Diluent* to dissolve. Sonicate if necessary to facilitate dissolution. Dilute with *Solution A* to volume. Mix, filter, and discard the first few mL. Protect from light.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 306 nm
Column: 4.6-mm × 15-cm; 5-µm packing L11
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of salicylic acid ($C_7H_6O_3$) in the portion of Plaster taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of salicylic acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store between 20° and 25°.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Salicylic Acid RS

Salmeterol Inhalation Powder

DEFINITION

Salmeterol Inhalation Powder for use in dry powder inhalers contains an amount of salmeterol xinafoate ($C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$) equivalent to NLT 90% and NMT 110% of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Delivered-Dose Uniformity*.

ASSAY

- **PROCEDURE**

Buffer: 0.15 M ammonium acetate
Mobile phase: Methanol, *Buffer*, and formic acid (65: 35: 0.5)
Diluent: Methanol and water (70:30)
System suitability solution: 11 µg/mL of USP Salmeterol Resolution Check RS in *Diluent*
Standard solution: 9 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*
Sample solution: Nominally 6 µg/mL of salmeterol free base from NLT 12 unit doses in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 276 nm
Column: 4.6-mm × 20-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 200 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for salmeterol and salmeterol-deoxy are 1.0 and 1.4, respectively.]
Suitability requirements
Tailing factor: NMT 1.5 for the salmeterol peak
Resolution: NLT 2.0 between salmeterol and salmeterol-deoxy
Relative standard deviation: NMT 2% for the salmeterol peak
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*

www.webofpharma.com

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of salmeterol free base in the *Sample solution* (µg/mL), based on the target emitted dose of 47 µg
M_{r1} = molecular weight of salmeterol free base, 415.57
M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: 90%–110%

PERFORMANCE TESTS

• **PARTICLE SIZE DISTRIBUTION BY CASCADE IMPACTION**

Sampling apparatus: Modified *Apparatus 3* (*Figure 1*) in *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* ⟨601⟩ with a modified *Induction Port* (*Figure 2*), and *Preseparator Top* (*Figure 3*) are to be used.

Buffer: 0.0025 M sodium dodecylsulfate in 1% (v/v) of glacial acetic acid

Mobile phase: Methanol and *Buffer* (100:5). [NOTE—The ratio of methanol to *Buffer* can be varied up to 100:15.]

System suitability solution: 0.1 µg/mL of USP Salmeterol Related Compound A RS and 1.4 µg/mL of USP Salmeterol Xinafoate RS in methanol

Standard solution: 0.7 µg/mL of USP Salmeterol Xinafoate RS in methanol

Sample solutions: Discharge the 10 unit doses into the cascade impaction sampling apparatus described above. Operate the pump for 3 s at an airflow rate of 60 L/min for each dose discharged. Detach the inhaler, and rinse each piece of the apparatus with methanol into a separate suitable volumetric flask. The final expected concentration of salmeterol should be in the range of 0.1–1 µg/mL. Dilute with methanol to volume. Repeat these steps on one additional sample preparation for a total of two *Sample solutions*.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Fluorescence
Excitation: 225 nm
Emission: 305 nm
Column: 3.0-mm × 5-cm; 5-µm packing L1
Column temperature: 40°
Flow rate: 0.5–1.5 mL/min
Injection volume: 100 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for salmeterol related compound A and salmeterol are 0.67 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 2.0 between salmeterol and salmeterol related compound A, *System suitability solution*
Relative standard deviation: NMT 2%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solutions*
Calculate the quantity, in µg/unit dose, of salmeterol free base ($C_{25}H_{37}NO_4$) in each *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/N) \times (M_{r1}/M_{r2})$$

r_U = peak response from the *Sample solutions*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (µg/mL)
V = total volume of the *Sample solutions* (mL)
N = number of unit doses discharged into the apparatus, 10
M_{r1} = molecular weight of salmeterol free base, 415.57
M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: The mean of the two samples for the mass of drug recovered from the cascade impactor component groupings are given in *Table 1*.

Table 1. Amount of Salmeterol in Cascade Impactor Stage Groupings

Apparatus Component	Salmeterol Deposited (µg/dose)
Mouthpiece adaptor, induction port, preseparator, and Stage 0	32–40
Stages 1–5	9.0–14
Stages 3 and 4	4.0–8.0
Stages 6, 7, and filter	NMT 1

• **DELIVERED-DOSE UNIFORMITY** ⟨601⟩

Sampling apparatus: Use the apparatus (*Figure 4A*) with the modified glass sampling device (*Figure 4B*).

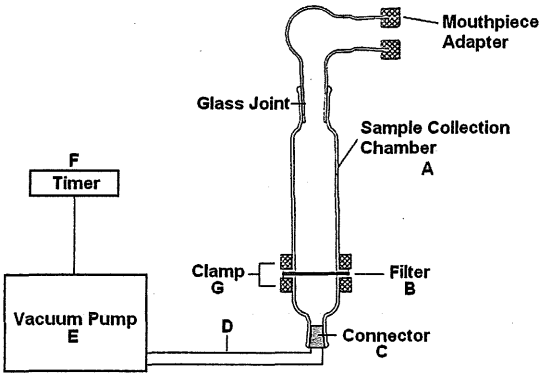

Figure 4A. Sampling apparatus.

Buffer, Mobile phase, Chromatographic system, and **System suitability:** Proceed as directed in *Particle Size Distribution by Cascade Impaction*.

System suitability solution: 0.1 µg/mL of USP Salmeterol Related Compound A RS and 0.7 µg/mL of USP Salmeterol Xinafoate RS in methanol

Standard solution: 0.36 µg/mL of USP Salmeterol Xinafoate RS in methanol

Sample solutions: Nominally 0.25 µg/mL of salmeterol free base in methanol prepared as follows. Discharge a single unit dose into the apparatus shown in *Figure 4A*. Operate the pump for 2 s at an airflow of 60 L/min to collect the dose. Detach the inhaler, and rinse the mouthpiece adaptor and each piece of the sample collection chamber with methanol. Place the filter and washings into a container, and sonicate for NMT 5 min. Transfer the contents to a 200 mL volumetric flask, and dilute with methanol to volume. Prepare 9 additional samples from 9 additional unit doses. For multi-dose inhalers, 1 dose must be collected from 10 inhalers with the 10 doses collected across the minimum number of recommended doses on the label of the inhaler.

Analysis
Samples: *Standard solution* and *Sample solutions*

USP Monographs

www.webofpharma.com

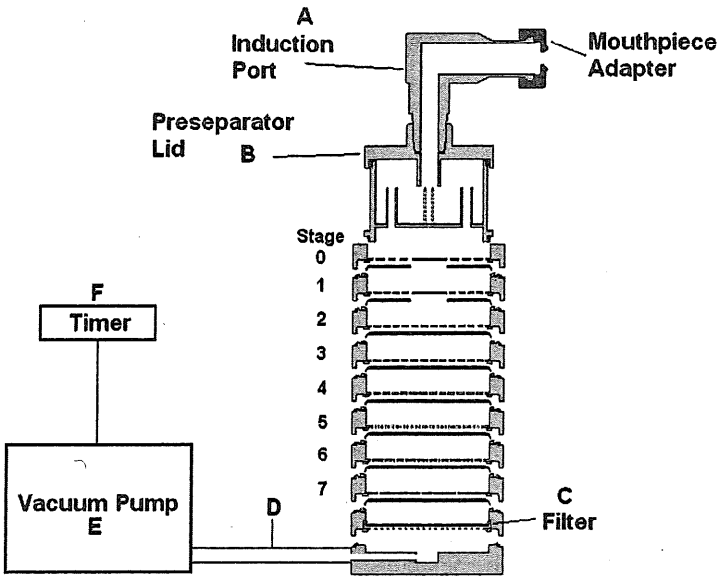

Figure 1. Cascade impaction sampling apparatus (modified *Apparatus 3* in ⟨601⟩) including *Induction Port* and *Preseparator Top*. (Salmeterol Inhalation Powder)

Calculate the percentage of the target emitted dose of salmeterol ($C_{25}H_{37}NO_4$) delivered by the Inhalation Powder in each of the *Sample solutions*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solutions*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Salmeterol xinafoate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of salmeterol free base in the *Sample solutions* (µg/mL) based on target emitted dose of 47 µg
M_{r1} = molecular weight of salmeterol free base, 415.57
M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria

The mean content of salmeterol of 10 doses is 85%–115% of the target emitted dose.
NMT 1 dose is outside 80%–120% of the target emitted dose.
No dose is outside 75%–125% of the target emitted dose.
If the first and second requirements described are not met, test an additional 20 unit doses.
The mean dose of salmeterol of 30 doses is NLT 85% and NMT 115% of the target emitted dose.
NMT 3 doses are outside 80%–120% of the target emitted dose.
No dose is outside 75%–125% of the target emitted dose.

IMPURITIES

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** It meets the requirements of the tests for absence of *Staphylococcus aureus, Pseudomonas aeruginosa, Escherichia coli, Salmonella* species, and bile-tolerant Gram-negative bacteria in 1 g of bulk powder. The total aerobic microbial count does not exceed 10^1 cfu/g of bulk powder. The total aerobic yeast and mold count does not exceed 10^1 cfu/g of bulk powder.
- **FOREIGN PARTICULATE MATTER**

Particulate Matter in Injections ⟨788⟩, *Method 2* describes details of the test apparatus to be used for the determination of particulate matter using a microscopic particle count test methodology. Samples should be carefully prepared to avoid environmental contamination, and testing should be performed with suitable controls, including the appropriate use of blank determinations.

Diluent: Methanol and water (65:35), passed through a filter of 0.45-µm pore size

Filter: Mixed cellulose and ester filter; 25-mm diameter and 0.45-µm pore size

Sample solution: Transfer the contents of 4 unit doses from each of 2 inhalers into a suitable receptacle, and dissolve the drug and excipient particles in about 75 mL of *Diluent*.

Analysis

Sample: *Sample solution*

Pass the *Sample solution* through the *Filter*, and allow the *Filter* to dry under conditions that will limit particulate contamination. Using a microscopic particle count test method, enumerate the number of particles present in the sample solution.

Calculate the number of particles per dose:

$$\text{Result} = (N_{<10} + N_{10\text{–}100} + N_{>100})/8$$

$N_{<10}$ = total number of particles <10 µm
$N_{10\text{–}100}$ = total number of particles between 10 and 100 µm
$N_{>100}$ = total number of particles >100 µm

Acceptance criteria: See *Table 4*.

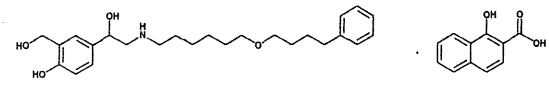
Table 4

Particle Size Range (µm)	Number of Particles Per Dose (NMT)
<10	200
10–100	100
>100	10
Total	300

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature, in a dry place away from direct heat or sunlight.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Salmeterol Related Compound A RS
4-[1-Hydroxy-2-(4-phenylbutylamino)ethyl]-2-(hydroxymethyl)phenol.
$C_{19}H_{25}NO_3$ 315.41



USP Salmeterol Related Compound H RS
1-Hydroxy-4-[2-hydroxy-5-(1-hydroxy-2-{[6-(4-phenylbutoxy)hexyl]amino}ethyl)benzyl]-2-naphthoic acid, monohydrate.
$C_{36}H_{43}NO_6 \cdot H_2O$ 603.76

USP Salmeterol Resolution Check RS
This is a mixture of salmeterol xinafoate, salmeterol related compound H, and salmeterol-deoxy, also known as
4-{1-Hydroxy-2-[6-(4-phenylbutoxy)hexylamino]ethyl}-2-methylphenol.

USP Salmeterol System Suitability RS
This is a mixture of salmeterol xinafoate, salmeterol related compound H, and salmeterol-*N*-alkyl, also known as
4-{1-Hydroxy-2-[(2-hydroxy-5-{1-hydroxy-2-[6-(4-phenylbutoxy)hexylamino]ethyl}benzyl)[6-(4-phenylbutoxy)hexyl]amino]ethyl}-2-(hydroxymethyl)phenol.

USP Salmeterol Xinafoate RS

Salmeterol Xinafoate

$C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$ 603.75

1,3-Benzenedimethanol, 4-hydroxy-α¹-[[[6-(4-phenylbut oxy) hexyl]amino]methyl]-, (±)-, 1-hydroxy-2-naphthalenecarboxylate (salt);
(±)-4-Hydroxy-α¹-[[[6-(4-phenylbutoxy)hexyl]amino]methyl]-*m*-xylene-α,α′-diol 1-hydroxy-2-naphthoate (salt) [94749-08-3].

DEFINITION

Salmeterol Xinafoate contains NLT 98.0% and NMT 102.0% of salmeterol xinafoate ($C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$), calculated on the water- and solvent-free basis.

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

www.webofpharma.com

[NOTE—The relative retention times for salmeterol related compound B and salmeterol are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.0 between salmeterol and salmeterol related compound B

Relative standard deviation: NMT 1.0% for salmeterol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of salmeterol xinafoate ($C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$) in the portion of Salmeterol Xinafoate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (mg/mL)

C_U = concentration of Salmeterol Xinafoate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the water- and solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **ORGANIC IMPURITIES**

[NOTE—It is recommended that solutions containing salmeterol be protected from light.]

Buffer A, Buffer B, and **Chromatographic system:** Proceed as directed in the *Assay*.

Diluent: Acetonitrile and water (50:50)

Solution A: Acetonitrile, *Buffer A*, and *Buffer B* (52:24:24). Adjust with glacial acetic acid to a pH of 3.8.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
16.0	100	0
36.0	30	70
45.0	30	70
45.1	100	0
50[a]	100[a]	0[a]

[a] The required equilibration time may be modified to achieve a stable baseline.

System suitability solution: 5.0 mg/mL of USP Salmeterol Xinafoate RS and 0.3 mg/mL each of USP Salmeterol Related Compound A RS and USP Salmeterol Related Compound B RS in *Diluent*

Sample solution: 5.0 mg/mL of Salmeterol Xinafoate in *Diluent*

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.0 between salmeterol and salmeterol related compound B

Tailing factor: NMT 2.5 for salmeterol

Analysis

[NOTE—Disregard the peak due to hydroxynaphthoic acid and any peaks from blank injections.]

Sample: *Sample solution*

Calculate the percentage of any individual impurity in the portion of Salmeterol Xinafoate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: See *Table 2*. [NOTE—Calculate the total impurities from the sum of all impurity peaks greater than or equal to 0.05%.]

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Change to read:

Identification, ▲***Spectroscopic Identification Tests*** ⟨197⟩, *Infrared Spectroscopy*: ***197M***▲ (CN 1-May-2020)
Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.5% of its weight.
Residue on ignition ⟨281⟩: not more than 0.10%.
Chloride ⟨221⟩—Dissolve 1.4 g in 6 mL of methanol, warming if necessary to effect solution. Dilute with water to 50 mL to precipitate the salsalate, allow to stand for 5 minutes, and filter. A 25-mL portion of the filtrate shows no more chloride than corresponds to 0.20 mL of 0.010 N hydrochloric acid (0.01%).
Sulfate ⟨221⟩—A 17-mL portion of the filtrate prepared for the test for *Chloride* shows no more sulfate than corresponds to 0.50 mL of 0.010 N sulfuric acid (0.05%).

Limit of dimethylaniline—
Internal standard solution—Prepare a solution in methylene chloride containing 0.4 mg of indene per mL.
Standard preparation—Transfer about 50 mg of *N,N*-dimethylaniline, accurately weighed, to a 100-mL volumetric flask, dilute with *Internal standard solution* to volume, insert the stopper securely, and mix.
Test preparation—Transfer about 5 g of Salsalate, accurately weighed, to a 125-mL separator fitted with a cotton pledget in its stem. Add 50 mL of water and 6 mL of 6 N ammonium hydroxide, and swirl until dissolved. Add 5.0 mL of *Internal standard solution*, insert the stopper into the separator, and shake for 1 minute. Keep the separator stoppered, and allow the layers to separate. Loosen the stopper, and drain most of the lower phase into a screw-capped test tube. Use this solution as the *Test preparation*.
Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a split injector with a 10:1 split ratio, and a 30-m × 0.53-mm capillary column, the internal wall of which is coated with a 1.0-µm film of phase G42. Maintain the column at 105°, the injector at 250°, and the detector block at 250°, and use helium as the carrier gas, at a flow rate of about 13 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 for indene and 1.0 for *N,N*-dimethylaniline, the resolution, *R*, between the indene peak and the *N,N*-dimethylaniline peak is not less than 2.0, and the relative standard deviation for replicate injections is not more than 3%.
Procedure— [NOTE—Use peak areas where peak responses are indicated.] Inject equal volumes (about 1 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Indene elutes before *N,N*-dimethylaniline. Calculate the percentage of *N,N*-dimethylaniline in the portion of Salsalate taken by the formula:

$$0.5(C/W)(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of *N,N*-dimethylaniline in the *Standard preparation*, *W* is the weight, in g, of Salsalate taken to prepare the *Test preparation*, and R_U and R_S are the ratios of the response of the *N,N*-dimethylaniline peak to that of the indene peak obtained from the *Test preparation* and the *Standard preparation*, respectively. The limit is 0.05%.

Isopropyl, ethyl, and methyl salicylates—
Standard stock solution—Prepare a solution in chromatographic *n*-heptane containing 0.20 mg of isopropyl salicylate, 0.50 mg of ethyl salicylate, and 0.50 mg of methyl salicylate per mL.
Standard preparation—Transfer to a suitable screw-capped test tube 2.0 g of Salsalate, add 10 mL of 1 N sodium hydroxide and 2 mL of chromatographic *n*-heptane, shake until dissolved, and allow the layers to separate. Draw off and discard all of the upper layer. To the lower layer add 2.0 mL of *Standard stock solution*, shake for 1 minute, and allow the layers to separate. Use the upper layer as the *Standard preparation*.
Test preparation—Transfer 2.0 g of Salsalate to a suitable screw-capped test tube, add 10 mL of 1 N sodium hydroxide and 2.0 mL of chromatographic *n*-heptane, shake until dissolved, and allow the layers to separate. Use the upper layer as the *Test preparation*.
Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a split injector with a 10:1 split ratio, and a 30-m × 0.53-mm capillary column, the internal wall of which is coated with a 1.0-µm film of phase G42. Maintain the column at 120° and the injector and detector block at about 250°. Helium is used as the carrier gas, flowing at the rate of about 13 mL per minute.
Procedure— [NOTE—Use peak areas where peak responses are indicated.] Inject equal volumes (about 1 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.65 for methyl salicylate, 0.9 for ethyl salicylate, and 1.0 for isopropyl salicylate. The response of any isopropyl salicylate peak obtained from the *Test preparation* is not greater than that obtained from the *Standard preparation* (0.02%), the response of any ethyl salicylate peak obtained from the *Test preparation* is not greater than that obtained from the *Standard preparation* (0.05%), and the response of any methyl salicylate peak obtained from the *Test preparation* is not greater than that obtained from the *Standard preparation* (0.05%).
Chromatographic purity—Using the chromatograms obtained in the *Assay*, calculate the percentage of each impurity, other than salicylic acid and trisalicylic acid, in the portion of Salsalate taken by the formula:

USP Monographs

www.webofpharma.com

$$10{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salsalate RS in the *Salsalate standard preparation*, W is the weight, in mg, of Salsalate taken to prepare the *Assay stock solution*, r_U is the response of the particular impurity peak obtained from the *Assay stock solution*, and r_S is the salsalate peak response obtained from the *Salsalate standard preparation:* not more than 0.2% of each other impurity is found.

Related compounds—The percentages of salicylic acid and trisalicylic acid, determined as directed in the *Assay*, do not exceed 0.5% and 2.5%, respectively.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of methanol, water, and phosphoric acid (650:350:1), and adjust with phosphoric acid or 1 N sodium hydroxide, if necessary, to a pH of 3.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of water, acetonitrile, and phosphoric acid (540:460:1).

Salsalate standard preparation—Dissolve an accurately weighed quantity of USP Salsalate RS in *Diluent* to obtain a stock solution having a known concentration of about 1 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.02 mg per mL.

Salicylic acid standard preparation—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Diluent* to obtain a stock solution having a known concentration of about 0.5 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.005 mg of USP Salicylic Acid RS per mL.

Trisalicylic acid standard preparation—Dissolve an accurately weighed quantity of USP Trisalicylic Acid RS in *Diluent* to obtain a stock solution having a known concentration of about 0.5 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.025 mg of USP Trisalicylic Acid RS per mL.

Resolution solution—Prepare a solution in *Diluent* containing about 0.02 mg of USP Salsalate RS per mL, 0.02 mg of USP Salicylic Acid RS per mL, and 0.04 mg of USP Trisalicylic Acid RS per mL.

Assay stock solution—Transfer about 100 mg of Salsalate, accurately weighed, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Sonicate if necessary to effect the solution.

Assay preparation—Transfer 2.0 mL of the *Assay stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 236-nm detector and a 4-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.55 for salicylic acid, 1.0 for salsalate, and 1.5 for trisalicylic acid, and the resolution, R, between the salicylic acid and salsalate peaks and between the salsalate and trisalicylic acid peaks is not less than 2.0. Chromatograph the *Salicylic acid standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation of the salicylic acid peak responses for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Salsalate standard preparation*, the *Salicylic acid standard preparation*, the *Trisalicylic acid standard preparation*, the *Assay stock solution*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—Continue chromatography after each injection for a period of time not less than the retention time of trisalicylic acid.] Calculate the percentage of salicylic acid ($C_7H_6O_3$) in the portion of Salsalate taken by the formula:

$$10{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Salicylic acid standard preparation*, W is the weight, in mg, of the portion of Salsalate taken, and r_U and r_S are the responses of the salicylic acid peak obtained from the *Assay stock solution* and the *Salicylic acid standard preparation*, respectively. Calculate the percentage of trisalicylic acid ($C_{21}H_{14}O_7$) in the portion of Salsalate taken by the formula:

$$10{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Trisalicylic Acid RS in the *Trisalicylic acid standard preparation*, and r_U and r_S are the responses of the trisalicylic acid peaks obtained from the *Assay stock solution* and the *Trisalicylic acid standard preparation*, respectively. Calculate the percentage of salsalate ($C_{14}H_{10}O_5$) in the portion of Salsalate taken by the formula:

$$500{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salsalate RS in the *Salsalate standard preparation*, and r_U and r_S are the salsalate peak responses obtained from the *Assay preparation* and the *Salsalate standard preparation*, respectively.

Salsalate Capsules

» Salsalate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{10}O_5$.

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—
USP Salsalate RS
USP Salicylic Acid RS
USP Trisalicylic Acid RS
$C_{21}H_{14}O_7$ 378.34

Identification—Transfer a quantity of Capsule contents, equivalent to about 500 mg of salsalate, to a stoppered glass test tube. Add 20 mL of ether to the tube, close the tube tightly, shake by mechanical means for 10 minutes, and filter. Evaporate the filtrate to dryness using a stream of nitrogen: the IR absorption spectrum of a mineral oil dispersion of the residue thus obtained, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Salsalate RS.

Disintegration ⟨701⟩: 30 minutes, simulated gastric fluid TS (without pepsin) being used.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Limit of salicylic acid—

Mobile phase, Diluent, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard preparation—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Diluent* to obtain a stock

www.webofpharma.com

solution having a known concentration of about 0.5 mg per mL. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.015 mg per mL.

Test preparation—Use the *Assay stock solution* prepared as directed in the *Assay*.

Procedure—Proceed as directed for *Procedure* in the *Assay*, except to inject equal volumes (about 10 µL) of the *Standard preparation* and the *Test preparation*. Calculate the percentage of salicylic acid ($C_7H_6O_3$) in the portion of Capsules taken by the formula:

$$10{,}000(C/O_T)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*, O_T is the quantity, in mg, of salsalate in the portion of Capsules taken based on the labeled amount, and r_U and r_S are the salicylic acid peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 1.5% is found.

Assay—

Mobile phase , *Diluent*, *Salsalate standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Salsalate*.

Assay preparation—Transfer as completely as possible the contents of not less than 20 Capsules to a suitable tared container, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of salsalate, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Sonicate for about 10 minutes, and mix. Filter a portion of this solution through a suitable filter of 0.5 µm or finer porosity. Use the clear filtrate as the *Assay stock solution*. Transfer 2.0 mL of the *Assay stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix (*Assay preparation*).

Procedure—Separately inject equal volumes (about 10 µL) of the *Salsalate standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the salsalate peaks. Calculate the quantity, in mg, of salsalate ($C_{14}H_{10}O_5$) in the portion of Capsules taken by the formula:

$$5000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salsalate RS in the *Salsalate standard preparation*, and r_U and r_S are the responses of the salsalate peaks obtained from the *Assay preparation* and the *Salsalate standard preparation*, respectively.

Salsalate Tablets

» Salsalate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{10}O_5$.

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—

USP Salsalate RS

USP Salicylic Acid RS

Identification—Transfer a quantity of finely powdered Tablets, equivalent to about 500 mg of salsalate, to a stoppered glass test tube. Add 20 mL of ether to the tube, close the tube tightly, shake by mechanical means for 10 minutes, and filter. Evaporate the filtrate to dryness using a stream of nitrogen: the IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Salsalate RS.

Dissolution ⟨711⟩—

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: 0.25 M pH 7.4 phosphate buffer, prepared by mixing 5.175 g of monobasic sodium phosphate and 30.17 g of anhydrous dibasic sodium phosphate with water to obtain 1000 mL of solution, and adjusting by the dropwise addition of 50% sodium hydroxide solution to a pH of 7.40 ± 0.05; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{14}H_{10}O_5$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 308 nm of filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Salsalate RS in the same *Medium*.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{14}H_{10}O_5$ is dissolved in 60 minutes.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.05 M, pH 7.5 phosphate buffer; prepared by mixing 40.83 g of monobasic potassium phosphate and 120 mL of 2 N sodium hydroxide with water to obtain 6 L of solution, and adjusting by the dropwise addition of 2 N sodium hydroxide or phosphoric acid to a pH of 7.50 ± 0.05; 900 mL.

Apparatus 2: 100 rpm.

Time and *Procedure*—Proceed as directed for *Test 1*.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{14}H_{10}O_5$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Limit of salicylic acid—

Mobile phase, *Diluent*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

Standard solution—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Diluent* to obtain a stock solution having a known concentration of about 0.5 mg per mL. Transfer 3.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.03 mg per mL.

Test solution—Use the *Assay stock preparation* prepared as directed in the *Assay*.

Procedure—Proceed as directed for *Procedure* in the *Assay*, except to inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution*. Calculate the percentage of salicylic acid ($C_7H_6O_3$) in the portion of Tablets taken by the formula:

$$10{,}000(C/O_T)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*; O_T is the quantity, in mg, of salsalate in the portion of Tablets taken based on the labeled amount; and r_U and r_S are the salicylic acid peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

Assay—

Mobile phase, *Diluent*, *Salsalate standard preparation*, *Salicylic acid standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Salsalate*.

USP Monographs

www.webofpharma.com

Assay stock preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of salsalate, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Sonicate for about 10 minutes, and mix. Pass a portion of this solution through a suitable filter of 0.5-µm or finer porosity. Use the clear filtrate.

Assay preparation— Transfer 2.0 mL of the *Assay stock preparation* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Salsalate*. Calculate the quantity, in mg, of $C_{14}H_{10}O_5$ in the portion of Tablets taken by the formula:

$$5000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salsalate RS in the *Salsalate standard preparation;* and r_U and r_S are the responses of the salsalate peaks obtained from the *Assay preparation* and the *Salsalate standard preparation,* respectively.

Samarium Sm 153 Lexidronam Injection

» Samarium Sm 153 Lexidronam Injection is a sterile aqueous solution suitable for intravenous injection that contains ^{153}Sm in the form of a complex with ethylenediaminetetramethyl enephosphonic acid (EDTMP). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{153}Sm expressed in megabecquerels per mL (or in millicuries per mL) at the date and time indicated in the labeling. Not less than 99 percent of the Sm-153 is complexed by EDTMP. It contains no antimicrobial agents.

Packaging and storage—Preserve in adequately shielded single-dose containers in a freezer.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{153}Sm complexed with EDTMP expressed as total megabecquerels (or millicuries) and the concentration as megabecquerels per mL (or millicuries per mL) at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{153}Sm is 46.3 hours. The labeling indicates that it should not be diluted or mixed with other solutions, that it is to be thawed at room temperature before administration, and that it is to be used within 8 hours of thawing.

Radionuclide identification ⟨821⟩—Samarium-153 decays by beta emission to stable Europium 153 as follows: 640 keV (30%), 710 keV (50%), and 810 keV (20%). The average emission energy is 233 keV. Its gamma-ray spectrum is identical to that of a specimen of known purity of ^{153}Sm that exhibits major photopeaks having energies of 70 keV and 103 keV.

Bacterial Endotoxins Test ⟨85⟩—The limit of endotoxin content is not more than 175/V USP Endotoxin Unit per mL of Injection, in which V is the maximum recommended total dose, in mL, at the expiration time.

pH ⟨791⟩: between 7.0 and 8.5.

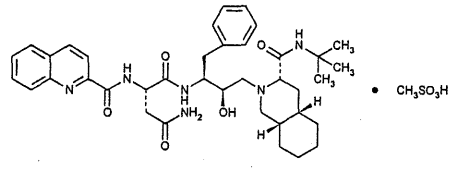
Radionuclidic purity ⟨821⟩—Using a gamma ray spectrophotometer, determine the radionuclidic purity of the Injection: not less than 99.8% of the total radioactivity is present as Sm 153 at the time of expiry. The Europium 154 radioactivity is not more than 3.44 kBq per 37 MBq of Samarium 153 (or 0.0093% of total Samarium 153 at expiry). The sum of all other radionuclidic impurities is less than or equal to 0.1907% of the total Sm 153 at expiry.

Radiochemical purity ⟨821⟩—

Mobile phase—Transfer 8.0 g of sodium chloride, 0.2 g of monobasic potassium phosphate, 1.15 g of dibasic sodium phosphate, and 0.2 g of potassium chloride to a 1-liter volumetric flask, dilute with distilled water to volume, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—A 10-mm × 40-mm glass chromatographic column is packed using gravity flow with a strong cation-exchange resin* (prepared by mixing 5 g of resin with 25 mL of water in a suitable beaker) to a final resin volume of 0.5 mL.

Procedure—Transfer the packed column to an ion-chamber dose counter to determine the background count for Sm 153. Apply about 10 µL of the Injection onto the column and place it in the ion-chamber counter, and record the total radioactivity. Elute the complexed radioactivity using about 20 mL of *Mobile phase,* and record the radioactivity retained on the column. Subtract the background radioactivity from all measured radioactivity values. Calculate the percentage of complexed radioactivity in the portion of Injection taken by the formula:



$$100(T - S/0.95)/T$$

in which T is the total amount of radioactivity; S is the quantity of free Sm-153 retained on the column; and 0.95 is the correction factor (5% of the uncomplexed Sm 153 passes through the column and into the Injection): not less than 99% of the Sm-153 is complexed by EDTMP.

Other requirements—Meets the requirements of *Injections and Implanted Drug Products* ⟨1⟩; not subject to *Container content*.

Assay for radioactivity (see *Radioactivity* ⟨821⟩)—Using a suitable counting assembly, determine the radioactivity in MBq (or mCi) per mL of Injection by use of a calibrated system: the activity is within ±10% of the labeled amount at the time of calibration.

Saquinavir Mesylate

$C_{38}H_{50}N_6O_5 \cdot CH_4O_3S$ 766.95

* Sephadex-CM C-25 brand of ion exchange resin is available from Aldrich Chemical (No. 27, 124-1).

Solution: 12 µg per mL.
Medium: methanol.
The absorptivity of the sample preparation at 238 ± 2 nm, calculated on the anhydrous basis, is between 61.0 and 63.4.
C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*
Specific rotation ⟨781S⟩**:** between −66.8° and −69.6° (λ = 436 nm at 20°).
Test solution: 5 mg per mL, in methanol.
Water Determination, *Method I* ⟨921⟩**:** not more than 1.0%.
Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chromatographic purity—
Triethylamine phosphate solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*
Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*
Test solution—Use the *Assay preparation.*
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Saquinavir Mesylate taken by the formula:

$$100F(C_S/C_U)(r_i/r_S)$$

in which F is a response factor and is equal to 2 for peaks, if present, at a retention time of 0.32 relative to saquinavir, to 0.5 for peaks, if present, at retention times of about 0.38 and 0.53 relative to saquinavir, and to 1 for all other peaks; C_S is the concentration, in mg per mL, of USP Saquinavir Mesylate RS in the Standard solution; C_U is the concentration, in mg per mL, of Saquinavir Mesylate in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for saquinavir obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

Assay—
Triethylamine phosphate solution—Transfer 10 mL of triethylamine to a 1-liter volumetric flask, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 2.5, and filter.
Mobile phase—Prepare a filtered and degassed mixture of *Triethylamine phosphate solution,* tetrahydrofuran, and acetonitrile (14:5:1). [NOTE—Protect from light.] Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
System suitability solution—Dissolve suitable quantities of USP Saquinavir Related Compound A RS and USP Saquinavir Mesylate RS in *Mobile phase* to obtain a solution containing about 2 µg per mL and 0.25 mg per mL, respectively.
Standard preparation—Dissolve an accurately weighed quantity of USP Saquinavir Mesylate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.25 mg per mL.
Assay preparation—Transfer about 12.5 mg of Saquinavir Mesylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix for about 20 minutes.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 20°, and the flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.89 for saquinavir related compound A and 1.0 for saquinavir; and the resolution, *R,* between saquinavir related compound A and saquinavir is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{38}H_{50}N_6O_5 \cdot CH_4O_3S$ in the portion of Saquinavir Mesylate taken by the formula:

$$50C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Saquinavir Mesylate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Saquinavir Capsules

» Saquinavir Capsules contain not less than 95.0 percent and not more than 105.0 percent of saquinavir ($C_{38}H_{50}N_6O_5$).

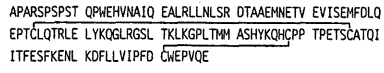
Standard solution—Use the Standard preparation, prepared as directed in the *Assay* under *Saquinavir Mesylate.*
Test solution—Use the *Assay preparation.*
Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$10{,}000F(670.86/766.96)(C/W)(r_i/r_S)$$



in which *F* is a response factor, and is equal to 2 for a peak, if present, at a retention time of 0.32 relative to saquinavir, to 0.5 for peaks, if present, at relative retention times of about 0.38 and 0.53, and to 1 for all other peaks; 670.86 and 766.96 are the molecular weights of saquinavir and saquinavir mesylate, respectively; *C* is the concentration, in mg per mL, of USP Saquinavir Mesylate RS in the *Standard solution; W* is the weight, in mg, of Capsule contents taken for the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for saquinavir obtained from the *Standard solution:* not more than 0.2% of any individual impurity is found, and not more than 1.0% of total impurities is found.

Assay—
Triethylamine phosphate solution,Mobile phase, System suitability solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Saquinavir Mesylate.*
Assay preparation—Empty and combine the contents of not fewer than 10 Capsules. Transfer an amount of Capsule contents, equivalent to about 22 mg of Saquinavir, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of saquinavir ($C_{38}H_{50}N_6O_5$) in the portion of Capsules taken by the formula:

$$(670.86/766.96)(100C)(r_U/r_S)$$

in which 670.86 and 766.96 are the molecular weights of saquinavir and saquinavir mesylate, respectively; *C* is the concentration, in mg per mL, of USP Saquinavir Mesylate RS in the *Standard preparation;* and r_U and r_S are the peaks obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Sargramostim

$C_{639}H_{1002}N_{168}O_{196}S_8$ (protein moiety) 14,414
[123774-72-1].

DEFINITION
Sargramostim is a single-chain, glycosylated polypeptide of 127 amino acid residues expressed from *Saccharomyces cerevisiae.* The glycoprotein primarily consists of three molecular species having relative molecular weights of approximately 19,500; 16,800; and 15,500 due to different levels of glycosylation. Sargramostim has the property of generating granulocyte, macrophage, and mixed granulocyte macrophage colonies from hematopoietic progenitor cells found in bone marrow. It possesses the primary sequence of the natural form of granulocyte-macrophage colony-stimulating factor with a substitution in the amino acid residue at position 23 (Leu_{23} in place of Arg_{23}). It has a biological potency of NLT 73.0% and NMT 146.0% of the potency stated on the label, the potency being 5.6 million USP Sargramostim Units/mg of protein. The presence of host cell DNA and host cell protein impurities in Sargramostim is process-specific; the limits of these impurities are determined by validated methods.

IDENTIFICATION
- **A.** The retention times of the peaks of the *Sample solution* do not differ by more than 0.5 min from those of the *Standard solution,* as obtained in the test for *Chromatographic Purity.*
- **B. PEPTIDE MAPPING**

Solution A: Trifluoroacetic acid and water (1:1000), filtered and degassed
Solution B: Trifluoroacetic acid and acetonitrile (1:1000), filtered and degassed
Mobile phase: See *Table 1.*

www.webofpharma.com

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
35	65	35
50	35	65

Digestion solution: Dissolve 29.4 mg of calcium chloride and 1.8 mg of β-alanine in 2 mL of water. Adjust with hydrochloric acid to a pH of 4.0. Add 0.4 mg of trypsin, and mix.

Standard solution: 500 µg/mL of USP Sargramostim RS in water. Transfer 100 µL of this solution to a clean test tube, and add 11 µL of pH 7.6 buffer solution (see *Reagents, Indicators, and Solutions—Buffer Solutions*) containing 0.1 M tris(hydroxymethyl)aminomethane. Add 25 µL of *Digestion solution*, and incubate at 37° for 2 h. Quench the reaction by adding 3 µL of 20% trifluoroacetic acid.

Sample solution: 500 µg/mL of Sargramostim in water. Transfer 100 µL of this solution to a clean test tube, and add 11 µL of pH 7.6 buffer solution (see *Reagents, Indicators, and Solutions—Buffer Solutions*) containing 0.1 M tris(hydroxymethyl)aminomethane. Add 25 µL of *Digestion solution*, and incubate at 37° for 2 h. Quench the reaction by adding 3 µL of 20% trifluoroacetic acid.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 10-µm packing L1

Column temperature: Ambient

Flow rate: 1 mL/min

Injection volume: 100 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Equilibrate the system with a *Mobile phase* consisting of 100% *Solution A*. Measure the responses for the eight major peaks as defined in the USP Sargramostim RS Data Sheet.

Acceptance criteria: The retention times of the peak responses of the *Sample solution* correspond to those of the *Standard solution* if the retention times of the corresponding peaks do not differ by more than 0.3 min; the peak area ratios for peaks 4, 8, and 10 are between 0.7 and 1.3; and no additional significant peaks or shoulders are found.

ASSAY

• **PROCEDURE**

Iscove's Modified Dulbecco's medium: Prepare a mixture of the ingredients in the quantities shown in *Table 2* in sufficient water to obtain 1 L of medium, and sterilize by filtration.

Table 2

Calcium chloride	165.00 mg
Potassium chloride	330.00 mg
Potassium nitrate	0.076 mg

Riboflavin	0.40 mg
Thiamine	4.00 mg

Medium A: Prepare a mixture of *Iscove's Modified Dulbecco's medium* with 10% heat-inactivated fetal bovine serum as described in *Table 3*.

Table 3

Iscove's Modified Dulbecco's medium	500 mL
Fetal bovine serum (inactivated at 56° for 30 min)	50 mL
Penicillin, streptomycin, and L-glutamine mixture containing, in each mL, 5000 units of penicillin G potassium, 5000 µg of streptomycin sulfate, and 29.2 mg of L-glutamine	5 mL
Gentamicin (50 mg/mL)	0.5 mL
2-Mercaptoethanol	0.5 mL

Prepare aseptically, sterilize by filtration, and store at 2°–8°. Use within 1 month.

www.webofpharma.com

Medium B: 1 µg/mL of USP Sargramostim RS in *Medium A*. Prepare aseptically, sterilize by filtration, and store at 2°–8°. Use within 1 month.

Standard solution: 100 ng/mL of USP Sargramostim RS in *Medium A*. Dispense aseptically in equal portions, and store at –60° or below. Use within 24 months. Store thawed portions at a temperature between 2° and 8°, and use within 1 month. At the time of use, dilute with *Medium A* to obtain a solution having a known concentration of 2 ng/mL.

Sample solution: 2 ng/mL of Sargramostim in *Medium A*

Cell culture preparation: Prepare cell cultures of TF-1 cells (ATCC CRL-2003). Passage the cultures every 3–4 days, using a 1:10 subculture of the cells for up to 3 months. After 3 months, initiate a new culture. Use *Medium A* containing 0.5% *Medium B* for passage propagation and storage in the frozen state.

Cell suspension: Wash the cells three times in *Medium A*, and adjust the cell concentration to 5×10^4 cells/mL in *Medium A*.

Tritiated thymidine solution: 1.0 mL of a solution of tritiated thymidine with a specific activity of 20 Ci/mmol in 49 mL of *Medium A*. Store at 2°–8°. Use within 2 weeks.

Analysis: Use a 96-well, flat-bottom microtitration plate with wells arranged in 8 rows (labeled A–H), with 12 wells (numbered 1–12) in each row. Place 50 µL of *Medium A* in wells 2–12. Place 100 µL of the *Standard solution* or each *Sample solution* or *Medium A* (negative control) in well 1. Make serial dilutions by transferring 50 µL from well 1 to well 2, and so on through well 12 (serial two-fold dilutions). Place 50 µL of the *Cell suspension* in each well, and incubate the microtitration plate for 72 h at 37° in a 10% carbon dioxide incubator. Following incubation, add 25 µL of *Tritiated thymidine solution* to each well, and return the plate to the same incubator for an additional 4–5 h. Before harvesting the cells on a filter mat, prewet the mat filter, using distilled water. [NOTE—The prewetting minimizes background radiation noise.] Using a multiple, automated sample harvesting system, place the incubated plate under the harvesting system. Fill the wells to the top with deionized water. Aspirate the water, and pass it through the collecting filter mat. Repeat the procedure at least five times or until all the cells have been fully harvested. When all wells have been fully harvested, pour 5–10 mL of alcohol on the plate tray, and aspirate the methanol. Repeat the procedure if further drying of the filter mat is desired. [NOTE—The alcohol helps to dry out the filter mat by carrying away the wash fluid.] Remove the filter mat, and repeat the procedure until all plates under test have been harvested. Dry the filter mat in a drying oven for about 30 min. Place the completely dry filter mats in a beta counter, and determine the amount of radioactivity in each cell well. Convert the amount of incorporated radioactivity in each well to a percentage of the maximum incorporated radioactivity. If fewer than five values are between 3% and 97% of the maximum revision, repeat the *Assay*. Using the least-squares method of regression analysis, plot the slope of each test specimen versus the slope of the standard, excluding any values exceeding the maximum of each dilution set. Calculate the USP Sargramostim Units in each mL of the *Sample solution* in terms of the dilution that gives half-maximal activity. To convert this value to units of protein/mg, divide the USP Sargramostim Units/mL by the weight, in mg/mL, of protein in the initial undiluted solution.

Acceptance criteria: The potency is 73.0%–146.0% of the potency stated on the label in terms of USP Sargramostim Units/mg of protein.

SPECIFIC TESTS

• **CHROMATOGRAPHIC PURITY**

Solution A: Trifluoroacetic acid and water (1:1000), filtered and degassed

Solution B: Trifluoroacetic acid and acetonitrile (1:1000), filtered and degassed

Solution C: Dissolve 116.9 g of sodium chloride in 2 L of water, adding 2 mL of trifluoroacetic acid.

Mobile phase: See *Table 4*. Make adjustments if necessary (see *Chromatography* ⟨621⟩, *System Suitability*).

Table 4

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	55	25	20
40	15	65	20

Standard solution: 1 mg/mL of USP Sargramostim RS in water

Sample solution: 1 mg/mL of Sargramostim in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: Ambient

Flow rate: 1 mL/min

Injection volume: 50 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Equilibrate the system with a *Mobile phase* consisting of 55% *Solution A*, 25% *Solution B*, and 20% *Solution C*. After injection of the solution under test, the composition is changed linearly. The major peaks are from hyperglycosylated sargramostim and from the three glycosylated forms of sargramostim, as indicated in the USP Sargramostim RS Data Sheet.

Calculate the percentage of hyperglycosylated sargramostim in the *Sample solution*:

$$\text{Result} = (r_U / r_T) \times 100$$

r_U = peak response of hyperglycosylated sargramostim

r_T = sum of all the peak responses of sargramostim

Calculate the percentage of each of the three glycosylated forms of sargramostim in the *Sample solution*:

$$\text{Result} = (r_U / r_T) \times 100$$

r_U = peak response of each individual glycosylated form of sargramostim

r_T = sum of the peak responses of all three glycosylated forms of sargramostim

Acceptance criteria: The peak responses of the *Sample solution* correspond to those of the *Standard solution*, and no peaks or shoulders are present in the chromatogram of the *Sample solution* that are not present in the chromatogram of the *Standard solution*. NMT 5.6% of hyperglycosylated sargramostim. The percentages of each of the three glycosylated forms of sargramostim, in order of elution, are 25%–42%, 14%–32%, and 35%–53%.

• **PROTEIN CONTENT**

Standard solutions: 100, 200, 400, 600, 800, and 1000 µg/mL of USP Sargramostim RS in water

USP Monographs

www.webofpharma.com

Sample solution: Between 250 and 500 µg/mL of Sargramostim in water
BCA reagent: Dissolve 10 g of bicinchoninic acid, 20 g of sodium carbonate monohydrate, 1.6 g of sodium tartrate, 4 g of sodium hydroxide, and 9.5 g of sodium bicarbonate in water. Adjust, if necessary, with sodium hydroxide or sodium bicarbonate to a pH of 11.25. Dilute with water to 1 L, and mix.
Copper sulfate reagent: 40 mg/mL of cupric sulfate
Copper–BCA reagent: *Copper sulfate reagent* and *BCA reagent* (1:50). [NOTE—If a commercially available kit is used, follow the manufacturer's instructions for preparation of the *Copper–BCA reagent.*]
Blank: Water
Analytical wavelength: 562 nm
Analysis: Mix 0.1 mL each of *Standard solution, Sample solution,* and *Blank* with 2 mL of the *Copper–BCA reagent.* Incubate the solutions at 37° for 30 min, and allow to stand for 5 min at room temperature. Within 60 min after incubation, determine the absorbances of the *Standard solutions* and the *Sample solution* in 1-cm cells with a suitable spectrophotometer (see *Ultraviolet-Visible Spectroscopy* ⟨857⟩), using the *Blank* to set the instrument to zero. Plot the absorbances of the *Standard solutions* versus the concentrations, in µg/mL, of USP Sargramostim RS, and draw a straight line best fitting the plotted points. From the graph, determine the concentration, in µg/mL, of protein in the *Sample solution.*

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 1 cfu/mL.

  USP Sargramostim RS

Sargramostim for Injection

DEFINITION

Sargramostim for Injection is a sterile, lyophilized preparation of Sargramostim. Its biological activity is NLT 73.0% and NMT 146.0% of that stated on the label in USP Sargramostim Units. It contains NLT 90.0% and NMT 110.0% of the total protein content stated on the label.

IDENTIFICATION

- **A.** The retention times of the peaks of the *Sample solution* do not differ by more than 0.5 min from those of the *Standard solution,* as obtained in the test for *Chromatographic Purity.*
- **B. PEPTIDE MAPPING**

Solution A: Trifluoroacetic acid and water (1:1000), filtered and degassed

Samples: *Standard solution* and *Sample solution*

Equilibrate the system with a *Mobile phase* consisting of 55% *Solution A*, 25% *Solution B*, and 20% *Solution C*. After injection of the solution under test, the composition is changed linearly. The major peaks are from hyperglycosylated sargramostim and from the three glycosylated forms of sargramostim, as indicated in the USP Sargramostim RS Data Sheet.

Calculate the percentage of hyperglycosylated sargramostim in the *Sample solution*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of hyperglycosylated sargramostim

r_T = sum of all the peak responses of sargramostim

Calculate the percentage of each of the three glycosylated forms of sargramostim in the *Sample solution*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual glycosylated form of sargramostim

r_T = sum of all the peak responses of all three glycosylated forms of sargramostim

Acceptance criteria: The peak responses of the *Sample solution* correspond to those of the *Standard solution*, and no peaks or shoulders are present in the chromatogram of the *Sample solution* that are not present in the chromatogram of the *Standard solution*. NMT 5.6% of hyperglycosylated sargramostim. The percentages of each of the three glycosylated forms of sargramostim, in order of elution, are 25%–42%, 14%–32%, and 35%–53%.

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 50 USP Endotoxin Units/mg
- **SAFETY:** Meets the requirements in *Biological Reactivity Tests, In Vivo* ⟨88⟩, *Safety Tests—Biologicals*
- **STERILITY TESTS** ⟨71⟩: It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **pH** ⟨791⟩: 7.1–7.7, in the solution constituted as directed in the labeling
- **WATER DETERMINATION,** *Method I* ⟨921⟩: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in hermetic containers at a temperature between 2° and 8°.
- **LABELING:** Label it to state the biological activity in USP Sargramostim Units/vial and the amount of protein/vial.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Sargramostim RS

Scaffold Bovine Dermis

DEFINITION

Scaffold Bovine Dermis is a remodelable collagen scaffold derived from fetal or neonatal bovine skin. It is presented to the physician as a flat white sheet that is cut to size and hydrated in room-temperature sterile saline solution before implantation. The sterile material is surgically secured, onlayed, and/or packed into deficient soft tissues such as skin, tendon, muscle, and dura mater. In order to provide antimicrobial protection of the Scaffold Bovine Dermis, silver nitrate solution may be added to the Scaffold Bovine Dermis, resulting in ionic silver as a component. The source fetal or neonatal bovine skin is mechanically and chemically processed to isolate the dermis and remove cells and cellular components. To prevent the transmission of infectious disease, the manufacturing process has been validated to inactivate viruses potentially present in the source material. To prevent the spread of transmissible spongiform encephalopathies, the source material is acquired from appropriate geographic locations in accordance with relevant guidelines subject to governmental oversight. The product is inspected and tested to ensure that the product meets specifications.

SPECIFIC TESTS

- **HISTOLOGICAL EVALUATION**

Solutions

1% Acidified alcohol solution: To 99 mL of 70% ethyl alcohol add 1 mL of hydrochloric acid (37.5%).

Potassium alum solution: Dissolve 100 g of potassium alum in 1000 mL of distilled water with the aid of heat and a magnetic stirrer.

Hematoxylin–alcohol solution: Dissolve 5 g of hematoxylin (see *Reagents, Indicators, and Solutions, Reagent Specifications*) in 50 mL of 100% ethyl alcohol at room temperature.

Hematoxylin solution: Slowly combine the 1000 mL of the *Potassium alum solution* with the 50 mL of the *Hematoxylin–alcohol solution*. Bring to a boil as rapidly as possible. Remove from heat, and slowly add 2.5 g of mercuric oxide. Return the solution to heat until it

www.webofpharma.com

becomes dark purple, remove from heat, and cool in a sink of cold water.

Eosin solution: Dissolve 1.0 g of eosin Y, water soluble, in 100 mL of distilled water. Dissolve 1.0 g of phloxine B in 100.0 mL of distilled water. Combine 100 mL of eosin Y solution with 10 mL of phloxine B solution, 780 mL of 95% ethyl alcohol, and 4.0 mL of glacial acetic acid. [NOTE—Filter daily before use.]

Bluing agent: Dissolve 1.54 g of lithium carbonate in 100 mL of distilled water.

10% Neutral buffered formalin: To 6.5 g of dibasic sodium phosphate (anhydrous) and 4.0 g of monobasic sodium phosphate, add 900 mL of distilled water and 100 mL of formaldehyde (37%–40%).

Sample preparation and staining: Remove a sample of the finished product with an 8.0-mm biopsy punch. Place the sample in a labeled tissue cassette, and fix for 24 h in *10% Neutral buffered formalin*. Dehydrate the sample in sequential soaks of the following: 70% ethyl alcohol (45 min), 80% ethyl alcohol (45 min), 95% ethyl alcohol (90 min), 100% ethyl alcohol (180 min), and xylene (90 min). Embed the sample in melted paraffin, cool, and cut 5-µm-thick sections with a microtome. Collect sections on microscope slides. Deparaffinize the slides with xylene, and hydrate with distilled water. Stain in *Hematoxylin solution* for 6–15 min. Wash in running tap water for 2–5 min. Dip two times in *1% Acidified alcohol solution*. Wash briefly in tap water. Place in *Bluing agent* until the sections are bright blue. Wash in running tap water for 10 min. Place in 80% ethyl alcohol for 1–2 min. Dehydrate, and clear through two changes each of 95% ethyl alcohol, 100% ethyl alcohol, and xylene, 2 min each. Affix a coverslip over the tissue, using an appropriate resinous mounting medium. The nuclei stain blue, the cytoplasm stains from pink to red, and the collagen fibers stain from pink to red.

Microscopic and morphological characteristics: The collagen fibers of the Scaffold Bovine Dermis stain pink-red, and no evidence of cell nuclei or cytoplasm is apparent in prepared histological sections, as shown in the USP Bovine Acellular Dermal Matrix Reference Photomicrographs,[1] of products with acceptable histological appearance.

- **PROTEIN DETERMINATION**

Use the Kjeldahl nitrogen (protein) determination method to calculate the percent protein of the final product, as directed in *Nitrogen Determination* ⟨461⟩, with the following specifics. Suitable equipment and procedures are readily available.[2]

Digestion: Prepare a rack of 15–20 Kjeldahl digestion tubes. In each, place 2.0–2.2 g of the final product, 0.2 ± 0.05 g of ammonium sulfate, a metallic catalyst tablet,[3] and boiling chips.[4] Prepare a blank tube with catalyst tablets and boiling chips (reagent blank). To each tube add 15 mL of concentrated sulfuric acid, and then, very slowly, 3 mL of hydrogen peroxide (30%–35%). Place the digestion tubes on a digestion block, and heat to 410°. Digest for 60 ± 5 min. The mixture in the tubes should be a clear green.

Distillation: Add excess base (50% sodium hydroxide). Generally, for each 5 mL of concentrated sulfuric acid used in the digestion, 20 mL of 40% (w/w) sodium hydroxide is required to make the digest strongly alkaline (pH >11). Mix each tube, and let cool to room temperature. Distill each tube to collect approximately 125 mL of total distillate in a flask containing 25 mL of 4% boric acid. A reagent blank is run with each set.

Titration: Titrate the collected distillate with 0.2 N sulfuric acid to a neutral gray color endpoint. Record the volume of sulfuric acid used.

Calculation: Calculate the percentage of protein:

$$\text{Result} = [(\text{mL of sulfuric acid} - \text{mL of blank}) \times \text{N of sulfuric acid} \times A \times B]/\text{weight of sample (g)}$$

A = milliequivalent weight N × 100 (%), 1.4007
B = protein factor for meat, 6.25

Acceptance criteria: The percentage of protein in 2.0–2.2 g of the Scaffold Bovine Dermis sample is between 90.0% and 95.0%.

- **LIPID ANALYSIS**

Analysis: A standard Soxhlet extraction apparatus is required. Dry flasks in an oven/desiccator and weigh, recording the weight to the nearest 0.0001 g. Grind or cut into small pieces 3.0–4.0 g of test material, and place into a thimble. Record the weight of the test material to the nearest 0.0001 g. Place the thimble of material and 80–90 mL of petroleum ether into an extraction flask, and place into the Soxhlet extraction tube. Reflux for 4 h. Collect all the ether into the flask, and evaporate. Weigh the flask, recording the weight to the nearest 0.0001 g. For the weight of lipid, subtract the weight of the clean flask from the final weight of the flask. Calculate the percentage of lipid on the basis of the weight of the starting material.

Acceptance criteria: The percentage of lipid in 3.0–4.0 g of the Scaffold Bovine Dermis sample is between 0% and 1.5%.

- **LOSS ON DRYING** ⟨731⟩**:** Calculate the moisture content, with the following specifics. Mince approximately 5.0 g of Scaffold Bovine Dermis, and place it into an aluminum dish. Dry the sample in an air oven for 16–18 h at 100°–102°. Calculate the percentage of moisture in the sample taken:

$$\text{Dry matter \%} = [(\text{weight of dried sample + pan (g)} - \text{weight of pan (g)})/\text{g of sample}] \times 100$$

$$\text{Moisture \%} = 100 - \text{dry matter \%}$$

Acceptance criteria: The moisture loss is NLT 10.0% and NMT 12.0% of the original sample weight.

- **ASH DETERMINATION**

Analysis: Place a sample of the final product, about 5.0 g, in a kiln-dried porcelain crucible. Record the weight to the nearest 0.0001 g. Place the crucible containing the sample into an oven at 125° for 2–4 h. Then place the crucible containing the sample into a cool muffle furnace. Heat the furnace to 350°, and maintain the temperature until smoking ceases (generally about 20 min). Heat the furnace to 550°. Maintain the temperature for 2 h. Cool the crucible in a dessicator. Weigh the crucible, and record the weight to the nearest 0.0001 g. Calculate the percentage of ash:

$$\text{Result} = [(\text{weight of crucible + residue (g)} - \text{weight of crucible (g)})/\text{g of sample}] \times 100$$

Acceptance criteria: The percentage of ash is between 0% and 0.3%.

- **CARBOHYDRATE CONTENT**

Calculate the percentage of carbohydrates:

[1] These photomicrographs are available as a CD from the USP Reference Standards collection, available to the reader through USP Customer Services. To order these and other Reference Standards, call 1-800-227-8772 (U.S. and Canada), +1-301-881-0666 or 00-800-4875-5555 (select Europe); or go online to www.usp.org. Order item number 1535824.

[2] A suitable device and associated procedures can be obtained from Labconoco, 8811 Prospect Ave., Kansas City, MO 64132-2696.

[3] A suitable catalyst is Pro-Pac CT-37, Alfie Packers, 8901 J St., Omaha, NE 68127.

[4] Commonly referred to as Henger granules.

www.webofpharma.com

Carbohydrate % = 100% – (protein % + lipid % + moisture % + ash %)

Acceptance criteria: The percentage of carbohydrates is equal to or less than 0.0%. Because this is a calculated value, influenced by the error inherent in the test methods above (*Protein Determination, Lipid Analysis, Loss on Drying,* and *Ash Determination*), a calculated value less than 0.0% is acceptable.

• **GEL ELECTROPHORESIS**

Solutions

Collagen extraction solution: Prepare a 0.5 M acetic acid solution containing 2 mM of ethylenediaminetetraacetic acid (EDTA).

2X Tris-glycine sample buffer: Prepare a 2X solution containing 63 mM Tris-HCl pH 6.8, 10% glycerol, 2% sodium dodecyl sulfate (SDS), 0.05% 2-mercaptoethanol, and 0.25% bromophenol blue.[5]

1X Tris-glycine sample buffer: Prepare a solution containing a mixture of *2X Tris-glycine sample buffer* and water (1:1).

SDS-PAGE running buffer: Prepare a solution containing 25 mM of Tris pH 8.3, 192 mM of glycine, and 0.1% of SDS.[6]

Polyacrylamide gel: Prepare a Tris-HCl polyacrylamide gel with a 4%–20% gradient.[7]

Molecular weight marker: Use a suitable molecular weight marker containing protein bands between 10 and 250 kilodaltons (kDa).

Staining solution: Prepare a solution containing 0.25% (w/v) Coomassie brilliant blue R-250 (see *Reagents, Indicators, and Solutions, Reagent Specifications*) in 10% acetic acid and 10% *n*-propanol.

Destain solution: Prepare a mixture of water, acetic acid, and *n*-propanol (8:1:1).

Collagen preparations: Mince 0.5 g of Scaffold Bovine Dermis final product. Weigh a sample of minced Scaffold Bovine Dermis, and add to a volume of *Collagen extraction solution* to obtain a concentration of 5 mg/mL (dry weight of Scaffold Bovine Dermis). Extract on a rocking platform at room temperature for 72 h.

Analysis: Dilute acid-extracted collagen samples in *2X Tris-glycine sample buffer* to a concentration of 0.5 mg/mL, and incubate for 5 min at 100°. Load the *Polyacrylamide gel* in the electrophoresis apparatus, and add *SDS-PAGE running buffer* to the top and bottom reservoirs. Load 10 µL of *Molecular weight marker* in the first well of the *Polyacrylamide gel* and 10 µL of *1X Tris-glycine sample buffer* in the second well. Load 10 µL (5 µg) of each *Collagen preparation* into subsequent gel wells. Attach the cathode and anode to the appropriate terminals, and apply 110 V to the gel. Run the gel until the bromophenol blue reaches the bottom of the gel. Remove the gel from the electrophoresis apparatus, and place it in a tray containing enough *Staining solution* to cover the gel. Incubate the gel for 3 h on a rocker at room temperature. Completely remove the *Staining solution* from the tray, cover the gel with *Destain solution*, and slowly rock the gel for 20 min. Remove the *Destain solution*, and repeat the destaining procedure three times. Inspect the gel for bands that have migrated from the origin.

System suitability: All *Molecular weight marker* bands between 20 and 200 kDa are present. The lane containing *1X Tris-glycine sample buffer* does not contain any bands.

Data analysis: Where a protein band appears in the gel, the molecular weight of this protein is determined by comparing the position of the band to that of the known *Molecular weight marker*.

Specificity and acceptance criteria: The lanes of the *Polyacrylamide gel* that correspond to Scaffold Bovine Dermis show four major protein bands. Two bands, when compared to the *Molecular weight marker*, appear at 96 and 94 kDa. These two bands correspond to the monomeric alpha 1 and alpha 2 chains of collagen Type I, respectively. Another two bands appear close together at 200 kDa, which correspond to alpha 1 and alpha 1/alpha 2 collagen dimers.

• **TENSILE STRENGTH**

Procedure: Cut test specimens 5-mm wide × 50-mm long from representative pieces from final product lots. Measure the thickness of the specimens. Test the specimens with a commercially available material test system.[8] Mount and align each specimen, gripping 1 cm of the test specimen on both ends to ensure a test specimen gauge length of 3 cm. Pull the grips apart at 30 mm/min while concurrently measuring the force exerted on the specimen. Record the maximum force (*N*) measured during the test. Calculate the tensile strength:

Tensile strength (N/mm^2) = maximum force (*N*)/5 (mm) × thickness (mm)

Acceptance criteria: The measured tensile strength for each lot is NLT 5 N/mm^2.

• **SUTURE RETENTION FORCE**

Analysis: Cut representative 1-cm × 1-cm test specimens from final product lots. Using an appropriate suture material (e.g., 4-0 polypropylene suture), thread the suture 3 mm from the edge of the sample in the center, and pull through. Clamp approximately 5 mm of the opposite, unsutured end of the test specimen in the upper pneumatic grip of a commercially available material test system.[9] The suture tails are hanging freely. Clamp the suture tails to the lower grip. Pull the grips apart at 20 mm/min while concurrently measuring the force exerted. Record the maximum force (*N*) measured.

Acceptance criteria: The suture retention force measured for each lot is NLT 5*N* for a 1-cm × 1-cm test sample of Scaffold Bovine Dermis.

• **THERMAL ANALYSIS**

Analysis: Heat a final product sample of approximately 10–20 mg at 2°/min from 30°–90°, hydrate with water, and measure the thermal characteristics of each processed sample with a differential scanning calorimeter as directed in *Thermal Analysis* ⟨891⟩.

Acceptance criteria: Scaffold Bovine Dermis displays a single thermal transition peak between 58° and 67°.

• **VISUAL INSPECTION**

Analysis: Visually inspect each piece of final product under a white light at a distance of 30–45 cm for color, the presence of particulates, and holes.

Acceptance criteria: Scaffold Bovine Dermis is white, and neither particulates nor holes are visible.

[5] A suitable sample buffer can be obtained from Invitrogen Corporation, 1600 Faraday Ave., P.O. Box 6482, Carlsbad, CA 92008.

[6] A suitable gel running buffer can be obtained from Bio-Rad Laboratories, 1000 Alfred Nobel Dr., Hercules, CA 94547.

[7] A suitable precast acrylamide gel can be obtained from Bio-Rad Laboratories, 1000 Alfred Nobel Dr., Hercules, CA 94547.

[8] A suitable material test system is available from Instron Corporation, 825 University Ave., Norwood, MA 02062-2643.

[9] A suitable material test system is available from Instron Corporation, 825 University Ave., Norwood, MA 02062-2643.

USP Monographs

www.webofpharma.com

• **HYDRATION RATE**
Analysis: Cut a sample of finished product lot approximately 1 cm × 1 cm. Fully hydrate the sample, as indicated by a change in color from white to gray.
Acceptance criteria: The sample should be fully hydrated in NMT 3 min when placed in room-temperature saline solution.

• **CONTENT OF SILVER**
Sample: Roll or fold a 4-cm × 4-cm sample of Scaffold Bovine Dermis into a labeled 50-mL Pyrex glass tube containing 30 mL of 6.0% nitric acid, and cap tightly. Heat the sample tube in a purified glycerin bath at 100°–105° for 16 h. Remove the sample tube from glycerin bath, and allow to cool to <30°. Transfer 0.5 mL of the dissolved *Sample* into a second Pyrex glass tube containing 30 mL of 2.0% nitric acid prepared freshly on the day of use, and cap tightly. The *Sample* should be stored at room temperature (15°–30°) until analysis is initiated.
Analysis: The *Sample* is analyzed for ionic silver via inductively coupled plasma–atomic emission spectrometry (ICP–AES). The instrument should be a computer-controlled emission spectrometer with background correction capability. Accurately weigh the *Sample*. Nebulize the *Sample*, and transport the resulting aerosol to the plasma torch. Element-specific spectra are produced by radio frequency inductively conducted plasma. Spectra are dispersed by a grating spectrometer, and the intensities of the line spectra are monitored at specific wavelengths by a photosensitive device. Photo currents from the photosensitive device are processed and controlled by a computer system. A background correction technique is required to compensate for variable background contribution to the determination of silver. Background must be measured adjacent to the analyte wavelength during analysis. Four types of blanks are required for the analysis: The calibration blank is used in establishing the analytical curve. The laboratory reagent blank is used to assess possible contamination from the *Sample* preparation procedure. The laboratory fortified blank is used to assess routine laboratory performance. A rinse blank is used to flush the instrument uptake system and nebulizer between standards and to check solutions and samples to reduce memory interferences.
Calibration and standardization: Before using this method, the user must optimize the plasma operating conditions. The purpose of plasma optimization is to provide a maximum signal-to-background ratio. The use of a mass flow controller to regulate the nebulizer gas flow rate greatly facilitates the procedure.
Data analysis and calculations: Report results up to three significant figures as mg/kg on the dry weight basis. Calculate the concentration of silver in the *Sample*:

$$\text{Result} = [C \times V \times D]/W$$

C = concentration in extract (mg/L)
V = volume of extract (L)
D = dilution factor (undiluted = 1)
W = weight of sample aliquot extracted (g × 0.001 = kg)

Acceptance criteria: The content of ionic silver in the Scaffold Bovine Dermis must be more than 100.0 µg/cm² and less than 165.0 µg/cm² as determined by ICP–AES.

• **STERILITY TESTS** ⟨71⟩**:** It meets the requirements.

Change to read:

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** It meets the requirements as directed in ▲*Medical Devices—Bacterial Endotoxin and Pyrogen Tests* ⟨161⟩.▲ (CN 1-May-2019)

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** The package is a sealed foil pouch that provides an effective moisture, light, gas, and sterility barrier. Store in clean, dry conditions between 15° and 30°.

• **LABELING:** Label it to indicate that it is derived from bovine origin. The product is labeled to indicate its intended clinical use. It is labeled with the dimensions of the product, the expiration date, the required storage conditions, the lot number, the part number, and the manufacturer's name and address. The label indicates that the product is sterile and nonpyrogenic and is designed for single-patient, one-time use. The labeling cautions the user to inspect the packaging for damage and to discard the product if the packaging has been compromised. The labeling also cautions the user to hydrate the product only in room-temperature sterile saline solution.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Authentic Visual References RS
USP Bovine Acellular Dermal Matrix Reference Photomicrographs.[1]
These photomicrographs show the histological appearance of failed, cell-containing source material (Photomicrographs 1 and 2) and of passing, processed, decellularized material (Photomicrographs 3 and 4). The samples were prepared as directed in the test for *Histological Evaluation* in *Specific Tests*.

Add the following:

▲Scaffold Human Amniotic Membrane Allograft

DEFINITION

Scaffold Human Amniotic Membrane Allograft is derived from normal human placental amniotic tissue obtained from full-term pregnancies. The amniotic tissue is isolated and decellularized to remove cellular contaminants, resulting in an extracellular matrix with basement membrane. Scaffold Human Amniotic Membrane Allograft is composed predominantly of collagen and elastin. Tissues are obtained from sources that have passed applicable donor tissue eligibility requirements for relevant diseases, are processed, dehydrated, and terminally sterilized with e-beam irradiation. Scaffold Human Amniotic Membrane Allograft is supplied in a dry sheet form and is stored at ambient temperature.

IMPURITIES

• **ANALYSIS OF RESIDUAL SODIUM DEOXYCHOLATE**
Solution A: Purified water liquid chromatography–mass spectrometry (LC/MS) grade
Solution B: Acetonitrile LC/MS grade
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5

www.webofpharma.com

Table 1 *(continued)*

Time (min)	Solution A (%)	Solution B (%)
8	25	75
9	2	98
13	95	5

Diluent 1: Acetonitrile and purified water, both LC/MS grade (50:50), and 0.1% formic acid
Diluent 2: Isopropyl alcohol and purified water (90:10)
Diluent 3: 50% ethanol in phosphate buffered saline (PBS)
Lock mass stock solution: Add 2.5 mL of purified LC/MS grade water to a 10-mg vial of leucine enkephalin acetate to obtain a 4-µg/µL stock solution.
Lock mass solution: 2 ng/µL prepared as follows. Transfer a 10-µL aliquot of the *Lock mass stock solution* to a 20-mL volumetric flask, and add *Diluent 1* to volume.
Calibration solution: 5 mM sodium formate in *Diluent 2*
Sodium deoxycholate stock solution 1: Weigh a 25 ± 0.5-mg portion of sodium deoxycholate, add to a 50-mL volumetric flask, and dissolve in *Diluent 3* to obtain a 500-µg/mL solution.
Sodium deoxycholate stock solution 2: Dilute *Sodium deoxycholate stock solution 1* volumetrically at a ratio of 1:50 in *Diluent 3* to obtain a 10-µg/mL solution.
Sodium deoxycholate standard solution: Dilute *Sodium deoxycholate stock solution 2* volumetrically at a ratio of 1:5 in *Diluent 3* to obtain a 2-µg/mL solution.
Lithocholic acid stock solution 1: Weigh a 25 ± 0.5-mg portion of lithocholic acid, add to a 50-mL volumetric flask, and dissolve in *Diluent 3* using a sonicator for approximately 30 min to obtain an approximate 500-µg/mL stock solution.
Lithocholic acid stock solution 2: Dilute *Lithocholic acid stock solution 1* volumetrically at a ratio of 1:50 in *Diluent 3* to obtain an approximate 10-µg/mL solution.
Lithocholic acid standard solution: Dilute *Lithocholic acid stock solution 2* volumetrically at a ratio of 1:5 in *Diluent 3* to obtain a 2-µg/mL solution.
Spiked internal standard solution 1: Dilute *Sodium deoxycholate standard solution* and *Lithocholic acid standard solution* in *Diluent 3* at a ratio of 1:1:18.
Spiked internal standard solution 2: Dilute *Sodium deoxycholate stock solution 2* and *Lithocholic acid stock solution 2* in *Diluent 3* at a ratio of 1:1:3.
Sample: 2 mg of Scaffold Human Amniotic Membrane Allograft. Subdivide the test and control sample(s) to facilitate transfer into 20-mL vials.
Spiked sample: Spike the sample with 60 µL of *Lithocholic acid standard solution*. Dry under a stream of nitrogen for 2 h.
Spiked control sample: Spike the sample with 60 µL of *Spiked internal standard solution 2*. Dry under a stream of nitrogen for 2 h.
Chromatographic system
Mode: UPLC
Detector: UV 190–400 nm
Column: 50-mm × 2.1-mm; 1.7-µm packing L7
Column temperature: 35°
Flow rate: 0.3 mL/min
Injection volume: 5 µL
Run time: 15 min
Mass spectrometry instrumental conditions
Mass analyzer: Quadrupole time of flight (QToF)
Mode of MS ionization: Electrospray ionization, negative ion mode
MS mode: Sensitivity
Spectral range: 50–1500 *m/z*
Detector: Time of flight (ToF)
Lock mass: 554.26 Da
Capillary: 2.6 kV
Sampling cone: 30 V
Extraction cone: 4 V
Temperatures
Source: 140°
Desolvation: 450°
System suitability
Sample: *Spiked internal standard solution 1*
Suitability requirements
Percent relative standard deviation (% RSD) detection limit: NMT 15%
Quality control check: 70%–130% of theoretical concentration
Relative response factor: 0.5–1.3
Deoxycholate–molecular mass (M–H): 391.2848 ± 0.02 Da
Internal standard–molecular mass (M–H): 375.2899 ± 0.02 Da
Analysis
Samples: *Spiked sample* and *Spiked control sample*
Sample extraction: Add *Diluent 3* to each sample vial containing *Spiked sample* or *Spiked control sample* using a ratio of 1.2 mL of *Diluent 3* per 2 mg of the sample. For each vial, extract the sample at 37 ± 2° for 120 ± 12 min. After the extraction is complete, remove the sample from each extraction vessel using a clean inert article, such as a disposable glass Pasteur pipette. Store the extract at 2°–8°.
Sample analysis: Analyze the extracts using instrument conditions described. Analyze 6 replicates of *Spiked internal standard solution 1* and *Diluent 3* as solvent blank as appropriate. Perform quality control (QC) checks at least every 10 samples using *Spiked internal standard solution 1*.
Analysis with mass spectrometer: Change the QToF mass spectrometer settings as follows.
Capillary: 2.6 kV
Sampling cone: 30.0 V
Extraction cone: 4 V
Temperatures
Source: 140°
Desolvation: 450°
Desolvation gas flow: 750 L/min
Use the *Calibration solution* to calibrate the mass spectrometer for a mass range of 50–1500 Da in sensitivity mode using tune page settings and without collision energy. Set up lock mass using *Lock mass solution* with a capillary voltage of 2.6 kV in negative mode of ionization at 554.26 Da (M–H).
Calculate the ratio of the deoxycholate peak area to the lithocholic acid peak area from the *Spiked sample* and the *Spiked control sample*.
Acceptance criteria: The ratio of the deoxycholate peak area to the lithocholic acid peak area from the *Spiked sample* must be less than that from the *Spiked control sample*.

www.webofpharma.com

• **Residual Cell Analysis**

Harris hematoxylin stock solution: Dissolve hematoxylin[1] in alcohol and 20 mL of water. Add ammonium aluminum sulfate in water with heat until completely dissolved. Remove the ammonium aluminum sulfate solution from heat and mix with the hematoxylin solution. Bring the mixed solution to a rapid boil. Immediately remove from heat, add sodium iodate, and mix. Reheat the solution to boiling and boil for approximately 2–3 min. Remove from heat and plunge the solution container into an ice bath. Allow the solution to cool and pass through a grade 541 or comparable filter paper. Store the solution in a light-protected bottle at room temperature. This solution is stable for approximately 2 months.

Harris hematoxylin working solution: Add 4 mL of glacial acetic acid to 100 mL of filtered *Harris hematoxylin stock solution*.

Eosin Y stock solution (1%): Add 1.0 g of eosin Y to 100 mL of distilled water and mix well. [Note—This solution can be stored for up to 1 year at room temperature.]

Phloxine B stock solution: Add 1.0 g of phloxine B to 100 mL of distilled water and mix well. [Note—This solution can be stored for up to 1 year at room temperature.]

Eosin–phloxine B working solution: Add 100 mL of *Eosin Y stock solution (1%)* and 10 mL of *Phloxine B stock solution* to 780 mL of 95% alcohol, then add 4 mL of glacial acetic acid and mix well. [Note—This solution can be stored for up to 1 year at room temperature.]

Samples: 5-mm × 5-mm pieces of Scaffold Human Amniotic Membrane Allograft prepared as follows. Place each piece of trimmed tissue into a pre-labeled tissue cassette. Place the cassettes into a tissue processor cassette basket that is set into a container of 10% formalin.

Tissue processing: Tissue processing can be done using an automated tissue processor programmed using a stepwise schedule with all steps done under a vacuum, except the first 10% neutral formalin step. The stepwise procedure is provided in *Table 2*.

Table 2

Step Solution	Time	Retort Temperature
10% neutral formalin	10 min	ambient
70% alcohol	15 min	ambient
80% alcohol	15 min	ambient
95% alcohol	15 min	ambient
95% alcohol	20 min	ambient
Absolute alcohol	15 min	ambient
Absolute alcohol	15 min	ambient
Absolute alcohol	20 min	ambient
Xylene	15 min	ambient
Xylene	20 min	ambient
Paraffin	20 min	61°
Paraffin	20 min	61°
Paraffin	20 min	61°

Embedding: Processed cassettes are placed into the embedding cassette bath and are embedded in paraffin–polyisobutylene embedding medium[2] on an on-edge orientation.

Sectioning: Blocks are sectioned at 5 µm using a microtome. Sections are floated on a water bath containing distilled water at a temperature of approximately 47°. A single section is placed on a charged slide. Multiple slides may be generated for additional stains. Before staining, slides are dried for 15 ± 5 min at 60 ± 5° in the slide drying oven.

Staining: Fixed *Samples* on slides are stained using the following procedure.

1. Deparaffinize sections, 2 changes of xylene, 5 min each
2. Re-hydrate in 1 change of absolute alcohol for 3 min
3. Re-hydrate in 95% alcohol for 2 min
4. Wash in running water for 3 min
5. Stain in *Harris hematoxylin working solution* for 10 min
6. Wash in running tap water for 5 min
7. Differentiate in 1% acid alcohol and 30% water containing 1% hydrochloric acid (70% for 15 s)
8. Wash in running tap water for 5 min
9. Stain with blue in ammonia water [1% solution of ammonium hydroxide (28%–30%)] for 6 s
10. Wash in running tap water for 5 min
11. 95% alcohol for 6 s
12. Counterstain in alcoholic eosin (0.25% eosin in 80% alcohol and 20% water) for 5 min
13. Differentiate in 95% alcohol for 10 s
14. Dehydrate in absolute alcohol for 30 s
15. Dehydrate in 2 changes of absolute alcohol, 2 min each
16. Clear in 2 changes of xylene, 1 min each
17. Hold in xylene for 2 min

Coverslipping and mounting: Stained slides are removed from xylene and are coverslipped. The appropriate size coverglass is placed with a suitable mountant using a volume appropriate for the selected coverglass size. When complete, the slides are removed, placed into slide flats and allowed to dry.

Analysis: Scaffold Human Amniotic Membrane Allograft preparations are identified as thin strips, NMT 100 µm of eosinophilic membranous material. The structure of the tissue includes distinct amniotic basement membrane with the bulk of the preparation appearing as dense, eosinophillic acellular matrix. If any residual amnion cells are present, the cells align on the surface of the membrane. Identify the presence of cell nuclei and cytoplasm in the samples:

1. Cell nuclei: stain blue
2. Cytoplasm: stains pink
3. Erythrocytes: stain red

The presence of cells is noted for each tissue sample. Tissue samples are examined and the number of cells per 2.5-mm length of tissue is counted. [Note—*Samples* are sterilized with e-beam radiation with a certified dose sufficient to render any remaining eukaryotic cells non-viable.]

Acceptance criteria: NLT 99% cell free or NMT 64 cells/mm² or NMT 2 cells/*Sample*. No bacterial cells identified by abnormal blue inclusions can be detected in the observed field. No inflammatory inclusions (such as granuloma) can be present in the *Sample*. No malignant

[1] A suitable reagent can be obtained from VWR, catalog #95057-858, or use a suitable equivalent.

[2] A suitable embedding and infiltration medium can be obtained from McCormick, catalog #39501006, or use a suitable equivalent.

www.webofpharma.com

cells, hyperplastic cells, benign tumor cells, or other cell debris can be present in the *Sample*.

SPECIFIC TESTS

• **HYDROXYPROLINE ASSAY FOR COLLAGEN CONTENT**

10X Assay buffer (10X acetate/citrate assay buffer): Weigh 50 g of citric acid, 120 g of sodium acetate trihydrate, and 34 g of sodium hydroxide. Add 890 mL of deionized or sterile water, 12 mL of glacial acetic acid, and 50 µL of toluene. Mix solution until it is free of visible particles, and then pass through a 0.22-µm filter. This buffer is stored at 2°–8° and is stable for at least 1 month.

1X Assay buffer (1X acetate/citrate assay buffer): Dilute 100 mL of *10X Assay buffer* with 900 mL of deionized or sterile water, and mix until solution is homogenous. Pass one time through a 0.22-µm filter. This buffer is stored at 2°–8° and is stable for at least 1 month.

Chloramine T reagent: Accurately weigh 4.23 g of chloramine T hydrate. Add 53.3 mL of *10X Assay buffer*, 20.7 mL of sterile water, and 26.0 mL of 1-propanol. Mix for approximately 1 h until solution is clear. This reagent is stored at room temperature and is stable for at least 12 h.

DMAB reagent: Weigh 12.0 g of 4-(dimethylamino) benzaldehyde (DMAB). Add 48 mL of 1-propanol and 20.7 mL of 70% perchloric acid, and then mix until the solution is free of visible particles. Solution is light sensitive and should be covered with foil until use. This reagent is stable at room temperature for at least 12 h after preparation.

System suitability solutions: Weigh 250 ± 5 mg of *trans*-4-hydroxy-L-proline. Calculate the volume of 6.0 N hydrochloride needed to create a 1000 µg/100 µL hydroxyproline solution and then, using the density of 6.0 N hydrochloride, which is 1.06 g/mL at 20°, determine the mass of that volume. Weigh the previously calculated mass of 6.0 N hydrochloride into an appropriate container, and then mix in the pre-weighed hydroxyproline reference material creating the 1000 µg/100 µL hydroxyproline solution.

High system suitability solution: 22.5 µg/200 µL prepared as follows. Weigh 121.476 g of 6.0 N hydrochloride and mix with 5.40 mL of 1000 µg/100 µL hydroxyproline solution.

Middle system suitability solution: 14.5 µg/200 µL prepared as follows. Weigh 123.511 g of 6.0 N hydrochloride and mix with 3.48 mL of 1000 µg/100 µL hydroxyproline solution.

Low system suitability solution: 6.5 µg/200 µL prepared as follows. Weigh 125.546 g of 6.0 N hydrochloride and mix with 1.56 mL of 1000 µg/100 µL hydroxyproline solution.

The *System suitability solutions* are stored in 2-mL aliquots at 2°–8° and are stable for at least 1 month.

Hydroxyproline stock solution: Purified hydroxyproline (1 mg/mL) in 0.01 N hydrochloride prepared as follows. Weigh 150 ± 5.0 mg of *trans*-4-hydroxy-L-proline reference material into a glass vial. Add a calculated volume of 0.01 N hydrochloride to create a 50-mg/mL hydroxyproline solution and mix until homogenous. Add 2.0 mL of 50-mg/mL hydroxyproline solution to a 100-mL volumetric flask, and add 0.01 N hydrochloride to volume. Invert the flask 7–10 times to ensure solution is homogenous. This solution is stored in 5.0-mL aliquots at 2°–8° and is stable for at least 1 month.

Standard solutions: Remove a single vial of the *Hydroxyproline stock solution* (1 mg/mL in 0.01 N hydrochloride) from storage and dilute 8 times in 0.01 N hydrochloride to a final concentration of 25 µg/200 µL. This working standard is the highest reference point in the hydroxyproline calibration curve. Prepare additional standard solutions by diluting the working standard with 0.01 N hydrochloride to final concentrations of 20, 16, 12, 8, and 4 µg per 200 µL. Include a 0.01 N hydrochloride blank in the assay as a background control.

Samples: Weigh NLT 3 samples, 5 ± 0.5 mg each, of Scaffold Human Amniotic Membrane Allograft. Place the samples in individual glass vials, and add 2 mL of 6.0 N hydrochloride to each vial so that the solution covers the material. Hydrolyze the samples by placing the vials on a dry heat block for 18 ± 1 h at 110°. After hydrolysis is complete, remove the vial caps and dry the samples uncovered at 110° for an additional 3–4 h. Resuspend the concentrated hydrolysate in 4.0 mL of 0.01 N hydrochloride for assay use.

System suitability requirements: The standard curve (R^2) must be NLT 0.98. The percent bias of the standard curve must be NMT 20% for 75% of all standard points (14 of 18). The percent coefficient value of the standard curve must be NMT 20% for 75% of all standard points. The percent bias of the *High system suitability solution*, *Middle system suitability solution*, and *Low system suitability solution* is NMT 20%. The percent coefficient value of the *High system suitability solution*, *Middle system suitability solution*, and *Low system suitability solution* is NMT 20%.

Analysis: Triplicate samples (100 µL) are added to individual glass vials labeled with the corresponding *Sample* weight (mg). Add 100 µL of 0.01 N hydrochloride to each *Sample* vial. To generate the hydroxyproline standard curve, 200 µL of each *Standard solution* is pipetted, in triplicate, into individual glass vials and 1.8 mL of *1X Assay buffer* is added to each *Sample* and hydroxyproline standard, bringing the final volumes to 2.0 mL. The hydroxyproline is oxidized by incubating the samples at room temperature for 30 min in 1.0 mL of *Chloramine T reagent*. At the end of this reaction, add 1.0 mL of *DMAB reagent* to each vial and allow to incubate at 60° for an additional 30 min. During this time, the *DMAB reagent* reacts with oxidized hydroxyproline residues, generating a colorimetric product that is directly proportional to the amount of hydroxyproline present in the test samples. At the conclusion of this reaction, transfer 200 µL of each *Standard solution* and *Sample* to individual wells of a clear, flat-bottom 96-well plate. Acquire data by spectrophotometer at an optical density (OD) of 550 nm. Hydroxyproline levels in test samples are determined by interpolation against the hydroxyproline standard curve using suitable software or by plotting.

Calculate the total amount of collagen:

$$\text{Result} = \{[(H_p/V_a) \times V_s]/F_1\}/F_2$$

H_p = hydroxyproline value interpolated from the standard curve (µg)
V_a = volume used in the assay (µL)
V_s = volume of 0.01 N hydrochloride used to resuspend the concentrated hydrolysate, 4000 µL
F_1 = standard factor, mass ratio of hydroxyproline residue in collagen, 0.125
F_2 = unit conversion factor, 1000 µg/mg

Calculate the percentage of collagen (%):

$$\text{Result} = (T/W) \times 100$$

T = total amount of collagen, previously calculated
W = *Sample* weight

USP Monographs

www.webofpharma.com

Acceptance criteria: Collagen content measured by hydroxyproline content is 74%–94%.

• **ELASTIN CONTENT**

Diluent: 200 mL of 85% (v/v) 1-propanol in water prepared as follows. Mix 30 mL of sterile water with 170 mL of 1-propanol.

Dye dissociation reagent: 3 M guanidine hydrochloride in *Diluent* prepared as follows. Weigh 28.7 ± 0.5 g of guanidine hydrochloride and add into 100 mL of *Diluent*. Stir at room temperature until completely dissolved (approximately 30 min). Wrap with aluminum foil. This reagent is stable for at least 1 month at room temperature.

Precipitating reagent: 15% (w/v) trichloroacetic acid in hydrochloride prepared as follows. Weigh 15 ± 1 g of trichloroacetic acid, add 60 mL of sterile water, and stir to dissolve. Add 20 mL of 0.06 N hydrochloride to make a solution with a pH of −0.3 ± 0.1. Add additional sterile water to 100 mL. Wrap the bottle with aluminum foil; store at 2°–8°. This reagent is stable for at least 3 months at a storage temperature of 2°–8°.

0.4 M phosphate buffer: Mix 320 mL of 1 M phosphate buffer stock solution, pH 7.4, with 480 mL of sterile water. This solution is stable for at least 3 months at a storage temperature of 2°–8°.

Saturated ammonium sulfate buffer: Dispense 200 mL of *0.4 M phosphate buffer* into an appropriate container. Add 150 ± 1 g of ammonium sulfate. Stir at room temperature for 30 min. The top solution phase is ready to use after undissolved ammonium sulfate settles completely. This solution is stable for at least 3 months at 2°–8°.

0.4 M phosphate buffer with 24% saturated ammonium sulfate: Prepare 600 mL as follows. Mix 144 mL of *Saturated ammonium sulfate buffer* with 456 mL of *0.4 M phosphate buffer*. This solution is stable for at least 3 months at 2°–8°.

Dye reagent: 0.5 mg/mL of 5,10,15,20-tetraphenyl-21*H*,23*H*-porphine-*p*, *p*′,*p*″,*p*‴-tetrasulfonic acid tetrasulfonate (TPPS) in *0.4 M phosphate buffer with 24% saturated ammonium sulfate*. Weigh 0.250 ± 0.05 g of TPPS powder. Add the weighed powder into 500 mL of *0.4 M phosphate buffer with 24% saturated ammonium sulfate*. Stir at room temperature until completely dissolved (approximately 15 min). Pass TPPS dye solution through a 0.22-µm filter. Wrap the bottle with aluminum foil. This reagent is stable for at least 1 month at 2°–8°.

Assay diluent: 0.25 M oxalic acid prepared as follows. Mix 1 part 0.5 M oxalic acid with 1 part deionized water. Store at 15°–30°.

High system suitability solution: 25 µg/250 µL of tropoelastin in *Assay diluent*

Middle system suitability solution: 20 µg/250 µL of tropoelastin in *Assay diluent*

Low system suitability solution: 15 µg/250 µL of tropoelastin in *Assay diluent*

Tropoelastin standard stock solution: 0.200 mg/mL of human recombinant tropoelastin in 0.25 M oxalic acid prepared as follows. Weigh 11 ± 1 g of tropoelastin (combine vials as needed), and place in a labeled glass vial. Record the weight. Calculate the amount of *Assay diluent* needed to make 4 mg/mL with the amount of tropoelastin measured above (e.g., 2.5 mL of oxalic acid is needed for 10.0 mg of tropoelastin). Record the volume. Add the calculated amount of *Assay diluent* to the labeled glass vial using a calibrated pipettor. Mix 6 times on a vortex mixer for 20 s each time at 3000 rpm. Invert the vial 3 times between each vortex. Visually check if tropoelastin is completely dissolved. If it did not dissolve, repeat previous step. Further dilute with *Assay diluent* the reconstituted 4 mg/mL tropoelastin solution to 0.200 mg/mL using a volumetric flask. Store at −20 ± 2°.

Standard solutions: Remove a single 2.2-mL vial of the *Tropoelastin standard stock solution* (0.200 mg/mL in *Assay diluent*) from storage at −20 ± 2°, thaw at room temperature, and dilute in *Assay diluent* to the following concentrations: 30, 27, 22, 17, 12, 10, and 8 µg per 250 µL. A blank of *Assay diluent* is included in the assay as a non-specific background control.

Sample: Weigh NLT 3 samples, 5.0 ± 1.0 mg each, of Scaffold Human Amniotic Membrane Allograft and place into individual glass vials. Add 2.5 mL of *Assay diluent* to each vial so that the solution covers the sample. Hydrolyze the samples by placing the vials on a dry heat block for 30 ± 5 min at 100°. Centrifuge the samples, and remove and set aside the supernatant. Repeat the hydrolysis step a second time, and pool the resulting supernatants. Store the pooled hydrolysate at 2°–8° until processed in the assay.

System suitability requirements: The standard curve (R^2) must be NLT 0.98. The percent bias of the standard curve must be NMT 20% for 75% of all standard points. The percent bias of the *High system suitability solution*, *Middle system suitability solution*, and *Low system suitability solution* is NMT 30% of each level's target concentration. The percent coefficient value of the *High system suitability solution*, *Middle system suitability solution*, and *Low system suitability solution* is NMT 20%.

Analysis: To each of 3 individual, labeled, microcentrifuge tubes, add 65 µL of the pooled hydrolysate sample. Add 185 µL of *Assay diluent* to each sample tube. To generate the tropoelastin standard curve, pipette 250 µL of each *Standard solution*, in triplicate, into individual microcentrifuge tubes. Thaw the *Standard solutions*, and transfer 250 µL of each into individual microcentrifuge tubes, in triplicate. Add 250 µL of pre-chilled *Precipitating reagent* (1:1) to all test samples and standards, and incubate at room temperature for 10 min. Centrifuge all samples and standards, and discard the supernatants. Add 1 mL of elastin dye reagent (5,10,15,20-tetraphenyl-21,23-porphine tetra-sulfonate or TPPS), which complexes with solubilized elastin, to the test samples and standards. Mix all the vials vigorously on a vortex mixer, and incubate for 120 min on an orbital shaker at room temperature. Subsequently, centrifuge the samples and standards, and discard the supernatants. Add 250 µL of elastin *Dye dissociation reagent* to the pellet (to dissociate the dye from the solubilized elastin), and incubate for 10 min at room temperature. Centrifuge the samples and standards briefly to pull down all condensate off of the microcentrifuge tube walls, and then transfer the full 250 µL from each tube to a 96-well microplate. Data is acquired by spectrophotometer at an optical density (OD) of 513 nm. Determine the elastin levels in the test samples by interpolating against the tropoelastin standard curve, using an absorbance plate reader and associated software capable of reading absorbance. Additional data analysis is performed using statistical analysis software.

Calculate the total amount of elastin in mg:

$$\text{Result} = (M_E/V_S) \times V_T \times F$$

M_E = measured mass of elastin (µg)
V_S = volume of pooled hydrolysate *Sample*, 65 µL
V_T = total volume of elastin extract for each *Sample*, 5000 µL
F = conversion factor, 0.001 (µg to mg)

www.webofpharma.com

Calculate the percentage of elastin (%):

$$\text{Result} = (E/S_W) \times 100$$

E = total amount of elastin (mg)
S_W = sample weight (mg)

Acceptance criteria: 9.0%–17.0% elastin content

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩
Sample: Prepare 2 cm × 3 cm of Scaffold Human Amniotic Membrane Allograft as follows. Extract the sample by immersing in endotoxin-free water and placing it on an orbital shaker in an incubator for NLT 60 min at 37°–40°.
Acceptance criteria: NMT 3.3 USP Endotoxin Units/*Sample*

• **STERILITY TESTS** ⟨71⟩
Sample: 1 cm × 2 cm of Scaffold Human Amniotic Membrane Allograft
Analysis: Test NLT 5 *Samples* in both *Soybean–Casein Digest Medium* and *Fluid Thioglycollate Medium* at an incubation temperature of 30°–35° and 20°–25°, respectively.
Acceptance criteria: Meets the requirements

• **WATER DETERMINATION** ⟨921⟩, *Method I, Method Ia*
Sample: Prepare 6 cm × 6 cm of Scaffold Human Amniotic Membrane Allograft as follows. Place the sample in a dry vial. Seal the vial with an aluminum seal and a cap and place it in a drying oven where the water content is thermally released and transferred to a titration vessel by means of a dried, inert purge gas.
Analysis: Proceed as directed in the chapter.
Acceptance criteria: NMT 20%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Scaffold Human Amniotic Membrane Allografts range in size from 1 cm × 2 cm to 6 cm × 6 cm per batch. Scaffold Human Amniotic Membrane Allografts are packaged in polyester-based heat-sealed laminate film peel pouches, supplied as a single-use, sterile, membrane sheet, and stored at room temperature.

• **LABELING:** The package label indicates the size of the Scaffold Human Amniotic Membrane Allograft, the lot number, the expiration date, the trade name, the required storage conditions, the dosage information, and manufacturer and/or distributor contact information. "Instructions for Use", which includes a summary of records used to make donor eligibility determination and necessary information for properly using the product for its intended use, is provided with each allograft.▲ 2S (USP41)

Scaffold Human Dermis

DEFINITION

Scaffold Human Dermis is derived from donated allograft human dermis that is processed to remove cells and freeze-dried to remove moisture while preserving biologic components and structure of the dermal matrix. It is biocompatible and supports remodeling by the recipient's own tissue. The matrix is composed of native human dermal architecture, consisting of collagen (mainly collagen Type I, with additional components of collagen Types III and IV), chondroitin sulfate and hyaluronic acid glycosaminoglycans, and elastin. The product can be provided in a sheet or powder form.

The donated human skin is processed in a manner that removes all cellular components, including the epidermal layer and dermal cells. The resulting product is then rendered into a particulate form (microsized), with a mean particle size of less than 100 µm, by processing with a freezer mill. Scaffold Human Dermis does not contain intact cells, cell nuclei, or chemically induced crosslinks. Human skin used to produce Scaffold Human Dermis is obtained from sources that have passed applicable donor eligibility requirements for relevant communicable diseases. Scaffold Human Dermis is manufactured using sterile solutions and equipment under aseptic conditions. The final product is inspected and tested to ensure that the product meets specifications.

SPECIFIC TESTS

• **HISTOLOGICAL EVALUATION**
Sucrose solution: Dissolve 20 g of sucrose in 100 mL of water.
Tissue preparation: Submerge a 1.4-cm or greater size piece of Scaffold Human Dermis in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Cut three 1.5-cm × 0.5-cm pieces of Scaffold Human Dermis, and place each piece from the same donor lot into a suitable histological tissue cassette for routine histology processing and paraffin embedding. Place the cassettes in 10% neutral buffered formalin[1] at room temperature for a minimum of 12 h. [NOTE—the cassettes may be kept at room temperature for 1 month.] From the same donor lot, cut a minimum of three 1.0-cm × 0.5-cm pieces of Scaffold Human Dermis for immunohistochemical (IHC) staining, and place in a vial containing the *Sucrose solution*. Store at between 2° and 8° for a minimum of 4 h, but the product can be held in the solution for up to 2 weeks.
Embedding and sectioning of histological samples: Place all cassettes to be processed into a suitable histological cassette basket including one cassette containing formalin-fixed normal skin to serve as a process control. The following steps can be performed using a vacuum infiltration tissue processor.[2] At room temperature (37° ± 2°), tissue samples that continue to fix in 10% neutral buffered formalin are dehydrated through graded reagent alcohol (70%, 80%, 95%, and 100%).[3] The tissue samples are cleared in a xylene substitute.[4]
The tissue is infiltrated with paraffin[5] at 60°. The following embedding procedure can be performed with the use of a histology tissue embedding unit, consisting of a thermal console, dispensing console, and cryo-console. Open the histological cassette. Partially fill embedding molds with molten paraffin (60°). While keeping the paraffin heated, position the three tissue pieces on edge in the paraffin so that cross-sections of the Scaffold Human Dermis, once they are completely embedded, can be cut. Rapidly cool the paraffin so that it partially solidifies. Completely fill the embedding mold with additional molten paraffin (60°), and cool until completely solidified.
Remove solidified paraffin blocks from embedding molds for sectioning. Sectioning of paraffin-embedded samples can be performed on a suitable microtome.[6] Clamp the tissue block into the holder of the microtome. Fill a histological water bath with fresh water. [NOTE—A quarter teaspoon of gelatin may be added to the water bath for

[1] 10% Neutral buffered formalin can be purchased through Statlab Medical Products, Inc. Lewisville, TX.
[2] A suitable processor can be the Tissue Tek V.I.P. Model #1000 vacuum infiltration tissue processor or the Leica ASP300 tissue processor.
[3] Graded alcohols: 70%, 80%, and 95% are prepared using 100% reagent alcohol, such as that purchased from Statlab Medical Products, Inc. Lewisville, TX.
[4] Such as a citrus clearing solvent from Richard-Allan Scientific, Kalamazoo, MI.
[5] Such as Paraplast, Extra, manufactured by McCormick Scientific, St. Louis, MO.
[6] Such as Leica RM 2155 or RM 2255 Rotary Microtome.

USP Monographs

www.webofpharma.com

section adhesion.] Maintain the water bath at 39° ± 2°. Cut sections to a thickness of 3–5 µm to form a ribbon, and gently lay the ribbon on the water bath. Place two consecutive sections on each glass microscope slide.

Embedding and sectioning of immunohistochemical samples: Fill histology embedding molds with a cryo-protectant embedding media. Transfer tissue pieces from the *Sucrose solution* to the embedding media in the mold, orient so that cross-sections can be cut, and let sit for 1–30 min. Freeze the molds with liquid nitrogen, and store at –80°. Remove the frozen blocks from the molds for sectioning. Cryo-section each block to 4–7 µm in thickness, and place the sections on glass microscope slides. Place at least two sections on each slide. Slides can be stored at between –70° and –85°.

Hematoxylin and eosin sample staining: [NOTE—Store all solutions at room temperature.]

1% Acid alcohol solution: Alcohol, hydrochloric acid, and water (1309:20:509)

95% Reagent alcohol solution: Alcohol and water (190:10)

80% Reagent alcohol solution: Alcohol and water (160:40)

Saturated lithium carbonate solution: Water, lithium carbonate (200:2), (v:w)

Analysis: The slide with affixed tissue (sections) is deparaffinized in three changes of xylene substitute, rehydrated in graded reagent alcohols (100% and 95%), and rinsed in tap water. The sections are stained with hematoxylin, rinsed, decolorized with *1% Acid alcohol solution*, and neutralized with *Saturated lithium carbonate solution*. The sections are counterstained with 1% alcoholic eosin Y, dehydrated through graded reagent alcohols (95% and 100%) and xylene substitute, and then coverslipped. A positive control is stained with each batch to ensure successful staining.

Acceptance criteria: Adequate staining is defined by a blue nuclear stain and a pink-red cytoplasm. Sections are assessed for tissue matrix integrity and are acceptable if they pass the following criteria: they must not show evidence of intact epidermal or dermal cells and must not show evidence of widespread collagen damage (broken, condensed, or distorted fibers) or unrecognizable papillary layer, as shown in the USP Scaffold Human Dermis Reference Photomicrographs[7] of products with acceptable appearance.

Immunohistochemical sample staining

0.5 M phosphate-buffered saline, pH 7.4 (PBS): Prepare by combining 8.50 g of sodium chloride, 0.85 g of dibasic sodium phosphate, and 0.54 g of monobasic potassium phosphate in 1 L water. Adjust the pH to 7.4 with 1.0–3.0 M sodium hydroxide. Store at room temperature.

Diluent PBS: Combine 0.250 g of bovine serum albumin, 25 mL of *PBS*, and 0.02–0.03 g of thimerosal. Store at between 2° and 8° for up to 1 year.

Primary and secondary antibodies: Perform a titer assay to determine the optimal dilution for each antibody when a new lot is used. Dilute in *Diluent PBS* as per titer assay.

Human monoclonal anti-type IV collagen:[8] 25- to 100-µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Human monoclonal anti-MHC class I:[9] 100- to 200-µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Human monoclonal anti-MHC class II:[10] 100- to 200-µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Goat anti-mouse IgG (Fab-specific) peroxidase conjugate:[11] 100- to 200-µL aliquots of concentrated antibody may be stored at between –70° and –85°.

3,3-Diaminobenzidine staining kit or stable diaminobenzidine (DAB):[12] To make the working stain, consult kit instructions. Store the kit at between 2° and 8°. 3,3-Diaminobenzidine is light sensitive; minimum exposure to light is advisable. Stable DAB is stored at between 0° and –20°.

3% Hydrogen peroxide: Store at room temperature.

Acetone: Store at between –10° and –20°.

Analysis for monoclonal anti-MHC class I and class II: Frozen sections are obtained and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. A cocktail of *Human monoclonal anti-MHC class I*, *Human monoclonal anti-MHC class II*, and bovine serum albumin are applied to the sections. Sections are rinsed with *PBS*, and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS*, and *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives exactly the same treatment as the test samples. The negative control is the same tissue section as the positive. The difference is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved, the stain is repeated.

Acceptance criteria: Adequate positive staining of sections will appear brown in color, focal, and cell-associated and will be clearly distinct from the background, as shown in the USP Scaffold Human Dermis Reference Photomicrographs of products with acceptable appearance for staining with MHC I and II antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

Analysis for monoclonal anti-type IV collagen: Frozen sections are obtained, and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. *Human monoclonal anti-type IV collagen* along with bovine serum albumin are applied to the sections. Sections are rinsed with *PBS*, and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS*, and *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives

exactly the same treatment as the test samples. The negative control is the same tissue section as the positive. The difference is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved, the stain is repeated.

Acceptance criteria: Adequate positive stain results will reveal a brown stain in the location of the basement membrane, as shown in the USP Scaffold Human Dermis Reference Photomicrographs of products with acceptable appearance for staining with collagen type IV antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

• **BIOCHEMICAL ANALYSIS**

Sample solution: Submerge 20 mg of Scaffold Human Dermis in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Freeze the sample, and mill using a freezer mill.[13] Suspend in 10 mL of 4 M guanidine hydrochloride, 50 mM sodium acetate, 5 mM EDTA, 0.1 mM phenylmethylsulfonyl fluoride (PMSF), 10 mM *N*-ethylmaleimide (NEM), 0.2% Triton X-100, pH 5.8, and extract for 48 h at 4°, with agitation. Centrifuge for 10 min at 4° and 23,500 *g*. Remove the supernatant, and digest with 20 µL of chondroitinase ABC,[14] 1 milli-Unit/µL. Analyze for *Glycosaminoglycan (GAG) content* and *Immunochemical analysis of decorin* (below). For *Collagen content* analysis, wash the pellet three times with 10 mL of deionized water, centrifuging for 10 min at 4° and 23,500 *g* after each wash. Resuspend in a minimal amount of water, freeze at –80°, and lyophilize. Resuspend 20 mg of the lyophilized pellet in 20 mL of 0.5 M acetic acid containing 100 µg of pepsin per mg of tissue, and incubate overnight at 4° with agitation. Remove undigested material by centrifugation at 23,500 *g* for 20 min.

Collagen content

Sample buffer: Prepare as directed for *Sample Buffer 1* in *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, *Electrophoretic Separation*.

Sample collagen solution: Add 20 µL of the supernatant from the *Sample solution* to 20 µL of *Sample buffer*, mix, and incubate at 60° for 15 min.

Control samples: Prepare suitable positive control samples (human placental collagen types I[15] and III[16]) similar to *Sample collagen solution*.

Gel electrophoresis: Load 40 µL of each of *Sample collagen solution* and the *Control samples* onto a 6% acrylamide gel, perform the electrophoretic separation, and stain with Coomassie brilliant blue as directed under *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

Acceptance criteria: The bands obtained from Scaffold Human Dermis are distinct and clearly visible at a mobility similar to that of the bands obtained from the collagen types I and III control samples. No smears corresponding to degraded collagen types I and III are found on the gel.

Glycosaminoglycan (GAG) content

Sample GAG solution: Use 15 µL of the supernatant prepared as directed for *Sample solution*.

DMMB reagent: Dissolve 16 mg of 1,9 dimethyl-methylene blue (DMMB) in 5 mL ethanol. Add 3.24 mL of formic acid and 2.94 mL of 10 M sodium hydroxide. Bring to 1000 mL with water.

50 mM Sodium acetate solution: Dissolve 1.03 g of sodium acetate in 250 mL of water.

Analysis: Add 15 µL of *Sample GAG solution* to each well of a 96-well microtiter plate. To each sample well, add 200 µL of *DMMB reagent* and 35 µL of *50 mM Sodium acetate solution*. Read the samples on a spectrophotometric microplate reader at 540 nm, using 595 nm as a reference. Perform the same procedure on a sample of bovine collagen type I[17] negative control and positive controls hyaluronic acid[18] and chondroitin sulfate,[19] using 15 µL of 3 mg/mL solutions from each of the controls.

Acceptance criteria: Scaffold Human Dermis contains glycosaminoglycans (GAG) as represented by positive control standards. GAG concentration can be determined by the preferential binding of DMMB dye to negatively charged ions such as sulfated GAGs.

Immunochemical analysis of decorin

Sample decorin solution: Submerge 100–200 mg of Scaffold Human Dermis in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Using a freezer mill as outlined above, extract the tissue in a solution of 4 M guanidine hydrochloride, 50 mM sodium acetate (pH 5.8) containing 5 mM EDTA, 0.1 mM PMSF, and 10 mM NEM for 24–48 h with agitation at 4°. Centrifuge the extracted tissue at 23,500 *g* for 10 min, and remove the supernatant.

Nitro blue tetrazolium (NBT): Dissolve 0.5 g in 10 mL of 70% dimethyl sulfoxide (DMSO). Store in the dark at room temperature.

5-Bromo-4-chloro-3-indolyl phosphate (BCIP): Dissolve 0.5 g in 10 mL of 100% DMSO. Store in the dark at room temperature.

Alkaline phosphatase buffer: 100 mM sodium chloride, 5 mM magnesium chloride, 100 mM Tris(hydroxymethyl) aminomethane hydrochloride, pH 9.5. Filter, and store at 4°.

Chromogenic substrate mixture: Mix 66 µL of *NBT* and 33 µL of *BCIP* in 10 mL of *Alkaline phosphatase buffer*.

Blotting buffer 1: 50 mM Tris buffered saline, pH 7.4, with 0.1% Tween 20 (TBST)

Blotting buffer 2: 5% blotting grade milk in TBST

Blotting buffer 3: 0.1% blotting grade milk in TBST

Analysis: Run an aliquot of *Sample decorin solution* on an 8% polyacrylamide gel at 100 V for approximately 60 min along with 100 µg of recombinant decorin[20] positive control, bovine type I collagen[21] negative control, and prestained molecular weight marker, and transfer to a polyvinylidene fluoride (PVDF) membrane according to the following procedure. In a shallow tray, soak two sheets of Whatman paper and two pieces of sponge in transfer buffer (200 mM glycine, 25 mM tris, and 20% methanol, pH 8.3). Soak the transfer membrane in methanol before soaking in the transfer buffer. Equilibrate the gel in transfer buffer for 10 min. Assemble the tank transfer apparatus according to manufacturer's instructions. Layer the following items within the apparatus in proper order: sponge, paper, gel, PVDF membrane, paper, and sponge.

[13] Such as SPEX/CertiPrep Freezer/Mill.

[14] Suitable chondroitinase is available from Seikagaku, Tokyo, Japan, catalog #100330.

[15] Suitable type I collagen is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C7774.

[16] Suitable type III collagen is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C4407.

[17] Suitable type I collagen is available from Invitrogen, 1600 Faraday Ave., PO Box 6482, Carlsbad, CA, 92008 catalog #100.

[18] Suitable hyaluronic acid is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #H1876.

[19] Suitable chondroitin sulfate is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C4384.

[20] Suitable decorin is available from R&D Systems, 614 McKinley Place NE, Minneapolis, MN 55413, catalog #143DE100.

[21] Suitable type I collagen is available from Invitrogen, 1600 Faraday Ave., PO Box 6482, Carlsbad, CA 92008.

www.webofpharma.com

Clamp the apparatus closed. Connect the electrodes, and transfer the gel bands to the membrane at about 100 V at 4° for about 1 h. Using prestained protein molecular weight marker, and staining the gel after electro-blotting, allow for visual determination of transfer completion. When transfer is complete, disconnect the transfer apparatus, and carefully remove the membrane. Block the membrane for at least 1 h with *Blotting buffer 2*, cover, and shake gently for 30 min. Wash the membrane three times for 5 min each with *Blotting buffer 1*. Add rabbit anti-human decorin primary antibody,[22] diluted to 2 µg/mL in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*. Add goat anti-rabbit IgG secondary antibody conjugated[23] to alkaline phosphatase, diluted 1:3000 in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*. Add 10 mL of *Chromogenic substrate mixture*, and incubate until color has developed. When the bands are clearly visible, stop the development reaction by rinsing the membrane with water.

Acceptance criteria: The decorin band obtained from Scaffold Human Dermis is the only band on the gel and is clearly visible at a mobility similar to the band obtained from the control sample recombinant decorin.

- **MICROBIAL ENUMERATION TESTS** ⟨61⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨62⟩**:** The total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. Scaffold Human Dermis meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **PARTICLE SIZE ANALYSIS**

(See *Particulate Matter in Injections* ⟨788⟩.)

[NOTE—Test specific to the powder form]

Sample: 100 mg of powder form of Scaffold Human Dermis material

Analysis: Add the *Sample* to 25 mL of saline in a clean 50-mL conical tube. Rehydrate and disperse the particles by probe sonication at 20 watts for 60 s. Place an appropriate aliquot of sample suspension in an appropriate liquid particle counter (LPC) for analysis by laser light obscuration (light extinction).

Acceptance criteria: The mean particle size is NMT 100 µm.

ADDITIONAL REQUIREMENTS

- **LABELING:** The package label indicates the weight of the Scaffold Human Dermis material enclosed. The label also contains the lot number, the expiration date, the trade name, the required storage conditions, the dosage information, and manufacturer and/or distributor contact information. "Instructions for Use," which includes a summary of records used to make donor eligibility determination and necessary information for properly using the product for its intended use, is provided with each unit.
- **PACKAGING AND STORAGE:** Scaffold Human Dermis is aseptically packaged and supplied in a freeze-dried configuration in a double pouch configuration. It is supplied in various sizes and thicknesses. The powder configuration is supplied in a single-use delivery syringe packaged in a hermetically sealed pouch. Scaffold Human Dermis is stored between 1° and 10° and labeled with the expiry date.

[22] Suitable primary antibody is available from BioVision, 980 Linda Vista Ave., Mountain View, CA 94043, catalog #3645100.

[23] A suitable secondary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, cat #A9917.

- **USP AUTHENTIC VISUAL REFERENCES** ⟨11⟩

USP Scaffold Human Dermis Reference Photomicrographs: the samples were prepared as directed in the test for *Histological Evaluation*. These photomicrographs show the histological appearance of passing histological evaluation with no evidence of intact epidermal or dermal cells, and no evidence of collagen damage (photomicrographs 2–6) and of failed material with collagen damage and condensed papillary dermis or attached epidermal remnant (photomicrographs 7–10). Passing and failed material are compared to photomicrograph 1 showing the staining of unprocessed normal human skin with intact epidermal or dermal cells. Photomicrographs 11 and 12 are negative and positive controls for the analysis of immunostaining with MHC I and II antibodies. Photomicrographs 13 and 14 are negative and positive controls for the analysis of immunostaining with collagen type IV antibodies. For both types of staining, a passing positive stain will appear brown in color, focal, and cell-associated, whereas a failed negative stain will appear clear with no brown staining.

Scaffold Porcine Bladder

DEFINITION

Scaffold Porcine Bladder is derived from porcine urinary bladder walls obtained from a certified closed pathogen-free herd. The bladder walls are processed by both mechanical and chemical methods that result in a sterile, decellularized material retaining a basement membrane with type IV collagen. Scaffold Porcine Bladder is manufactured in single and multi-layered lyophilized sheets as well as powder forms.

IDENTIFICATION

[NOTE—Powdered and multi-layered product forms must meet the requirements for *Identification* as single sheets before conversion to the other product types.]

- **A. IMMUNOHISTOCHEMISTRY FOR TYPE IV COLLAGEN**

Diluent: Tris-buffered saline (TBS) containing suitable amounts of normal serum, surfactant, and a preservative[1]

Primary antibody: Rabbit anti-human collagen IV,[2] cross-reactive with the corresponding porcine protein, diluted 1:500 in *Diluent*

Negative control solution: Diluted normal rabbit serum[3]

Secondary antibody: About 25 µg/mL of polymerized alkaline phosphatase-labeled anti-rabbit IgG[4] in *Diluent*

Sample preparations: Formalin-fixed, paraffin-embedded tissue samples are prepared, one per device, and sectioned at a thickness of 5 µm using suitable, validated methods. [NOTE—See also *Preparation of Biological Specimens for Histologic and Immunohistochemical Analysis* ⟨1285⟩ for helpful but not mandatory guidance.] Positive controls include normal porcine bladder, which is known to contain collagen IV at the location of the epithelial basement membrane. An additional sample of Scaffold Porcine Bladder is used as a negative control and incubated with *Negative control solution* rather than *Primary antibody* in the *Analysis*. One negative and one positive control section are used per test group. Before staining, sections are dewaxed with a suitable solvent[5] for 5 min, immersed in 100%

[1] Included in Leica Biosystems kit catalog #AR9352 or a suitable alternative.

[2] Abcam catalog #ab6586 or a suitable alternative.

[3] Leica Biosystems catalog #PA0777 or a suitable alternative.

[5] Leica Biosystems catalog #AR9222 or a suitable alternative.

www.webofpharma.com

ethanol for 5 min, then washed after the alcohol step and between each subsequent immunohistochemical step in a suitable buffer[6] three times for 5 min each. Note that all immersions and washes are done at ambient temperatures.

Analysis: *Sample preparations* are then treated for 10 min with a suitable enzyme[7] to retrieve the type IV collagen antigen followed by rinsing as above. Except for the negative control sample, the *Primary antibody* is then added for 30 min followed by rinsing as described above. For the negative control sample, *Negative control solution* is added to the sample for this incubation, rather than *Primary antibody*. Next the *Secondary antibody* is added for 30 min followed by rinsing as described above and then a final rinse in deionized water for 5 min. A suitable enzyme[8] substrate is added for 5 min followed by three rinses of 5 min each in deionized water to stop the reaction. The tissue is then stained with a hematoxylin solution[9] for 5 min followed by two rinses of 5 min each in deionized water then one rinse in a suitable buffer[10] for 5 min. The tissue is then placed in a clarifying buffer[11] for 10 min, followed by three washes for 5 min each in a suitable buffer. The tissue sections are then dehydrated in 100% alcohol, followed by xylene, and then a coverslip is mounted on each section using a suitable mounting medium.[12] Sections are examined with a light microscope at 40× magnification.

System suitability criteria: Negative controls should not contain any magenta staining, and positive controls should have magenta staining.

Acceptance criteria: Intense magenta staining (intensity of magenta staining should be similar to that observed with the positive controls) for the basement membrane protein type IV collagen must be observed on the luminal surface of the Scaffold Porcine Bladder sample.

- **B. Periodic Acid-Schiff Stain for Basement Membrane Structure**

Sample preparations: Formalin-fixed, paraffin-embedded tissue samples are prepared, one per device, and sectioned at a thickness of 5 µm using suitable, validated methods. [Note—See also ⟨1285⟩ for helpful but not mandatory guidance.] Positive controls include normal porcine bladder and a canine positive tissue control. Two positive control sections are used per test group. Before staining, sections are dewaxed with a suitable solvent[13] for 5 min, then immersed in 100% ethanol for 5 min, followed by a graded series of alcohols of 5 min each, ending in distilled water for 5 min.

Analysis: *Sample preparations* are placed in a 0.5% periodic acid solution[14] for 5 min followed by several washes in distilled water. The sections are then placed in a room temperature Schiff reagent solution[15] for 15 min, followed by rinsing with running, lukewarm water for 10 min. The sections are then immersed in a hematoxylin solution[16] for about 1 min, followed by rinsing in distilled water for 30 s. Sections are then placed in a bluing reagent[17] for 1 min, followed by rinsing in distilled water for 30 s. The stained sections are then placed in 95% ethanol for 1 min, then 100% ethanol for 1 min, then three washes in xylene for 1 min each, followed by mounting a coverslip over each section using a suitable mounting medium.[18] Stained sections are examined with a light microscope at 40× magnification.

System suitability criteria: Positive controls should have dark purple staining.

Acceptance criteria: Intense dark purple staining (intensity of dark purple staining should be similar to that observed with the positive controls) for basement membrane must be observed on the luminal surface of a single layer of scaffold.

SPECIFIC TESTS

- **Tensile Strength of Sheet Forms**

[Note—Powdered products must meet the requirement for *Tensile Strength of Sheet Forms* before conversion to powder.]

Sample preparation: Cut the test specimens using a dogbone die template with a narrow width of 0.125 in and an overall length of 2.50 in, from a representative of the final product.

Analysis: Hydrate the material. Test using an Instron material testing system. Set the distance between the grips to 1 in and the crosshead speed to 0.5 in/min (12.7 mm/min). Secure the test sample in the bottom and top test grips. Start the test and run until sample failure.

Calculations: To determine strain, take the extension at failure (l_f), subtract the extension at pre-load (l_i), and divide the difference by extension at pre-load (l_i). Multiply by 100 to convert to a percentage.

Acceptance criteria: >10% strain

- **Sterility Tests** ⟨71⟩**:** Meets the requirements
- **Bacterial Endotoxins Test** ⟨85⟩**:** It contains NMT 20 USP Endotoxin Units/device or per 1000 mg of powder.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Sheets are packaged in single-use, double barrier, peel-open pouches. Powder forms are stored in a glass vial or other container within a peel-open package. Store under clean, dry conditions, between 15° and 30°.
- **Labeling:** The package label indicates dimensions or mg, as applicable, of the Scaffold Porcine Bladder device, as well as the lot number, expiration date, and required storage conditions. The label is also marked "Sterile" followed by an "R" for irradiation method of sterilization.

Scaffold Porcine Small Intestinal Submucosa

DEFINITION

Scaffold Porcine Small Intestinal Submucosa is a collagen-based scaffold, translucent and off-white in color. It is obtained from the small intestinal submucosa layer of the domestic pig (*Sus scrofa* L.). This layer has been mechanically separated from the adjoining layers of the intestine to remove the serosal, mucosal, and muscular elements. The isolated submucosa is chemically cleaned, decellularized, freeze-dried, and terminally sterilized. Scaffold Porcine Small Intestinal Submucosa also undergoes a viral inactivation; the inactivation method is validated using parvovirus, reovirus, pseudorabies virus, and leukemia retrovirus as the test viruses. By dried weight, Scaffold Porcine Small Intestinal Submucosa consists of about 70% protein, about 20%

www.webofpharma.com

carbohydrate, and about 7% lipid. The protein component is primarily collagen type I, with minor amounts of elastin and collagen type III, collagen type IV, and collagen type VI. In addition to these components, additional extracellular matrix components, such as glycosaminoglycans and fibroblast growth factor-2, are also retained.

SPECIFIC TESTS

- **FIBROBLAST GROWTH FACTOR-2 CONTENT**

Sterile PBS solution: 8.065 g/L of sodium chloride and 0.2 g/L of potassium chloride in 0.01 M sodium phosphate buffer, pH 7.4

Sample solution: Obtain a 1-cm^2 sample of Scaffold Porcine Small Intestinal Submucosa, weigh, and submerge in 400 µL of *Sterile PBS solution*. Pulverize the tissue for 90 s using a tissue grinder, intermittently checking to be sure that the tissue remains immersed in the *Sterile PBS solution* and becomes homogenized. Centrifuge at 12,000 × *g* for 5 min at 4°. Use immediately upon preparation.

Analysis: Examine duplicate aliquots of the *Sample solution* by a suitably sensitive ELISA method.[1]

System suitability: The analysis is considered valid if the ELISA kit generates a linear standard curve with the square of the correlation coefficient (r^2) NLT 0.95, and if the duplicate aliquots of the *Sample solution* yield results that are within 20% of each other.

Acceptance criteria: The average content of fibroblast growth factor-2 is NLT 10,000 pg/g of Scaffold Porcine Small Intestinal Submucosa.

- **GLYCOSAMINOGLYCAN CONTENT**

1,9-Dimethylmethylene blue solution: Mix 95 mL of 0.1 M hydrochloric acid in 500 mL of water. Add 16 mg of 1,9-dimethylmethylene blue, 3.04 g of aminoacetic acid, and 2.37 g of sodium chloride. Dilute with water to 1 L, and adjust to a pH of 3.0 with sterile solutions of either 1.0 M sodium hydroxide or 1.0 M hydrochloric acid. Store in low-actinic glassware.

Sterile PBS solution: 8.065 g/L of sodium chloride and 0.2 g/L of potassium chloride in 0.01 M sodium phosphate buffer, pH 7.4

Proteinase K solution: 600 Units/mL of *Tritirachium album* proteinase K

Stock heparin standard solution: 1 mg/mL of heparin

Heparin standard curve solutions: Use *Stock heparin standard solution* to prepare three solutions containing 20, 50, and 100 µg/mL of heparin.

Sample solution: Prepare samples in duplicate. Accurately weigh about 25 mg of Scaffold Porcine Small Intestinal Submucosa and cut into small pieces (roughly 2 mm × 2 mm). Transfer to a 1.5-mL microcentrifuge tube, and add 180 µL of *Sterile PBS solution* and 20 µL of *Proteinase K solution*. Mix, and incubate the sample at 56° for 15 min; during the incubation, mix intermittently on a vortex mixer. Cool the sample to room temperature. Dilute with water to obtain a concentration of 12.5 mg/mL of digested Scaffold Porcine Small Intestinal Submucosa.

Blank solution: Water

Collagen control solution: Accurately weigh about 25 mg of a bovine collagen, type I, that contains less than 1 µg of glycosaminoglycan/mg. Transfer to a 1.5-mL microcentrifuge tube, and add 180 µL of *Sterile PBS solution* and 20 µL of *Proteinase K solution*. Mix, and incubate the sample at 56° for 15 min; during the incubation, mix intermittently on a vortex mixer. Cool the sample to room temperature. Dilute with water to obtain a concentration of 12.5 mg/mL of digested bovine collagen.

Analysis

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Add 2.5 mL of *1,9-Dimethylmethylene blue solution* to triplicate 100-µL aliquots each of *Heparin standard curve solutions*, *Sample solution*, *Blank solution*, and *Collagen control solution*. Mix on a vortex mixer for 1 s and immediately read the absorbance at 525 nm. Generate a standard curve of absorbance versus concentration using the averages of each *Heparin standard curve solution*, correcting for the blank, and calculate the regression line and regression coefficient. The concentration of glycosaminoglycan in the *Sample solution* and the *Collagen control solution* is determined directly from the regression line. If the absorbance of the *Sample solution* is greater than the highest *Heparin standard curve solution*, then dilute the *Sample solution* appropriately, and repeat the *Analysis* detailed in this section.

System suitability: The test is considered valid if the regression curve has a square of the correlation coefficient (r^2) NLT 0.95; the triplicate aliquots of the *Sample solution* and *Collagen control solution* yield results that are within 20% of each other, respectively; and the average glycosaminoglycan content of the *Sample solution* is statistically greater than the *Collagen control solution* using one-tailed, unequal variances, *t*-test at $\alpha = 0.05$.

Acceptance criteria: The average glycosaminoglycan content of the *Sample solution* is NLT 2 µg/mg.

- **BIOACTIVITY**

[NOTE—Aseptic cell culture techniques must be used throughout the performance of this test.]

Modified RPMI-1640 culture medium: Prepare a sterile solution that contains the components included in *Table 1*.

Penicillin–streptomycin solution: 10,000 USP Penicillin Units of penicillin/mL and 10 mg of streptomycin/mL in a suitable buffer[2]

PC12 cell line culture medium: Mix 420 mL of *Modified RPMI-1640 culture medium*, 50 mL of horse serum,[3] 25 mL of fetal bovine serum,[4] and 5 mL of *Penicillin–streptomycin solution*. Sterilize by passing through a 0.22-µm filter.

Sterile PBS solution: 8.065 g/L of sodium chloride and 0.2 g/L of potassium chloride in 0.01 M sodium phosphate buffer, pH 7.4

Rat tail collagen solution: Prepare a suspension containing 0.2 mg/mL of rat tail collagen, type I, in sterile water.

Cell culture apparatus: Prepare by adding a sufficient volume of *Rat tail collagen solution* to completely cover the bottom of each well of a 12-well cell culture plate (dimension of each well is about 22–23 mm in diameter and about 17–18 mm in depth). Incubate under sterile conditions for 2 h at 37° or overnight at room temperature. Remove the *Rat tail collagen solution* by aspiration. Rinse with *Sterile PBS solution* that has been preheated to 37°.

PC12 cells: Use cultured rat pheochromocytoma cells (ATCC CRL-1721).

Cultivation of PC12 cells: Prewarm *PC12 cell line culture medium* to 37°. Add 15 mL of prewarmed *PC12 cell line culture medium* to a T-75 culture flask. Place a single vial containing the frozen *PC12 cells* in a 37° water bath with gentle agitation until they start to thaw (about 1 min). Complete the thawing procedure by slowly rotating the vial between the hands. Rinse the outside of the vial with 70% alcohol. Transfer the contents of the vial to the T-75 flask, and mix. Incubate the cells overnight at 37° in a 5% carbon dioxide atmosphere. Transfer the contents of the T-75 culture flask to a sterile centrifuge tube, centrifuge at 200 × *g* for 5 min at 37°, and discard the supernatant. Resuspend the cells in 15 mL of *PC12 cell line culture medium*, and transfer the contents back to the T-75 culture flask. Incubate the cells at 37° in a 5% carbon dioxide atmosphere for 3 days.

Cell feeding: At the end of 3 days, the cells will need to be fed for optimal growth. To feed the cells, remove a flask of cells from the incubator, tightening the cap in the process. Examine the T-75 flask under the microscope and check for microbial contamination and confluency. If there is microbial contamination, then discard the flask. If the cells appear confluent, follow the instructions below for perpetuating the PC12 cell line (see *Culture perpetuation*). Otherwise, harvest the cells from the flask by pipetting the contents of the flask across the bottom of the flask several times. Transfer the cell suspension to a sterile 50-mL centrifuge tube. Centrifuge the cells at 200 × *g* for 5 min at 37°, and discard the supernatant. Resuspend the cells in 13 mL of *PC12 cell line culture medium*, prewarmed to 37°. Transfer the cell suspension back to the T-75 flask, and mix. Loosen the cap of the flask, and return to the incubator; incubate the cells at 37° in a 5% carbon dioxide atmosphere for another 3–7 days.

Culture perpetuation: To perpetuate a line of *PC12 cells* for culture, examine under the microscope a T-75 flask containing cells and check for microbial contamination and confluency. If there is microbial contamination, discard the flask and use another. If the cells do not appear confluent, then follow the instructions above for feeding the PC12 cell line (see *Cell feeding*), beginning with "Otherwise, harvest the cells from the flask by pipetting the contents of the flask across the bottom of the flask several times." If the cells are confluent and there is no contamination, harvest the cells from the flask by pipetting the contents of the flask across the bottom of the flask several times to loosen up the cells from their attachment to the bottom of the flask and to break up cell clusters. Check under the microscope before proceeding to ensure that most of the cells have detached from the plastic. Transfer the cell suspension to a sterile 50-mL centrifuge tube, and centrifuge the cells at 200 × *g* for 5 min at 37°. Discard the supernatant and resuspend the cells with 10 mL of *PC12 cell line culture medium*, prewarmed to 37°. Dispense an equal amount of the cell suspension into each of 3–5 T-75 flasks, each flask containing 10 mL of *PC12 cell line culture medium*, prewarmed to 37°, and mix. Return the passaged cells to the incubator, being sure to loosen the cap of the flasks. Incubate the cells at 37° in a 5% carbon dioxide atmosphere. Feed the cells after 3 days as directed above, beginning with "To feed the cells, remove a flask of cells from the incubator, tightening the cap in the process." [NOTE—Do not use cells that have undergone more than 15 passages after obtaining them from ATCC.]

Positive control solution: Prepare a solution containing about 10 ng of fibroblast growth factor-2/mL of *PC12 cell line culture medium*.

Negative control solution: Use *PC12 cell line culture medium*.

Sample solution: Immerse 70 cm² of Scaffold Porcine Small Intestinal Submucosa in sterile water for 5 min. Remove the Scaffold Porcine Small Intestinal Submucosa, and blot excess water using sterile gauze. Weigh the rehydrated Scaffold Porcine Small Intestinal Submucosa to the nearest 0.1 g and add *Modified RPMI-1640 culture medium* at a ratio of 7.5 mL of *Modified RPMI-1640 culture medium* for each 1.0 g of Scaffold Porcine Small Intestinal Submucosa. Incubate for 24 h at 37° with constant shaking. Remove the Scaffold Porcine Small Intestinal Submucosa, and pass the solution through a 0.22-µm filter. Add sufficient quantities of sterile horse serum and sterile fetal bovine serum to concentrations of 10% and 5%, respectively, and add a sufficient quantity of *Penicillin–streptomycin solution* such that there are 100 USP Penicillin Units and 0.1 mg of streptomycin/mL. Adjust the pH of the *Sample solution* to 7.4, using a sterile solution of either 1.0 M sodium hydroxide or 1.0 M hydrochloric acid.

[2] A suitable buffered solution containing 10,000 USP Penicillin Units of penicillin/mL and 10 mg of streptomycin/mL can be obtained from Sigma-Aldrich Corp., St. Louis, MO.

[3] A suitable horse serum can be obtained from American Type Culture Collection, P.O. Box 1549, Manassas, VA (www.atcc.org).

[4] A suitable fetal bovine serum can be obtained from American Type Culture Collection, P.O. Box 1549, Manassas, VA (www.atcc.org).

www.webofpharma.com

Analysis: Harvest a flask of confluent *PC12 cells* by pipetting the contents of the flask across the bottom of the flask to loosen the cells, then transfer the cell suspension to a centrifuge tube and centrifuge at 200 × *g* for 5 min. Remove the supernatant by aspiration, and resuspend the pellet to obtain a concentration of about 1 × 10^6 cells/mL of *PC12 cell line culture medium*. Add to each of three wells of the *Cell culture apparatus* 1.0 mL of *Negative control solution*. To a second set of three wells, add to each well 1.0 mL of *Positive control solution*, and to a third set of three wells, add to each well 1.0 mL of *Sample solution*. Add to each well about 20,000 cells, mix by gentle rocking, and incubate for 48 h at 37°. For each well, count three random microscopic fields of cells using a microscope with a 10× ocular lens and a 20× objective lens. Each field should have at least 20 cells; avoid large clumps of cells where individual cell bodies cannot be ascertained. Determine the total number of cells in the field and, using USP Cultured Rat Pheochromocytoma Reference Photomicrographs of normal and differentiated rat pheochromocytoma cells for comparison, determine the total number of cells that have formed at least one neurite-like extension at least twice the diameter of a normal, undifferentiated cell body. For each experimental group, record the total number of cells counted and the total number of cells differentiated across all three wells, and calculate the total percentage of cells that have differentiated.

System suitability: For a test to be valid, the following criteria must be met: (1) none of the wells are microbially contaminated; (2) the weighted percentage of differentiated cells across the *Negative control solution* wells is NMT 5%; (3) the weighted percentage of differentiated cells across the *Positive control solution* wells is NLT 6%; and (4) the weighted percentage of differentiated cells across the *Negative control solution* wells is statistically less than the weighted percentage of differentiated cells across the *Positive control solution* wells, using a one-sided, two-sample test for proportions at $\alpha = 0.05$.

Acceptance criteria: The weighted percentage of differentiated cells incubated in the *Sample solution* wells is statistically greater than those incubated in the *Negative control solution* wells, using a one-sided, two-sample test for proportions at $\alpha = 0.05$.

- **METABOLIC ACTIVITY ASSESSMENT**

Dulbecco's modified Eagle's tissue culture medium: Prepare a solution that contains the components included in *Table 2*.

Table 2

Component	Content (mg/L)
Calcium nitrate, tetrahydrate	100.0
Ferric nitrate, nonahydrate	0.10

MTT reagent: A suitable solution of 3-(4,5-dimethylthiazol-2yl)-2,5-diphenyl tetrazolium bromide.[5]

Detergent reagent: A suitable sodium dodecyl sulfate detergent solution.[6]

Analysis: Remove three 12-mm diameter circular sections of Scaffold Porcine Small Intestinal Submucosa, using the appropriate size biopsy punch. Immerse each section into individual wells of a 12-well cell culture plate (dimension of each well is about 22–23 mm in diameter and about 17–18 mm in depth), each containing 1 mL of *Dulbecco's modified Eagle's tissue culture medium*. Prepare a positive control by harvesting a full-thickness section of porcine jejunum immediately following slaughter. Rinse the section of jejunum at 37° in isotonic sodium chloride solution for 5 min to remove intestinal debris. Using scissors, split open the section of jejunum to form a sheet. Remove three

[5] A suitable solution of 3-(4,5-dimethylthiazol-2yl)-2,5-diphenyl tetrazolium bromide can be obtained as part of the MTT Cell Proliferation Assay (Catalog # 30-1010K) from American Type Culture Collection, P.O. Box 1549, Manassas, VA (www.atcc.org) or equivalent.

[6] A suitable sodium dodecyl sulfate detergent reagent can be obtained as part of the MTT Cell Proliferation Assay (Catalog #30-1010K) from American Type Culture Collection, P.O. Box 1549, Manassas, VA (www.atcc.org) or equivalent.

www.webofpharma.com

12-mm diameter circular sections of jejunum, using the appropriate size biopsy punch. Immerse each section into individual wells of a 12-well cell culture plate, each well containing 1 mL of *Dulbecco's modified Eagle's tissue culture medium*. Treat these positive control wells in the same manner as the sample wells. Prepare a *Blank solution* using 1 mL of *Dulbecco's modified Eagle's tissue culture medium*. Allow sections to hydrate for 5 min, add 50 µL of *MTT reagent* to each of the sections and the blank, and mix. Incubate for 3 h at 37° in an atmosphere containing 5% carbon dioxide. Add 100 µL of *Detergent reagent* to each well, and mix. Leave the samples at ambient temperature in the dark for 2 h. Measure the absorbance of the resulting solution at 570 nm, adjusting for the blank.

System suitability: The average absorbance in the positive control wells is greater than 0.100.

Acceptance criteria: The average absorbance reading for the Scaffold Porcine Small Intestinal Submucosa wells is less than 0.100.

- **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩

Sample: 70 cm^2 of Scaffold Porcine Small Intestinal Submucosa

Analysis: Immerse the *Sample* in 40 mL of LAL Reagent Water. Extract for 60 min at 37° with shaking. Remove a 100-µL aliquot to measure the amount of bacterial endotoxins.

Acceptance criteria: NMT 20.0 USP Endotoxin Units/70 cm^2

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in single-use, peel-open pouches that are gas permeable for sterilization purposes. Store under clean, dry conditions at 25°, excursions permitted between 15° and 30°.
- **LABELING:** The package is labeled to indicate the dimensions of the enclosed Scaffold Porcine Small Intestinal Submucosa, the expiry date, required storage conditions, and the lot number. The label indicates that the Scaffold Porcine Small Intestinal Submucosa is sterile if the package is intact, and that the Scaffold Porcine Small Intestinal Submucosa is designed for single patient, one-time use.
- **USP REFERENCE STANDARDS,** *Authentic Visual References* ⟨11⟩

USP Cultured Rat Pheochromocytoma Reference Photomicrographs

These photomicrographs represent examples of normal and differentiated rat pheochromocytoma cells and are used to assist in ascertaining bioactivity.

Scaffold Silk Fibroin

DEFINITION

Scaffold Silk Fibroin is a surgical scaffold device made from the silk of the *Bombyx Mori* silkworm. Raw silk filaments are comprised of a fibroin protein core that is naturally coated with the globular protein sericin. The sericin is removed from the fiber by aqueous extraction leaving the fibroin protein behind, consisting of layers of anti-parallel beta sheets, which give the fiber strength. The fiber is then assembled into a three dimensional patterned scaffold. The scaffold is a mechanically strong, flexible, single use device that can be produced in a variety of shapes, sizes, and thicknesses, and is terminally sterilized.

IMPURITIES

- **NONPOLAR SOLVENT EXTRACTION**

Positive control: 20 mg of mineral oil[1]

Negative control: 45 mL of *n*-hexane

Sample: Scaffold Silk Fibroin

Analysis: [NOTE—Gloves should be worn throughout the procedure as natural skin oil may affect the results. Glassware preparation: Each sample or control requires one 60-mL bottle and cap and one glass Petri dish. Wash glass Petri dishes (10 cm × 2 cm) and a corresponding number of 60-mL glass jars with lids with liquid detergent and rinse well with tap water. Rinse again with deionized water. Transfer glassware in the chemical hood and rinse all glassware with hexane. Air-dry glassware in the chemical hood for at least 15 min. Transfer dried glassware to a desiccator for NLT 30 min before weighing.] Ensure the relative humidity of the room is between 30% and 80% before weighing or labeling bottles and petri dishes. Label and pre-weigh 60-mL bottles. For the *Positive control*, add 20 mg of mineral oil to a 60-mL bottle and for the *Negative control*, add 45 mL of hexane to a 60-mL bottle. For the *Sample*, use stainless steel tweezers to place one device per 60-mL bottle and cap. Re-weigh bottles and calculate the sample weight (SW) by subtracting the initial mass of the bottle from the mass of the sample-containing bottle. In the chemical hood, open the bottles and add 45 mL of *n*-hexane to each, then re-close making sure that the hexane does not come in contact with the caps. Prepare an ultrasonic water bath for sample processing by degassing it. For this, use the "degas" setting of the equipment for 10 min. Place all 60-mL bottles, prepared as above, in the water bath. Ensure that the water level is 0.5-cm below the lids of the bottles. Sonicate bottles for 5 min on the "sonication" setting (frequency of 40 KHz). Label Petri dishes so that each bottle has a correspondingly labeled Petri dish. Weigh each dish individually and record the mass ($m_{initial}$). Pour the hexane solution from each bottle into the corresponding pre-labeled Petri dish. Add 15 mL of *n*-hexane to each bottle, rinse then pour in the corresponding Petri dish. Repeat this rinsing step and collect the solution. The final hexane volume in each of the Petri dishes should be approximately 75 mL (45 mL from extraction + 15 mL from first rinse + 15 mL from second rinse). Leave Petri dishes uncovered in the chemical hood for 12 h to evaporate the *n*-hexane. Re-weigh each Petri dish after hexane evaporation and record mass (m_{final}). Calculate the recovery of the *Positive control* in percentage with the following formula:

$$\text{Result} = [(m_F - m_I)/W_O] \times 100$$

m_F = final mass of Petri dish after *n*-hexane evaporation in mg

m_I = initial mass of empty Petri dish in mg

W_O = weight of oil added, mg

Calculate the concentration of organic residuals, in ppm, in each tested device:

$$\text{Result} = [(m_F - m_I)/W_S] \times F$$

m_F = final mass of Petri dish after *n*-hexane evaporation in mg

m_I = initial mass of empty Petri dish in mg

[1] A suitable mineral oil can be obtained from Avantor Performance Materials, Inc. (Mallinckrodt Chemicals, Inc.), Center Valley, PA or equivalent.

USP Monographs

www.webofpharma.com

W_S = sample weight, g (calculated by subtracting the initial mass of the bottle from the mass of the sample-containing bottle)
F = conversion factor for kg to g, 1000

System suitability criteria: The determined m_F for the *Negative control* should be NMT 0.2 mg and the *Positive control* recovery should be 95%–105%.
Acceptance criteria: Hexane extractable residues should be NMT 1106 ppm per tested device.

• **ELEMENTAL IMPURITIES—LIMITS** ⟨232⟩ and **ELEMENTAL IMPURITIES—PROCEDURES** ⟨233⟩
Nitric acid solution: 2% (v/v) nitric acid in water
Sample solution: Weigh 3–4 g of Scaffold Silk Fibroin, record the mass, then place in a 50-mL conical tube. Add 25 mL of *Nitric acid solution* to the tube. Incubate for 16 h at room temperature.
Analysis: Transfer 5 mL of the *Sample solution* to a tube that is compatible for testing. The levels of chromium, cadmium, nickel, vanadium, lead, and arsenic are determined by an inductively coupled plasma–atomic emission spectroscopy (ICP-AES) (see *Plasma Spectrochemistry* ⟨730⟩) normalized to the mass of the tested device and reported in parts per million (ppm).
Acceptance criteria: Meets the requirements of the Parental Daily Dose PDE (µg/day) in *Elemental Impurities—Limits* ⟨232⟩

SPECIFIC TESTS

• **FIBROIN CONTENT**
Digestion solution: 6 N hydrochloric acid
Reconstitution solution: 0.02 N hydrochloric acid
Borate buffer: 0.2 M sodium borate, pH 8.8 with 5 mM calcium disodium ethylenediaminetetraacetic acid (EDTA). Prepare the buffer by dissolving 124 g boric acid in 80 mL of deionized water; add 187 mg calcium disodium EDTA then titrate with 1 N sodium hydroxide to a pH of 8.8. Add deionized water to a final volume of 100 mL.
Derivatization reagent: 10 mM of 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate in acetonitrile. Vortex for 10 s at 2700 rpm. Incubate the solution for 10 min at 55°, and vortex occasionally until the powder dissolves.
Preparation of hydrolysis sample vials and tubes: Clean glass acid hydrolysis sample vials (30 × 120 mm) and hydrolysis tubes (6 × 50 mm) used for sample preparation with a phosphate-free detergent[2], rinse with purified water then pyrolyze at 220° for 24 h. Allow vials to cool to room temperature then add 200 µL of constant boiling 6 N hydrochloric acid[3] to each hydrolysis tube along with a single phenol crystal.[4] Cap tubes with a polytetrafluoroethyl (PTFE) cap with a chlorotrifluoroethylene (CTFE) screw type on-off valve until needed.
System suitability solution: 25 µM in water from commercially available amino acid standard[5]
Fibroin solution: Bring 2 L of water to a boil in a glass beaker, then add 4.24 g of sodium carbonate. Add 5 g of raw silk yarn[6] and boil for 1 h. Remove yarn containing fibroin with a spatula and rinse in 2 L of water. Squeeze yarn with gloved hands to remove excess water. Rinse yarn 3 more times in 2 L of water for 20 min under agitation (use a stir bar for agitation and set the stir plate to 250 rpm). Squeeze yarn with gloved hands to remove excess water, place the fibroin yarn on a clean sheet of aluminum foil and dry for 16 h in a chemical hood. Transfer 1 mg of the fibroin yarn to a hydrolysis tube to obtain 5 mg/mL of fibroin in 6 N hydrochloric acid. Prepare three replicates. Incubate at 115° for 16 h. Allow the tubes to cool for 1 h at room temperature. Remove acid with a speed vacuum. Add 20 µL of *Reconstitution solution* to each tube and incubate at 50° for 10 min. Dilute each solution 5-fold (to 0.1 µg/µL) with *Reconstitution solution*.
Sericin solution: Add 1 mg of sericin[7] per hydrolysis tube to obtain 5 mg/mL sericin in 6 N hydrochloric acid. Prepare three replicates. Incubate at 115° for 16 h. Allow the tubes to cool for 1 h at room temperature. Remove acid with a speed vacuum. Add 20 µL of *Reconstitution solution* to each tube and incubate at 50° for 10 min. Dilute each solution 5-fold (to 0.1 g/µL) with *Reconstitution solution*.
Standard solutions: Prepare amino acid standards at the following concentrations: 600, 500, 400, 300, 200, 100, 50, 10, 5, and 1 µM in water from commercially available amino acid standard.[8]
Sample solutions: Add 1 mg of Scaffold Silk Fibroin per hydrolysis tube to obtain 5 mg/mL of Scaffold Silk Fibroin in 6 N hydrochloric acid. Prepare six replicates. Incubate at 115° for 16 h. Allow the tubes to cool for 1 h at room temperature. Remove acid with a speed vacuum. Add 20 µL of *Reconstitution solution* to each tube and incubate at 50° for 10 min. Dilute each solution 5-fold (to 0.1 µg/µL) with *Reconstitution solution*.
Amino acid derivatization: *Standard solutions* and reconstituted *Fibroin solution*, *Sericin solution*, and *Sample solutions* are derivatized. *Borate buffer* (70 µL) is added to 12- × 32-mm screw neck total recovery vials (the number of vials needed is equal to the number of Standards, samples, fibroin and sericin solutions, and one blank solution). An aliquot of 10 µL of each amino acid standard (one standard sample for each concentration) and each control (triplicates of *Fibroin solution* and *Sericin solution*) and sample (one sample per finished Scaffold Silk Fibroin) are added to the respective vials. The vials are vortexed for 5 s at 2700 rpm, followed by the addition of 20 µL of *Derivatization reagent*. The vials are capped and vortexed again for 5 s. The vials are then heated for 10 min at 55°. A blank is also prepared using 10 µL of *Reconstitution solution* instead of amino acid standard.
Solution A: Prepare a mixture of acetonitrile, formic acid, and 100 mM ammonium formate (10:6:84). Dilute this mixture with water (5:95).
Solution B: Acetonitrile and formic acid (98:2)
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	99.9	0.1
0.54	99.9	0.1
5.74	90.9	9.1
7.74	78.8	21.2

[2] A suitable detergent can be obtained from EMD Biosciences, Inc., Darmstadt, Germany or equivalent.
[3] Suitable acid can be obtained from Pierce Biotechnology, Inc., Rockford, IL or equivalent.
[4] Suitable phenol crystals can be obtained from Sigma-Aldrich, St. Louis, MO or equivalent.
[5] Suitable amino acid standards can be obtained from Pierce Biotechnology, Inc., Rockford, IL or equivalent.
[6] Suitable raw silk yarn can be obtained from Bratac S.A, Londrina, Brazil or equivalent.
[7] A suitable sericin standard/reference can be obtained from Silk Biochemical Co., Ltd., Zhejiang, China or equivalent.
[8] Suitable amino acid standards can be obtained from Pierce Biotechnology, Inc., Rockford, IL or equivalent.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 260 nm
Column: 2.1-mm × 10-cm; L1 with particle size 1.7 µm and pore size 130 Å
Column temperature: 55°
Flow rate: 0.7 mL/min
Injection volume: 1 µL
Run time: 10 min
System suitability
Sample: *System suitability solution*
Suitability requirements
Plate count: NLT 2000 for all the amino acids
Tailing factor: NMT 2
Resolution: NLT 2
Signal-to-noise ratio: NLT 10 for all the amino acids
Analysis
Samples: *Fibroin solution*, *Sericin solution*, *Standard solutions*, and *Sample solutions*
Create a calibration curve for each amino acid by integrating the peak area obtained from the chromatograph for each concentration of *Standard solution* then plot the integrated peak area as a function of concentration. Run each replicate of *Fibroin solution* and *Sericin solution*. Perform one run for each of the six *Sample solutions*. Determine the concentration of each constituent amino acid of each control solution and *Sample solution* from the calibration curves of the amino acid standards.
A mathematical algorithm development software is used to set up a matrix based calculation for fibroin purity.[9] The algorithm uses 7 out of the 16 detected amino acids: glycine (Gly), alanine (Ala), tyrosine (Tyr), serine (Ser), asparagine (Asx), glutamate/glutamic acid (Glx), and threonine (Thr). [NOTE—The 7 amino acids were selected because the magnitude difference in weight percent of each found in sericin compared to fibroin is at least 2-fold.]
Convert the fibroin and sericin reference data into a [7 × 2] matrix (*Matrix A*), with 7 (columns) representing each of the selected amino acids and 2 (rows) representing the number of Reference Standards analyzed. Represent the amino acid composition of the silk samples being analyzed as a [7 × 6] matrix (*Matrix B*), where 7 (columns) represent each of the selected amino acids and 6 (rows) for each of the total number of samples analyzed. Specifically,

$$\text{Matrix A} = \begin{bmatrix} Gly & Ala & Tyr & Ser & Glx & Asx & Thr \\ Gly & Ala & Tyr & Ser & Glx & Asx & Thr \end{bmatrix}$$

Where:
- the first row is the sericin reference amino acid average from the three runs
- the second row is the fibroin reference amino acid average from the three runs

$$\text{Matrix B(1 to 6)} = \begin{bmatrix} Gly_1 & Ala_1 & Tyr_1 & Ser_1 & Glx_1 & Asx_1 & Thr_1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ Gly_6 & Ala_6 & Tyr_6 & Ser_6 & Glx_6 & Asx_6 & Thr_6 \end{bmatrix}$$

Where:
- the rows indicated the amino acid averages for the six samples analyzed

The mass proportion of fibroin and sericin from each *Sample solution* is calculated by performing the matrix operation $B \times (A^{-1})$. The percent weight compositions of fibroin and sericin for each analyzed *Sample solution* are calculated by the software from the mass proportions.
Acceptance criteria: NLT 95% for fibroin content and NMT 5% for sericin content

- **DIMENSIONAL ANALYSIS**
Sample: Scaffold Silk Fibroin
Analysis: Measure the length and width of intact Scaffold Fibroin Silk devices with a NIST traceable caliper with an accuracy of at least 0.02 mm.[10] Take three measurements at the top, the center, and the bottom of the device for each parameter. Measure the length of the scaffold in the longest direction. Measure the width of the scaffold along the shortest direction. Measure the thickness of the sample (single measurement) using a NIST traceable thickness gauge with accuracy of at least 0.01 mm.[11] Place the sample (either intact scaffold or sectioned piece) between the gauge feelers taking care to avoid creases and folds. Close the feelers and take the measurement. [NOTE—Test between 13 and 50 devices.]
Acceptance criteria: Each device is NLT 15 ± 1.5 cm in length and NLT 5 ± 0.5 cm wide, with a thickness range of 0.6–1.0 mm.

- **DENSITY DETERMINATION**
Sample: Scaffold Silk Fibroin
Analysis: Determine the mass of the sample by a single measurement using a scientific calibrated balance that can be read to at least 0.1 mg.[12] The average length and width is determined by averaging the three measurements from the *Dimensional Analysis*. The thickness is measured as described in the *Analysis* of the *Dimensional Analysis*. Calculate the density, mg/mm ^{3} of each sample by using the equation:

$$\text{Result} = M/(L \times W \times T)$$

M = mass, mg
L = average length, mm
W = average width, mm
T = thickness, mm

Acceptance criteria: NLT 0.14 mg/mm ^{3} and NMT 0.18 mg/mm ^{3}

- **PORE CHARACTERIZATION**
Sample: Scaffold Silk Fibroin
Analysis: The assembled scaffold has a lattice-like appearance, with open spaces (pores) between the length and width constituent fibers that run perpendicular to each other. Measure the pore dimensions of the scaffold by using a stereo microscope with sufficient magnification and

[9] A suitable software can be obtained from MathWorks, Natick, MA or equivalent.

[10] A suitable ruler can be obtained from Mitutoyo American Corporation, Aurora, IL or equivalent.
[11] A suitable thickness gauge can be obtained from Käfer Messuhrenfabrik GmbH & Co. KG, Villingen-Schwenningen, Germany or equivalent.
[12] A suitable balance can be obtained from Denver Instrument, Bohemia, NY or equivalent.

USP Monographs

www.webofpharma.com

image capture capability. Select a magnification based upon the resolution of the pore in the scaffold pattern being examined (typical range is 0.5–2×). Take images under magnification. Randomly select eight pore images, determine the pore area and average the results. Measure pore size and analyze with a suitable image analysis software package.

Acceptance criteria: The pore area of each device is NLT 1 × 10^4 µm ^{2}.

- **BALL BURST TESTING**

0.01 M phosphate buffered saline: Dissolve 8 g of sodium chloride, 0.2 g of potassium chloride, 1.44 g of monobasic sodium phosphate, and 0.24 g of dibasic potassium phosphate in 800 mL of deionized water. Adjust with 1 N hydrochloric acid to a pH of 7.4, add deionized water to a final volume of 1000 mL.

Sample: Sections (40 × 40 mm) that are cut from the full sized, Scaffold Silk Fibroin. [NOTE—Test one section per device. Test between 13 and 50 devices.]

Analysis: Submerge the *Sample* fully in *0.01 M phosphate buffered saline* and incubate at 37° for 2 h. Use a suitable mechanical testing instrument and test frame.[13] Compress each device sample tested between the two circular fixation brackets (inner diameter of 18.6 mm) of the mechanical testing instrument. Secure the *Sample* with a torque wrench to a value of 0.2 ± 0.1 N/m.[14] Ensure that the lattice structure of the *Sample* is evenly distributed across the inner fixture diameter and not skewed or sheared (the *Sample* should remain taut within the fixation brackets with even distribution of tension). Attach the ball burst fixture (10 mm diameter) to the mechanical testing instrument with a calibrated load cell. Insert the fixture ball through the center of the fixation brackets at a constant rate of 60 mm/min until the *Sample* fails. The resulting instrument output represents the maximum load sustained by the test sample. Calculate the ultimate burst stress of the *Sample* in MPa:

$$\text{Result} = [B/(E_A)] \times F$$

B = maximum burst load, N
E_A = exposed area, m^2
F = conversion factor, 10^{-6}

The exposed area is the circular area of the test article covering the radius (r) of the inner fixture diameter and is calculated using the equation below:

$$\text{Exposed area} = \pi r^2$$

An additional sample parameter, burst stiffness that is reflective of elastic properties and indicative of the scaffold's capacity to withstand anatomical forces before failure is calculated by determining the slope of the middle of the linear region of the compressive load versus extension curve.

Acceptance criteria: The ultimate burst stress for each tested sample is NLT 0.5 MPa. The burst stiffness for each tested sample is NLT 30 N/mm.

- **TENSILE TESTING**

Sample: Cut two sample sections of 10 × 60 mm from each Scaffold Silk Fibroin tested, one in length direction and one in the width direction. Fully immerse samples in phosphate buffered saline and incubate at 37° for 2 h.

Analysis: Use a suitable mechanical testing instrument.[15] The tensile testing is done following the same principles as outlined in *Tensile Strength* ⟨881⟩, but modified as specified below. Clamp device samples in the mechanical test frame. Mount the upper clamp to the load cell, which is attached to the actuator. Mount the lower clamp to the support plate. Align the upper clamp to make the faces of both clamps parallel to each other. Adjust the height of the mechanical equipment crosshead so that the actuator is positioned to allow for a defined amount of upward movement and a specific sample gauge length resides between the upper and lower sample clamps.

Given a device sample of 60-mm long by 10-mm wide, load the sample by clamping the first 10 mm length of the *Sample* into the upper clamp and allowing the remainder of the *Sample* to fall unrestrained into the bottom clamp opening. Fix the last 10 mm of the *Sample* with the bottom clamp. Avoid pre-straining the *Sample*. Once the *Sample* is clamped, adjust the actuator height so that the *Sample* has a preload of 2 Newtons. Adjust the actuator position to achieve a 40-mm gauge length then reset to the zero-position. Strain the test sample at a rate of 2400 mm/min until it experiences ultimate tensile failure. The instrument output will provide maximum load value that was sustained by the *Sample*. [NOTE—The straining rate represents 100% of the gauge length/s and ensures that the *Sample* fails within 1 s (40 mm × 60 s = 2400 mm/min). Depending on the manufactured lot size, test between 13 and 50 devices. Use the maximum load value to calculate the ultimate tensile stress and percent elongation at break.]

Calculate the ultimate tensile stress in MPa using the equation:

$$\text{Result} = [M_L/(S_W \times S_T)] \times F$$

M_L = maximum load, N
S_W = sample width, m
S_T = sample thickness, m
F = conversion factor mm ^{2} to m ^{2}, 10^{-6}

The sample width (S_W) is equal to 10 mm, and the sample thickness is determined as described in the *Analysis* section of the *Dimensional Analysis*.

The elongation at break in percentage is determined using the equation:

$$\text{Result} = [(L_B - O_L)/O_L] \times 100$$

L_B = length at break, mm
O_L = original length, mm

The numerator (length at break – original length) is measured and indicated by the instrument length = 40 mm (60 mm total length – 10 mm held by the upper clamp – 10 mm held by the lower clamp). Tensile stiffness is calculated by determining the slope of the trend line of the linear portion of the tensile load vs. elongation curve bound by an upper and lower tensile load.

Acceptance criteria: The maximum load for each tested sample along the scaffold length is NLT 31 N. The ultimate tensile stress (the force at which the device fails) for each tested sample is NLT 5 MPa. The percent elongation at break for each tested sample is NLT 35% in the direction of length. In the same direction, the tensile stiffness for each tested sample is NLT 0.8 N/mm.

[13] Suitable mechanical testing instrument can be obtained from Instron Corporation, Norwood, MA or equivalent.
[14] A suitable torque wrench can be obtained from CDI Torque Products, City of Industry, CA or equivalent.
[15] A suitable mechanical testing instrument can be obtained from Instron Corporation, Norwood, MA or equivalent.

www.webofpharma.com

• **SUTURE RETENTION FORCE**

Sample: Cut two sample sections of 20 × 40 mm from each Scaffold Silk Fibroin tested, one in the length direction and one in the width direction. Rehydrate all samples by completely submerging in phosphate buffered saline and incubating for 2 h at 37°.

Analysis: Use a suitable mechanical testing instrument.[16] Insert the upper part of the *Sample* into the upper clamp with the top 10 mm of the *Sample* gripped by the clamp with a pressure of 85 psi. Assess the overall suture retention strength of the samples in both orientations. Using 2-0 polypropylene,[17] guide the first suture 10 mm from both sides of the *Sample* and approximately 3 mm from the lower edge. Loop the suture through a pore. Guide two more polypropylene sutures through the same way, but at a distance of 6 mm to the left and right of the center suture loop. Lower the upper actuator to maintain a distance of 10 mm between bottom edge of the *Sample* and lower clamp. Clamp the ends of the three sutures into the bottom clamp with a pressure of 85 psi. The created gauge length is 27 mm. Preload the *Sample* with 1 Newton. Strain the *Sample* at a constant rate of 1620 mm/min until the device sample breaks from the sutures or the sutures pull through the *Sample*. The instrument output represents the maximum load at failure. [NOTE—The straining rate represents 100% of the gauge length/s (27 mm × 60 s = 1620 mm/min) and ensures that the *Sample* fails within 1 s. Depending on the manufactured lot size, test between 13 and 50 devices.]

Calculate the average suture retention strength using the equation:

$$\text{Average Maximum Strength per Suture} = \frac{Maximum\,Load\,[N]}{3\,[suture]}$$

Acceptance criteria: The average suture retention force is NLT 13 N/suture in both vertical and horizontal orientations.

• **TEAR TESTING**

Sample: Cut two sample sections of 20 × 40 mm from each Scaffold Silk Fibroin tested, one in the length direction, and one in the width direction. Make a small cut one fourth the size of the test sample width in the center of the sample perpendicular to the length. Submerge all samples completely and incubate for 2 h in phosphate buffered saline at 37°.

Analysis: Use a material characterization mechanical testing instrument.[18] Affix clamps to the test frame of the mechanical testing equipment with tear testing capability. Mount the upper clamp to the actuator and the lower clamp to the load cell that is attached to the base support plate. Align the two clamps parallel to each other. Adjust the height of the mechanical equipment crosshead to position the actuator to allow for a defined amount of upward movement (minimum of 57 mm) and to ensure that a sample gauge length of 40 mm resides between the upper and lower clamps. Place the device sample in the upper clamp. The clamp should cover the top 10 mm of the *Sample*. Align the *Sample* perpendicular with the clamp before the clamp is closed. Allow the bottom portion of the *Sample* to fall unrestrained into the bottom clamp opening. Close the clamp and preload the *Sample* with 2 Newtons. Strain the *Sample* at a constant rate 2400 mm/min until it tears at the cut point. The maximum tear resistance load is calculated by the software of the mechanical instrument.[19]

[NOTE—The strain rate represents 100% of the gauge length/s and was chosen to ensure that the *Sample* fails within 1 s (40 mm × 60 s = 2400 mm/min). Depending on the manufactured lot size, test between 13 and 50 samples.]

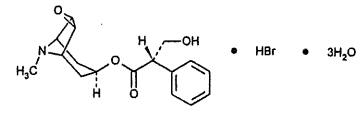
Acceptance criteria: The tear strength for each sample is NLT 109 N.

• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩

Sample: Scaffold Silk Fibroin

Analysis: Using depyrogenated forceps, place a 70-cm ^{2} sample of Scaffold Silk Fibroin in a depyrogenated 250-mL Erlenmeyer flask. Add 27 mL of limulus amebocyte lysate reagent water and 3 mL of tetrahydrofuran to the flask and cover with parafilm. Place on an orbital shaker at 250 rotations/min for 1 h at room temperature. Collect 0.5-mL samples from each flask and further dilute 20-fold with limulus amebocyte lysate reagent water. Analyze each sample in duplicate for bacterial endotoxin following *Turbidimetric Technique* in the chapter.



Acceptance criteria: Each sample should contain NMT 20.0 USP Endotoxin Units/device.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in single-use, peel-open pouches that are gas permeable for sterilization purposes. Store under clean, dry conditions at room temperature, between 15° and 25°.

• **LABELING:** The package label indicates the dimensions of the enclosed Scaffold Silk Fibroin, the lot number, the expiry date, the required storage conditions, the trade name, the product manufacturer, and the manufacturer's contact information. In addition, the label indicates the product has been sterilized by EO and provides a date when the sterilization has taken place. It also lists some precautionary statements such as the product should not be reused, it should not be re-sterilized, or used if the package is damaged or open upon receipt. The instructions for use are included with each unit.

Scopolamine Hydrobromide

$C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$ 438.31

Benzeneacetic acid, α-(hydroxymethyl)-, 9-methyl-3-oxa-9-azatricyclo[3.3.1.0.^{2,4}]non-7-yl ester, hydrobromide, trihydrate, [7(*S*)-(1α,2β,4β,5α,7β)]-;

6β,7β-Epoxy-1α*H*,5α*H*-tropan-3α-ol (–)-tropate (ester) hydrobromide trihydrate [6533-68-2].

Anhydrous 384.27

[114-49-8].

DEFINITION

Scopolamine Hydrobromide contains NLT 98.0% and NMT 102.0% of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr$), calculated on the anhydrous basis.

[16] Suitable mechanical testing equipment and data processing software can be obtained from Instron Corporation, Norwood, MA or equivalent.

[17] A suitable suture (2-0 FiberWire, cat # AR-7220) can be obtained from Arthrex, Inc., Naples, FL or equivalent.

[18] Suitable mechanical testing equipment can be obtained from Instron Corporation, Norwood, MA or equivalent.

[19] Suitable data processing software can be obtained from Instron Corporation, Norwood, MA or equivalent.

www.webofpharma.com

[**CAUTION**—Handle scopolamine hydrobromide with exceptional care, because it is highly potent.]

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Analysis: Dissolve 3 mg in 1 mL of alcohol, and evaporate the solution on a steam bath to dryness. Dissolve the residue in 0.5 mL of chloroform, add 200 mg of potassium bromide, previously dried at 105° for 30 min, and stir frequently for 5 min. Allow the chloroform to evaporate to dryness, and stir frequently to obtain a flowing powder residue. Dry the residue on a steam bath for 5 min, and then immediately compress the residue to a disk.
Acceptance criteria: Meets the requirements

Change to read:

• **B.**
Sample solution: 50 mg/mL ▲in water▲ (ERR 1-Apr-2019)
Analysis: To 1 mL of *Sample solution* add a few drops of chlorine TS, and shake the mixture with 1 mL of chloroform.
Acceptance criteria: Brownish color in chloroform layer
• **C.** The retention time of the scopolamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**
Buffer solution: 7.0 g/L of monobasic potassium phosphate in water. Adjust with 0.05 M phosphoric acid to a pH of 3.3.
Solution A: Dissolve 3.5 g of sodium dodecyl sulfate in 606 mL of *Buffer solution*. Add 320 mL of acetonitrile and mix.
Solution B: acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
2.0	95	5
20.0	70	30
20.1	95	5
25.0	95	5

Standard solution: 0.2 mg/mL of USP Scopolamine Hydrobromide RS in *Solution A*
Sample solution: 0.2 mg/mL of Scopolamine Hydrobromide in *Solution A*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 10-cm; 3-µm packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 0.73%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr$) in the portion of Scopolamine Hydrobromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of scopolamine from the *Sample solution*
r_S = peak response of scopolamine from the *Standard solution*
C_S = concentration of USP Scopolamine Hydrobromide RS in the *Standard solution* (mg/mL)
C_U = concentration of Scopolamine Hydrobromide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩
Sample: 1 g
Acceptance criteria: NMT 0.1%
• **ORGANIC IMPURITIES**
Buffer solution, Solution A, Solution B, Mobile phase, and **Chromatographic system:** Proceed as directed in the *Assay*.
System suitability solution: 0.2 mg/mL of USP Scopolamine Hydrobromide RS and 0.001 mg/mL of USP Norscopolamine RS in *Solution A*
Standard solution: 0.002 mg/mL of USP Scopolamine Hydrobromide RS in *Solution A*
Sample solution: 2.0 mg/mL of Scopolamine Hydrobromide in *Solution A*
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between the norscopolamine and scopolamine peaks, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Scopolamine Hydrobromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/F \times 100$$

r_U = peak response of the impurity from the *Sample solution*
r_S = peak response of scopolamine from the *Standard solution*
C_S = concentration of USP Scopolamine Hydrobromide RS in the *Standard solution* (mg/mL)
C_U = concentration of Scopolamine Hydrobromide in the *Sample solution* (mg/mL)
F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%. Disregard any peak due to the bromide ion at RRT 0.1 that appears close to the solvent peak.

www.webofpharma.com

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

▲Scopolamine Hydrobromide Injection

» Scopolamine Hydrobromide Injection is a sterile solution of Scopolamine Hydrobromide in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$.

Packaging and Storage—Preserve in light-resistant, single-dose or multiple-dose containers, preferably of Type I glass.
USP Reference Standards ⟨ 11 ⟩ —
USP Scopolamine Hydrobromide RS

Identification—

A: Transfer a volume of Injection, equivalent to about 3 mg of scopolamine hydrobromide, to a 50-mL separator, dilute with water, if necessary, to 10 mL, add 0.2 mL of ammonium hydroxide, and extract with 25 mL of chloroform. Add 50 mL of ether to the chloroform solution, and pass the mixture through a 25- × 250-mm chromatographic tube fitted with a pledget of glass wool at the base and packed with 2 g of purified siliceous earth that previously has been mixed with 1 mL of 0.2 N phosphoric acid saturated with sodium bromide. Discard the eluate, and pass 25 mL of water-saturated ether through the column and discard. Elute with 100 mL of water-saturated chloroform, collect the eluate in a suitable receiver, and evaporate just to dryness. Dissolve the residue in 1 mL of alcohol, and proceed as directed in *Identification* test *A* under *Scopolamine Hydrobromide*, beginning with "and evaporate the solution on a steam bath to dryness."

B: Add to the Injection silver nitrate TS: a yellowish white precipitate, insoluble in nitric acid but slightly soluble in 6 N ammonium hydroxide, is formed.

Bacterial Endotoxins ⟨ 85 ⟩ —It contains not more than 555.0 USP Endotoxin Units per mg of scopolamine hydrobromide.

pH ⟨ 791 ⟩ : between 3.5 and 6.5.

Other Requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—

pH 9.0 Buffer—Dissolve 34.8 g of dibasic potassium phosphate in 900 mL of water, and adjust with 3 N hydrochloric acid or 1 N sodium hydroxide, as necessary, to a pH of 9.0, determined electrometrically, and mix.

Internal standard solution—Transfer about 25 mg of homatropine hydrobromide to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Prepare fresh daily.

Standard stock solution—Transfer about 10 mg of USP Scopolamine Hydrobromide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Prepare fresh daily.

Standard preparation—Pipet 10 mL of the *Standard stock solution* into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *pH 9.0 Buffer*, and carefully adjust the solution with 1 N sodium hydroxide to a pH of 9.0, avoiding any excess. Immediately extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under nitrogen to approximately 2.0 mL.

Assay solution—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of scopolamine hydrobromide, to a 100-mL volumetric flask. Dilute with water to volume, and mix.

Assay preparation—Pipet 10 mL of the *Assay solution* into a separator, and proceed as directed for *Standard preparation*, beginning with "add 2.0 mL of *Internal standard solution*."

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph contains a 2-mm × 1.8-m glass column packed with 3% liquid phase G3 on support S1AB. The carrier gas is nitrogen, flowing at a rate of 25 mL per minute. The column temperature is maintained at 225°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution factor, *R*, between homatropine and scopolamine is not less than 5; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

www.webofpharma.com

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the ratio, A_U, of the area of the scopolamine hydrobromide peak to the area of the internal standard peak in the chromatogram from the *Assay preparation*, and similarly calculate the ratio, A_S, in the chromatogram from the *Standard preparation*. Calculate the quantity, in mg, of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$) in the volume of Injection taken by the formula:

$$1.141W(A_U/A_S),$$

in which 1.141 is the ratio of the molecular weight of scopolamine hydrobromide trihydrate to that of anhydrous scopolamine hydrobromide; W is the weight, in mg, of USP Scopolamine Hydrobromide RS in the *Standard preparation*; and A_U and A_S are as calculated above. ▲ (USP 1-May-2020)

USP Secobarbital RS
Identification, *Infrared Absorption* ⟨ 197M ⟩ .
Loss on Drying ⟨ 731 ⟩ —Dry it over silica gel for 18 hours: it loses not more than 1.0% of its weight.
Residue on Ignition ⟨ 281 ⟩ : not more than 0.1%.
Isomer content—Dissolve about 300 ± 5 mg in 5 mL of sodium hydroxide solution (1 in 100), add a solution of 300 ± 5 mg of *p*-nitrobenzyl bromide in 10 mL of alcohol, reflux for 30 minutes, cool, collect the precipitate on a small filter, and wash with water: the precipitate, recrystallized from 25 mL of alcohol and dried at 105° for 30 minutes, melts between 156° and 161°.
Assay—Add about 450 mg of Secobarbital, accurately weighed, to 60 mL of dimethylformamide in a 125-mL conical flask. Add 4 drops of thymol blue TS, and titrate with 0.1 N sodium methoxide VS, using a magnetic stirrer and taking precautions against the absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 23.83 mg of $C_{12}H_{18}N_2O_3$. ▲ (USP 1-May-2020)

Secobarbital Sodium

$C_{12}H_{17}N_2NaO_3$ 260.26
2,4,6(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-(1-methylbutyl)-5-(2-propenyl)-, monosodium salt.
Sodium 5-allyl-5-(1-methylbutyl)barbiturate [309-43-3].

» Secobarbital Sodium contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{17}N_2NaO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.
Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
USP Reference standards ⟨11⟩—
USP Secobarbital RS
Completeness of solution—Mix 1.0 g with 10 mL of carbon dioxide-free water: after 1 minute, the solution is clear and free from undissolved solid.

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020)—
Test specimen: Dissolve about 500 mg of Secobarbital Sodium, accurately weighed, in 15 mL of water in a separator. To the solution, add 2 mL of hydrochloric acid, shake, and extract the liberated secobarbital with eight 25-mL portions of dichloromethane. Test for completeness of extraction by extracting with an additional 10-mL portion of dichloromethane and evaporating the solvent: not more than 0.5 mg of residue remains. Filter the extracts into a tared beaker, and finally rinse the separator and the filter with several small portions of dichloromethane. Evaporate the combined filtrate and washings on a steam bath with the aid of a current of air just to dryness. Dissolve the residue in 2 mL of dehydrated alcohol, and evaporate to dryness. Repeat the dissolution and evaporation with 2 mL of dehydrated alcohol, and dry the residue at 100° for 2 hours. Use a suitable amount of the residue for examination.
B: Ignite about 500 mg: the residue effervesces with acids, and meets the requirements of the tests for *Sodium* ⟨191⟩.
C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.
pH ⟨791⟩: between 9.7 and 10.5, in the solution prepared in the test for *Completeness of solution*.
Loss on drying ⟨731⟩—Dry it at 80° for 5 hours: it loses not more than 3.0% of its weight.

Related compounds—
Buffer, *Mobile phase*, and *Standard preparation*—Prepare as directed in the *Assay*.
Standard solution—Quantitatively dilute with *Mobile phase* a suitable volume of the *Standard preparation* to obtain a final solution having a known concentration of about 5 µg per mL of USP Secobarbital RS.
Test solution—Use the *Assay stock preparation*.
Chromatographic system—Prepare as directed for *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor for secobarbital is not more than 2.0; and the relative standard deviation for five replicate injections for secobarbital is not more than 6.0%.
Procedure—Separately inject a volume (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatograms. Identify the peaks due to the impurities using the relative retention times given in *Table 1*. Calculate the percentage of each impurity in the portion of Secobarbital Sodium taken by the formula:

$$100(r_i/r_s)(C_s/C_u)(1/F)$$

in which r_i is the response of the impurity peak obtained from the *Test solution;* r_s is the response of secobarbital obtained from the *Standard solution;* C_s is the concentration of USP Secobarbital RS, in mg per mL, in the *Standard solution*; C_u is the nominal concentration of Secobarbital Sodium, in mg per mL, in the *Test solution;* and *F* is the relative response factor given in *Table 1*. The impurities meet the limits given in *Table 1*.

Table 1

Compound	Relative Retention Time (RRT)	Relative Response Factor (*F*)	Limit (%)
Imino impurity[1]	0.33	1.7	NMT 1.0
2-Hydroxy propyl impurity[2]	0.38	0.95	NMT 0.25
Secobarbital	1.0	1.0	—
MIBK impurity[3]	1.61	0.96	NMT 0.55
Any individual unspecified impurity	—	1.0	NMT 0.10

www.webofpharma.com

Table 1 *(continued)*

Compound	Relative Retention Time (RRT)	Relative Response Factor (*F*)	Limit (%)
Total impurities	—	—	NMT 1.5

[1] 5-Allyl-4-imino-5-(1-methylbutyl) barbituric acid.
[2] 5-(2-Hydroxypropyl)-5-(1-methylbutyl) barbituric acid.
[3] 5-Allyl-5-(1-3-dimethylbutyl) barbituric acid.

Other requirements—Where the label states that Secobarbital Sodium is sterile, it meets the requirements for *Sterility Tests* ⟨71⟩ and for *Bacterial endotoxins* under *Secobarbital Sodium for Injection*. Where the label states that Secobarbital Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Secobarbital Sodium for Injection*.

Assay—

Buffer—Dissolve 1.36 g of monobasic potassium phosphate in 1000 mL of water.

Diluted phosphoric acid—Dilute orthophosphoric acid with water (4:1).

Mobile phase—Prepare a mixture of *Buffer* and acetonitrile (13:7). Adjust with *Diluted phosphoric acid* to a pH of 3.5.

Standard preparation—In a suitable volumetric flask, dissolve an accurately weighed quantity of USP Secobarbital RS in *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL of secobarbital.

Assay stock preparation—Transfer about 100 mg of Secobarbital Sodium into a 100-mL volumetric flask. Add 60 mL of *Mobile phase,* and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Quantitatively dilute with *Mobile phase* the *Assay stock preparation* to obtain a nominal concentration of 0.4 mg per mL of secobarbital sodium.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15.0-cm column containing 3.5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for secobarbital is not more than 2.0; and the relative standard deviation from replicate injections for secobarbital is not more than 2.0%.

Procedure—Separately inject a volume (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and record the chromatograms. Identify the peaks due to the impurities using the relative retention times given in *Table 1*. Calculate the percentage of $C_{12}H_{17}N_2NaO_3$, in the portion of Secobarbital Sodium taken by the formula:

$$100(C_S/C_U)(r_U/r_S)(Mr_1/Mr_2)$$

in which C_S is the concentration, in mg per mL, of USP Secobarbital RS in the *Standard preparation;* C_U is the nominal concentration of Secobarbital Sodium, in mg per mL, in the *Assay preparation;* r_U is the response of secobarbital peak obtained from the *Assay preparation;* r_S is the response of secobarbital peak obtained from the *Standard preparation;* Mr_1 is the molecular weight of secobarbital sodium, 260.27; and Mr_2 is the molecular weight of secobarbital, 238.28.

Secobarbital Sodium Capsules

DEFINITION

Secobarbital Sodium Capsules contain NLT 92.5% and NMT 107.5% of the labeled amount of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$).

IDENTIFICATION

Change to read:

- **A.** ▲**SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*▲ (CN 1-May-2020)

Sample solution: Nominally 5 mg/mL of secobarbital sodium in water from the contents of Capsules

Analysis: Transfer 10 mL of the filtered *Sample solution* to a separator. Add 2 mL of 3 N hydrochloric acid. Extract the liberated secobarbital with 20 mL of chloroform, and evaporate the extract to dryness. Dissolve the residue in chloroform to prepare a 5-mg/mL solution.

Acceptance criteria: The *Sample solution* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Secobarbital RS.

- **B.** The retention time of the secobarbital peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: Phosphoric acid and water (80:20)

Buffer: 1.4 g/L of monobasic potassium phosphate in water adjusted with *Solution A* to a pH of 3.5

Mobile phase: Acetonitrile and *Buffer* (35:65)

Diluent: Acetonitrile and water (35:65)

Standard solution: 0.4 mg/mL of USP Secobarbital RS in *Diluent*. Sonication may be used to aid in dissolution.

Sample solution: Nominally 0.4 mg/mL of secobarbital sodium in a solution prepared as follows. Transfer the equivalent of 44 mg of secobarbital sodium from the contents of NLT 20 Capsules to a 100-mL volumetric flask. Dilute with *Diluent* to volume. Shaking and sonication may be used to aid in dissolution. Centrifuge a portion of this solution, and use the supernatant.

Chromatographic system
(see *Chromatography* ⟨621⟩, *System Suitability*)
Mode: LC
Detector: 215 nm
Column: 4.6-mm × 15.0-cm; 3.5-µm packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
Run time: 2 times the retention time of secobarbital

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 1.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Secobarbital RS in the *Standard solution* (mg/mL)

USP Monographs

www.webofpharma.com

C_U = nominal concentration of secobarbital sodium in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of secobarbital sodium, 260.26
M_{r2} = molecular weight of secobarbital, 238.28

Acceptance criteria: 92.5%–107.5%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩
Medium: Water; 500 mL
Apparatus 1: 100 rpm
Time: 60 min
Standard solution: USP Secobarbital RS in 0.1 N sodium hydroxide
Sample solution: Solution under test, mixed with sufficient sodium hydroxide to provide a concentration of 0.1 N sodium hydroxide, and diluted with *Medium*, as needed, so that the concentration is similar to that of the *Standard solution*
Instrumental conditions
Mode: UV
Analytical wavelength: 243 nm
Tolerances: NLT 75% (*Q*) of the labeled amount of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

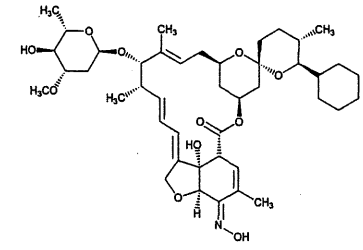
• **ORGANIC IMPURITIES**
Solution A, Buffer, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.
Standard solution: 0.005 mg/mL of USP Secobarbital RS in *Diluent*. Sonication may be used to aid in dissolution.
Sample solution: Nominally 1 mg/mL of secobarbital sodium in a solution prepared as follows. Transfer the equivalent of 100 mg of secobarbital sodium from NLT 20 Capsules to a 100-mL volumetric flask. Dilute with *Mobile phase* to 50% of the final flask volume. Sonicate and shake. Dilute with *Mobile phase* to volume. Pass through a suitable filter of 0.45-µm pore size.
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 6.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual unspecified degradant in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of any individual unspecified degradant from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Secobarbital RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of secobarbital sodium in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of secobarbital sodium, 260.26
M_{r2} = molecular weight of secobarbital, 238.28

Acceptance criteria: See *Table 1*.

Table 1



Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Iminosecobarbital[a]	0.33	1.0
2-Hydroxypropyl analog[b]	0.38	0.24
Secobarbital	1.0	—
1,3-Dimethylbutyl analog[c]	1.61	0.54
Any individual unspecified degradant	—	0.10
Total impurities	—	1.5

[a] 5-Allyl-4-imino-5-(1-methylbutyl) barbituric acid.
[b] 5-(2-Hydroxypropyl)-5-(1-methylbutyl) barbituric acid.
[c] 5-Allyl-5-(1-3-dimethylbutyl) barbituric acid.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Secobarbital RS

Selamectin

$C_{43}H_{63}NO_{11}$ 769.96
25-Cyclohexyl-4′-*O*-de(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-5-demethoxy-25-de(1-methylpropyl)-22,23-dihydro-5-(hydroxyimino)-avermectin A1a; (2a*E*,4*E*,5′*S*,6*S*,6′*S*,7*S*,8*E*,11*R*,13*R*,15*S*,17a*R*,20a*R*,20b*S*)-6′-Cyclohexyl-7-[(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)oxy]-3′,4′,5′,6,6′,7,10,11,14,15,20a,20b-dodecahydro-20b-hydroxy-5′,6,8,19-tetramethylspiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2′-[2*H*]pyran]-17,20(17a*H*)-dione 20-oxime [220119-17-5].

DEFINITION

Selamectin contains NLT 96.0% and NMT 102.0% of selamectin ($C_{43}H_{63}NO_{11}$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

Selegiline Hydrochloride

$C_{13}H_{17}N \cdot HCl$ 223.74

www.webofpharma.com

Benzeneethanamine, *N*,α-dimethyl-*N*-2-propynyl-, hydrochloride, (*R*)-.
(–)-(*R*)-*N*,α-Dimethyl-*N*-2-propynylphenethylamine hydrochloride [14611-52-0].

» Selegiline Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{13}H_{17}N \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.
USP Reference standards ⟨11⟩—
USP Selegiline Hydrochloride RS
USP Methamphetamine Hydrochloride RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020).

Change to read:

B: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Ultraviolet-Visible Spectroscopy: 197U*▲ (CN 1-May-2020)
Solution: 0.5 mg per mL.
Medium: water.
C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay.*
D: It responds to the tests for *Chloride* ⟨191⟩.
Melting range ⟨741⟩: not greater than 2°, within the limits of 141° and 145°.
Specific rotation ⟨781S⟩: between –10.0° and –12.0°.
Test solution: 100 mg per mL, in water.
Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.
Residue on ignition ⟨281⟩: not more than 0.2%.

Chromatographic purity—
Buffer solution, Mobile phase, and *System suitability solution*—Proceed as directed in the *Assay.*
Standard solution—Transfer 10.0 mL of the *System suitability solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 50 mL volumetric flask, dilute with *Mobile phase* to volume, and mix.
Test solution—Transfer 50 mg of Selegiline Hydrochloride to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Chromatographic system—Proceed as directed in the *Assay.* Inject about 20 µL of the *Standard solution,* and record the peak responses as directed in the *Procedure:* the resolution, *R,* between the methamphetamine and selegiline peaks is not less than 3, and the relative standard deviation for replicate injections is not more than 5.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than three times the retention time of selegiline. Record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Selegiline Hydrochloride taken by the formula:

$$5000(C/W)(r_i/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Selegiline Hydrochloride RS in the *Standard solution, W* is the weight, in mg, of Selegiline Hydrochloride taken to prepare the *Test solution,* r_i is the peak response for each impurity in the chromatogram of the *Test solution,* and r_S is the peak response for selegiline in the chromatogram of the *Standard solution.* Not more than 0.2% of any individual impurity is found, and the sum of all impurities is not more than 1.0%.

Assay—
Buffer solution—Prepare a solution of 0.1 M monobasic ammonium phosphate, adjust with phosphoric acid to a pH of 3.1, and mix.
Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard preparation—Dissolve an accurately weighed quantity of USP Selegiline Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.
System suitability solution—Dissolve accurately weighed quantities of USP Methamphetamine Hydrochloride RS and USP Selegiline Hydrochloride RS in *Mobile phase* to obtain a solution containing 0.1 mg per mL of each Reference Standard.
Assay preparation—Transfer an accurately weighed quantity, about 50 mg of Selegiline Hydrochloride, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the methamphetamine and selegiline peaks is not less than 3, and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{17}N \cdot HCl$ in the portion of Selegiline Hydrochloride taken by the formula:

$$500C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Selegiline Hydrochloride RS in the *Standard preparation,* and r_U and r_S are the selegiline peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Selegiline Hydrochloride Capsules

DEFINITION
Selegiline Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

www.webofpharma.com

ASSAY

• **PROCEDURE**

Buffer: 11.5 g/L of monobasic ammonium phosphate in water. Adjust with phosphoric acid to a pH of 3.1.

Mobile phase: Acetonitrile and *Buffer* (20:80)

System suitability solution: 0.1 mg/mL each of USP Selegiline Hydrochloride RS and USP Methamphetamine Hydrochloride RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Selegiline Hydrochloride RS in *Mobile phase*

Sample stock solution: Nominally, 1 mg/mL of selegiline hydrochloride from the contents of NLT 20 Capsules, prepared as follows. To the weighed portion of the sample in a suitable volumetric flask add *Mobile phase* to fill 80% of the final flask volume. Sonicate for at least 10 min. Dilute with *Mobile phase* to volume, and centrifuge a portion of the solution for at least 10 min.

Sample solution: Nominally, 0.1 mg/mL of selegiline hydrochloride, by diluting a portion of the supernatant from the *Sample stock solution* with *Mobile phase*. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 1.5 times the retention time of selegiline

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for methamphetamine and selegiline are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3 between the methamphetamine and selegiline peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of selegiline from the *Sample solution*

r_S = peak response of selegiline from the *Standard solution*

C_S = concentration of USP Selegiline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of selegiline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨711⟩

Medium: Water; 500 mL

Apparatus 1: 50 rpm

Time: 20 min

Buffer, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.01 mg/mL of USP Selegiline Hydrochloride RS in *Mobile phase*

Sample solution: Pass a portion of the solution under test through a suitable filter.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Selegiline Hydrochloride RS in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer and **Mobile phase:** Proceed as directed in the *Assay*.

Standard stock solution A: 0.2 mg/mL each of USP Selegiline Hydrochloride RS and USP Selegiline Related Compound D RS in *Mobile phase*

Standard stock solution B: 0.2 mg/mL of USP Methamphetamine Hydrochloride RS in *Mobile phase*

Standard solution: 2 µg/mL each of USP Selegiline Hydrochloride RS and USP Selegiline Related Compound D RS, and 20 µg/mL of USP Methamphetamine Hydrochloride RS in *Mobile phase* from *Standard stock solution A* and *Standard stock solution B*, respectively

Sample solution: Nominally, 1 mg/mL of selegiline hydrochloride in *Mobile phase* from the contents of NLT 20 Capsules, prepared as follows. To the weighed portion of sample in a suitable volumetric flask add *Mobile phase* to fill 60% of the final flask volume. Sonicate for at least 10 min, and dilute with *Mobile phase* to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system: Proceed as directed in the *Assay* except use a run time of 3 times the retention time of selegiline.

System suitability

Sample: *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 6.0 between methamphetamine and selegiline related compound D; NLT 3.2 between selegiline related compound D and selegiline

Relative standard deviation: NMT 10.0% for each of the selegiline related compound D and selegiline peaks; NMT 5.0% for the methamphetamine peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methamphetamine and selegiline related compound D in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of methamphetamine or selegiline related compound D from the *Sample solution*

r_S = peak response of the corresponding Reference Standard from the *Standard solution*

C_S = concentration of the corresponding Reference Standard in the *Standard solution* (mg/mL)

www.webofpharma.com

C_U = nominal concentration of selegiline hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of each individual unspecified impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*
r_S = peak response of USP Selegiline Hydrochloride RS from the *Standard solution*
C_S = concentration of USP Selegiline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of selegiline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. Disregard any peak below 0.1%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methamphetamine[a]	0.62	2.0
Selegiline related compound D[b]	0.85	0.50
Selegiline	1.0	--
Any individual unspecified degradation product	—	0.50
Total impurities[c]	—	2.0

[a] Benzeneethanamine, *N*,α-dimethyl-, (*S*)-.
[b] (*R*)-*N*-(1-Phenylpropan-2-yl)prop-2-yn-1-amine.
[c] Does not include methamphetamine.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light resistant containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Methamphetamine Hydrochloride RS
  USP Selegiline Hydrochloride RS
  USP Selegiline Related Compound D RS
  (*R*)-*N*-(1-Phenylpropan-2-yl)prop-2-yn-1-amine hydrochloride.
  $C_{12}H_{15}N \cdot HCl$ 209.72

Selegiline Hydrochloride Tablets

» Selegiline Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{13}H_{17}N \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—
USP Selegiline Hydrochloride RS
USP Methamphetamine Hydrochloride RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

Dissolution ⟨711⟩—
Medium: water; 500 mL.
Apparatus 1: 50 rpm.
Time: 20 minutes.

Determine the amount of $C_{13}H_{17}N \cdot HCl$ dissolved using the following method.

Monobasic ammonium phosphate solution—Dissolve 11.5 g of monobasic ammonium phosphate in 1000 mL of water. Adjust with 85% phosphoric acid to a pH of 3.1.

Mobile phase—Prepare a filtered and degassed mixture of *Monobasic ammonium phosphate solution* and acetonitrile (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer 25.0 mg, accurately weighed, of USP Selegiline Hydrochloride RS to a 50-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Pipet 2.0 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—At 20 minutes withdraw a 10-mL portion of the solution under test and centrifuge for 10 minutes at 3500 rpm.

Chromatographic system—The liquid chromatograph is equipped with a 205-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is 1.0 mL/min. Chromatograph the *Standard solution*, and record the peak responses. The relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{13}H_{17}N \cdot HCl$ dissolved.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{13}H_{17}N \cdot HCl$ is dissolved in 20 minutes.

Chromatographic purity—

Buffer solution , *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Selegiline Hydrochloride*.

Standard solution—Transfer 10.0 mL of the *System suitability solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 20-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Use a portion of the supernatant obtained from the *Assay preparation*.

Procedure—Proceed as directed in the test for *Chromatographic purity* under *Selegiline Hydrochloride*. Calculate the percentage of each impurity, excluding methamphetamine hydrochloride, in the portion of Tablets taken by the formula:

$$5000(C/W)(r_i/r_s)$$

in which W is the weight, in mg, of the labeled content of selegiline hydrochloride in the portion of Tablets taken to prepare the *Test solution*, and the other terms are as defined therein. Not more than 0.5% of any individual impurity is found, and the sum of all impurities, excluding methamphetamine hydrochloride, is not more than 2.0%.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Limit of methamphetamine hydrochloride—

Buffer solution , *Mobile phase*, *System suitability solution*, *Test solution*, and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Selegiline Hydrochloride*.

Standard solution—Transfer 10.0 mL of the *System suitability solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed in the test for *Chromatographic purity* under *Selegiline Hydrochloride*.

USP Monographs

www.webofpharma.com

Calculate the percentage of methamphetamine hydrochloride in the portion of Tablets taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Methamphetamine Hydrochloride RS in the *Standard solution*, W is the weight, in mg, of the labeled content of selegiline hydrochloride in the portion of Tablets taken to prepare the *Test solution*, and r_U and r_S are the methamphetamine peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 2.0% of methamphetamine hydrochloride is found.

Assay—

Buffer solution , *Mobile phase*, *Standard preparation*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the test for *Assay* under *Selegiline Hydrochloride*.

Assay preparation—Weigh and powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder equivalent to about 50 mg of selegiline hydrochloride to a 50-mL volumetric flask. Add 40 mL of *Mobile phase*, sonicate for 10 minutes, dilute with *Mobile phase* to volume, and mix. Centrifuge a 25-mL aliquot of this solution at 3500 rpm for 10 minutes. [NOTE—Retain a portion of the supernatant for the *Chromatographic purity* and *Limit of methamphetamine hydrochloride* tests.] Transfer 10.0 mL of the supernatant to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Selegiline Hydrochloride*. Calculate the quantity, in mg, of $C_{13}H_{17}N \cdot HCl$ in the portion of Tablets taken by the formula:

$$500C(r_U/r_S)$$

in which the terms are as defined therein.

Selegiline Hydrochloride Compounded Topical Gel

DEFINITION

Selegiline Hydrochloride Compounded Topical Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$).

Prepare Selegiline Hydrochloride Compounded Topical Gel 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩). For this preparation, a soy lecithin–isopropyl palmitate mixture and a poloxamer gel need to be separately prepared.

Sorbic Acid	0.2 g
Soy lecithin	50 g
Isopropyl Palmitate	50 g

Prepare a soy lecithin–isopropyl palmitate mixture by mixing 0.2 g of *Sorbic Acid*, 50 g of *Soy lecithin*, and 50 g of *Isopropyl Palmitate* together. Allow the mixture to set overnight, and mix again.

Sorbic Acid	0.2 g
Poloxamer 407	30 g
Purified Water, a sufficient quantity to make	100 mL

Separately, prepare a 30% poloxamer gel by mixing 0.2 g of *Sorbic Acid*, 30 g of *Poloxamer 407*, and a sufficient amount of *Purified Water* to bring to a final volume of 100 mL. Place the gel in the refrigerator overnight, and mix again.

Selegiline hydrochloride powder	1 g
Purified Water	5 mL
Soy lecithin–isopropyl palmitate mixture	22 mL
Poloxamer gel (30%), a sufficient quantity to make	100 mL

Dissolve 1 g of *Selegiline hydrochloride powder* in 5 mL of *Purified Water* in a suitable mortar. Add 22 mL of the previously prepared soy lecithin–isopropyl palmitate mixture to the mortar, and mix well. Add a sufficient amount of the previously prepared 30% poloxamer gel to bring to final volume, and mix using high-shear methods.

ASSAY

• **PROCEDURE**

Solution A: 0.1 M monobasic ammonium phosphate adjusted with phosphoric acid to a pH of 3.1

Mobile phase: Acetonitrile and *Solution A* (20:80). Filter, and degas.

System suitability solution: 0.4 mg/mL each of USP Selegiline Hydrochloride RS and USP Methamphetamine Hydrochloride RS in *Mobile phase*

Standard solution: 0.4 mg/mL of USP Selegiline Hydrochloride RS in *Mobile phase*

Sample solution: Shake thoroughly each container of Topical Gel. Transfer 0.4 mL of Topical Gel into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix well.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 8 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for methamphetamine hydrochloride and selegiline hydrochloride are about 0.63 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0, *Standard solution*

Resolution: NLT 8.0 between selegiline and methamphetamine, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of selegiline hydrochloride ($C_{13}H_{17}N \cdot HCl$) in the portion of Topical Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of selegiline hydrochloride from the *Sample solution*

r_S = peak response of selegiline hydrochloride from the *Standard solution*

C_S = concentration of selegiline hydrochloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of selegiline hydrochloride in the *Sample solution* (mg/mL)

USP Monographs

www.webofpharma.com

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
- **pH** ⟨791⟩: 4.6–5.6

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Package in a tight, light-resistant suitable calibrated dispenser. Store at 2°–8° or at controlled room temperature.
- **Beyond-Use Date:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or at controlled room temperature
- **Labeling:** Label it to indicate that it is for external use only, keep out of the reach of children, use only as directed, and to state the *Beyond-Use Date.*
- **USP Reference Standards** ⟨11⟩
  USP Methamphetamine Hydrochloride RS
  USP Selegiline Hydrochloride RS

Selenious Acid

H_2SeO_3 128.97
Selenium dioxide, monohydrated;
Selenious acid [7783-00-8].

DEFINITION
Selenious Acid contains NLT 93.0% and NMT 101.0% of H_2SeO_3.

IDENTIFICATION
- **A.**
  Sample: 50 mg
  Analysis: Dissolve the *Sample* in 5 mL of water. Add 100 mg of sodium bicarbonate, and mix.
  Acceptance criteria: Gas bubbles develop.
- **B.**
  Sample: 50 mg
  Analysis: Dissolve the *Sample* in 5 mL of 0.1 N hydrochloric acid. Add 50 mg of stannous chloride.
  Acceptance criteria: A curdy tan-orange precipitate is formed.

ASSAY
- **Procedure**
  Sample solution: Transfer 100 mg to a suitable glass-stoppered flask, and dissolve in 50 mL of water.
  Analysis: Add 10 mL of a 300-mg/mL potassium iodide solution and 5 mL of hydrochloric acid to the *Sample solution,* and mix. Insert the stopper in the flask, and allow to stand for 10 min. Add 50 mL of water and 3 mL of starch TS. Titrate with 0.1 N sodium thiosulfate VS until the solution is colorless, then titrate with 0.1 N iodine VS to a blue endpoint. Subtract the volume of 0.1 N iodine from the volume of 0.1 N sodium thiosulfate to obtain the volume of 0.1 N sodium thiosulfate equivalent to selenious acid. Each mL of 0.1 N sodium thiosulfate is equivalent to 3.225 mg of H_2SeO_3.
  Acceptance criteria: 93.0%–101.0%

IMPURITIES
- **Residue on Ignition** ⟨281⟩
  Sample: 10 g
  Acceptance criteria: NMT 1.0 mg (0.01%)
- **Insoluble Matter**
  Sample: 1 g
  Analysis: Dissolve the *Sample* in 5 mL of water.
  Acceptance criteria: It dissolves completely, and the solution is clear.
- **Selenate and Sulfate**
  Sample solution: Dissolve 0.5 g in 10 mL of water.
  Analysis: Add 0.1 mL of hydrochloric acid and 1 mL of barium chloride TS to the *Sample solution,* and mix.
  Acceptance criteria: No turbidity or precipitate is formed in 10 min.

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight containers.

Selenious Acid Injection

DEFINITION
Selenious Acid Injection is a sterile solution in Water for Injection of Selenious Acid or of selenium dissolved in nitric acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of selenium (Se).

IDENTIFICATION
- **A.** The *Sample solution,* prepared as directed in the *Assay,* exhibits an absorption maximum at about 196 nm, when tested as directed in the *Assay.*

ASSAY
- **Procedure**
  [**Caution**—Selenium is toxic; handle it with care.]
  Standard stock solution: 1000 µg/mL of selenium, prepared as follows. Dissolve about 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, dilute with 3 N hydrochloric acid to volume, and mix.
  Standard solution A: 30 µg/mL of selenium from the *Standard stock solution* diluted with water
  Standard solution B: 40 µg/mL of selenium from the *Standard stock solution* diluted with water
  Standard solution C: 50 µg/mL of selenium from the *Standard stock solution* diluted with water
  Sample solution: 40 µg/mL of selenium from Injection diluted with water
  Instrumental conditions
  (See *Atomic Absorption Spectroscopy* ⟨852⟩.)
  Mode: Atomic absorption spectrophotometer
  Lamp: Selenium electrodeless discharge
  Flame: Air–acetylene
  Analytical wavelength: Selenium emission line at 196 nm
  Blank: Water
  Analysis
  Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*
  Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C_S, in µg/mL, of selenium in the *Sample solution.*
  Calculate the percentage of the labeled amount of selenium (Se) in the portion of Injection taken:

$$\text{Result} = (C_S/C_U) \times 100$$

C_S = concentration of selenium in the *Sample solution* determined from the calibration graph (µg/mL)
C_U = nominal concentration of selenium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

www.webofpharma.com

SPECIFIC TESTS
- **pH** ⟨791⟩: 1.8–2.4
- **Particulate Matter in Injections** ⟨788⟩: Meets the requirements for small-volume injections
- **Bacterial Endotoxins Test** ⟨85⟩: NMT 3.5 USP Endotoxin Units/µg of selenium
- **Other Requirements:** Meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.
- **Labeling:** Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid before administration.

Selenium Sulfide

SeS_2 143.09
Selenium sulfide (SeS_2).
Selenium sulfide (SeS_2) [7488-56-4].

» Selenium Sulfide contains not less than 52.0 percent and not more than 55.5 percent of selenium (Se).

Packaging and storage—Preserve in well-closed containers.

Identification—
A: Filter 20 mL of the solution of Selenium Sulfide prepared as directed in the *Assay*, and to 10 mL of the filtrate add 5 mL of water and 5 g of urea. Heat to boiling, cool, and add 2 mL of potassium iodide solution (1 in 10): a yellowish orange to orange color is produced, and it darkens rapidly (*presence of selenium*).
B: Allow the solution obtained in *Identification* test *A* to stand for 10 minutes, filter, and to the filtrate add 10 mL of barium chloride TS: the solution becomes turbid (*presence of sulfur*).
Residue on ignition ⟨281⟩: not more than 0.2%.

Soluble selenium compounds—
Test solution—Mix 10.0 g of Selenium Sulfide with 100.0 mL of water in a 250-mL flask, allow to stand for 1 hour, with frequent agitation, and filter. To 10.0 mL of the filtrate add 2 mL of 2.5 M formic acid, dilute with water to 50 mL, mix, and adjust, if necessary, to a pH of 2.5 ± 0.5. Add 2 mL of freshly prepared 3,3′-diaminobenzidine hydrochloride solution (1 in 200), mix, allow to stand for 45 minutes, and adjust with 6 N ammonium hydroxide to a pH of 6.5 ± 0.5. Transfer to a separator, add 10.0 mL of toluene, shake vigorously for 1 minute, allow the layers to separate, and discard the aqueous phase.
Standard solution—Using 10.0 mL of a solution of selenious acid containing 0.5 µg of selenium per mL, prepare a solution as directed under *Test solution*, beginning with "add 2 mL of 2.5 M formic acid."
Procedure—Concomitantly determine the absorbances of the toluene layers of the *Test solution* and the *Standard solution* in 1-cm cells at 420 nm, with a suitable spectrophotometer, using a blank consisting of the same quantities of the same reagents treated in the same manner as the *Test solution:* the absorbance of the *Test solution* is not greater than that of the *Standard solution* (5 ppm).

Assay—Place about 100 mg of Selenium Sulfide, accurately weighed, in a suitable container, add 25 mL of fuming nitric acid, and digest over gentle heat until no further solution occurs. Cool, transfer the solution to a 250-mL volumetric flask containing 100 mL of water, cool again, dilute with water to volume, and mix. Pipet 50 mL of the solution into a suitable flask, add 25 mL of water and 10 g of urea, and heat to boiling. Cool, add 3 mL of starch TS, then add 10 mL of potassium iodide solution (1 in 10), and immediately titrate with 0.05 N sodium thiosulfate VS. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N sodium thiosulfate is equivalent to 987.0 µg of Se.

Selenium Sulfide Topical Suspension

» Selenium Sulfide Topical Suspension is an aqueous, stabilized suspension of Selenium Sulfide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of SeS_2. It contains suitable buffering and dispersing agents.
[NOTE—Where labeled for use as a shampoo, it contains a detergent. Where labeled for other uses, it may contain a detergent.]

Packaging and storage—Preserve in tight containers.
Identification—Digest about 2 g with 5 mL of nitric acid over gentle heat for 1 hour, dilute with water to about 50 mL, and filter: the solution responds to *Identification* test *A* under *Selenium Sulfide,* when tested as directed, beginning with "to 10 mL of the filtrate add 5 mL of water."
pH ⟨791⟩: between 2.0 and 6.0.
Assay—Place a portion of well-mixed Topical Suspension, equivalent to about 100 mg of selenium sulfide and accurately weighed, in a suitable flask. Cautiously digest with 25 mL of fuming nitric acid over gentle heat for 2 hours, and proceed as directed in the *Assay* under *Selenium Sulfide,* beginning with "Cool, transfer the solution to a 250-mL volumetric flask." Each mL of 0.05 N sodium thiosulfate is equivalent to 1.789 mg of SeS_2. Where the Topical Suspension is labeled in terms of percentage (w/v) or of the amount of SeS_2 in a given volume of Topical Suspension, determine the density of the Topical Suspension as follows: Using a tared, 100-mL volumetric flask, weigh 100 mL of Topical Suspension that previously has been shaken to ensure homogeneity, allowed to stand until the entrapped air rises, and finally inverted carefully just prior to transfer to the volumetric flask. From the observed weight of 100 mL of the Topical Suspension, calculate the quantity of SeS_2 in each 100 mL.

Senna Leaf

DEFINITION
Senna Leaf consists of the dried leaflet of *Senna alexandrina* Mill., also known as *Cassia acutifolia* Delile (Alexandrian senna) or *C. angustifolia* Vahl (Tinnevelly senna), (Fam. Fabaceae). Senna Leaf contains NLT 2.5% of anthraquinone glucosides, calculated as sennosides, on the dried basis.

www.webofpharma.com

IDENTIFICATION

• **A.**

Potassium hydroxide solution: 100 mg/mL of potassium hydroxide in alcohol

Sample: 500 mg of finely powdered Senna Leaf

Analysis: Add 10 mL of *Potassium hydroxide solution* to the *Sample*. Boil for 2 min, dilute with 10 mL of water, and filter. Acidify the filtrate with hydrochloric acid. Shake with ether, remove the ether layer, and shake with 5 mL of 6 N ammonium hydroxide.

Acceptance criteria: The aqueous layer is orange or bluish red.

ASSAY

• **PROCEDURE**

[NOTE—Conduct all sample preparations with minimal exposure to subdued light, and use low-actinic glassware to protect solutions from light.]

Ferric chloride solution: 105 mg/mL of ferric chloride

Methanolic magnesium acetate solution: 5 mg/mL of magnesium acetate in methanol

Sodium bicarbonate solution: 5 mg/mL of sodium bicarbonate

Standard solution: 0.13 mg/mL of USP Sennosides RS in *Sodium bicarbonate solution*

Sample solution: Weigh and pulverize 10 g of Senna Leaf. Transfer 0.15 g to a 100-mL round-bottom flask. Add 30 mL of water. Mix, weigh, attach a condenser, and reflux in a water bath for 15 min. Cool to room temperature, weigh, and adjust to the original weight with water. Centrifuge, and transfer 20.0 mL of the supernatant to a 150-mL separatory funnel. Add 0.1 mL of diluted hydrochloric acid, and shake with three 15-mL quantities of chloroform. Allow to separate, and discard the chloroform layer after each addition. Add about 0.1 g of sodium bicarbonate, shake for 3 min, and centrifuge. Use the supernatant as the *Sample solution*.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: Vis

Wavelength: 515 nm

Cell: Quartz

Blank: Methanol

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Transfer 10.0 mL each of the *Standard solution* and the *Sample solution* to separate 100-mL round-bottom flasks equipped with condensers. Add 20 mL of *Ferric chloride solution*, and mix. Reflux in a water bath for 20 min. Add 1 mL of hydrochloric acid, and reflux for an additional 20 min, with frequent shaking, to dissolve the precipitates. Cool to room temperature, transfer the mixtures to separate 100-mL separatory funnels, and shake with three 25-mL quantities of ether previously used to rinse the flasks. Combine the ether extracts, mix, and wash with two 15-mL quantities of water. Transfer the ether layers to separate 100-mL volumetric flasks. Dilute with ether to volume, and mix. Evaporate 10.0 mL of the ether extracts to dryness, and dissolve the residue in 10.0 mL of *Methanolic magnesium acetate solution*. Determine the absorbance of the resulting solution from the *Standard solution* and *Sample solution*, with a suitable spectrophotometer fitted with matched quartz cells, using the *Blank*.

Calculate the percentage of sennosides in the portion of Senna Leaf taken:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/W) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Sennosides RS in the *Standard solution* (mg/mL)

V = volume of water to which powdered Senna Leaf was added, 30 mL

W = weight of powdered Senna Leaf (mg)

Acceptance criteria: NLT 2.5% of anthraquinone glucosides, calculated as sennosides, on the dried basis

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** ⟨2021⟩**:** The total bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** ⟨2022⟩, *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli***:** Meets the requirements

• **ARTICLES OF BOTANICAL ORIGIN** ⟨561⟩, *Pesticide Residue Analysis***:** Meets the requirements

SPECIFIC TESTS

• **BOTANICAL CHARACTERISTICS**

Macroscopic

Unground Alexandrian senna leaf: Inequilaterally lanceolate or lance-ovate leaflets, frequently broken; 1.5–3.5 cm in length and 5–10 mm in width, unequal at the base, with very short, stout petiolules. The leaflets are acutely cuspidate, entire, brittle, and subcoriaceous, with short and somewhat appressed hairs, few on the upper surface, more numerous on the lower surface, where they occur spreading on the midrib, especially on its lower part. The color is weak yellow to light grayish green to pale olive. The odor is characteristic.

Unground Tinnevelly senna leaf: Usually unbroken leaflets, 2–5 cm in length and 6–15 mm in width; acute at the apex; and slightly hairy. The color of the leaves is weak yellow to pale olive.

Powdered Senna Leaf: Dusky greenish yellow to light olive brown

Microscopic

Transverse section: Senna Leaf shows polygonal epidermal cells with straight walls and frequently containing mucilage; numerous, broadly elliptical stomata mostly 20–35 µm in length, usually bordered by two neighbor-cells with their long axes parallel to that of the stoma, and rarely, though more frequently in Alexandrian senna leaf, a third epidermal cell at the end of the stoma. The hairs are nonglandular, one-celled, conical, often curved, with thick papillose walls, 100–350 µm in length. Palisade cells in a single layer underlie both surfaces except in the midrib region where they occur only beneath the upper epidermis. A meristele occurs in the midrib composed of several radially arranged fibrovascular bundles, the latter separated by narrow vascular rays and supported above and below by arcs of lignified pericyclic fibers. Calcium oxalate occurs in rosette aggregates in the spongy parenchyma and in six- to eight-sided prisms in the crystal fibers, which lie on the outer surface of each group of pericyclic fibers.

Powdered Senna Leaf: Fragments of veins bearing lignified vessels, tracheids, and crystal fibers, isolated hairs, masses of palisade and spongy parenchyma, fragments of epidermis with stomata, free calcium oxalate rosette aggregates, and prisms 10–20 µm in length. In powdered Alexandrian senna leaf, the hairs are more numerous than in powdered Tinnevelly senna leaf.

• **ARTICLES OF BOTANICAL ORIGIN** ⟨561⟩, *Methods of Analysis, Foreign Organic Matter***:** The amount of senna stems is NMT

Senna Fluidextract

DEFINITION
Prepare Senna Fluidextract as follows. Mix 1000 g of Senna, in coarse powder, with a sufficient quantity (600–800 mL) of menstruum consisting of a mixture of 1 volume of alcohol and 2 volumes of water to make it evenly and distinctly damp. After 15 min, pack the mixture firmly into a suitable percolator, and cover the drug with additional menstruum. Macerate for 24 h, then percolate at a moderate rate, adding fresh menstruum, until the drug is practically exhausted of its active principals. Reserve the first 800 mL of percolate, and use it to dissolve the residue from the additional percolate that has been concentrated to a soft extract at a temperature not to exceed 60°. Add water and alcohol to make the product measure 1000 mL.

OTHER COMPONENTS
- **ALCOHOL DETERMINATION,** *Method I* ⟨611⟩: 23.0%–27.0% of C_2H_5OH

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

Senna Pods

DEFINITION
Senna Pods are the dried ripe fruits of *Senna alexandrina* Mill., also known as *Cassia acutifolia* Delile (Alexandrian senna) or *C. angustifolia* Vahl (Tinnevelly senna), (Fam. Fabaceae). Senna Pods contain NLT 3.4% (Alexandrian senna) and NLT 2.2% (Tinnevelly senna) of anthraquinone glucosides, calculated as sennosides, on the dried basis.

IDENTIFICATION
- **A.**

Potassium hydroxide solution: 100 mg/mL of potassium hydroxide in alcohol

SPECIFIC TESTS

- **BOTANICAL CHARACTERISTICS**

Macroscopic

Unground Alexandrian senna pods: Occur as flattened, reniform, membranous, leathery pods; green to greenish brown with brown patches at the positions corresponding to the seeds; 40–50 mm in length and at least 20 mm wide; at one end is a stylar point and at the other a short stalk. The pods contain six or seven flattened and obovate seeds, green to pale brown, with a continuous network of prominent ridges on the testa.

Unground Tinnevelly senna pods: Occur as flattened, slightly reniform, membranous, leathery pods; brown to yellowish brown with brown patches at the positions corresponding to the seeds; slightly longer but narrower than Alexandrian senna pods, 35–60 mm in length and 14–18 mm wide; at one end is a stylar point and at the other a short stalk. The pods contain 5–8 flattened and obovate seeds, green to pale brown, with incomplete, wavy, transverse ridges on the testa.

Powdered Senna Pods: Brown powder

Microscopic

Senna Pods: Senna Pods show epicarp with very thick cuticulized polygonal cells, occasional anomocytic or paracytic stomata, and very few nonglandular, one-celled, conical, often curved hairs, with thick papillose walls, 100–350 µm in length; mesocarp consists of parenchymatous tissue containing a layer of calcium oxalate prisms and vascular bundles partially enclosed by fibers; endocarp with two crossed layers of fibers; seeds with a subepidermal layer of palisade cells with thick outer walls and endosperm of polyhedral cells with mucilaginous walls.

Powdered Senna Pods: Polygonal cells with occasional small numbers of nonglandular hairs and anomocytic or paracytic stomata, fibers in two crossed layers accompanied by a crystal sheath of calcium oxalate prisms, isolated hairs, masses of palisade cells of the seeds, clusters, and prisms of calcium oxalate.

Senna Oral Solution

DEFINITION

Prepare Senna Oral Solution as follows.

Senna Fluidextract	250 mL
Suitable essential oil(s)	
Sucrose	635 g
Purified Water, a sufficient quantity to make	1000 mL

Mix the oil(s) with the *Senna Fluidextract*, and gradually add 330 mL of *Purified Water*. Allow the mixture to stand for 24 h in a cool place, with occasional agitation, then filter, and pass enough *Purified Water* through the filter to obtain 580 mL of filtrate. Dissolve the *Sucrose* in this liquid, and add sufficient *Purified Water* to make the product measure 1000 mL. Mix, and strain.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION,** *Method I* ⟨611⟩: 90.0%–110.0% of the labeled amount of C_2H_5OH

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 25°.

Sennosides

DEFINITION

Change to read:

Sennosides is a partially purified natural complex of anthraquinone glucosides, isolated from senna leaflets and/or senna pods, *Senna alexandrina* Mill. [syn. *Cassia acutifolia* ▲Delile▲ 2S (USP41) or *C. angustifolia* ▲Vahl] (Family Fabaceae),▲ 2S (USP41) as calcium salts. It contains NLT 90.0% and NMT 110.0% of the labeled amount of sennosides. The labeled amount is NLT 60.0% (w/w), calculated on the dried basis.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

Solvent: Ethyl acetate, *n*-propyl alcohol, and water (1:1:1). Shake well, and discard the upper layer.
Standard solution: 1 mg/mL of USP Sennosides RS in *Solvent*
Sample solution: 1 mg/mL of Sennosides in *Solvent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *General Procedures, Thin-Layer Chromatography*.)
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 20 µL
Developing solvent system: Ethyl acetate, *n*-propyl alcohol, and water (4:4:3)

USP Monographs

www.webofpharma.com

Analysis: Apply the solutions, as 1-cm bands, on a line 2.5 cm from the bottom edge of a thin-layer chromatographic plate. Develop and dry. Examine the plate under long-wavelength UV light. Expose the plate to ammonium hydroxide vapor until color develops (about 5 min). Cover the plate with a piece of glass, and heat at 120° for 5 min.

Acceptance criteria: The two most prominent spots of the *Sample solution* correspond in color and position to those of the *Standard solution*.

COMPOSITION

• **CONTENT OF TOTAL SENNOSIDES**

Buffer: Dissolve 4.54 g of monobasic potassium phosphate in water to make 500 mL of solution. Dissolve 4.73 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Mix 38.9 mL of the monobasic potassium phosphate solution with 61.1 mL of the dibasic sodium phosphate solution. Adjust, if necessary, with the dibasic sodium phosphate solution to a pH of 7.0.

Borate solution: 37.9 g/L of sodium borate in water

Sodium dithionite solution: 15 g/L of sodium dithionite in water

Standard solution: 1 mg/mL of USP Sennosides RS in *Buffer*. Dissolve with the aid of an ultrasonic bath.

Sample solution: 1 mg/mL of Sennosides in *Buffer*

Instrumental conditions

(See *Fluorescence Spectroscopy* ⟨853⟩.)

Mode: Fluorescence

Excitation wavelength: 392 nm

Emission wavelength: 505 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Pipet 1-mL portions of the *Standard solution* and the *Sample solution* into separate 100-mL volumetric flasks, and dilute with *Borate solution* to volume. Transfer 5.0-mL portions of each of the resulting solutions to separate, low-actinic glass, 50-mL volumetric flasks. Add 15.0 mL of *Borate solution* and 15.0 mL of *Sodium dithionite solution*. Pass nitrogen through the solutions, seal the flasks with nitrogen-filled balloons, and heat in a water bath for 30 min. Cool the flasks for 15 min in a water bath thermostatically controlled at 20°. Dilute the solutions with *Borate solution* to volume. Determine, without delay, the fluorescence intensities of the resulting solutions, for which the time elapsed between the addition of *Sodium dithionite solution* and the measurement is the same.

Calculate the percentage of the labeled amount of sennosides in the portion of the *Sample* taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times (100/L)$$

I_U = fluorescence value observed in the *Sample solution*

I_S = fluorescence value observed in the *Standard solution*

C_S = concentration of USP Sennosides RS in the *Standard solution*, corrected for loss on drying (mg/mL)

C_U = concentration of Sennosides in the *Sample solution* (mg/mL)

L = labeled amount of total sennosides (mg/mg)

Acceptance criteria: 90.0%–110.0% of the labeled amount of sennosides

Change to read:

• **CONTENT OF SENNOSIDES A AND B**

Solvent: 1% sodium acetate in water

Buffer solution: Dissolve 3.6 g of dibasic sodium phosphate dodecahydrate in 50 mL of water, add to a solution of 6.2 g monobasic sodium phosphate dihydrate in 200 mL of water, mix, and adjust the pH to 5.0. Dilute the final solution (1:10) in water.

Solution A: Use a filtered and degassed mixture of *Buffer solution* and acetonitrile (1:1), containing 0.5% of benzyldimethylstearylammonium chloride.

Solution B: Use filtered and degassed acetonitrile.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Elution
0–35	100	0	Isocratic
35–40	100→30	0→70	Linear gradient
40–50	30	70	Isocratic
50–55	30→100	70→0	Linear gradient
55–60	100	0	Isocratic

Standard solution A: 0.1 mg/mL of USP Sennoside A RS in *Solvent*. Pass through a membrane filter of 0.45-µm pore size, discarding the first few milliliters of the filtrate.

Standard solution B: 0.1 mg/mL of USP Sennoside B RS in *Solvent*. Pass through a membrane filter of 0.45-µm pore size, discarding the first few milliliters of the filtrate.

▲**Standard solution C:** 0.3 mg/mL of USP Sennosides RS in *Solvent*. Pass through a membrane filter of 0.45-µm pore size, discarding the first few milliliters of the filtrate.▲ 2S (USP41)

Sample solution: 0.3 mg/mL of Sennosides in *Solvent*. Pass through a membrane filter of 0.45-µm pore size, discarding the first few milliliters of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 360 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: About 1 mL/min, adjusted so the retention time of the sennoside B peak is 30 min

Injection volume: 10 µL

System suitability

Sample: ▲*Standard solution C*▲ 2S (USP41)

Suitability requirements

Resolution: ▲NLT 1.5 between the sennoside B and preceding peaks, between the sennoside B and sennoside A peaks, and between the sennoside A and subsequent peaks▲ 2S (USP41)

Relative standard deviation: NMT 2.0% determined for the sum of the areas of the sennoside A and sennoside B peaks in replicate injections

▲**Chromatogram similarity:** The chromatogram obtained is similar to the reference chromatogram provided with the lot of USP Sennosides RS being used.▲ 2S (USP41)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of sennosides A and B in the portion of Sennosides taken:

$$\text{Result} = (r_U/r_S) \times (C \times V/W) \times 100 \times F$$

www.webofpharma.com

r_U = peak area of relevant sennoside in the *Sample solution*
r_S = peak area of relevant sennoside in the corresponding *Standard solution*
C = concentration of relevant sennoside in the corresponding *Standard solution* (mg/mL)
V = volume of the *Sample solution* (mL)
W = weight of Sennosides, corrected for the loss on drying, taken to prepare the *Sample solution* (mg)
F = conversion factor for the molecular weights of sennoside A or sennoside B to the corresponding calcium salt, 1.044

Calculate the total percentage of sennoside A and sennoside B relative to the labeled amount of total sennosides:

$$\text{Result} = [(A + B)/L] \times 100$$

A = percentage of sennoside A
B = percentage of sennoside B
L = labeled amount of total sennosides (%)

Acceptance criteria: The total percentage of sennosides A and B is NLT 60% of the labeled amount of total sennosides, calculated on the dried basis.

  Tolerances: NLT 75% (*Q*) of the labeled amount of sennosides is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sennosides RS

Serine

$C_3H_7NO_3$ 105.09
L-Serine [56-45-1].

DEFINITION
Serine contains NLT 98.5% and NMT 101.5% of L-serine ($C_3H_7NO_3$), calculated on the dried basis.

IDENTIFICATION

Change to read:

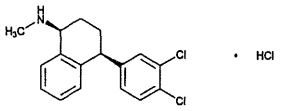
- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)

ASSAY
- **PROCEDURE**
  Sample: 100 mg of Serine
  Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.
  Titrimetric system
  (See *Titrimetry* ⟨541⟩.)
  Mode: Direct titration
  Titrant: 0.1 N perchloric acid VS
  Endpoint detection: Potentiometric
  Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant*. Perform the *Blank* determination.
  Calculate the percentage of serine ($C_3H_7NO_3$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 105.1 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis



IMPURITIES
- **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%
- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
  Standard solution: 0.50 mL of 0.020 N hydrochloric acid
  Sample: 0.73 g of Serine
  Acceptance criteria: NMT 0.05%
- **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩
  Standard solution: 0.10 mL of 0.020 N sulfuric acid
  Sample: 0.33 g of Serine
  Acceptance criteria: NMT 0.03%
- **IRON** ⟨241⟩: NMT 30 ppm
- **RELATED COMPOUNDS**
  System suitability solution: 0.4 mg/mL each of USP L-Serine RS and USP L-Methionine RS in 0.1 N hydrochloric acid
  Standard solution: 0.05 mg/mL of USP L-Serine RS in 0.1 N hydrochloric acid. [NOTE—This solution has a concentration equivalent to about 0.5% of that of the *Sample solution*.]
  Sample solution: 10 mg/mL of Serine in 0.1 N hydrochloric acid
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
  Application volume: 5 µL
  Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)
  Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)
  System suitability
  Suitability requirements: The chromatogram of the *System suitability solution* exhibits two clearly separated spots.
  Analysis
  Samples: *System suitability solution*, *Standard solution*, and *Sample solution*.
  After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.
  Acceptance criteria: Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.
  Individual impurities: NMT 0.5%
  Total impurities: NMT 2.0%

SPECIFIC TESTS
- **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
  Sample solution: 100 mg/mL in 2 N hydrochloric acid
  Acceptance criteria: +14.0° to +15.6°
- **LOSS ON DRYING** ⟨731⟩: Dry a sample at 105° for 3 h: it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP L-Methionine RS
  USP L-Serine RS

Sertraline Hydrochloride

$C_{17}H_{17}Cl_2N \cdot HCl$ 342.69

1-Naphthalenamine, 4-(3,4-dichlorophenyl)-1,2,3,4-tetrahydro-*N*-methyl-, hydrochloride, (1*S*-*cis*)-;
(1*S*,4*S*)-4-(3,4-Dichlorophenyl)-1,2,3,4-tetrahydro-*N*-methyl-1-naphthylamine hydrochloride [79559-97-0].

DEFINITION

Sertraline Hydrochloride contains NLT 97.0% and NMT 102.0% of sertraline hydrochloride ($C_{17}H_{17}Cl_2N \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS ⟨197⟩, *Infrared Spectroscopy*: 197M▲** (CN 1-May-2020)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of sertraline hydrochloride from the *System suitability solution*, as obtained in the test for *Limit of (R,R) Sertraline Hydrochloride*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩

Sample solution: 1 mg/mL of Sertraline Hydrochloride in a mixture of dehydrated alcohol and water (1:1), prepared as follows. Dissolve 10 mg of Sertraline Hydrochloride in 5 mL of dehydrated alcohol. Add 5 mL of water to the solution.

Acceptance criteria: Meets the requirements of test *A*

ASSAY

- **PROCEDURE**

Buffer: To 28.6 mL of glacial acetic acid, slowly add, while stirring, 34.8 mL of triethylamine, and dilute with water to 100 mL. Dilute 10 mL of the resulting solution with water to 1 L.

Mobile phase: Acetonitrile, methanol, and *Buffer* (45:15:40)

Standard solution: 0.05 mg/mL of USP Sertraline Hydrochloride RS in *Mobile phase*

Sample solution: 0.05 mg/mL of Sertraline Hydrochloride in *Mobile phase*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 3.9-mm × 15-cm; 4-µm packing L1
Column temperature: 30°
Flow rate: 1.8 mL/min
Injection volume: 20 µL
Run time: 2 times the retention time of sertraline

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sertraline hydrochloride ($C_{17}H_{17}Cl_2N \cdot HCl$) in the portion of Sertraline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Sertraline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.3%
- **LIMIT OF (*R,R*) SERTRALINE HYDROCHLORIDE**

Mobile phase: Hexane, 2-propanol, and diethylamine (960: 40: 1.5)

System suitability solution: Transfer 10 mg of USP Sertraline Hydrochloride Racemic Mixture RS into a 20-mL volumetric flask. Add 4 mL of diluted ammonia water (1 in 10) and 10 mL of hexane. Shake well until the organic phase is clear. Wait for phase separation, transfer about 2.0 mL from the top layer into a 20-mL volumetric flask, and dilute with hexane to volume.

Standard solution: Transfer 10 mg of USP Sertraline Hydrochloride RS into a 20-mL volumetric flask. Add 4 mL of diluted ammonia water (1 in 10) and 10 mL of hexane. Shake well until the organic phase is clear. Wait for phase separation, transfer 1.0 mL from the top layer into a 10-mL volumetric flask, and dilute with hexane to volume. Further dilute quantitatively and stepwise, if necessary, to obtain a solution having a known concentration of 0.01 mg/mL.

Sample solution: Transfer 20 mg of Sertraline Hydrochloride to a 20-mL volumetric flask. Add 4 mL of diluted ammonia water (1 in 10) and 10 mL of hexane. Shake well until the organic phase is clear. Wait for phase separation, and use the top layer.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 nm
Column: 4.6-mm × 25-cm; 5-µm packing L40
Column temperature: 5°
Flow rate: 1 mL/min
Injection volume: 20 µL

System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for sertraline and (*R,R*) sertraline are about 1.0 and 1.16, respectively.]
Suitability requirements
Resolution: NLT 2.8 between sertraline and (*R,R*) sertraline
Relative standard deviation: NMT 10.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of (*R,R*) sertraline hydrochloride in the portion of Sertraline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for (*R,R*) sertraline from the *Sample solution*
r_S = peak response for sertraline from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Sertraline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.5%

USP Monographs

www.webofpharma.com

• **ORGANIC IMPURITIES, PROCEDURE 1**

If sertralone is a known process impurity, then the tests for *Organic Impurities, Procedure 2*, and *Limit of Mandelic Acid* are recommended.

Buffer: 5.8 g/L of monobasic ammonium phosphate in water. Adjust with phosphoric acid to a pH of 4.2.

Mobile phase: Methanol and *Buffer* (48:52)

System suitability solution: 0.5 mg/mL each of USP Sertraline Hydrochloride RS and USP Sertraline Hydrochloride Related Compound A RS in *Mobile phase*

Standard solution: 0.5 µg/mL of USP Sertraline Hydrochloride RS in *Mobile phase*

Sample solution: 0.5 mg/mL of Sertraline Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.0-mm × 25-cm; 5-µm packing L45

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.2 between sertraline hydrochloride related compound A (trans-*R,S* isomer) and sertraline, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in sertraline hydrochloride ($C_{17}H_{17}Cl_2N \cdot HCl$) in the portion of Sertraline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity in the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Sertraline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
2,3-Isosertraline[a]	0.32	0.15
4-Deschlorosertraline[b]	0.42	0.20
3-Deschlorosertraline[c]	0.60	0.20
Mandelic acid	0.70	0.10
Sertraline	1.0	—
Sertraline related compound A (trans-*R,S* isomer)	1.19	0.10
Sertraline related compound A (trans-*S,R* isomer)	1.64	0.10
Any individual unspecified impurity	—	0.10
Total impurities	—	0.5

[a] (1*RS*,4*RS*)-4-(2,3-Dichlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine.

[b] (1*RS*,4*RS*)-4-(3-Chlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine.

[c] (1*RS*,4*RS*)-4-(4-Chlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine. [NOTE—Disregard any peak at or below 0.05%.]

• **ORGANIC IMPURITIES, PROCEDURE 2**

System suitability solution: Dissolve 50 mg of USP Sertraline Hydrochloride RS and 0.5 mg of USP Sertraline Hydrochloride Related Compound A RS in 2 mL of methanol in a stoppered centrifuge tube. Add 0.2 mL of 25% potassium carbonate solution, and mix in a vortex mixer for 30 s. Add 8 mL of methylene chloride. Stopper the tube, and mix in a vortex mixer for 60 s. Add 1 g of anhydrous sodium sulfate. Mix well, and centrifuge for 5 min.

Sample solution: Dissolve 250 mg of Sertraline Hydrochloride in 2 mL of methanol in a stoppered centrifuge tube. Add 0.2 mL of 25% potassium carbonate solution, and mix in a vortex mixer for 30 s. Add 8 mL of methylene chloride. Stopper the tube, and mix in a vortex mixer for 60 s. Add 1 g of anhydrous sodium sulfate. Mix well, and centrifuge for 5 min.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: GC

Detector: Flame-ionization

Column: 30-m × 0.53-mm fused silica column coated with a 1.0-µm film of phase G3

Temperatures

Injection port: 250°

Detector: 280°

Column: See *Table 2* for the column temperature program.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
200	0	200	1
200	2	260	8

Carrier gas: Helium

Flow rate: 9 mL/min

Injection volume: 1 µL

Injection type: Split ratio, 1:10

System suitability

Sample: *System suitability solution*

Suitability requirements

Peak-to-valley ratio: The ratio of the height of the sertraline related compound A peak to the height of the valley between the sertraline related compound A peak and the sertraline peak is NLT 15.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Sertraline Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

USP Monographs

www.webofpharma.com

r_U = peak response of each impurity from the *Sample solution*
r_T = sum of the peak responses for all the peaks from the *Sample solution*

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
3,4-Deschlorosertraline[a]	0.5	0.2
3-Deschlorosertraline[b] and 4-Deschlorosertraline[c]	0.7	0.8
Sertraline	1.0	—
Sertraline related compound A	1.05	0.2
Sertralone[d]	1.1	0.2
Any individual unspecified impurity	—	0.10
Total impurities[e]	—	1.5

[a] (1*RS*,4*RS*)-4-Phenyl-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine.
[b] (1*RS*,4*RS*)-4-(4-Chlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine.
[c] (1*RS*,4*RS*)-4-(3-Chlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine.
[d] 4-(3,4-Dichlorophenyl)-3,4-dihydronaphthalen-1(2*H*)-one.
[e] Does not include mandelic acid and 1*R*,4*R*-sertraline hydrochloride. [NOTE—Disregard any peak at or below 0.05%.]

• **LIMIT OF MANDELIC ACID**
Perform this test only if *Organic Impurities, Procedure 2*, is used.
Solution A: Dissolve 1 g of sodium dodecylsulfate in 800 mL of water. Add 200 mL of acetonitrile and 1 mL of phosphoric acid.
Solution B: Dissolve 1 g of sodium dodecylsulfate in 100 mL of water. Add 900 mL of acetonitrile and 1 mL of phosphoric acid.
Diluent: *Solution A* and *Solution B* (50:50)
Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	60	40
8	60	40
9	10	90
16	10	90
16.1	60	40
20	60	40

System suitability solution: 0.005 mg/mL each of USP Benzoic Acid RS and USP Mandelic Acid RS in *Diluent*
Standard solution: 0.002 mg/mL of USP Mandelic Acid RS in *Diluent*
Sample solution: 1 mg/mL of Sertraline Hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 3-µm packing L1
Flow rate: 1 mL/min
Injection volume: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for mandelic acid, benzoic acid, and sertraline are 0.2, 0.3, and 1.0 respectively.]
Suitability requirements
Resolution: NLT 5 between benzoic acid and mandelic acid, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of mandelic acid in the portion of Sertraline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of mandelic acid from the *Sample solution*
r_S = peak response of mandelic acid from the *Standard solution*
C_S = concentration of USP Mandelic Acid RS in the *Standard solution* (mg/mL)
C_U = concentration of Sertraline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.2%

SPECIFIC TESTS
• **WATER DETERMINATION,** *Method Ia* ⟨921⟩**:** NMT 0.50%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature NMT 40°.
• **LABELING:** Label to indicate the *Organic Impurities* procedure with which the article complies, if *Organic Impurities, Procedure 1*, is not used.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Benzoic Acid RS
USP Mandelic Acid RS

$C_{17}H_{17}Cl_2 \cdot HCl$ 342.69
USP Sertraline Hydrochloride Related Compound A RS
(1*RS*,4*SR*)-4-(3,4-Dichlorophenyl)-*N*-methyl-1,2,3,4-tetrahydro-1-naphthylamine hydrochloride.
$C_{17}H_{17}Cl_2N \cdot HCl$ 342.69

Sertraline Hydrochloride Oral Solution

DEFINITION
Sertraline Hydrochloride Oral Solution contains an amount of sertraline hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of sertraline ($C_{17}H_{17}Cl_2N$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Buffer: 0.8 g/L of ammonium acetate in water. To each L of this solution add 10 mL of triethylamine, and adjust with phosphoric acid to a pH of 5.0.
Mobile phase: Acetonitrile and *Buffer* (30:70)

USP Monographs

www.webofpharma.com

Diluent: Methanol and water (50:50)
Standard solution: 0.1 mg/mL of USP Sertraline Hydrochloride RS in *Diluent*
Sample solution: Nominally, 0.1 mg/mL of sertraline in *Diluent*, from a portion of Oral Solution
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 50°
Flow rate: 2 mL/min
Injection volume: 20 µL
Run time: 1.3 times the retention time of sertraline
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.7
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sertraline ($C_{17}H_{17}Cl_2N$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of sertraline from the *Sample solution*
r_S = peak response of sertraline from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sertraline in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sertraline free base, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **Deliverable Volume** ⟨698⟩**:** Meets the requirement

IMPURITIES
• **Organic Impurities**
Buffer: Dissolve 5.7 g of β-cyclodextrin hydrate and 8 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 6.5 ± 0.1.
Solvent mixture: Acetonitrile and methanol (55:45)
Mobile phase: *Solvent mixture* and *Buffer* (40:60)
Diluent: Acetonitrile and water (70:30)
Standard solution: 2.3 µg/mL of USP Sertraline Hydrochloride RS in *Diluent*
Sample solution: Nominally, 2 mg/mL of sertraline in *Diluent*, from a portion of Oral Solution
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm; 5-µm packing L11
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume: 20 µL
Run time: 3 times the retention time of sertraline
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 5.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual degradation product in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*
r_S = peak response of sertraline from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sertraline in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sertraline free base, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sertraline	1.0	—
Any individual unspecified degradation product	—	0.10
Total impurities	—	0.5

SPECIFIC TESTS
• **pH** ⟨791⟩**:** 4.5–6.0
• **Microbial Enumeration Tests** ⟨61⟩ and **Tests for Specified Microorganisms** ⟨62⟩**:** The total aerobic microbial count does not exceed 10^2 cfu/mL. The total molds and yeasts count does not exceed 10^1 cfu/mL. It meets the requirement of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in light-resistant containers. Store at controlled room temperature.
• **USP Reference Standards** ⟨11⟩
USP Sertraline Hydrochloride RS

Sertraline Hydrochloride Tablets

DEFINITION
Sertraline Hydrochloride Tablets contain an amount of sertraline hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of sertraline free base ($C_{17}H_{17}Cl_2N$).

IDENTIFICATION
• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **Procedure**
Mobile phase: Methanol and 0.1% (v/v) phosphoric acid (1:1)
Standard solution: 0.05 mg/mL of USP Sertraline Hydrochloride RS in *Mobile phase*
Sample stock solution: 0.5 mg/mL of sertraline free base prepared as follows. Transfer NLT 10 Tablets to a suitable

www.webofpharma.com

volumetric flask. Dissolve in 0.1% phosphoric acid equivalent to 50% of the flask volume. Sonicate for 15 min with intermittent shaking to disperse the Tablets. Add an amount of methanol equivalent to 40% of the flask volume, and continue to sonicate for an additional 10 min. Cool the solution, and dilute with methanol to volume.

Sample solution: Nominally 0.05 mg/mL of sertraline free base in *Mobile phase* from the *Sample stock solution*. Pass a portion of this solution through a nylon filter of 0.45-µm or finer pore size, discard the first few mL, and collect the rest of the filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 25-cm; 5-µm packing L10
Column temperature: 30°
Flow rate: 1.5 mL/min
Injection volume: 10 µL
Run time: Twice the retention time of sertraline

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 1.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sertraline free base ($C_{17}H_{17}Cl_2N$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sertraline free base in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sertraline, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69

Acceptance criteria: 90.0%–110.0% of sertraline free base

PERFORMANCE TESTS

• **Dissolution** ⟨711⟩

Test 1
Medium: Acetate buffer (3.0 g/L of sodium acetate trihydrate and 1.6 mL/L of glacial acetic acid; adjust with glacial acetic acid to a pH of 4.5); 900 mL
Apparatus 2: 75 rpm
Time: 30 min
Standard stock solution: 0.56 mg/mL of USP Sertraline Hydrochloride RS in *Medium*. A small volume of methanol, not exceeding 5% of the final volume, may be used to help solubilize sertraline.
Standard solution
For Tablets labeled to contain 50, 100, 150, or 200 mg: 0.056 mg/mL of USP Sertraline Hydrochloride RS in *Medium* from the *Standard stock solution*
For Tablets labeled to contain 25 mg: 0.028 mg/mL of USP Sertraline Hydrochloride RS in *Medium* from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size. Dilute with *Medium*, if necessary.
Mobile phase: Acetonitrile and 0.1% (v/v) phosphoric acid (1:3)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 25-cm; 5-µm packing L10
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection volume
For Tablets labeled to contain 50, 100, 150, or 200 mg: 10 µL
For Tablets labeled to contain 25 mg: 20 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sertraline free base ($C_{17}H_{17}Cl_2N$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times D \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
M_{r1} = molecular weight of sertraline, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69
D = dilution factor for the *Sample solution*
V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of sertraline free base ($C_{17}H_{17}Cl_2N$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: pH 4.5 acetate buffer (6.8 g/L of sodium acetate trihydrate and 32 mL/L of 2 N acetic acid; adjust with 2 N acetic acid to a pH of 4.5); 900 mL
Apparatus 2: 75 rpm
Time: 45 min
Buffer: 3 mL/L of glacial acetic acid and 7 mL/L of triethylamine in water
Mobile phase: Acetonitrile, methanol, and *Buffer* (10:4:8)
Standard solution: (L/800) mg/mL of USP Sertraline Hydrochloride RS in *Medium*, where L is the label claim in mg/Tablet
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 273 nm
Column: 3.9-mm × 15-cm; 4-µm packing L1
Column temperature: 30°
Flow rate: 1.0 mL/min
Injection volume: 20 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sertraline free base ($C_{17}H_{17}Cl_2N$) dissolved:

www.webofpharma.com

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times D \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
M_{r1} = molecular weight of sertraline, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69

• **Uniformity of Dosage Units** ⟨905⟩: Meet the requirements

IMPURITIES

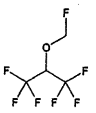
• **Organic Impurities**
[Note—Use freshly prepared samples.]
Buffer: 2.72 g/L of monobasic potassium phosphate. Adjust with triethylamine to a pH of 7.0.
Mobile phase: Methanol, acetonitrile, and *Buffer* (6:3:11). Adjust with triethylamine to a pH of 8.0.
System suitability solution: 5 µg/mL of USP Sertraline Hydrochloride Racemic Mixture RS and 0.5 mg/mL of USP Sertraline Hydrochloride RS in *Mobile phase*
Standard solution: 2.5 µg/mL of USP Sertraline Hydrochloride RS in *Mobile phase*
Sample solution: [Note—Sonicate for about 10 min with shaking to disperse the Tablets.] Prepare a solution of 0.5 mg/mL of sertraline in *Mobile phase* from NLT 20 powdered Tablets. Pass a portion of this solution through a nylon filter of 0.45-µm or finer pore size, discard the first few mL, and use the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.0-mm × 25-cm; 5-µm packing L45
Flow rate: 0.7 mL/min
Injection volume: 20 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[Note—The relative retention times for the 1*R*, 4*R*-*cis*-isomer of sertraline and sertraline are 0.9 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 1.5 between sertraline and the 1*R*, 4*R*-*cis*-isomer of sertraline, *System suitability solution*
Relative standard deviation: NMT 5%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual degradation product from the *Sample solution*
r_S = peak response of sertraline from the *Standard solution*
C_S = concentration of USP Sertraline Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sertraline in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sertraline, 306.23
M_{r2} = molecular weight of sertraline hydrochloride, 342.69

Acceptance criteria
Disregard any peak below 0.1%. Disregard the peak due to the process impurity 1*R*,4*R*-*cis*-isomer of sertraline.
Individual degradation product: NMT 0.2%
Total degradation products: NMT 2.0%, excluding the 1*R*,4*R*-*cis*-isomer of sertraline

ADDITIONAL REQUIREMENTS



• **Packaging and Storage:** Preserve in well-closed containers, and store at controlled room temperature.

www.webofpharma.com

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sertraline Hydrochloride RS
USP Sertraline Hydrochloride Racemic Mixture RS
(1*RS*,4*RS*)-4-(3,4-Dichlorophenyl)-*N*-methyl-1,2,3,4-tetrahydro-1-naphthylamine hydrochloride.

Sevoflurane

$C_4H_3F_7O$ 200.05

Propane, 1,1,1,3,3,3-hexafluoro-2-(fluoromethoxy)-; Fluoromethyl 2,2,2-trifluoro-1-(trifluoromethyl)ethyl ether [28523-86-6].

DEFINITION
Sevoflurane contains NLT 99.97% and NMT 100.00% of sevoflurane ($C_4H_3F_7O$).

IDENTIFICATION
• **A. INFRARED ABSORPTION**
Acceptance criteria: The IR absorption spectrum of Sevoflurane, obtained using a gas cell, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Sevoflurane RS.

ASSAY
• **PROCEDURE**
Analysis: Using the results from the test for *Organic Impurities*, calculate the percentage of sevoflurane ($C_4H_3F_7O$) in the volume of Sevoflurane taken by subtracting the sum of percentages for all impurities found from 100.00%.
Acceptance criteria: 99.97%–100.00%

IMPURITIES
• **LIMIT OF FLUORIDE**
[NOTE—Use plastic utensils throughout this test.]
Buffer solution: Transfer 110 g of sodium chloride and 1 g of sodium citrate to a 2000-mL volumetric flask. Dissolve in 700 mL of water. Carefully add 150 g of sodium hydroxide, and shake to dissolve. Cool to room temperature, and carefully add 450 mL of glacial acetic acid while stirring. Cool, add 600 mL of isopropyl alcohol, and dilute with water to volume. [NOTE—The pH of this solution is 5.0–5.5. This solution may be used for 6 weeks when stored at room temperature.]
Solution A: Transfer 221 mg of sodium fluoride, previously dried at 150° for 4 h, to a 100-mL volumetric flask. Add about 20 mL of water, and mix to dissolve. Add 1.0 mL of 0.01 N sodium hydroxide, and dilute with water to volume. Each mL of this solution contains 1 mg of fluoride. Store in a tightly closed, plastic container. [NOTE—This solution may be used for 2 weeks when stored in a refrigerator.]
Standard stock solution 1: 0.2 µg/mL of fluoride from *Solution A* in water
Standard stock solution 2: 0.5 µg/mL of fluoride from *Solution A* in water
Standard stock solution 3: 2 µg/mL of fluoride from *Solution A* in water
Standard stock solution 4: 5 µg/mL of fluoride from *Solution A* in water
Standard solution 1: 0.10 µg/mL of fluoride from *Standard stock solution 1* in *Buffer solution*
Standard solution 2: 0.25 µg/mL of fluoride from *Standard stocksolution 2* in *Buffer solution*
Standard solution 3: 1.0 µg/mL of fluoride from *Standard stocksolution 3* in *Buffer solution*
Standard solution 4: 2.5 µg/mL of fluoride from *Standard stocksolution 4* in *Buffer solution*
Sample solution: Pipet 50.0 mL of Sevoflurane and 50.0 mL of water into a separatory funnel, shake vigorously for 3 min, and allow the liquids to separate completely. Transfer 25.0 mL of the aqueous top layer to a 50-mL volumetric flask, and dilute with *Buffer solution* to volume.
Analysis
Samples: *Standard solutions 1–4* and *Sample solution*
Concomitantly measure the potentials, in mV, of *Standard solutions 1–4* and the *Sample solution* with a pH meter (see *pH* ⟨791⟩) capable of a minimum reproducibility of ±0.2 mV, and equipped with a fluoride-specific ion-indicating electrode and a glass-sleeved calomel reference electrode. When taking measurements, transfer the solution under test to a 100-mL beaker containing a polytef-coated stirring bar, and immerse the electrodes. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained in about 2–3 min, and record the potential. Rinse the electrodes with the *Buffer solution*, and dry, taking care to avoid damaging the crystal of the specific-ion electrode. A satisfactory response is achieved if the difference between the potentials obtained with *Standard solution 4* and *Standard solution 2* is in the range between 50 and 60 mV. Plot the logarithms of the fluoride concentrations, in µg/mL, of *Standard solutions 1–4* versus potentials, in mV. From the graph and the measured potential of the *Sample solution*, determine the concentration, *C* (µg/mL) of fluoride in the *Sample solution*. Multiply *C* by 2 to obtain the concentration (µg/mL) of fluoride in the portion of Sevoflurane taken.
Acceptance criteria: NMT 2 µg/mL is found.

• **LIMIT OF NONVOLATILE RESIDUE**
Analysis: Transfer 10.0 mL of Sevoflurane to an evaporating dish, evaporate to dryness on a steam bath, and dry the residue at 105° for 2 h.
Acceptance criteria: The weight of the residue does not exceed 1.0 mg.

• **ORGANIC IMPURITIES**
Internal standard solution: Use dimethoxymethane.
Ethylene dichloride identification solution: Transfer 2.0 mL of Sevoflurane to a vial, and seal with a cap and septum. Using a microsyringe, add 20 µL of ethylene dichloride through the septum of the vial, and mix thoroughly.
Sevoflurane related compounds stock solution: Transfer 20 mL of Sevoflurane to a 40-mL vial with a septum lid. Add 20 µL each of USP Sevoflurane Related Compound A RS, USP Sevoflurane Related Compound B RS, and USP Sevoflurane Related Compound C RS to the vial, and mix thoroughly.
Related compounds identification solution: Transfer 1.0 mL of *Ethylene dichloride identification solution* to a 10-mL volumetric flask, and dilute with Sevoflurane to volume. Transfer 2 mL of this solution and 5 mL of *Sevoflurane related compounds stock solution* to a 50-mL volumetric flask, dilute with Sevoflurane to volume, and mix thoroughly.
Standard solutions: Prepare in duplicate, proceeding for each as follows. Transfer 2.0 mL of ethylene dichloride to a

USP Monographs

www.webofpharma.com

screw-capped vial, immediately seal with a cap and septum, and place on a balance. Using a microsyringe, transfer about 20 µL of USP Sevoflurane RS to the vial by inserting the syringe needle through the septum. Record the quantity, in mg, of USP Sevoflurane RS added. Using the same method, transfer about 20 µL of the *Internal standard solution* to the vial, and record the quantity, in mg, of the solution added.

Control standard solution: Place a 40-mL vial with a septum lid on an analytical balance, and tare out the weight. Add 30 mL of ethylene dichloride to the vial, and seal tightly. Record the weight of the ethylene dichloride, and tare. Using a microsyringe, add 20 µL of the USP Sevoflurane RS through the septum of the vial, record the weight, and mix thoroughly. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with ethylene dichloride to volume.

Sample solution: Transfer 20.0 mL of Sevoflurane to a vial, and insert the stopper. Using a microsyringe, add 5 µL of the *Internal standard solution* to the vial.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column coated with a 3.0-µm film of liquid phase G43

Temperatures

Injection port: 200°

Detector: 225°

Column: See *Table 1*. Before use, condition the column overnight at a temperature of 250°.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	10
40	10	200	14

Carrier gas: Helium

Flow rate: 1 mL/min. [NOTE—The make-up gas flow rate is 20 mL/min.]

Injection volume: 2 µL

Injection type: Split ratio 1:20

System suitability

Samples: *Related compounds identification solution* and one of the *Standard solutions*

Suitability requirements

[NOTE—Identify the peaks using the relative retention times given in *Table 2*.]

Resolution: NLT 2.0 between sevoflurane related compound C and ethylene dichloride, *Related compounds identification solution*

Column efficiency: NLT 6000 theoretical plates for the sevoflurane peak, *Standard solution*

Relative standard deviation: NMT 3.0% from the peak area ratio of sevoflurane to the internal standard, *Standard solution*

Analysis

Samples: *Ethylene dichloride identification solution*, *Standard solutions*, *Control standard solution*, and *Sample solution*

Calculate the response factor for each of the *Standard solutions*:

$$\text{Result} = (W_I/W_S) \times R_S$$

W_I = weight of the internal standard in the *Standard solutions* (mg)

W_S = weight of USP Sevoflurane RS in the *Standard solutions* (mg)

R_S = peak area response ratio of sevoflurane to that of the internal standard from the *Standard solutions*

The response factors for the duplicate *Standard solutions* do not differ by more than 3.0% from their average.

Calculate the quantity, in µg/g, of each impurity in the portion of Sevoflurane ($C_4H_3F_7O$) taken:

$$\text{Result} = (S_1/S_2) \times (R_I/F_R) \times (1/F) \times 250$$

S_1 = specific gravity of the internal standard, 0.859

S_2 = specific gravity of sevoflurane, 1.525

R_I = peak area response ratio of the impurity to that of the internal standard from the *Sample solution*

F_R = average response factor obtained as directed above

F = respective relative response factor for the impurities (see *Table 2*)

Acceptance criteria

[NOTE—Do not include sevoflurane, the internal standard, or any peak identified as solvent carryover (ethylene dichloride). Also, disregard any peak with an area less than 30% of the average area of the principal peak from the *Control standard solution*.]

Individual impurities: NMT 25 µg/g of sevoflurane related compound A and NMT 100 µg/g of any other single impurity

Total impurities: NMT 300 µg/g

Table 2

Name	Relative Retention Time	Relative Response Factor
Sevoflurane related compound A	0.78	1.0
Sevoflurane related compound B	0.83	1.0
Sevoflurane	1.0	—
Internal standard (dimethoxymethane)	1.35	—
Ethylene dichloride	2.28	—
Sevoflurane related compound C	2.31	0.46
Unknown impurities	—	1

SPECIFIC TESTS

- **REFRACTIVE INDEX** ⟨831⟩: 1.2745–1.2760 at 20°
- **ACIDITY OR ALKALINITY:** Transfer 20.0 mL of Sevoflurane and 20.0 mL of carbon dioxide-free water to a separatory funnel, shake for 3 min, and allow the layers to separate.

  Acceptance criteria: The aqueous layer requires NMT 0.10 mL of 0.010 N sodium hydroxide or NMT 0.60 mL of 0.010 N hydrochloric acid for neutralization, bromocresol purple TS being used as the indicator.
- **WATER DETERMINATION,** *Method I* ⟨921⟩: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature. Replace the cap securely after each use.
- **USP REFERENCE STANDARDS** ⟨11⟩

Sildenafil Tablets

DEFINITION
Sildenafil Tablets contain sildenafil citrate equivalent to NLT 90% and NMT 110% of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020)
Solution A: Ammonium hydroxide and water (10:90)
Standard solution: 1.4 mg/mL of USP Sildenafil Citrate RS in *Solution A*
Sample solution: Grind 1 Tablet and add a sufficient amount of *Solution A* to obtain nominally 1 mg/mL of sildenafil. Sonicate for 2 min, shake well, and centrifuge. Use the supernatant.
Analysis: For each of the *Standard solution* and the *Sample solution*, prewash a 6-cc C18 solid phase extraction cartridge with 10 mL of methanol followed by 10 mL of *Solution A*, discarding both washings. Apply 5 mL each of the *Standard solution* and the *Sample solution* to separate prewashed cartridges and draw each solution through the cartridge. Wash each cartridge with 10 mL of water and allow the cartridge to dry under vacuum. Elute the sildenafil from each cartridge with 5 mL of methanol, collecting the eluant in a suitable container. Add about 200 mg of potassium bromide to each container, mix well, and evaporate to dryness. To about 70 mg of each dried mixture, add about 140 mg of potassium bromide and mix.
Acceptance criteria: Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
Buffer: Dilute 7 mL of triethylamine with water to 1 L. Adjust with phosphoric acid to a pH of 3.0.
Mobile phase: *Buffer*, methanol, and acetonitrile (58:25:17)
Diluent: Acetonitrile and water (90:10)
Standard solution: 0.028 mg/mL of USP Sildenafil Citrate RS in *Mobile phase*
Sample stock solution: Disperse 1 Tablet in at least 5 mL of *Diluent* with the aid of sonication. Once the Tablet is fully dispersed, dilute with *Mobile phase* to 250.0 mL while swirling. Centrifuge and use the supernatant.
Sample solution: Nominally 0.02 mg/mL of sildenafil prepared by diluting a suitable portion of the *Sample stock solution* with *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 290 nm
Column: 3.9-mm × 15-cm; 5-µm packing L1
Column temperature: 30°
Flow rate: 1 mL/min
Injection volume: 20 µL
Run time: NLT 1.5 times the retention time of sildenafil
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.3
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of sildenafil from the *Sample solution*
r_S = peak response of sildenafil from the *Standard solution*
C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sildenafil in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sildenafil, 474.58
M_{r2} = molecular weight of sildenafil citrate, 666.70

Acceptance criteria: 90%–110%

PERFORMANCE TESTS
- **DISSOLUTION** ⟨711⟩
Medium: 0.01 N hydrochloric acid; 900 mL
Apparatus 1: 100 rpm
Time: 15 min
Standard solution: 0.03 mg/mL of USP Sildenafil Citrate RS in *Medium*
Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*, if necessary
Instrumental conditions
Mode: UV-Vis
Analytical wavelength: Maximum at about 290 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)
D = dilution factor for the *Sample solution*, if needed
V = volume of *Medium*, 900 mL
L = label claim (mg/Tablet)
M_{r1} = molecular weight of sildenafil, 474.58
M_{r2} = molecular weight of sildenafil citrate, 666.70

Tolerances: NLT 80% (Q) of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES
- **ORGANIC IMPURITIES**
Buffer, Mobile phase, Diluent, and **Chromatographic system:** Proceed as directed in the *Assay*, except for *Run time*.

USP Monographs

www.webofpharma.com

Run time: NLT 3 times the retention time of sildenafil
System suitability solution: A mixture of sildenafil and sildenafil *N*-oxide in *Mobile phase*, prepared as follows. Dissolve 70 mg of USP Sildenafil Citrate RS in 1 mL of a solution of hydrogen peroxide and formic acid (2:1), allow to stand for NMT 10 min, and then dilute with *Mobile phase* to 250.0 mL.
Standard solution: 0.0014 mg/mL of USP Sildenafil Citrate RS in *Mobile phase*
Sensitivity solution: 0.00035 mg/mL of USP Sildenafil Citrate RS in *Mobile phase* from the *Standard solution*
Sample stock solution: Transfer 5 Tablets to a 250-mL volumetric flask and disperse in 25 mL of *Diluent* with the aid of sonication. Dilute with *Mobile phase* to volume. Sonicate, if necessary. Centrifuge and use the supernatant.
Sample solution: Nominally 0.5 mg/mL of sildenafil prepared by diluting a suitable portion of the *Sample stock solution* with *Mobile phase*
System suitability
Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*
[NOTE—See *Table 1* for the relative retention times.]
Suitability requirements
Resolution: NLT 2.6 between sildenafil *N*-oxide and sildenafil, *System suitability solution*
Tailing factor: NMT 1.3, *Standard solution*
Relative standard deviation: NMT 3.0%, *Standard solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual degradation product in the portion of Tablets taken:

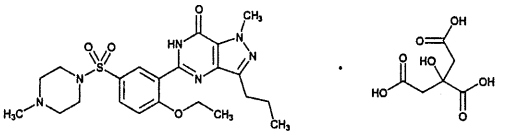
$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of any individual degradation product from the *Sample solution*
r_S = peak response of sildenafil from the *Standard solution*
C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sildenafil in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of sildenafil, 474.58
M_{r2} = molecular weight of sildenafil citrate, 666.70

Acceptance criteria: See *Table 1*. Disregard any peak less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sildenafil	1.0	—
Sildenafil *N*-oxide[a]	1.2	0.20
Any individual degradation product	—	0.20
Total degradation products	—	0.50



[a] 1-{[3-(6,7-Dihydro-1-methyl-7-oxo-3-propyl-1*H*-pyrazolo[4,3-*d*]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl}-4-methylpiperazine N^4-oxide.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Sildenafil Citrate RS

Sildenafil Citrate

$C_{22}H_{30}N_6O_4S \cdot C_6H_8O_7$ 666.70
Piperazine, 1-[[3-(6,7-dihydro-1-methyl-7-oxo-3-propyl-1*H*-pyrazolo[4,3-*d*]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl]-4-methyl-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1); 1-[[3-(6,7-Dihydro-1-methyl-7-oxo-3-propyl-1*H*-pyrazolo[4,3-*d*]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl]-4-methylpiperazine citrate (1:1) [171599-83-0].
Sildenafil

$C_{22}H_{30}N_6O_4S$ 474.58
[139755-83-2].

DEFINITION

Sildenafil Citrate contains NLT 98.0% and NMT 102.0% of sildenafil citrate ($C_{22}H_{30}N_6O_4S \cdot C_6H_8O_7$), calculated on the anhydrous and solvent-free basis.

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 0.85% for six replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of sildenafil citrate ($C_{22}H_{30}N_6O_4S \cdot C_6H_8O_7$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sildenafil from the *Sample solution*

USP Monographs

www.webofpharma.com

r_S = peak response of sildenafil from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩
Sample: NLT 0.5 g
Acceptance criteria: NMT 0.1%

• **LIMIT OF IMIDAZOLE**
Diluent: Methanol, water, and ammonium hydroxide (15:5:1)
Standard solution 1: 0.035 mg/mL of USP Imidazole RS in *Diluent*
Standard solution 2: 0.0175 mg/mL of USP Imidazole RS in *Diluent* from *Standard solution 1*
Sample solution: 17.5 mg/mL of Sildenafil Citrate in *Diluent*
System suitability solution: Mix equal volumes of *Sample solution* and *Standard solution 1*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.2-mm layer of chromatographic silica gel mixture with a particle size of 2–10 µm (HPTLC plates)
Application volume: 10 µL. [NOTE—Apply as 6-mm bands.]
Developing solvent system: Methylene chloride, ethyl acetate, alcohol, and ammonium hydroxide (50:30:20:1)
System suitability
Sample: *System suitability solution*
Suitability requirements: The chromatogram shows two clearly separated zones.
Analysis:
Samples: *Standard solution 2* and *Sample solution*
Develop the plate over a distance of about two-thirds of the length of the plate. Dry at 100° for about 15 min, and cool. Expose the plate to iodine vapor until the plate is light brown, and examine the plate under UV light at 254 nm. [NOTE—The retardation factors for citrate, imidazole, and sildenafil are about 0, 0.25, and 0.4, respectively.]
Acceptance criteria: Any spot corresponding to imidazole in the *Sample solution* is not more intense than the principal spot from *Standard solution 2* (0.1%).

• **ORGANIC IMPURITIES**
Buffer, Mobile phase, and **Chromatographic system:** Proceed as directed in the *Assay*, except to run the chromatograph for 3 times the retention time of sildenafil.
Identification solution: 7.5 µg/mL of USP Sildenafil Related Compound A RS in *Mobile phase*
System suitability solution: Dissolve 70 mg of Sildenafil Citrate in 1 mL of a solution of hydrogen peroxide and anhydrous formic acid (2:1). Allow to stand for at least 10 min to generate sildenafil *N*-oxide, and then dilute with *Mobile phase* to 250 mL.
Sample solution: 0.7 mg/mL of Sildenafil Citrate in *Mobile phase*
Diluted sample solution: 1.4 µg/mL of sildenafil citrate in *Mobile phase* from the *Sample solution*
Sensitivity solution: 0.35 µg/mL of sildenafil citrate in *Mobile phase* from the *Diluted sample solution*
System suitability
Samples: *Diluted sample solution, Sensitivity solution,* and *System suitability solution*
[NOTE—The relative retention times for sildenafil, sildenafil *N*-oxide, and sildenafil related compound A are about 1.0, 1.2, and 1.7, respectively.]
Suitability requirements
Resolution: NLT 2.5 between sildenafil *N*-oxide and sildenafil, *System suitability solution*
Tailing factor: NMT 1.5 for the sildenafil peak, *Diluted sample solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*
Analysis
Samples: *Identification solution, Diluted sample solution,* and *Sample solution*
[NOTE—Identify sildenafil related compound A from the *Identification solution*.]
Calculate the percentage of sildenafil related compound A and any other unspecified individual impurity in the portion of Sildenafil Citrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sildenafil related compound A or any other unspecifed impurity from the *Sample solution*
r_S = peak response of sildenafil from the *Diluted sample solution*
C_S = concentration of the *Diluted sample solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria
Sildenafil related compound A: NMT 0.3%
Any other unspecified individual impurity: NMT 0.10%
Total unspecified impurities: NMT 0.3%
Total impurities: NMT 0.5%. Disregard any peak less than 0.05%.

SPECIFIC TESTS

$C_{23}H_{32}N_6O_4S$ 488.60

Sildenafil Compounded Oral Suspension

DEFINITION

Sildenafil Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$).

Prepare Sildenafil Compounded Oral Suspension containing 2.5 mg/mL of sildenafil as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sildenafil Citrate tablets[a] equivalent to	250 mg of sildenafil

www.webofpharma.com

Vehicle: a 1:1 mixture of Ora-Sweet[b] and Ora-Plus,[b] a sufficient quantity to make	100 mL

[a] Viagra 25-mg tablets, Pfizer Inc., New York, NY.
[b] Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Sildenafil Citrate tablets* in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a sildenafil liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and 0.2 M ammonium acetate (50:50). Pass through a nylon 66 filter of 0.45-µm pore size, and degas.

Standard stock solution: 2.5 mg/mL of sildenafil prepared from USP Sildenafil Citrate RS in *Mobile phase*

Standard solution: 0.25 mg/mL of sildenafil prepared from *Standard stock solution* and *Mobile phase*

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.25 mg/mL of sildenafil from Oral Suspension and *Mobile phase*, and centrifuge.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 3.0-mm × 15-cm; 5-µm packing L1

Column temperature: 25°

Flow rate: 0.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for sildenafil is about 7.1 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of sildenafil in the *Standard solution* (mg/mL)
C_U = nominal concentration of sildenafil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** ⟨791⟩: 3.9–4.9

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.

• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored in a refrigerator or at controlled room temperature

• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sildenafil Citrate RS

Silver Nitrate

$AgNO_3$ 169.87

Nitric acid silver(1+) salt;
Silver(1+) nitrate [7761-88-8].

DEFINITION

Silver Nitrate, powdered and then dried in the dark over silica gel for 4 h, contains NLT 99.8% and NMT 100.5% of silver nitrate ($AgNO_3$).

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL,** *Silver* ⟨191⟩

Sample: 20 mg/mL

Acceptance criteria: Meets the requirements

• **B.**

Sample solution: 100 mg/mL

Analysis: Add 1 drop of diphenylamine TS to the *Sample solution*, and then carefully superimpose it upon sulfuric acid.

Acceptance criteria: A deep blue color appears at the zone of contact.

ASSAY

• **PROCEDURE**

Sample solution: Powder about 1 g of Silver Nitrate, and dry in the dark over silica gel for 4 h. Dissolve about 700 mg of this dried salt in 50 mL of water, add 2 mL of nitric acid and 2 mL of ferric ammonium sulfate TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N ammonium thiocyanate VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with *Titrant*. Each mL of 0.1 N ammonium thiocyanate is equivalent to 16.99 mg of silver nitrate ($AgNO_3$.)

Acceptance criteria: 99.8%–100.5%

SPECIFIC TESTS

• **CLARITY AND COLOR OF SOLUTION**

Sample solution: 100 mg/mL

Acceptance criteria: The solution is clear and colorless.

• **COPPER**

Sample solution: 100 mg/mL

Analysis: To 5 mL of the *Sample solution* add 6 N ammonium hydroxide, dropwise, until a precipitate first formed is just dissolved.

Acceptance criteria: No blue color is produced.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Silver Nitrate Ophthalmic Solution

DEFINITION

Silver Nitrate Ophthalmic Solution is a solution of Silver Nitrate in a water medium. It contains NLT 0.95% and NMT 1.05% of silver nitrate ($AgNO_3$). The solution may be buffered by the addition of Sodium Acetate.

USP Monographs

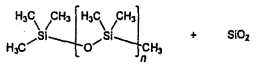
www.webofpharma.com

IDENTIFICATION
• **A. IDENTIFICATION TESTS—GENERAL,** *Silver* ⟨191⟩and*Nitrate* ⟨191⟩**:** Meets the requirements

ASSAY
• **PROCEDURE**
Sample solution: Place 5 mL of Ophthalmic Solution in a conical flask, dilute with 20 mL of water, and add 1 mL of nitric acid and 1 mL of ferric ammonium sulfate TS.
Titrimetric system
Mode: Direct titration
Titrant: 0.02 N ammonium thiocyanate VS
Endpoint detection: Visual
Analysis: Titrate the *Sample solution* with *Titrant*. Each mL of 0.02 N ammonium thiocyanate is equivalent to 3.397 mg of silver nitrate ($AgNO_3$).
Acceptance criteria: 0.95%–1.05%

SPECIFIC TESTS
• **CLARITY AND COLOR OF SOLUTION:** Clear and colorless
• **pH** ⟨791⟩**:** 4.5–6.0
• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve it protected from light, in inert, collapsible capsules or in other suitable single-dose containers.



Toughened Silver Nitrate

» Toughened Silver Nitrate contains not less than 94.5 percent of $AgNO_3$, the remainder consisting of silver chloride (AgCl).

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—
A: A solution (1 in 50) responds to the tests for *Silver* ⟨191⟩.
B: Mix a solution (1 in 10) in a test tube with 1 drop of diphenylamine TS, then carefully superimpose it upon sulfuric acid: a deep blue color appears at the zone of contact.
Copper—A solution (1 in 10) shows no trace of blue coloration when treated with an excess of 6 N ammonium hydroxide.
Assay—Add about 700 mg of Toughened Silver Nitrate, accurately weighed, to 50 mL of water, and when the silver nitrate has dissolved, filter the solution. Thoroughly wash the filter and sediment with water, add 2 mL of nitric acid and 2 mL of ferric ammonium sulfate TS to the combined filtrate and washings, and titrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N ammonium thiocyanate is equivalent to 16.99 mg of $AgNO_3$.

Simethicone

Simethicone;
α-(Trimethylsilyl)-ω-methylpoly[oxy(dimethylsilylene)], mixture with silicon dioxide [8050-81-5].

DEFINITION
Simethicone is a mixture of fully methylated linear siloxane polymers containing repeating units of the formula $[-(CH_3)_2SiO-]_n$, stabilized with trimethylsiloxy end-blocking units of the formula $[-(CH_3)_3SiO-]$, and silicon dioxide. It contains NLT 90.5% and NMT 99.0% of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$), and NLT 4.0% and NMT 7.0% of silicon dioxide.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩**,** *Infrared Spectroscopy*: **197F.▲** (CN 1-May-2020) Meets the requirements

ASSAY
• **PROCEDURE**
Standard stock solution: 2 mg/mL of USP Polydimethylsiloxane RS in toluene
Standard solution: Add 25.0 mL of *Standard stock solution* to a round, narrow-mouth, screw-capped, 120-mL bottle. Add 50 mL of dilute hydrochloric acid (2 in 5), close the bottle securely with a cap having an inert liner, and shake for 5 min, accurately timed, on a reciprocating shaker at a suitable rate (e.g., about 200 oscillations/min and a stroke of 38 ± 2 mm). Transfer the mixture to a 125-mL separator, and remove 5 mL of the upper organic (toluene) layer to a 15-mL, screw-capped test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.
Sample stock solution: Add 50 mg of Simethicone to a round, narrow-mouth, screw-capped, 120-mL bottle. Add 25.0 mL of toluene, and swirl to disperse.
Sample solution: Using the *Sample stock solution*, proceed as directed in the *Standard solution*, beginning with "Add 50 mL of dilute hydrochloric acid (2 in 5)".
Blank: Add 25 mL of toluene to a round, narrow-mouth, screw-capped, 120-mL bottle. Proceed as directed in the *Standard solution*, beginning with "Add 50 mL of dilute hydrochloric acid (2 in 5)".
Instrumental conditions
Mode: IR
Analytical wavelength: Wavelength of maximum absorbance at about 7.9 µm
Cell: 0.5 mm
Analysis
Samples: *Standard solution* and *Sample solution*
Determine the absorbance of the *Samples*, using the *Blank* to set the instrument.
Calculate the percentage of polydimethylsiloxane $[-(CH_3)_2SiO-]_n$ in the portion of Simethicone taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Polydimethylsiloxane RS in the *Standard stock solution* (mg/mL)
C_U = concentration of Simethicone in the *Sample stock solution* (mg/mL)

Acceptance criteria: 90.5%–99.0%

OTHER COMPONENTS
• **CONTENT OF SILICON DIOXIDE**
Standard solution: Transfer 3.00 g of USP Simethicone RS to a screw-capped bottle, add 10.0 mL of *n*-hexane, and mix by shaking.

www.webofpharma.com

Sample solution: Transfer 3.00 g of Simethicone to a screw-capped bottle, add 10.0 mL of *n*-hexane, and mix by shaking.
Dimethicone solution: Transfer 3.00 g of dimethicone having a viscosity of 500 centistokes to a screw-capped bottle, add 10.0 mL of *n*-hexane, and mix by shaking.
Instrumental conditions
Mode: IR
Analytical wavelength: 7–9 µm
Cell: 0.1 mm
Blank: *n*-Hexane
Analysis
Samples: *Standard solution*, *Sample solution*, and *Dimethicone solution*
Record the absorbance spectra of the *Samples* between 7 and 9 µm. Determine the absorbances of the *Samples* at the wavelength of minimum absorbance at about 8.2 µm, observed in the spectrum obtained from the *Dimethicone solution*.
Calculate the percentage of silicon dioxide in the portion of Simethicone taken:

$$\text{Result} = [(A_U - A_D)/(A_S - A_D)] \times C$$

A_U = absorbance of the *Sample solution*
A_D = absorbance of the *Dimethicone solution*
A_S = absorbance of the *Standard solution*
C = designated percentage of silicon dioxide in USP Simethicone RS

Acceptance criteria: 4.0%–7.0%

SPECIFIC TESTS

• **Loss on Heating**
Sample: 15 g
Analysis: Heat the *Sample* in an open, tared vessel having a diameter of 5.5 ± 0.5 cm and a wall height of 2.5 ± 1.0 cm at 200° in a circulating air oven for 4 h, and allow to come to room temperature in a desiccator before weighing.
Acceptance criteria: NMT 18.0%
• **Defoaming Activity**
Foaming solution: 1 g of octoxynol 9 in 100 mL of water
Sample solution: Transfer 200 mg of Simethicone to a 60-mL bottle, add 50 mL of tertiary butyl alcohol, cap the bottle, and shake vigorously. Warm slightly, if necessary, to dissolve.
Analysis
Samples: *Foaming solution* and *Sample solution*
For each test use a clean, unused, 250-mL glass jar. Add, dropwise, 500 µL of the *Sample solution* to the 250-mL glass jar, fitted with a 50-mm cap, containing 100 mL of the *Foaming solution*. Cap the jar, and clamp it in an upright position on a wrist-action shaker. Using a radius of 13.3 ± 0.4 cm (measured from the center of the shaft to the center of the bottle), shake for 10 s through an arc of 10° at a frequency of 300 ± 30 strokes/min. Record the time required for the foam to collapse. The time, in s, for foam collapse is determined at the instant the first portion of foam-free liquid surface appears, measured from the end of the shaking period.
Acceptance criteria: The defoaming activity time does not exceed 15 s.

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in tight containers.
• **USP Reference Standards** ⟨11⟩
USP Polydimethylsiloxane RS
USP Simethicone RS

Simethicone Capsules

DEFINITION

Simethicone Capsules contain an amount of polydimethylsiloxane ($[-(CH_3)_2\ SiO-]_n$) that is NLT 85.0% and NMT 115.0% of the labeled amount of simethicone.

IDENTIFICATION

Change to read:

• **A. ▲Spectroscopic Identification Tests** ⟨197⟩, *Infrared Spectroscopy*: **1975**▲ (CN 1-May-2020)
Standard solution, Sample solution, and **Blank:** Prepare as directed in the *Assay*.
Cell: 0.5 mm
Acceptance criteria: Meet the requirements

ASSAY

• **Procedure**
Perform this procedure on at least 3 individual Capsules. The mean of the assay values obtained is the assay value.
Standard solution: Prepare similarly to the *Sample solution*, except use 2.5 mg/mL of USP Polydimethylsiloxane RS in toluene.
Sample solution: Transfer 1 Capsule to a round, narrow-mouth, screw-capped, 120-mL bottle. Add 20 mL of 6 N hydrochloric acid, and allow to stand, with frequent swirling, until the Capsule has dissolved. Add 10.0 mL of toluene for each 25 mg of the labeled amount of simethicone in the Capsule, close the bottle securely with a cap having an inert liner, and shake by mechanical means for 5 min. Allow the phases to separate, draw off 10 mL of the upper organic (toluene) layer to a test tube containing 0.5 g of anhydrous sodium sulfate, agitate vigorously for 30 s, and allow the mixture to settle. If necessary, centrifuge the mixture to obtain a clear solution.
Blank: Prepare similarly to the *Sample solution*, except use 10 mL of toluene.
Analysis
Samples: *Standard solution* and *Sample solution*
Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution* in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9 µm, with a suitable IR spectrophotometer, using the *Blank* to set the instrument.
Calculate the percentage of polydimethylsiloxane ($[-(CH_3)_2\ SiO-]_n$) in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Polydimethylsiloxane RS in the *Standard solution* (mg/mL)
V = volume of toluene used to prepare the *Sample solution* (mL)
L = labeled amount of simethicone (mg/Capsule)

Acceptance criteria: 85.0%–115.0%

PERFORMANCE TESTS

• **Disintegration** ⟨701⟩
For hard gelatin capsules
Time: 30 min, determined using water
For soft gelatin capsules
Time: 30 min, determined using 1.0% octoxynol-9 (w/w) in water, using disks
Acceptance criteria: Meet the requirements

USP Monographs

www.webofpharma.com

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Polydimethylsiloxane RS

Simethicone Emulsion

DEFINITION
Simethicone Emulsion is a water-dispersible form of Simethicone composed of Simethicone, suitable emulsifiers, preservatives, and water. It may contain suitable viscosity-increasing agents. It contains an amount of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$) that is NLT 85.0% and NMT 110.0% of the labeled amount of simethicone.

IDENTIFICATION

Change to read:

- **▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*▲ (CN 1-May-2020)

Standard solution and **Sample solution:** Prepare as directed in the *Assay*.

Analysis: Place a suitable amount of the *Sample solution* in a suitable container, and dry it with a stream of nitrogen or other appropriate means to evaporate the solvent. Similarly proceed with the *Standard solution*. Record the spectra of the residues using ⟨197A⟩ or ⟨197F⟩, and examine the spectra in the range between 1400 cm^{-1} and 700 cm^{-1}.

Acceptance criteria

For spectra obtained using ⟨197A⟩: The spectrum from the *Sample solution* shows strong bands at 1260 ± 10 cm^{-1}, 1015 ± 15 cm^{-1}, and 795 ± 15 cm^{-1}, and a broad shoulder at 1085 ± 15 cm^{-1}, similar to the spectrum from the *Standard solution*. [NOTE—The exact maxima of the broad shoulder near 1085 cm^{-1} may differ by up to 15 cm^{-1} for the spectra from the *Sample solution* and the *Standard solution*.]

For spectra obtained using ⟨197F⟩: The spectrum from the *Sample solution* shows a strong band at 1260 ± 10 cm^{-1} and partially resolved bands near 1095 ± 15 cm^{-1}, 1020 ± 15 cm^{-1}, and 800 ± 15 cm^{-1}, similar to the spectrum from the *Standard solution*.

ASSAY
- **PROCEDURE**

Use glass apparatus only; avoid use of plasticware. Proper mixing of the Emulsion before sampling and testing is crucial.

Standard solution: 2 mg/mL of USP Polydimethylsiloxane RS in toluene. Treat a 25.0-mL aliquot of this solution in the same manner as the *Blank*, beginning with "add 50 mL of dilute hydrochloric acid (2 in 5)...".

Sample: Equivalent to 50 mg of simethicone from the Emulsion

Sample solution: To the *Sample* add 25.0 mL of toluene. Treat in the same manner as the *Blank*, beginning with "add 50 mL of dilute hydrochloric acid (2 in 5)...".

Instrumental conditions
(See *Mid-Infrared Spectroscopy* ⟨854⟩.)
Mode: Infrared
Cell: 0.5 mm
Analytical wavelength: Maximum absorbance at about 7.9 µm (1259 cm^{-1})

Blank: To 25.0 mL of toluene add 50 mL of dilute hydrochloric acid (2 in 5), close the bottle securely with a cap having an inert liner, vigorously shake by hand for 5 s, then shake for 5–20 min on a suitable shaker. [NOTE—The following shakers were found suitable: (1) a reciprocating shaker at a rate of about 200 oscillations/min and a stroke of 38 ± 2 mm or (2) a wrist-action shaker with a radius of 13.3 ± 0.4 cm (measured from center of shaft to center of bottle) that uses an arc of 10° at a frequency of 300 ± 30 strokes/min. The recommended shaking time is about 20 min, which can be adjusted as needed.] Centrifuge the mixture. [NOTE—The following centrifuging condition was found suitable: 1500 × g for 30–40 min.] Remove from the centrifuge, and immediately transfer about 5 mL of the upper organic (toluene) layer to a 15-mL screw-capped test tube containing about 1 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained. [NOTE—The following centrifuging condition was found suitable: 1500 × g for about 10 min.]

Analysis
[NOTE—Wash the cell with copious amounts of toluene to ensure that there is no carryover or residue.]

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$) in the labeled amount of simethicone in the Emulsion:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Polydimethylsiloxane RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of simethicone in the *Sample solution* (mg/mL)

Acceptance criteria: 85.0%–110.0%

SPECIFIC TESTS
- **MICROBIAL ENUMERATION TESTS** ⟨61⟩: The total aerobic microbial count does not exceed 10^2 cfu/g.
- **DEFOAMING ACTIVITY**

Foaming solution: 10 mg/mL of octoxynol 9 in water

Sample solution: Transfer a quantity of Emulsion, equivalent to 300 mg of simethicone, to a 60-mL bottle. Dilute with water to 30 g, cap the bottle, and shake vigorously.

Analysis
[NOTE—For each test, use a clean, unused, 250-mL glass jar.]
Add, dropwise, 500 µL of the *Sample solution* to a clean, unused, cylindrical 250-mL glass jar, fitted with a 50-mm cap and containing 100 mL of the *Foaming solution*. Cap the jar, and clamp it in an upright position on a wrist-action shaker. Using a radius of 13.3 ± 0.4 cm (measured from the center of the shaft to the center of the bottle), shake for 10 s through an arc of 10° at a frequency of 300 ± 30 strokes/min. Record the time, in s, required for the foam to collapse. The time for foam collapse is determined at the instant the first portion of foam-free liquid surface appears, measured from the end of the shaking period.

Acceptance criteria: The defoaming activity time does not exceed 15 s.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.

USP Monographs

www.webofpharma.com

• **USP REFERENCE STANDARDS** ⟨11⟩
USP Polydimethylsiloxane RS

Simethicone Oral Suspension

DEFINITION
Simethicone Oral Suspension is a suspension of Simethicone in Water. It contains an amount of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$) that is NLT 85.0% and NMT 115.0% of the labeled amount of simethicone.

IDENTIFICATION

Change to read:

• **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197S**▲ (CN 1-May-2020)
Standard solution, Sample solution, and **Blank:** Prepare as directed in the *Assay*.
Cell: 0.5 mm
Acceptance criteria: Meets the requirements

ASSAY
• **PROCEDURE**
Standard solution: 2.4 mg/mL of USP Polydimethylsiloxane RS, prepared as follows. Transfer 60 mg of USP Polydimethylsiloxane RS to a 25-mL volumetric flask, add 15 mL of hexanes, and sonicate for 3 min. Allow to cool, dilute with hexanes to volume, and mix. Transfer 10 mL of this solution to a capped test tube, add 1 g of anhydrous sodium sulfate, mix for about 1 min, centrifuge, and use the clear supernatant.
Sample solution: Transfer an quantity of Oral Suspension, equivalent to about 240 mg of simethicone, to a glass-stoppered centrifuge tube. Add 5 mL of methanol, and mix for about 15 s. Add 30.0 mL of hexanes, and mix for about 10 s. Loosen the stopper, and heat the tube for about 10 min in a water bath at 65° ± 1°. Mix for 1 min, and centrifuge. Using a glass syringe, transfer the upper hexanes layer to a 100-mL volumetric flask. Repeat the extraction with two 30.0-mL portions of hexanes, combining the hexanes extracts in the 100-mL volumetric flask. If an emulsion forms during any of the extractions, as much as 2 mL of methanol may be added to disperse the emulsion. Allow the combined extracts to cool, dilute with hexanes to volume, and mix. Transfer 10 mL of this solution to a capped test tube, add 1 g of anhydrous sodium sulfate, mix for 1 min, centrifuge, and use the clear supernatant.
Blank: Mix 100 mL of hexanes and 10 g of anhydrous sodium sulfate, allow to settle, centrifuge, and use the clear supernatant.
Analysis
Samples: *Standard solution* and *Sample solution*
Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution* at the wavelength of maximum absorbance at about 7.9 µm, with a suitable IR spectrophotometer, using the *Blank* to set the instrument.
Calculate the percentage of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$) in the portion of the Oral Suspension taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Polydimethylsiloxane RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of simethicone in the *Sample solution* (mg/mL)

Acceptance criteria: 85.0%–115.0%

SPECIFIC TESTS
• **pH** ⟨791⟩: 3.5–4.6

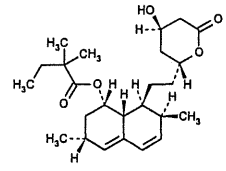
ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Polydimethylsiloxane RS

Simethicone Tablets

» Simethicone Tablets contain an amount of polydimethylsiloxane ($[-(CH_3)_2SiO-]_n$) that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in well-closed containers.
Labeling—Tablets that are gelatin-coated are so labeled.
USP Reference standards ⟨11⟩—
USP Polydimethylsiloxane RS

Change to read:



Identification, ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197S*▲ (CN 1-May-2020)
[NOTE—Use the procedural blank, prepared as directed in the *Assay*, to set the instrument.]
Test solution—Prepare as directed for the *Assay preparation* in the *Assay*.
Standard solution—Prepare as directed for the *Standard preparation* in the *Assay*.
Cell size: 0.5 mm.
Disintegration ⟨701⟩: 30 minutes in water; 60 minutes in water for plain-coated Tablets; and 45 minutes in simulated gastric fluid for Tablets labeled as gelatin-coated.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Assay—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of simethicone, to a round, narrow-mouth, screw-capped, 120-mL bottle, and proceed as directed in the *Assay* under *Simethicone*, beginning with "add 25.0 mL of toluene," except that for Tablets labeled as gelatin-coated, shake for 30 minutes instead of 5 minutes. Calculate the quantity, in mg, of $[-(CH_3)_2SiO-]_n$ in the portion of Tablets taken by the formula:

$$25C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Polydimethylsiloxane RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Tablets and the Standard solution, respectively.

Simvastatin

$C_{25}H_{38}O_5$ 418.57

Butanoic acid, 2,2-dimethyl-, 1,2,3,7,8,8a-hexahydro-3,7-dimethyl-8-[2-(tetrahydro-4-hydroxy-6-oxo-2*H*-pyran-2-yl)ethyl]-1-naphthalenyl ester, [1*S*-[1α,3α,7β,8β(2*S**,4*S**),8aβ]].

2,2-Dimethylbutyric acid, 8-ester with (4*R*,6*R*)-6-2-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-1,2,6,7,8,8a-hexahydro-8-hydroxy-2,6-dimethyl-1-naphthyl]ethyl]tetrahydro-4-hydroxy-2*H*-pyran-2-one [79902-63-9].

» Simvastatin contains not less than 98.0 percent and not more than 102.0 percent of $C_{25}H_{38}O_5$, calculated on the dried basis. It may contain a suitable antioxidant.

Packaging and storage—Preserve in well-closed containers. Store between 15° and 30°, or under refrigeration.

USP Reference standards ⟨11⟩—
USP Lovastatin RS
USP Simvastatin RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197M*▲ (CN 1-May-2020).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** between +285° and +298°.
Test solution: 5 mg per mL, in acetonitrile.

Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chromatographic purity— [NOTE—The Simvastatin solutions are stable for up to 3 days when stored at 4°. Without refrigeration, they should be injected immediately after preparation.]

Mobile phase, Diluent, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Inject about 5 µL of the *Test solution* into the chromatograph, record the chromatogram, identify the specified impurities listed in *Table 1,* and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Simvastatin taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak area for each impurity; and r_s is the sum of the areas of all the peaks. Reporting level for impurities is 0.05%.

Table 1

Name	Relative Retention Time	Limit %
Simvastatin hydroxyacid[1]	0.45	0.4
Epilovastatin[2] and Lovastatin	0.60	1.0[3]
Methylene simvastatin[4]	0.80	0.4
Simvastatin	1.0	n/a

Anhydro simvastatin[6]	2.42	0.4
Simvastatin dimer[7]	3.80	0.4
Any other individual impurity	—	0.1
Total impurities other than lovastatin and epilovastatin	—	1.0

[1] (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-Dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid.

[2] (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-Hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*R*)-2-methylbutanoate.

[3] If present, lovastatin and epilovastatin may not be completely resolved by the method. These peaks are integrated together to determine conformance.

[4] (1*S*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-Hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbut-3-enoate.

[5] (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-(Acetyloxy)-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate.

[6] (1*S*,3*R*,7*S*,8*S*,8a*R*)-3,7-Dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate.

[7] (2*R*,4*R*)-2-[[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-Dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoate.

Assay— [NOTE—The Simvastatin solutions are stable for up to 3 days when stored at 4°. Without refrigeration, they should be injected immediately after preparation.]

Dilute phosphoric acid—Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume.

Solution A—Prepare a mixture of acetonitrile and *Dilute phosphoric acid* (50:50).

Solution B—Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with acetonitrile to volume.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Buffer solution—Prepare a solution containing 1.4 g of monobasic potassium phosphate per L, and adjust with phosphoric acid to a pH of 4.0.

Diluent—Prepare a mixture of acetonitrile and *Buffer solution* (3:2).

System suitability preparation—Dissolve accurately weighed quantities of USP Simvastatin RS and USP Lovastatin RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 1.5 mg per mL of USP Simvastatin RS and 0.015 mg per mL of USP Lovastatin RS.

Standard preparation—Dissolve an accurately weighed quantity of USP Simvastatin RS in *Diluent* to obtain a solution having a known concentration of about 1.5 mg per mL.

Assay preparation—Transfer about 75 mg of Simvastatin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.6- × 33-mm column that contains packing L1. The flow rate is about 3.0 mL per minute. The chromatograph is programmed as follows.

USP Monographs

www.webofpharma.com

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–4.5	100	0	isocratic
4.5–4.6	100→95	0→5	linear gradient
4.6–8.0	95→25	5→75	linear gradient
8.0–11.5	25	75	isocratic
11.5–11.6	25→100	75→0	linear gradient
11.6–13	100	0	re-equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.60 for lovastatin and 1.0 for simvastatin; and the resolution, *R,* between simvastatin and lovastatin is greater than 3. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{38}O_5$ in the portion of Simvastatin taken by the formula:

$$VC(r_U/r_S)$$

in which V is the volume, in mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Simvastatin RS in the *Standard preparation;* and r_U and r_S are the responses of the simvastatin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Simvastatin Tablets

DEFINITION

Simvastatin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of simvastatin ($C_{25}H_{38}O_5$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

- **PROCEDURE**

Buffer solution: Dissolve 3.9 g of monobasic sodium phosphate in 900 mL of water. Adjust, if necessary, with either sodium hydroxide or phosphoric acid to a pH of 4.5. Dilute with water to 1000 mL and mix.

Mobile phase: Acetonitrile and *Buffer solution* (65:35)

Solution A: Add 3.0 mL of glacial acetic acid to 900 mL of water. Adjust with 5 N sodium hydroxide to a pH of 4.0 and dilute with water to 1 L.

Diluent: Acetonitrile and *Solution A* (8:2)

Standard solution: 0.1 mg/mL of USP Simvastatin RS in *Diluent*

Sample solution: Nominally 0.1 mg/mL of simvastatin from Tablets in *Diluent* as follows. Crush NLT 20 Tablets into a fine powder and transfer the powder equivalent to 100 mg of simvastatin to a suitable volumetric flask. Add *Diluent* to fill 70% of the volume of the flask, and sonicate with intermittent swirling for 10 min. Equilibrate to room temperature and dilute with *Diluent* to volume. Centrifuge a portion of the mixture, and pass the clear supernatant through a filter of 0.45-µm pore size. Discard the first few milliliters of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability.*)

Mode: LC

Detector: UV 238 nm. For *Identification B,* use a diode array detector in the range of 190–300 nm.

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of simvastatin ($C_{25}H_{38}O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of simvastatin from the *Sample solution*

r_S = peak area of simvastatin from the *Standard solution*

C_S = concentration of USP Simvastatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of simvastatin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: Prepare a pH 7.0 buffer solution containing 0.5% sodium dodecyl sulfate in 0.01 M sodium phosphate as follows. Dissolve 30 g of sodium dodecyl sulfate and 8.28 g of monobasic sodium phosphate in 6000 mL of water and adjust with 50% (w/v) sodium hydroxide solution to a pH of 7.0; 900 mL.

Apparatus 2: 50 rpm

Time: 30 min

Prewashed manganese dioxide: Transfer 10 g of manganese dioxide to a suitable container, and treat as follows. Add 50 mL of *Medium,* and shake vigorously for 5 min. Centrifuge, decant the supernatant layer, and discard. Repeat twice, first with *Medium* and then with water. Dry the solid at 100° for 1 h before use.

Standard solution: USP Simvastatin RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Transfer a portion of the solution to a centrifuge tube containing about 10 mg of *Prewashed manganese dioxide* per milliliter of transferred solution under test, and mix. Allow the mixture to stand for 30 min with occasional shaking, centrifuge, and use a portion of the clear supernatant.

Instrumental conditions

Mode: UV

Analytical wavelengths: 247 and 257 nm

Blank: Prepare as directed for the *Sample solution,* except use the *Medium.*

Analysis: Calculate the percentage of the labeled amount of simvastatin ($C_{25}H_{38}O_5$) dissolved from the difference between the UV absorbances at the wavelengths of maximum and minimum absorbances at about 247 and 257 nm, respectively, of the *Sample solution,* in comparison with the *Standard solution.*

www.webofpharma.com

Tolerances: NLT 75% (*Q*) of the labeled amount of simvastatin ($C_{25}H_{38}O_5$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A: Prepare a mixture of acetonitrile and dilute phosphoric acid (1 mL in 1 L of water) (45:55).

Solution B: Prepare a mixture of acetonitrile and dilute phosphoric acid (1 mL in 1 L of water) (90:10).

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
38	100	0
40	65	35
50	65	35
70	0	100
90	0	100
92	100	0
100	100	0

Solution C: 1.4 g/L of monobasic potassium phosphate in water. Adjust with diluted ammonia solution to a pH of 7.0.

Diluent: Acetonitrile and *Solution C* (60:40)

System suitability stock solution: 0.2 mg/mL each of USP Simvastatin RS and USP Lovastatin RS in *Diluent*. Sonicate if necessary.

System suitability solution: 0.02 mg/mL each of USP Simvastatin RS and USP Lovastatin RS in *Diluent* from *System suitability stock solution*

Standard solution: 7.5 µg/mL of USP Simvastatin RS and equivalent to 0.015 mg/mL of tenivastatin from USP Tenivastatin Calcium RS in *Diluent*

Sample solution: Nominally 1.5 mg/mL of simvastatin in *Diluent* prepared as follows. Transfer a suitable amount of powdered Tablets (NLT 20) to a volumetric flask. Add *Diluent* to fill 60% of the volume of the flask, and sonicate with intermittent swirling for 5 min. Dilute with *Diluent* to volume. Pass the solution through a filter of 0.45-µm pore size. Discard the first few milliliters of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 238 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Temperatures

Autosampler: 10°

Column: 30°

Flow rate: 2 mL/min

Injection volume: 20 µL

Run time: NLT 3 times the retention time of simvastatin

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 8.0 between simvastatin and lovastatin, *System suitability solution*

Tailing factor: NMT 1.5 for simvastatin, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tenivastatin in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tenivastatin from the *Sample solution*

r_S = peak response of tenivastatin from the *Standard solution*

C_S = concentration of USP Tenivastatin Calcium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of simvastatin in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_S = peak response of simvastatin from the *Standard solution*

C_S = concentration of USP Simvastatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of simvastatin in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Sipuleucel-T

DEFINITION

Sipuleucel-T is an autologous cellular immunotherapy. The active components of sipuleucel-T are autologous antigen presenting cells (APCs) and a recombinant protein, PAP-GM-CSF that consists of human prostatic acid phosphatase (PAP) fused through the C-terminus to the N-terminus of human granulocyte-macrophage colony-stimulating factor (GM-CSF) by a Gly-Ser linker. PAP is an antigen expressed in prostate cancer tissue and GM-CSF is an immune cell activator. Minimal residual levels of the intact PAP-GM-CSF are detectable in the final product.

Sipuleucel-T is prepared using a patient's own peripheral blood mononuclear cells obtained via a 1.5–2.0 blood volume leukapheresis approximately 3 days prior to the infusion date. The cells obtained are further processed and then cultured for 36–44 h in a nutrient-rich medium in the presence of PAP-GM-CSF. The cells are then aseptically harvested, washed, formulated, and packaged for intravenous infusion. Sipuleucel-T is a sterile, live cell suspension for autologous use only. Each dose contains a minimum of 50 million autologous CD54+ cells activated with PAP-GM-CSF, suspended in 250 mL of Lactated Ringer's Injection, *USP*.

IDENTIFICATION

- **A.** Meets the requirements in the *Assay*

ASSAY

- **PROCEDURE**

[NOTE—To determine potency by flow cytometry, both an in-process sample taken prior to culture with PAP-GM-CSF and a sipuleucel-T final product sample are tested.]

Phosphate buffered saline (PBS): Use Dulbecco's phosphate-buffered saline without calcium or magnesium, pH 7.0–7.2.

Analysis: Stain one 30-µL aliquot of cells (containing 20 × 10^6) with 40 µL of monoclonal anti-CD54 antibody conjugated 1:1 with phycoerythrin (PE) and a second aliquot with 40 µL of isotype control antibody conjugated 1:1 with PE.[1] Incubate for 15–25 min in the dark, then wash away unbound antibody with *PBS* by centrifugation. Resuspend cells in 400 µL of *PBS* containing 1 µg/mL of laser dye styryl–751 (LDS-751),[2] stain for 5 min, and then add an equal volume of *PBS* to each sample. Reconstitute PE-conjugated flow cytometry bead standards[3] in 300 µL of *PBS* containing 0.5 µg/mL of LDS-751.

Data acquisition: Acquire the flow cytometry bead standards on a multi-color flow cytometer using an acquisition plot with forward scatter (FSC) vs. side scatter (SSC) axes and a gate to encompass approximately 10,000 bead singlet events. Use a second acquisition plot gated on the bead singlet events to graph only the events in the singlet gate by PE fluorescence vs. event count. Use histogram region markers to calculate the geometric mean fluorescence intensity (MFI) of each of the labeled bead populations. The number of PE molecules reported by the manufacturer is used to generate a PE vs. MFI standard curve from which the number of PE molecules on the surface of the test sample population can be calculated.

Acquire approximately 10,000 events for the CD54-PE and isotype control-stained test samples using an acquisition plot with LDS-751 fluorescence vs. FSC and an inclusion gate set on LDS+ leukocytes. This gate allows the user to remove nonspecific signal from debris and/or erythrocytes from the evaluation. Precise gating and therefore removal (from data analysis) of these two smaller product subcomponents is not critical due to the use of a second acquisition plot that focuses solely on the analysis of CD54+ large cell events.

Calculating number of CD54+ cells: LDS fluorescence vs. FSC is evaluated for both the anti-CD54-PE (1:1)-stained and the isotype control-stained samples. The second analysis plot, which includes only the LDS+ leukocyte populations in both the test and control samples, evaluates PE fluorescence vs. FSC, and is used to derive statistics for each sample. A pair of stacked regions allow the user to set a threshold (lower region) based on the isotype control-stained cells, while placing the upper region to encompass the large CD54+ leukocytes. The latter region provides the results for both MFI and the

[1] Suitable anti-CD54-PE (1:1) and isotype control-PE (1:1) antibodies can be obtained from Becton Dickinson, catalog# 332811.
[2] Suitable laser dye styryl–751 (LDS-751) can be obtained from Molecular Probes, catalog# L-7595.
[3] Suitable flow cytometry standards, QuantiBRITE-PE™ Beads, can be obtained from Becton Dickinson, catalog# 340495.

www.webofpharma.com

percentage of large CD54+ cells present in each test sample. The percentage of large CD54+ cells is multiplied by both the total leukocyte concentration (determined using an automated hematology analyzer) and the percent of viable cells to obtain the number of CD54+ cells in the product.

Calculating CD54 upregulation: To determine CD54 upregulation, stain and acquire preculture samples and final product samples as described above. For each sample, calculate the MFI for the large CD54+ cells for both the isotype control and the anti-CD54-PE (1:1)-stained sample. Using the corresponding bead standard PE vs. MFI standard curves, convert the test MFI results to the number of PE molecules bound per cell. To correct for nonspecific staining, subtract the isotype control result from the corresponding result for the anti-CD54-PE (1:1)-stained sample to obtain the number of PE molecules specifically bound. Divide the final product number of PE molecules specifically bound by the preculture number to obtain the CD54 upregulation ratio.

Acceptance criteria: The preculture material must contain NLT 165 × 10^6 CD54+ cells to meet in-process acceptance criteria. Sipuleucel-T final product must contain NLT 50 × 10^6 CD54+ cells and must demonstrate NLT a 2.6-fold CD54 upregulation.

SPECIFIC TESTS

- **ELISA ASSAY**

[NOTE—To ensure that the cells have been treated with the appropriate antigen, an ELISA test is used to measure residual intact PAP-GM-CSF in the final product.]

Phosphate buffered saline (PBS): Prepare as directed in the *Assay*.

Capture antibody: Prepare a solution containing 5 µg of monoclonal anti-PAP antibody/mL[4] of *PBS*.

Assay diluent: Prepare a solution of 10% blocking solution[5] in Lactated Ringer's Injection, *USP*.

Secondary antibody: Prepare a solution containing anti-GM-CSF antibody[6] conjugated with horseradish peroxidase (HRP) diluted in blocking solution.

2X positive control: Prepare a solution containing 500 pg of PAP-GM-CSF/mL of *Assay diluent*.

Wash buffer: Dilute concentrated wash buffer[7] to the recommended working strength.

Test sample: A 2-mL test sample is removed from the final product formulation. A 1-mL aliquot of this sample is centrifuged to pellet the cells, and then 900 µL of supernatant is combined with 100 µL of blocking solution in preparation for loading on the plate.

Analysis: Prepare assay plates by coating microtiter plate wells with *Capture antibody* for 120 min and then blocking with undiluted blocking solution. Load separate wells with either 50 µL of *Assay diluent* (in triplicate), 50 µL of *Test sample*, or 50 µL of a 1:1 mixture of *Test sample* with *2X positive control*. The triplicate *Assay diluent* wells act as a negative control for the establishment of a background signal. Add 50 µL of *Secondary antibody* to each well, and incubate for 90 min at room temperature. Wash the plate with *Wash buffer*, and add 100 µL of TMB Chromogen.[8] After 30 min, stop the reaction with 100 µL of stop solution[9] and, using a plate reader, determine the absorbance of the well contents with an optical density of 450 nm, with a reference filter set to 570 nm.

Calculations and system suitability: The mean and standard deviation of the negative control sample replicates (*Assay diluent*) are calculated. The mean of the *Test sample* results is also calculated. The threshold value is calculated as the mean absorbance of the negative control plus three times the standard deviation. The mean absorbance of the negative control must be NMT 0.061.

Acceptance criteria: If the *Test sample* mean absorbance is greater than the threshold value, then the *Test sample* is identified as sipuleucel-T that has been exposed to PAP-GM-CSF.

- **TOTAL NUCLEATED CELL COUNT ASSAY**

Test sample: 2 mL of Sipuleucel-T. If required, dilute the sample with *PBS* to obtain a result within the linear range of the method being used.

Analysis: Use a commercially available hematology analyzer or a manual counting procedure to determine the white blood cell concentration on triplicate analyses of neat sample derived from the appropriate process step. Proceed as directed in the instrument operating manual or manual procedure.

Calculation: Multiply the white blood cell concentration by the net volume and the viability of the sample to determine the total nucleated cell count.

Acceptance criteria: NLT 5 × 10^7 cells in the final product. The total nucleated cell result for the final product formulation is used to determine the number of CD54+ cells.

- **TRYPAN BLUE EXCLUSION (VIABILITY) ASSAY**

Test sample: 2 mL of Sipuleucel-T

Analysis: Based on the cell concentration (which can be determined manually, or using an automated hematology analyzer), dilute duplicate aliquots of the *Test sample* with *PBS* to yield total counts of 100–400 cells per hemacytometer chamber. Mix equal volumes of each *Test sample* with the same volume of 0.4% isotonic trypan blue. Load the samples in a hemacytometer, and count the cells in the four large corner squares in each chamber.

Calculation: Calculate the percentage of viable cells (unstained cells) relative to the total number of cells (stained and unstained cells).

Acceptance criteria: NLT 80% viability in both the incoming leukapheresis component and in the sipuleucel-T final product.

- **STERILITY TESTS** ⟨71⟩: Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.5 USP Endotoxin Unit/mL of final product. A 2-mL sample is removed from the final product formulation and 0.45-mL of this sample is mixed with 0.45 mL of LAL Reagent Water, then 0.10-mL duplicate samples are analyzed.

ADDITIONAL REQUIREMENTS

- **LABELING:** The final product is labeled to indicate the identity of the patient, the expiration time and date, the required storage conditions (refrigerated at 2–8°), and the lot number. The label indicates that the product is for autologous use only, and that the product is not routinely tested for transmissible infectious diseases.
- **PACKAGING AND STORAGE:** Sipuleucel-T is supplied in a sealed infusion bag labeled for the specific recipient. The product is shipped in a cardboard shipping box with a

[4] A suitable antibody can be produced with the hybridoma cell line, ATCC catalog No. HB-8526, or Aragen Bioscience, special order.

[5] A suitable blocking solution can be obtained from Thermo Scientific, catalog# 337516.

[6] A suitable antibody can be obtained from Anogen, catalog# MO-C40090T.

[7] A suitable wash buffer concentrate can be obtained from Invitrogen, catalog# WB01.

[8] A suitable TMB Chromogen can be obtained from Invitrogen, catalog# SB01.

[9] A suitable stop solution can be obtained from Invitrogen, catalog# SS01.

www.webofpharma.com

special insulated polyurethane container inside. The insulated container and gel packs within the container maintain the appropriate transportation and storage temperature of sipuleucel-T until infusion. The infusion bag must remain within the insulated polyurethane container and shipping box until the time of administration.

Sitagliptin Tablets

DEFINITION

Sitagliptin Tablets contain an amount of sitagliptin phosphate ($C_{16}H_{15}F_6N_5O \cdot H_3PO_4 \cdot H_2O$) equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of sitagliptin ($C_{16}H_{15}F_6N_5O$).

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197K**▲ (CN 1-May-2020) or ⟨197A⟩

  Sample: Grind a Tablet, and use a suitable amount of the powdered Tablet to prepare a specimen.

  Analysis: Record the spectra of the *Sample* and the Standard using ⟨197A⟩ or ⟨197K⟩, and examine the spectra in the range between 1800 cm^{-1} and 650 cm^{-1}.

  Acceptance criteria: The spectrum obtained from the *Sample* shows bands at approximately 1669, 1513, 1425, 1207, 880, and 844 cm^{-1}, similar to the spectrum from the Standard similarly obtained. [NOTE—Peak positions may vary slightly between instruments (within ±10 cm^{-1}). Other peaks may be present in the spectra that do not appear in this list.]
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

  Buffer: 1.36 g/L of monobasic potassium phosphate, adjusted with phosphoric acid to a pH of 2.0

  Mobile phase: Acetonitrile and *Buffer* (15:85)

  Dilute phosphoric acid: Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume.

  Diluent: Acetonitrile and *Dilute phosphoric acid* (5:95)

  Standard solution: 0.1 mg/mL of USP Sitagliptin Phosphate RS in *Diluent*

  Sample stock solution: Nominally 1.0 mg/mL of sitagliptin, prepared as follows. Place 10 Tablets in a suitable volumetric flask, and dilute with *Diluent* to volume. Add a stir bar and stir vigorously for 1 h, ensuring that a vortex is achieved during stirring.

  Sample solution: Nominally 0.08 mg/mL of sitagliptin, prepared as follows. Transfer 8.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with *Diluent* to volume. Centrifuge a portion of the solution for 10 min or until the solution is clear, and use the supernatant.

Mode: LC
Detector: UV 268 nm
Column: 4.6-mm × 25-cm; 5-µm packing L51
Column temperature: 35°
Flow rate: 0.8 mL/min
Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

[NOTE—The relative retention times for sitagliptin, which is the *R*-enantiomer, and the *S*-enantiomer are 1.0 and 0.9, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the *S*-enantiomer and sitagliptin, *System suitability solution*

Signal-to-noise ratio: NLT 10 for the sitagliptin peak, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of *S*-enantiomer in the portion of Sitagliptin Phosphate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of the *S*-enantiomer from the *Sample solution*
r_T = sum of the peak responses of the *S*-enantiomer and sitagliptin from the *Sample solution*

Acceptance criteria: NMT 0.5% of the *S*-enantiomer

SPECIFIC TESTS

• **WATER DETERMINATION,** *Method Ia* ⟨921⟩**:** 3.3%–3.7%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sitagliptin Phosphate RS
USP Sitagliptin System Suitability Mixture RS
Sitagliptin Phosphate containing *S*-enantiomer.

Sodium Acetate

$C_2H_3NaO_2 \cdot 3H_2O$ 136.08
$C_2H_3NaO_2$ 82.03

Acetic acid, sodium salt, trihydrate;
Sodium acetate trihydrate [6131-90-4].
Anhydrous [127-09-3].

DEFINITION

Sodium Acetate contains three molecules of water of hydration, or is anhydrous. It contains NLT 99.0% and NMT 101.0% of sodium acetate ($C_2H_3NaO_2$), calculated on the dried basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chemical Identification Tests, Sodium*: Meets the requirements

USP Monographs

www.webofpharma.com

• **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Acetate*
Sample solution : 10 mg/mL of Sodium Acetate in water. Adjust with 0.1 N sodium hydroxide VS to a slightly alkaline pH.
Acceptance criteria: Meets the requirements in test *A*

ASSAY
• **PROCEDURE**
Sample solution: Equivalent to 200 mg of anhydrous Sodium Acetate in 50 mL of glacial acetic acid. Heat gently on a steam bath for about 5 min to dissolve. Cover the solution and stir while cooling.
Blank: 50 mL of glacial acetic acid
Titrimetric system
(See *Titrimetry* ⟨541⟩.)
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Endpoint detection: Potentiometric
Analysis: Titrate the *Sample solution* with *Titrant*. Perform a blank determination, and make any necessary correction. Calculate the percentage of sodium acetate ($C_2H_3NaO_2$) in the portion of Sodium Acetate taken:

$$\text{Result} = [(V_S - V_B) \times N_A \times F \times 100]/W$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N_A = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 82.03 mg/mEq
W = equivalent weight of anhydrous Sodium Acetate in the *Sample solution* (mg)

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES
• **CHLORIDE AND SULFATE** ⟨221⟩, *Chloride*
Sample: Equivalent to 1.0 g of anhydrous Sodium Acetate
Acceptance criteria: Shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid VS (350 ppm).
• **CHLORIDE AND SULFATE** ⟨221⟩, *Sulfate*
Sample: Equivalent to 10 g of anhydrous Sodium Acetate
Acceptance criteria: Shows no more sulfate than corresponds to 0.50 mL of 0.020 N sulfuric acid VS (50 ppm).
• **CALCIUM AND MAGNESIUM**
Sample solution: Equivalent to 10 mg/mL of anhydrous Sodium Acetate
Analysis: To 20 mL of *Sample solution*, add 2 mL each of 6 N ammonium hydroxide, ammonium oxalate TS, and dibasic sodium phosphate TS.
Acceptance criteria: No turbidity is produced within 5 min.
• **POTASSIUM**
Sample solution: Dissolve the equivalent of 3 g of anhydrous Sodium Acetate in 5 mL of water.
Analysis: To the *Sample solution*, add 1 N acetic acid dropwise until the solution is slightly acidic, and then add 5 drops of sodium cobaltinitrite TS.
Acceptance criteria: No precipitate is formed.
• **ALUMINUM** ⟨206⟩ (where it is labeled as intended for use in hemodialysis)
Test preparation: Prepare as directed in the chapter, using a portion equivalent to 10 g of sodium acetate trihydrate.
Acceptance criteria: 0.2 µg/g

SPECIFIC TESTS
• **pH** ⟨791⟩
Sample solution: Equivalent to 30 mg/mL of anhydrous Sodium Acetate in carbon dioxide-free water
Acceptance criteria: 7.5–9.2
• **LOSS ON DRYING** ⟨731⟩
Analysis: Dry at 120° to constant weight.
Acceptance criteria
Anhydrous: NMT 1.0%
Trihydrate: 38.0%–41.0%
• **INSOLUBLE MATTER**
Sample: Equivalent to 20 g of anhydrous Sodium Acetate
Analysis: Dissolve the *Sample* in 150 mL of water, heat to boiling, and digest in a covered beaker on a steam bath for 1 h. Filter through a tared filtering crucible, wash thoroughly, and dry at 105°.
Acceptance criteria: The weight of the residue is NMT 10 mg (0.05%).

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers.
• **LABELING:** Label it to indicate whether it is the trihydrate or is anhydrous. Where Sodium Acetate is intended for use in hemodialysis, it is so labeled.

Sodium Acetate Injection

» Sodium Acetate Injection is a sterile solution of Sodium Acetate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of CH_3COONa.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.
Labeling—The label states the sodium acetate content in terms of weight and of milliequivalents in a given volume. Label the Injection to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration. The label states also the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Acetate* ⟨191⟩.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 3.90 USP Endotoxin Units per mEq.
pH ⟨791⟩: between 6.0 and 7.0.
Particulate Matter in Injections ⟨788⟩: meets the requirements under *Small-volume Injections*.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

Assay—
Standard stock solution—Dissolve 570.0 mg of sodium chloride, previously dried at 105° for 2 hours, in 100 mL of water, transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains 224 µg of sodium, equivalent to 800 µg of anhydrous sodium acetate.
Standard preparations—Transfer to each of four 100-mL volumetric flasks 10 mL of a nonionic wetting agent (1 in 500). Dilute the contents of one of the flasks with water to volume to provide a blank. To the remaining flasks add, respectively,

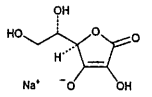
USP Monographs

www.webofpharma.com

5.0, 10.0, and 15.0 mL of *Standard stock solution*, dilute with water to volume, and mix.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 800 mg of anhydrous sodium acetate, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask containing 10 mL of a nonionic wetting agent (1 in 500), dilute with water to volume, and mix.

Standard graph—Set a flame photometer for maximum transmittance at a wavelength of about 589 nm. Adjust the instrument to zero transmittance with the blank, and to 100% transmittance with the most concentrated of the *Standard preparations*. Read the transmittances of the other *Standard preparations*, and plot transmittances versus equivalent concentration of sodium acetate.



Procedure—Adjust the instrument as directed under *Standard graph*, read the transmittance of the *Assay preparation*, and calculate the sodium acetate content, in mg per mL, of Injection.

Sodium Acetate Solution

» Sodium Acetate Solution is an aqueous solution of Sodium Acetate. It contains not less than 97.0 percent and not more than 103.0 percent (w/w) of the labeled amount of $C_2H_3NaO_2$.

Packaging and storage—Preserve in tight containers.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Acetate* ⟨191⟩.
pH ⟨791⟩: between 7.5 and 9.2, when diluted with carbon dioxide-free water to contain 5% of solids.
Insoluble matter—Dilute a quantity of Solution, equivalent to 20 g of anhydrous sodium acetate, with water to 150 mL, heat to boiling, and digest in a covered beaker on a steam bath for 1 hour. Filter through a tared filtering crucible, wash thoroughly, and dry at 105°: the weight of the residue does not exceed 1 mg (0.005%).
Chloride ⟨221⟩—A quantity of Solution, equivalent to 1.0 g of anhydrous sodium acetate, shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.035%).
Sulfate ⟨221⟩—A quantity of Solution, equivalent to 10 g of anhydrous sodium acetate, shows no more sulfate than corresponds to 0.50 mL of 0.020 N sulfuric acid (0.005%).
Calcium and magnesium—Dilute a quantity of Solution, equivalent to 1.0 g of anhydrous sodium acetate, to 100 mL with water. To 20 mL of this solution add 2 mL each of 6 N ammonium hydroxide, ammonium oxalate TS, and sodium phosphate TS: no turbidity is produced within 5 minutes.
Potassium—To a quantity of Solution, equivalent to 3.0 g of anhydrous sodium acetate, add 0.2 mL of sodium bitartrate TS: no turbidity is produced within 5 minutes.
Assay—Weigh accurately about 1 g of Solution into a 250-mL conical flask, cautiously add (in a fume hood) 2.6 mL of acetic anhydride, mix, and allow to stand for 5 minutes. Add 25 mL of glacial acetic acid and 2 drops of *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, using 0.5 mL of water, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 8.203 mg of $C_2H_3NaO_2$.

Sodium Ascorbate

$C_6H_7NaO_6$ 198.11
L-Ascorbic acid, monosodium salt;
Monosodium L-ascorbate [134-03-2].

DEFINITION
Sodium Ascorbate contains NLT 99.0% and NMT 101.0% of sodium ascorbate ($C_6H_7NaO_6$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A. ▲SPECTROSCOPIC IDENTIFICATION TESTS** ⟨197⟩, *Infrared Spectroscopy*: **197M**▲ (CN 1-May-2020)
  Sample: Use undried Sodium Ascorbate.
  Acceptance criteria: Meets the requirements
- **B. REDUCING CAPACITY**
  Sample solution: 20 mg/mL
  Analysis: Add 1 mL of 0.1 N hydrochloric acid to 4 mL of the *Sample solution*, and add alkaline cupric tartrate TS.
  Acceptance criteria: The solution reduces alkaline cupric tartrate TS slowly at room temperature, but more readily upon heating.
- **C. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩: A 20-mg/mL solution meets the requirements.

ASSAY
- **PROCEDURE**
  Sample: 400 mg of Sodium Ascorbate
  Blank: 100 mL of carbon dioxide-free water and 25 mL of 2 N sulfuric acid
  Titrimetric system
  (See *Titrimetry* ⟨541⟩.)
  Mode: Direct titration
  Titrant: 0.1 N iodine VS
  Endpoint detection: Visual
  Analysis: Dissolve the *Sample* in a mixture of 100 mL of carbon dioxide-free water and 25 mL of 2 N sulfuric acid. Titrate immediately with the *Titrant*, and add 3 mL of starch TS as the endpoint is approached. Perform the *Blank* determination.
  Calculate the percentage of sodium ascorbate ($C_6H_7NaO_6$) in the portion of Sodium Ascorbate taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
V_B = *Titrant* volume consumed by the *Blank* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 99.05 mg/mEq
W = *Sample* weight (mg)

Acceptance criteria: 99.0%–101.0% on the dried basis

SPECIFIC TESTS
- **OPTICAL ROTATION,** *Specific Rotation* ⟨781S⟩
  Sample solution: 100 mg/mL in carbon dioxide-free water. Use the solution immediately after preparation.
  Acceptance criteria: +103° to +108°
- **pH** ⟨791⟩
  Sample solution: 100-mg/mL solution
  Acceptance criteria: 7.0–8.0

USP Monographs

www.webofpharma.com

• **Loss on Drying** ⟨731⟩: Dry a sample in a suitable vacuum drying tube, using phosphorus pentoxide as the desiccant, at 60° for 4 h: it loses NMT 0.25% of its weight.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight, light-resistant containers.
• **USP Reference Standards** ⟨11⟩
USP Sodium Ascorbate RS

Add the following:

▲Sodium Benzoate Compounded Oral Solution

DEFINITION
Sodium Benzoate Compounded Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium benzoate ($C_7H_5NaO_2$).
Prepare Sodium Benzoate Compounded Oral Solution 100 mg/mL and 300 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sodium Benzoate Compounded Oral Solution 100 mg/mL

Sodium Benzoate powder	10 g
Purified Water, a sufficient quantity to make	100 mL

Sodium Benzoate Compounded Oral Solution 300 mg/mL

Sodium Benzoate powder	30 g
Purified Water, a sufficient quantity to make	100 mL

In an appropriately size calibrated container, dissolve the *Sodium Benzoate powder* in about 80 mL of *Purified Water*. Stir until dissolved. Bring to final volume with *Purified Water* and mix well.

ASSAY
• **Procedure**
Solution A: 30 mM of potassium phosphate monobasic buffer adjusted with phosphoric acid to a pH of 3
Mobile phase: Methanol and *Solution A* (50:50)
Standard solution: 0.1 mg/mL of USP Sodium Benzoate RS in *Mobile phase*
Sample solution
For Oral Solution 100 mg/mL: Transfer 1 mL of Oral Solution into a 100-mL volumetric flask, add approximately 80 mL of *Mobile phase*, and vortex. Dilute with *Mobile phase* to volume. Transfer 1 mL of this solution to a 10-mL volumetric flask, add approximately 8 mL of *Mobile phase*, and vortex. Dilute with *Mobile phase* to volume.
For Oral Solution 300 mg/mL: Transfer 1 mL of Oral Solution into a 100-mL volumetric flask, add approximately 80 mL of *Mobile phase*, and vortex. Dilute with *Mobile phase* to volume. Transfer 7 mL of this solution to a 200-mL volumetric flask, add approximately 150 mL of *Mobile phase*, and vortex. Dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*)
Mode: LC
Detector: UV 230 nm
Column: 2-mm × 15-cm; 3-µm packing L1
Flow rate: 0.2 mL/min
Injection volume: 15 µL
System suitability
Sample: *Standard solution*
[Note—The retention time for sodium benzoate is about 6.5 min.]
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0% for replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of sodium benzoate ($C_7H_5NaO_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sodium benzoate from the *Sample solution*
r_S = peak response of sodium benzoate from the *Standard solution*
C_S = concentration of USP Sodium Benzoate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of sodium benzoate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **pH** ⟨791⟩
For Oral Solution 100 mg/mL: 6.7–7.7
For Oral Solution 300 mg/mL: 7.3–8.3

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
• **Beyond-Use Date:** NMT 90 days from the date on which it was prepared when stored at controlled room temperature or in a refrigerator.
• **Labeling:** Label it to state the *Beyond-Use Date*.
• **USP Reference Standards** ⟨11⟩
USP Sodium Benzoate RS▲ (USP 1-May-2020)

Sodium Bicarbonate

$NaHCO_3$ 84.01
Carbonic acid monosodium salt;
Monosodium carbonate [144-55-8].

DEFINITION
Sodium Bicarbonate contains NLT 99.0% and NMT 100.5% of sodium bicarbonate ($NaHCO_3$), calculated on the dried basis.

IDENTIFICATION
• **A. Identification Tests—General** ⟨191⟩, *Sodium*: Meets the requirements
• **B. Identification Tests—General** ⟨191⟩, *Bicarbonate*: Meets the requirements

ASSAY
• **Procedure**
Sample: 3 g

USP Monographs

www.webofpharma.com

Analysis: Mix the *Sample* with 100 mL of water, add methyl red TS, and titrate with 1 N hydrochloric acid. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the faint pink color no longer fades after boiling. Each mL of 1 N hydrochloric acid is equivalent to 84.01 mg of sodium bicarbonate.

Acceptance criteria: 99.0%–100.5% on the dried basis

Change to read:

IMPURITIES

- **INSOLUBLE SUBSTANCES**

Sample solution: Dissolve 1 g in 20 mL of water.

Acceptance criteria: The resulting solution is complete and clear.

- **CARBONATE** (where it is labeled as intended for use in hemodialysis)

Apparatus: The apparatus (see *Figure 1*) consists of a 50-mL flask with a side arm connected to a source of carbon dioxide humidified by bubbling through a saturated solution of sodium bicarbonate. The flask is equipped with a top-mounted stopper fitted with an exit tube. The exit tube is connected via a T-tube to a system vent and a leveling buret and reservoir.

Reagents

Saturated sodium bicarbonate solution: Mix 20 g of sodium bicarbonate in 100 mL of water, and allow any undissolved crystals to settle. Use the clear supernatant.

Displacement solution: Dissolve 100 g of sodium chloride in 350 mL of water, and add 1 g of sodium bicarbonate and 1 mL of methyl orange TS. After the sodium bicarbonate has dissolved, add 6 N sulfuric acid until the solution turns pink. Use this solution to fill the reservoir of the apparatus.

Analysis: Add 25 mL of *Saturated sodium bicarbonate solution* to the 50-mL flask, and flush the system by allowing humidified carbon dioxide to enter through the side arm. Close the carbon dioxide inlet and the system vent, and stir the *Saturated sodium bicarbonate solution* until no further carbon dioxide absorption is noted from successive buret readings. Maintain atmospheric pressure in the apparatus by adjusting the *Displacement solution* to the same level in both the reservoir and the buret, noting the buret reading. Open the system vent, and reintroduce humidified carbon dioxide through the side arm of the flask. Close the carbon dioxide inlet and the system vent, and stir the *Saturated sodium bicarbonate solution* vigorously until no further carbon dioxide absorption is noted. Repeat the carbon dioxide absorption procedure starting with "Open the system vent" until NMT a 0.2-mL change in buret reading is noted. Discontinue stirring, reintroduce humidified carbon dioxide through the side arm of the flask, remove the top-mounted stopper from the flask briefly, and promptly add 10 g of ▲Sodium Bicarbonate▲ (ERR 1-Jul-2019) to the flask. Replace the stopper, continue the flow of humidified carbon dioxide for about 30 s, and then close the carbon dioxide inlet and the system vent. Stir the solution in the flask vigorously until carbon dioxide absorption ceases, noting the volume absorbed from the buret reading. Restore atmospheric pressure in the apparatus by leveling the *Displacement solution* in the reservoir and the buret, and discontinue stirring. Open the system vent, and flush humidified carbon dioxide through the system. Close the carbon dioxide inlet and the system vent, and stir the solution in the flask vigorously until carbon dioxide absorption ceases.

Determine the total volume, *V*, in mL, of carbon dioxide absorbed after the addition of the specimen to the flask, and calculate the percentage of carbonate in the portion of specimen tested:

$$\text{Result} = 273V \times (6001P)/[22{,}400 \times (273 + T) \times (760W)]$$

V = total volume of carbon dioxide absorbed (mL)
P = ambient atmospheric pressure (mm of mercury)
T = ambient temperature
W = weight of Sodium Bicarbonate taken (g)

[NOTE—Maintain a constant temperature during the measurement of the volume of carbon dioxide absorbed.]

Acceptance criteria: NMT 0.23%

- **NORMAL CARBONATE**

Sample: 1 g

Analysis: Dissolve the *Sample* in 20 mL of water with very gentle swirling at a temperature not exceeding 15°. Add 2.0 mL of 0.10 N hydrochloric acid and 2 drops of phenolphthalein TS.

Acceptance criteria: The solution does not assume more than a faint pink color immediately.

- **CHLORIDE AND SULFATE** ⟨221⟩, *Chloride*

Sample: 0.35 g

Acceptance criteria: No more chloride than corresponds to 1.5 mL of 0.0010 N hydrochloric acid (NMT 0.015%)

- **LIMIT OF SULFUR COMPOUNDS**

Sample: 2.0 g

Standard solution: To 0.30 mL of 0.02 N sulfuric acid add 1 mL of 0.06 N hydrochloric acid, and dilute with water to 20 mL.

Sample solution: Dissolve the *Sample* in 20 mL of water, and evaporate to 5 mL by boiling. Add 1 mL of bromine TS, evaporate to dryness, and cool. Dissolve the residue in 10 mL of 3 N hydrochloric acid, evaporate to dryness, and cool. Dissolve the residue in 5 mL of 3 N hydrochloric acid, evaporate to dryness, and cool. Dissolve the residue in 10 mL of water, and adjust with 3 N hydrochloric acid or 6 N ammonium hydroxide to a pH of 2. If necessary to obtain a clear solution, filter the solution, washing the filter with two 2-mL portions of water. Dilute with water to 20 mL.

Analysis: Add 1 mL of barium chloride TS to each of the *Standard solution* and the *Sample solution*. Mix, and allow to stand for 30 min.

Acceptance criteria: Any turbidity produced in the *Sample solution* is not more intense than that produced in the *Standard solution* (NMT 0.015%).

- **ALUMINUM** ⟨206⟩ (where it is labeled as intended for use in hemodialysis)

Test preparation: Transfer 1.0 g of Sodium Bicarbonate to a 100-mL plastic volumetric flask. Carefully add 4 mL of nitric acid. Sonicate for 30 min, and dilute with water to volume.

Acceptance criteria: NMT 2 µg/g

- **ARSENIC** ⟨211⟩, *Method I*

Test preparation: Dissolve 1.5 g of Sodium Bicarbonate in 20 mL of 7 N sulfuric acid, and add 35 mL of water.

Analysis: Proceed as directed in the chapter, omitting the addition of 20 mL of 7 N sulfuric acid.

Acceptance criteria: NMT 2 ppm

- **CALCIUM** (where it is labeled as intended for use in hemodialysis)

[NOTE—The *Standard solutions* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

USP Monographs

www.webofpharma.com

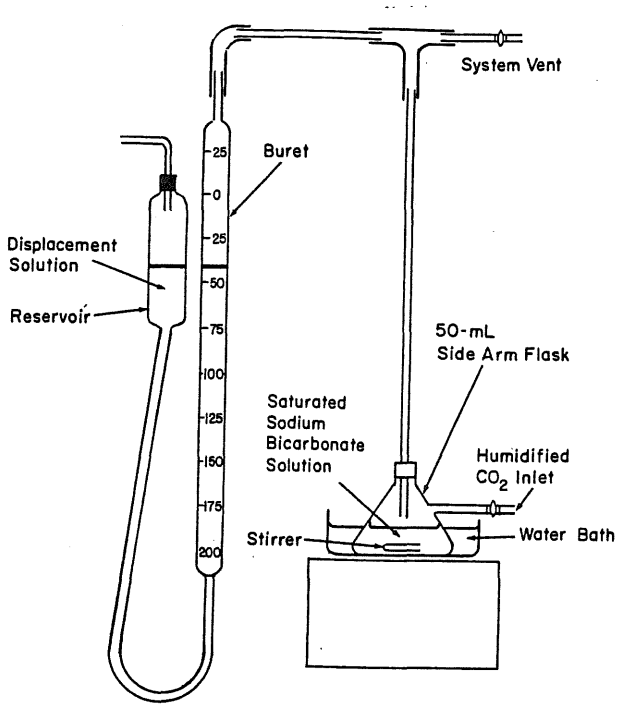


Figure 1. Carbonate apparatus. (Sodium Bicarbonate)

Potassium chloride solution: 10 mg/mL of potassium chloride in 0.36 N hydrochloric acid

Standard solutions: Transfer 249.7 mg of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, to a 100-mL volumetric flask. Dissolve in 6 mL of 6 N hydrochloric acid, add 1 g of potassium chloride, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, and dilute with *Potassium chloride solution* to volume. This solution contains 100 µg/mL of calcium. Transfer 2.0-, 3.0-, 4.0-, and 5.0-mL portions of this solution to separate 100-mL volumetric flasks (each containing 6 mL of 6 N hydrochloric acid), and dilute with *Potassium chloride solution* to volume. These *Standard solutions* contain 2.0, 3.0, 4.0, and 5.0 µg/mL of calcium, respectively.

Sample solution: Transfer 3.0 g of Sodium Bicarbonate to a 100-mL volumetric flask. Add 6 mL of 6 N hydrochloric acid and 1 g of potassium chloride, and dilute with water to volume.

Blank: *Potassium chloride solution*

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*

Plot the absorbances of the *Standard solutions* versus their contents of calcium, in µg/mL, by drawing a straight line best fitting the four plotted points. From the graph so obtained determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of calcium in the portion of Sodium Bicarbonate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of calcium in the *Sample solution* (µg/mL)

C_U = concentration of Sodium Bicarbonate in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.01%

• **MAGNESIUM** (where it is labeled as intended for use in hemodialysis)

[NOTE—The *Standard solutions* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

Potassium chloride solution, Sample solution, and **Blank:** Proceed as directed in the test for *Calcium*.

Standard solutions: To 1.000 g of magnesium in a 250-mL beaker containing 20 mL of water, carefully add 20 mL of hydrochloric acid, warming if necessary to complete the reaction. Transfer this solution to a 1000-mL volumetric flask containing 10 g of potassium chloride, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask containing 1 g of potassium chloride, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, and dilute with *Potassium chloride solution* to volume. This solution contains 10.0 µg/mL of magnesium. Transfer 2.0-, 3.0-, 4.0-, and 5.0-mL portions of this solution to separate 100-mL volumetric flasks (each containing 6 mL of 6 N hydrochloric acid), and dilute with *Potassium chloride solution* to volume. These *Standard solutions* contain 0.2, 0.3, 0.4, and 0.5 µg/mL of magnesium, respectively.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* ⟨852⟩.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Magnesium emission line at 285.2 nm

www.webofpharma.com

Flame: Reducing air–acetylene
Analysis
Samples: *Sample solution* and *Standard solutions*
Plot the absorbances of the *Standard solutions* versus their contents of magnesium, in µg/mL, by drawing a straight line best fitting the four plotted points. From the graph so obtained determine the concentration, *C*, in µg/mL, of magnesium in the *Sample solution*.
Calculate the percentage of magnesium in the portion of Sodium Bicarbonate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of magnesium in the *Sample solution* (µg/mL)
C_U = concentration of Sodium Bicarbonate in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.004%

• **COPPER** (where it is labeled as intended for use in hemodialysis)
[NOTE—The *Standard solution* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]
Diluent: Dilute 40 mL of nitric acid with water to 1000 mL.
Standard solution: 10.0 µg/mL of copper, prepared as follows. Transfer 1.000 g of copper to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, and dilute with 0.2 N nitric acid to volume. Transfer 10.0 mL of this solution to a second 1000-mL volumetric flask, and dilute with 0.2 N nitric acid to volume. Store in a polyethylene bottle.
Sample solution: Transfer 5.0 g of Sodium Bicarbonate to a 100-mL plastic volumetric flask, and carefully add 4 mL of nitric acid. Sonicate for 30 min, and dilute with water to volume.
Spiked sample solution: To 10.0 mL of the *Sample solution* add 20 µL of the *Standard solution*. This solution contains 0.02 µg/mL of added copper.
Blank: *Diluent*
Instrumental conditions
(See *Atomic Absorption Spectroscopy* ⟨852⟩.)
Mode: Atomic absorption spectrophotometry
Analytical wavelength: Copper emission line at 324.7 nm
Lamp: Copper hollow-cathode
Flame: Flameless electrically heated furnace
Analysis
Samples: *Sample solution* and *Spiked sample solution*
Plot the absorbances of the *Sample solution* and the *Spiked sample solution* versus their contents of added copper, in µg/mL. Draw a line connecting the two points, and extrapolate the line until it intercepts the concentration axis. From the intercept, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.
Calculate the amount, in ppm, of copper in the portion of Sodium Bicarbonate taken:

$$\text{Result} = (C/C_U) \times 10^6$$

C = concentration of copper in the *Sample solution* (µg/mL)
C_U = concentration of Sodium Bicarbonate in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 1 ppm

• **IRON** ⟨241⟩ (where it is labeled as intended for use in hemodialysis)
Sample solution: Place 2.0 g of Sodium Bicarbonate in a beaker, and neutralize with hydrochloric acid, noting the volume of acid consumed. Transfer this solution to a 25-mL volumetric flask with the aid of water.
Standard solution: Transfer 1.0 mL of *Standard Iron Solution* to a 25-mL volumetric flask. Add the same volume of hydrochloric acid as used to prepare the *Sample solution*.
Blank: Use the same volume of hydrochloric acid in a 25-mL volumetric flask as used to prepare the *Sample solution*.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV-Vis
Analytical wavelength: 480 nm
Analysis
Samples: *Sample solution*, *Standard solution*, and *Blank*
To each of the flasks containing the *Standard solution*, the *Sample solution*, and the *Blank* add 50 mg of ammonium peroxydisulfate crystals and 2 mL of *Ammonium Thiocyanate Solution*. Dilute with water to volume. Concomitantly determine the absorbances of the solutions from the *Standard solution* and the *Sample solution*.
Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (NMT 5 ppm).

• **LIMIT OF AMMONIA**
Use water with a resistivity NLT 18 megohm-cm to prepare all of the solutions.
Solution A: 100 mM methanesulfonic acid in water
Solution B: Water
Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	7	93
26	7	93
26.1	70	30
34	70	30

Alternatively, *Mobile phase* can be generated electrolytically using an automatic eluant generator.
System suitability stock solution A: 10 mg/mL of sodium bicarbonate in water
System suitability stock solution B: 3 µg/mL of ammonium chloride (equivalent to 1 µg/mL of ammonium ions) in water. [NOTE—This solution may also be prepared as containing 1 µg/mL of ammonium ions from commercially available NIST traceable ion chromatography ammonium ion standard solution.]
System suitability solution: 1 mg/mL of Sodium Bicarbonate and 0.02 µg/mL of ammonium ions from suitable volumes of *System suitability stock solution A* and *System suitability stock solution B* in water
Standard solution: 0.02 µg/mL of ammonium ions from commercially available NIST traceable ion chromatography ammonium ion standard solution
Sample solution: 1 mg/mL of Sodium Bicarbonate in water
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: Conductivity with suppression. [NOTE—A 2-mm suppressor is recommended for better performance.]
Columns
Guard: 3-mm × 5-cm; 5-µm packing L84

www.webofpharma.com

Analytical: 3-mm × 25-cm; 5-µm packing L84
Temperatures
Detector: 30°
Column: 40°
Flow rate: 0.43 mL/min
Injection volume: 25 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for sodium and ammonium ions are 1.0 and 1.3, respectively.]
Suitability requirements
Resolution: NLT 4.0 between sodium and ammonium ions
Tailing factor: NMT 1.5 for ammonium ion
Signal-to-noise ratio: NLT 20 for ammonium ion
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria: The response due to the ammonium ion in the *Sample solution* is NMT the response due to the ammonium ion in the *Standard solution* (NMT 20 ppm).

• **LIMIT OF ORGANICS** (where it is labeled as intended for use in hemodialysis)
Silver sulfate solution: 11 g/L of silver sulfate in sulfuric acid
Indicator solution: 14.85 mg/mL of 1,10-phenanthroline and 6.95 mg/mL of ferrous sulfate in water
Standard solution: Transfer 850.3 mg of potassium biphthalate, previously crushed lightly and dried at 120° for 2 h, to a 1000-mL volumetric flask. Dilute with water to volume. Transfer 6.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. It contains the equivalent of 0.06 mg/mL of organic equivalents. Transfer 40.0 mL of this solution to a 500-mL reflux flask.
Sample solution: Transfer 20 g of Sodium Bicarbonate to a 500-mL reflux flask. Add 20 mL of water, and swirl. Cautiously add 20 mL of sulfuric acid, and swirl. [**CAUTION**—Perform this operation under a hood.]
Blank: Add 40 mL of water to a 500-mL reflux flask.
Analysis
Samples: *Standard solution*, *Sample solution*, and *Blank*
Concomitantly treat the *Samples* as follows. To each flask add 1 g of mercuric sulfate and about five glass beads. Cool the flask in an ice bath, and add 5 mL of *Silver sulfate solution*. While gently swirling the flask in the ice bath, add 25.0 mL of 0.025 N potassium dichromate VS and, slowly, 70 mL of *Silver sulfate solution*. Fit a cold water condenser on the reflux flask, and reflux for 2 h. Allow the contents of the flask to cool for 10 min, and wash the condenser with 50 mL of water, collecting the washings in the flask. Add water to the flask to obtain a volume of about 350 mL. Add 3 drops of *Indicator solution*, and titrate at room temperature with 0.07 N ferrous ammonium sulfate VS until the solution changes from greenish blue to reddish brown.
To verify the suitability of the system, calculate the amount, in mg, of organic equivalents in the *Standard solution*:

$$\text{Result} = (V_B - V_S) \times 8N$$

V_B = volume of 0.07 N ferrous ammonium sulfate VS consumed by the *Blank* (mL)
V_S = volume of 0.07 N ferrous ammonium sulfate VS consumed by the *Standard solution* (mL)
N = normality of ferrous ammonium sulfate VS

Suitability criteria: 2.328–2.424 mg
Calculate the amount, in mg, of organic equivalents in the portion of Sodium Bicarbonate taken:

$$\text{Result} = (V_B - V_U) \times 8N$$

V_B = volume of 0.07 N ferrous ammonium sulfate VS consumed by the *Blank* (mL)
V_U = volume of 0.07 N ferrous ammonium sulfate VS consumed by the *Sample solution* (mL)
N = normality of ferrous ammonium sulfate VS

Acceptance criteria: NMT 0.01%

SPECIFIC TESTS
• **LOSS ON DRYING** ⟨731⟩
Sample: 4 g
Analysis: Dry the *Sample* over silica gel for 4 h.
Acceptance criteria: NMT 0.25%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in well-closed containers.
• **LABELING:** Where Sodium Bicarbonate is intended for use in hemodialysis, it is so labeled.

Sodium Bicarbonate Injection

» Sodium Bicarbonate Injection is a sterile solution of Sodium Bicarbonate in Water for Injection, the pH of which may be adjusted by means of added Carbon Dioxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $NaHCO_3$.
[NOTE—Do not use the Injection if it contains a precipitate.]

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I glass. Store at controlled room temperature.
Labeling—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Bicarbonate* ⟨191⟩.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 5.0 USP Endotoxin Units per mEq.
pH ⟨791⟩: between 7.0 and 8.5.
Particulate Matter in Injections ⟨788⟩: meets the requirements under small-volume injections.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Measure accurately a volume of Injection, equivalent to about 3 g of sodium bicarbonate, add methyl red TS, and titrate with 1 N hydrochloric acid VS. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the faint pink color no longer fades after boiling. Each mL of 1 N hydrochloric acid is equivalent to 84.01 mg of $NaHCO_3$.

USP Monographs

www.webofpharma.com

Sodium Bicarbonate Compounded Injection

DEFINITION

Sodium Bicarbonate Compounded Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium bicarbonate ($NaHCO_3$). It contains no bacteriostat or other preservatives.

Prepare Sodium Bicarbonate Compounded Injection 8.4% (1 mEq/mL) as follows (see *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

Sodium Bicarbonate	8.4 g
Sterile Water for Injection, a sufficient quantity to make	100 mL

Dissolve the *Sodium Bicarbonate* in sufficient *Sterile Water for Injection* and bring to final volume. Pass through a sterile filter of 0.22-µm pore size into a sterile container.

ASSAY

- **PROCEDURE FOR SODIUM**

Mobile phase: 8 mM methanesulfonic acid

Standard solution: 0.025 mg/mL of sodium prepared with USP Sodium Chloride RS and water

Sample solution: Transfer 1 mL of Injection into a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: Conductivity

Column: 4.6-mm × 25-cm; packing L97

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for sodium is about 3.6 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of sodium from the *Sample solution*

r_S = peak response of sodium from the *Standard solution*

C_S = concentration of sodium in the *Standard solution* (mg/mL)

C_U = nominal concentration of sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

Change to read:

- **PROCEDURE FOR SODIUM BICARBONATE**

Sample solution: A volume of Injection, equivalent to about 3 g of sodium bicarbonate

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 1 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Add methyl red TS to the *Sample solution*. Add *Titrant* slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the faint pink color no longer fades after boiling. Perform a blank determination, and make any necessary correction.

Calculate the percentage of the labeled amount of sodium bicarbonate ($NaHCO_3$) in the portion of Injection taken:

$$\text{Result} = [(V_S - V_B) \times N_A \times {}^{\blacktriangle}F \times 100]/W_{\blacktriangle}$$ (ERR 1-May-2019)

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the blank (mL)

N_A = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 84.01 mg/$^{\blacktriangle}$mEq

W = sample weight (mg)$_{\blacktriangle}$ (ERR 1-May-2019)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **pH** ⟨791⟩**:** 7.0–8.5
- **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 5.0 USP Endotoxin Units/mEq of sodium bicarbonate
- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** Meets the requirements for small-volume injections

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in single-dose glass containers. Store at controlled room temperature.
- **BEYOND-USE DATE:** In the absence of passing a sterility and endotoxin test, the storage conditions for high-risk compounded sterile preparations (CSPs) in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ apply. After successful completion of sterility and endotoxin testing, NMT 120 days after the date on which it was compounded when stored at controlled room temperature.
- **LABELING:** Label it to state the *Beyond-Use Date*. The label states the total osmolar concentration in mOsmol/mL.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Chloride RS

Sodium Bicarbonate Oral Powder

» Sodium Bicarbonate Oral Powder contains Sodium Bicarbonate and suitable added substances. It contains not less than 98.5 percent and not more than 100.5 percent of $NaHCO_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label Oral Powder to indicate that it is for oral use only.

Other requirements—It meets the requirements for *Identification* and *Loss on drying* under *Sodium Bicarbonate*.

Assay—Proceed with Oral Powder as directed in the *Assay* under *Sodium Bicarbonate*.

www.webofpharma.com

Sodium Bicarbonate Tablets

» Sodium Bicarbonate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $NaHCO_3$.

Packaging and storage—Preserve in well-closed containers.
Identification—A solution of Tablets responds to the tests for *Sodium* ⟨191⟩ and for *Bicarbonate* ⟨191⟩.
Disintegration ⟨701⟩: 30 minutes, simulated gastric fluid TS being substituted for water in the test.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Assay—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 2 g of sodium bicarbonate, dissolve in 100 mL of water, add methyl red TS, and titrate with 1 N hydrochloric acid VS. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the pink color no longer fades after boiling. Each mL of 1 N hydrochloric acid is equivalent to 84.01 mg of $NaHCO_3$.

Sodium Bromide

NaBr 102.89
Sodium bromide.
Sodium bromide [7647-15-6].

» Sodium Bromide contains not less than 98.0 percent and not more than 100.5 percent of NaBr, calculated on the dried basis. It contains no added substances.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.
Appearance of solution: clear and colorless.
Test solution—Dissolve 10.0 g in carbon dioxide-free water, and dilute with the same solvent to 100 mL.

Identification—
A: A solution containing 4.0 mg of sodium bromide responds to the test for *Bromide* ⟨191⟩.
B: It responds to the test for *Sodium* ⟨191⟩.
Acidity or alkalinity—To 10 mL of the solution prepared for the test for *Appearance of solution,* add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.
Loss on drying ⟨731⟩—Dry it at 100° to 105° for 3 hours: it loses not more than 3.0% of its weight.

Bromates—
Starch–mercuric iodide solution—Triturate 1.0 g of soluble starch with 5 mL of water, and pour the mixture into 100 mL of boiling water containing 10 mg of mercuric iodide.
Procedure—To 10 mL of the solution prepared for the test for *Appearance of solution* add 1 mL of *Starch–mercuric iodide solution,* 0.1 mL of a 100 g per L solution of potassium iodide, and 0.25 mL of 0.5 M sulfuric acid. Allow to stand protected from light for 5 minutes. No blue or violet color develops.
Limit of chlorine: not more than 0.6%.
Nitric acid solution and *Ferric ammonium sulfate solution*—Proceed as directed in the *Assay.*
Procedure—Dissolve 1.000 g Sodium Bromide in 20 mL of *Nitric acid solution* in a conical flask, add and mix 5 mL of 30 percent hydrogen peroxide, and heat in a water bath until the solution is colorless. Rinse the sides of the flask with a small quantity of water, and heat in a water bath for 15 minutes. Allow to cool, dilute with water to 50 mL, and add 5.0 mL of silver nitrate VS and 1 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 5 mL of *Ferric ammonium sulfate solution* as the indicator. Perform a blank titration. Not more than 1.7 mL of silver nitrate VS is used.
Iodides—To 5 mL of the solution prepared for the test for *Appearance of solution* add 0.15 mL of a 10.5 g per 100 mL ferric chloride solution, and 2 mL of dichloromethane. Shake, and allow to separate. The lower layer is colorless.
Sulfates ⟨221⟩—A 2.0-g portion shows no more sulfate than corresponds to 0.2 mL of 0.020 N sulfuric acid (0.01%).
Limit of iron: not more than 20 ppm.
Citric acid solution—Prepare a 200 mg citric acid per mL solution.
Iron standard solution—Transfer 0.863 g of ferric ammonium sulfate to a 500-mL volumetric flask, and dissolve in 25 mL of dilute sulfuric acid. Dilute with water to volume. Transfer 1.0 mL of the resulting solution to a 10-mL volumetric flask, and dilute with water to volume. Transfer 2.5 mL of this resulting solution to a 50-mL volumetric flask, and dilute with water to volume.
[NOTE—Prepare immediately before use.]
Test solution—Transfer 5 mL of the solution prepared for the test for *Appearance of solution* to a 10-mL volumetric flask, and dilute with water to volume.
Procedure—To 10 mL each of the *Iron standard solution* and the *Test solution* add 2.0 mL of the *Citric acid solution* and 0.1 mL of thioglycolic acid. Make alkaline to litmus with ammonia water, and dilute with water to 20 mL. After 5 minutes, any pink color in the *Test solution* is not more intense than that in the *Iron standard solution.*
Magnesium and alkaline-earth metals—To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of pH 10.0 ammonia–ammonium chloride buffer (prepared by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide, and diluting to 100 mL), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T trituration. Heat to about 40°. Titrate this solution (see *Titrimetry* ⟨541⟩) with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Bromide dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 5.0 mL (0.02%, calculated as Ca).

Assay—
Nitric acid solution—Dilute 14 mL of nitric acid with water to 100 mL.
Ferric ammonium sulfate solution—Transfer 10 g of ferric ammonium sulfate to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.
Procedure—Dissolve 2.000 g of Sodium Bromide in water, and dilute with water to 100.0 mL. To 10.0 mL of the solution add 50 mL of water, 5 mL of *Nitric acid solution,* 25.0 mL of silver nitrate VS, and 2 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 2 mL of *Ferric ammonium sulfate solution* as the indicator, shaking vigorously towards the endpoint. Each mL of 0.1 M silver nitrate is equivalent to 10.29 mg of NaBr. Calculate the percent content of Sodium Bromide, corrected for the chloride content, by the formula:

$$a - 2.902b$$

www.webofpharma.com

in which *a* is the percent content of NaBr and NaCl obtained, calculated as NaBr; and *b* is the percent content of chlorides.

Sodium Bromide Compounded Injection, Veterinary

DEFINITION

Sodium Bromide Compounded Injection, Veterinary contains NLT 27 mg and NMT 33 mg of Sodium Bromide (NaBr) per mL, equivalent to NLT 21.0 mg and NMT 25.6 mg of bromide (Br^-) per mL.

Prepare Sodium Bromide Compounded Injection, Veterinary as follows (see *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

Sodium Bromide	3.0 g
Sterile Water for Injection, *USP*, a sufficient quantity to make	100 mL

Dissolve the *Sodium Bromide* in *Sterile Water for Injection* with mixing. Sterilize by a suitable means such as sterile filtration or autoclaving.

ASSAY

• **PROCEDURE**

TCA solution: 20% (w/v) trichloroacetic acid in water

Gold chloride solution: 5 mg/mL of gold chloride in water

Standard stock solution: Dissolve USP Sodium Bromide RS in water to obtain a solution with a nominal concentration of 20 mg/mL of bromide.

Standard solutions: Prepare four solutions of known concentrations of about 2.0, 1.0, 0.5, and 0.25 mg/mL of bromide from *Standard stock solution* and water.

Sample solution: Dilute Injection, Veterinary quantitatively with water (1:19).

Blank: Water

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)

Mode: Vis

Analytical wavelength: 440 nm

System suitability

Samples: *Standard solutions* and *Blank*

Suitability requirements

Correlation coefficient: NLT 0.99, linear regression of the *Standard solutions*

Analysis

Samples: *Sample solution* and *Blank*

To 750-µL aliquots of each *Sample* add 500 µL of *TCA solution* and 250 µL of *Gold chloride solution*. Mix on a vortex mixer, and immediately read the absorbance of each *Sample*.

Calculate the concentration of bromide (Br^-), in mg/mL, in the portion of Injection, Veterinary taken:

$$\text{Result} = C \times D$$

C = concentration of the *Sample solution* (mg/mL) calculated from the standard curve

D = dilution factor of the *Sample solution* (20)

Acceptance criteria: 21.0–25.6 mg/mL of bromide (Br^-)

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.03 USP Endotoxin Units/mg of sodium bromide

• **STERILITY TESTS** ⟨71⟩: Meets the requirements

• **OTHER REQUIREMENTS:** It meets the requirements in *Labeling* ⟨7⟩, *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in single-dose containers, preferably of Type I glass, and store in a refrigerator.

Change to read:

• **BEYOND-USE DATE:** ▲In the absence of passing a sterility test and endotoxins test, the BUDs in ⟨797⟩ apply. If prepared as a Category 2 CSP and a sterility test and endotoxins test is passed, NMT 180 days after the date on which it was compounded when stored in a refrigerator.▲ (CN 1-May-2020)

• **LABELING:** Label to state the *Beyond-Use Date*. Label to state that it is for infusion only at a rate not to exceed 150 mg of sodium bromide per kg of body weight per hour. Label to state that it is for veterinary use only.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Sodium Bromide RS

Sodium Bromide Compounded Oral Solution, Veterinary

DEFINITION

Sodium Bromide Compounded Oral Solution, Veterinary contains NLT 194.4 mg and NMT 237.6 mg of sodium bromide (NaBr) per mL equivalent to NLT 151 mg and NMT 185 mg of bromide (Br^-) per mL.

Prepare Sodium Bromide Compounded Oral Solution, Veterinary as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sodium Bromide	21.6 g
Purified Water	60 mL
Corn Syrup, *FCC*, a sufficient quantity to make	100 mL

Dissolve the *Sodium Bromide* in *Purified Water*. Add *Corn Syrup* to bring the preparation to final volume with mixing.

ASSAY

• **PROCEDURE**

TCA solution: 20% (w/v) trichloroacetic acid in water

Gold chloride solution: 5 mg/mL of gold chloride in water

Standard stock solution: Dissolve USP Sodium Bromide RS in water to obtain a solution with a nominal concentration of 20 mg/mL of bromide.

Standard solutions: Prepare four solutions of known concentrations of about 2.0, 1.0, 0.5, and 0.25 mg/mL of bromide from *Standard stock solution* in water.

Sample solution: Dilute Oral Solution, Veterinary quantitatively with water (1:99).

- **USP REFERENCE STANDARDS** ⟨11⟩
USP Sodium Bromide RS

Sodium Butyrate

$C_4H_7NaO_2$ 110.09
Butyric acid, sodium salt.
Sodium butyrate [156-54-7].

» Sodium Butyrate contains not less than 98.0 percent and not more than 101.0 percent of $C_4H_7NaO_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.
Labeling—Label it to indicate that it is intended for use in compounding dosage forms for rectal use only.
USP Reference standards ⟨11⟩—
USP Sodium Butyrate RS

Identification—

Change to read:

A: ▲*Spectroscopic Identification Tests* ⟨197⟩, *Infrared Spectroscopy: 197K*▲ (CN 1-May-2020), on the undried specimen.
B: A solution (1 in 10) meets the requirements of the tests for *Sodium* ⟨191⟩.
Alkalinity—Dissolve 2.0 g in 20 mL of water, and add 1 drop of phenolphthalein TS: if a pink color is produced, it is discharged by 0.50 mL of 0.10 N sulfuric acid.
Water Determination, *Method I* ⟨921⟩: not more than 1.0%.
Assay—Dissolve about 200 mg of Sodium Butyrate, accurately weighed, in 50 mL of glacial acetic acid. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 11.01 mg of $C_4H_7NaO_2$.

Sodium Chloride

Portions of this monograph that are national *USP* text, and are not part of the harmonized text, are marked with symbols (• •) to specify this fact.

NaCl 58.44
Sodium Chloride [7647-14-5].

DEFINITION
Sodium Chloride contains NLT 99.0% and NMT 100.5% of sodium chloride (NaCl), calculated on the dried basis.

IDENTIFICATION
- **A. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Sodium*: Meets the requirements
- **B. CHLORIDE**
Sample solution: 3 mg of Sodium Chloride in 2 mL of water
Analysis: Acidify the *Sample solution* with diluted nitric acid, and add 0.4 mL of silver nitrate TS. Shake, and allow to stand. A curdled, white precipitate is formed. Centrifuge, wash the precipitate with three 1-mL portions of water, and discard the washings. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant may not become perfectly clear. Suspend the precipitate in 2 mL of water, and add 1.5 mL of 10 N ammonium hydroxide.
Acceptance criteria: The precipitate dissolves easily with the possible exception of a few large particles, which dissolve more slowly.

ASSAY
- **PROCEDURE**
Sample: 50 mg of Sodium Chloride
Analysis: Dissolve the *Sample* in 50 mL of water, and titrate with 0.1 N silver nitrate VS (see *Titrimetry* ⟨541⟩), determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride (NaCl).
Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES
- **ALUMINUM** (where it is labeled as intended for use in the manufacture of peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)
Buffer: Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, and dilute with water to 250 mL.
Aluminum standard solution: To 352 mg of aluminum potassium sulfate in a 100-mL volumetric flask add a few mL of water, and swirl to dissolve. Add 20 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.
Sample solution: Dissolve 20.0 g of Sodium Chloride in 100 mL of water, and add 10 mL of *Buffer*. Extract this solution with successive portions of 20, 20, and 10 mL of a 0.5% solution of 8-hydroxyquinoline in chloroform, combining the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume.
Standard solution: Prepare a mixture of 2.0 mL of *Aluminum standard solution*, 10.0 mL of *Buffer*, and 98 mL of water. Extract this mixture as described for the *Sample solution*, and dilute the combined extracts with chloroform to volume.
Blank solution: Prepare a mixture of 10 mL of *Buffer* and 100 mL of water. Extract this mixture as described for *Sample solution*, and dilute the combined extracts with chloroform to volume.
Instrumental conditions
(See *Fluorescence Spectroscopy* ⟨853⟩.)

USP Monographs

www.webofpharma.com

Mode: Fluorescence
Excitation wavelength: 392 nm
Emission wavelength: 518 nm
Analysis
Samples: *Sample solution, Standard solution,* and *Blank solution.* Use the *Blank solution* to set the instrument to zero.
Determine the fluorescence intensities of the *Sample solution* and *Standard solution.*
Acceptance criteria: The fluorescence of the *Sample solution* does not exceed that of the *Standard solution* (0.2 ppm).

• ‘ **ARSENIC** ⟨211⟩, *Method I*: NMT 1 ppm.

• **BARIUM**
Analysis: To 5 mL of the solution prepared for the test for *Appearance of Solution* add 2 mL of 2 N sulfuric acid and 5 mL of water, as test solution. To another 5 mL of the solution prepared for the test for *Appearance of Solution* add 7 mL of water, as reference solution. Let stand for 2 h.
Acceptance criteria: Any opalescence in the test solution is not more intense than that in the reference solution.

• **FERROCYANIDES**
Sample solution: Dissolve 2.0 g in 6 mL of water.
Analysis: To the *Sample solution* add 0.5 mL of a mixture of 5 mL of ferric ammonium sulfate solution (10 mg/mL in 2.5 g/L (0.05 N) of sulfuric acid) and 95 mL of ferrous sulfate solution (10 mg/mL in water).
Acceptance criteria: No blue color develops in 10 min.

• **IODIDES**
Sample: 5 g of Sodium Chloride
Analysis: Moisten the *Sample* by the dropwise addition of a freshly prepared mixture of 0.15 mL of sodium nitrite solution (100 mg/mL), 2 mL of 1 N sulfuric acid, 25 mL of iodide-free starch TS, and 25 mL of water. After 5 min, examine the substance in natural light.
Acceptance criteria: No blue color is observed.

• **IRON**
Sample solution: Use a 10-mL portion of the solution prepared for the test for *Appearance of Solution.*
Standard solution: Immediately before use, dilute *Standard Iron Solution* (see *Iron* ⟨241⟩) 1 to 10 with water. This solution contains the equivalent of 1 µg/mL of iron. Combine 4 mL of this solution and 6 mL of water.
Analysis: To each of the solutions add 2 mL of a 200-mg/mL solution of citric acid and 0.1 mL of thioglycolic acid. Mix, make alkaline with stronger ammonia water, and dilute with water to 20 mL.
Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that from the *Standard solution* (NMT 2 ppm).

• **LIMIT OF BROMIDES**
[NOTE—Prepare the *Sample solution* and the *Standard solution* concomitantly.]
Standard solution: To 5.0 mL of a solution containing 3 µg/mL of potassium bromide add 2.0 mL of pH 4.7 phenol red TS and 1.0 mL of chloramine T solution (0.1 mg/mL), and mix immediately. After 2 min, add 0.15 mL of 0.1 N sodium thiosulfate, mix, and dilute with water to 10.0 mL.
Sample solution: To 0.5 mL of the solution prepared for the test for *Appearance of Solution* add 4.0 mL of water, 2.0 mL of pH 4.7 phenol red TS, and 1.0 mL of chloramine T solution (0.1 mg/mL), and mix immediately. After 2 min, add 0.15 mL of 0.1 N sodium thiosulfate, mix, and dilute with water to 10.0 mL.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV-Vis
Analytical wavelength: 590 nm
Comparison liquid: Water
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria: The absorbance of the *Sample solution* is not greater than that of the *Standard solution* (NMT 100 ppm).

• **LIMIT OF PHOSPHATES**
Sulfomolybdic acid solution: Dissolve with heating 2.5 g of ammonium molybdate in 20 mL of water. Dilute 28 mL of sulfuric acid in 50 mL of water, then cool. Mix the two solutions, and dilute with water to 100 mL.
Phosphate standard stock solution: 0.716 mg/mL of monobasic potassium phosphate in water
Phosphate standard solution: 7.16 µg/mL from *Phosphate standard stock solution* in water. [NOTE—Prepare this solution fresh.]
Standard solution: Dilute 2 mL of the *Phosphate standard solution* with water to 100 mL.
Sample solution: Dilute 2 mL of the solution prepared in the test for *Appearance of Solution* with water to 100 mL.
Analysis: To the *Standard solution* and the *Sample solution* add 4 mL of *Sulfomolybdic acid solution,* and add 0.1 mL of a mixture of 1 mL of stronger acid stannous chloride TS and 10 mL of 2 N hydrochloric acid. After 10 min, compare the colors of 20 mL of each solution.
Acceptance criteria: Any color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 25 ppm).

• **LIMIT OF POTASSIUM** (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)
[NOTE—The *Standard solution* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]
Standard solutions: Dissolve 1.144 g of potassium chloride, previously dried at 105° for 3 h, in water. Dilute with water to 1000 mL, and mix. This solution contains the equivalent of 600 µg/mL of potassium. Dilute as required to obtain NLT 3 solutions at concentrations that span the expected value in the *Sample solution.*
Sample solution: Transfer 1.00 g of Sodium Chloride to a 100-mL volumetric flask. Add water and swirl to dissolve, dilute with water to volume, and mix.
Instrumental conditions
(See *Atomic Absorption Spectroscopy* ⟨852⟩.)
Mode: Atomic emission spectroscopy
Analytical wavelength: 766.5 nm
Flame: Air–acetylene
Analysis
Samples: *Standard solutions* and *Sample solution*
Measure, at least three times, the emission intensity of the *Sample solution* and the *Standard solutions.* Prepare a calibration curve from the mean of the readings obtained with the *Standard solutions,* and determine the concentration of potassium in the *Sample solution.*
Acceptance criteria: NMT 500 ppm

• **MAGNESIUM AND ALKALINE-EARTH METALS**
Buffer: Prepare pH 10.0 ammonia–ammonium chloride buffer by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide, and diluting with water to 100 mL.
Analysis: To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of *Buffer,* 1 mL of 0.1 M zinc sulfate, and 0.15 g of eriochrome black T trituration. Heat to 40°. Titrate this solution with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Chloride dissolved in 100 mL of water. If

www.webofpharma.com

the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint.
Acceptance criteria: The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 2.5 mL (NMT 100 ppm, calculated as Ca).

• **NITRITES**
Sample solution: To 10 mL of the solution prepared in the test for *Appearance of Solution* add 10 mL of water.
Instrumental conditions
(See *Ultraviolet-Visible Spectroscopy* ⟨857⟩.)
Mode: UV-Vis
Analytical wavelength: 354 nm
Cell: 1 cm
Analysis
Sample: *Sample solution*
Acceptance criteria: Absorbance is NMT 0.01.

• **SULFATE**
[NOTE—All solutions used for this test must be prepared with distilled water.]
Sulfate standard solution A: To 181 mg of potassium sulfate in a 100-mL volumetric flask add a few mL of 30% alcohol. Swirl to dissolve, dilute with 30% alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, and dilute with 30% alcohol to volume (10 µg/mL of sulfate).
Sulfate standard solution B: To 181 mg of potassium sulfate in a 100-mL volumetric flask add a few mL of water. Swirl to dissolve, dilute with water to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume (10 µg/mL of sulfate).
Sodium chloride solution: 50 mg/mL of Sodium Chloride in water
Barium chloride solution: 250 mg/mL of barium chloride in water
Standard solution: To 1.5 mL of *Sulfate standard solution A* add 1 mL of *Barium chloride solution*. Shake, and allow to stand for 1 min. To 2.5 mL of the resulting suspension add 15 mL of *Sulfate standard solution B* and 0.5 mL of 5 N acetic acid, and mix.
Sample solution: To 1.5 mL of *Sulfate standard solution A* add 1 mL of *Barium chloride solution*. Shake, and allow to stand for 1 min. To 2.5 mL of the resulting suspension add 15 mL of *Sodium chloride solution* and 0.5 mL of 5 N acetic acid, and mix.
Acceptance criteria: Any opalescence produced in the *Sample solution* after 5 min standing is NMT that produced in the *Standard solution* (200 ppm).

SPECIFIC TESTS

• **‘APPEARANCE OF SOLUTION:** Dissolve 20.0 g of Sodium Chloride in carbon dioxide-free water, and dilute with the same solvent to 100.0 mL. This solution is clear and colorless.◆

• **ACIDITY OR ALKALINITY**
Analysis: To 20 mL of the solution prepared for the test for *Appearance of Solution* add 0.1 mL of bromothymol blue TS.
Acceptance criteria: NMT 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

• **LOSS ON DRYING** ⟨731⟩
Sample: 1.000 g
Analysis: Dry the *Sample* in an oven at 105° for 2 h.
Acceptance criteria: NMT 0.5%

• ‘ **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Sodium Chloride is used can be met. Where the label states that Sodium Chloride must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Sodium Chloride is used can be met.◆

• ‘ **STERILITY TESTS** ⟨71⟩: Where the label states that Sodium Chloride is sterile, it meets the requirements for *Sterility* under the relevant dosage form monograph(s) in which Sodium Chloride is used.◆

ADDITIONAL REQUIREMENTS

• ‘**PACKAGING AND STORAGE:** Preserve in well-closed containers.◆

• ‘**LABELING:** Where Sodium Chloride is intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions, it is so labeled. Where Sodium Chloride must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Sodium Chloride is sterile, it is so labeled.◆

Sodium Chloride Injection

DEFINITION

Sodium Chloride Injection is a sterile solution of Sodium Chloride in Water for Injection. It contains no antimicrobial agents. It contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium chloride (NaCl).

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩ and *Chloride* ⟨191⟩: Meets the requirements

ASSAY

• **PROCEDURE**
Sample solution: Transfer a volume of Injection, equivalent to 90 mg of sodium chloride, into a conical flask. Add water, if necessary, to bring the volume to 10 mL, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.
Analysis: Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride (NaCl).
Acceptance criteria: 95.0%–105.0%

IMPURITIES

• **IRON** ⟨241⟩
Test preparation: Dilute 5.0 mL of Injection with water to 45 mL, and add 2 mL of hydrochloric acid.
Acceptance criteria: NMT 2 ppm

SPECIFIC TESTS

• **pH** ⟨791⟩: 4.5–7.0

• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩: Meets the requirements

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩: NMT 0.5 USP Endotoxin Unit/mL where the labeled amount of sodium chloride in the Injection is between 0.5% and 0.9%, and NMT 3.6 USP Endotoxin Units/mL where the labeled amount of sodium chloride in the Injection is between 3.0% and 24.3%

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

• **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct

www.webofpharma.com

injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol/mL.

Bacteriostatic Sodium Chloride Injection

DEFINITION

Bacteriostatic Sodium Chloride Injection is a sterile, isotonic solution of Sodium Chloride in Water for Injection, and it contains one or more suitable antimicrobial agents. It contains NLT 0.85% and NMT 0.95% of NaCl.

[NOTE—Use Bacteriostatic Sodium Chloride Injection with due regard for the compatibility of the antimicrobial agent or agents it contains with the particular medicinal substance that is to be dissolved or diluted.]

IDENTIFICATION

- **IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩ and *Chloride* ⟨191⟩**:** Meets the requirements

ASSAY

- **PROCEDURE**

Sample solution: Equivalent to 90 mg of sodium chloride from the volume of Injection. Add water, if necessary, to bring the volume to 10 mL, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Analysis: Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

Acceptance criteria: 0.85%–0.95%

IMPURITIES

INORGANIC IMPURITIES

- **Iron** ⟨241⟩

Test preparation: Dilute 5.0 mL of Injection with water to 45 mL, and add 2 mL of hydrochloric acid.

Acceptance criteria: NMT 2 ppm

SPECIFIC TESTS

- **ANTIMICROBIAL AGENT(S):** It meets the requirements under *Antimicrobial Effectiveness Testing* ⟨51⟩, and meets the labeled claim for content of the antimicrobial agent(s) as determined by the method set forth under *Antimicrobial Agents—Content* ⟨341⟩, except use the following procedure when methylparaben and propylparaben are used as the antimicrobial agents.

Mobile phase: Methanol and water (7:3)

Standard stock solution: 1.2 mg/mL of USP Methylparaben RS and 0.12 mg/mL of USP Propylparaben RS in methanol

Standard solution: Pipet 5 mL of the *Standard stock solution* into a 50-mL volumetric flask, add by pipet 30 mL of methanol, and dilute with water to volume.

Sample solution: Pipet 1 mL of Injection into a 10-mL volumetric flask, add by pipet 7.0 mL of methanol, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 12 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor: 0.52 for methylparaben and 1.05 for propylparaben

Resolution: NLT 2.0 between the methylparaben and propylparaben peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration, in mg/mL, of methylparaben or propylparaben in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak height from the *Sample solution*

r_S = peak height from the *Standard solution*

C_S = concentration of USP Methylparaben RS or USP Propylparaben RS in the *Standard solution* (mg/mL)

- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** Meets the requirements for small-volume injections
- **pH** ⟨791⟩**:** 4.5–7.0
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** NMT 1.0 USP Endotoxin Unit/mL
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, of not larger than 30-mL size, preferably of Type I or Type II glass.
- **LABELING:** Label it to indicate the name(s) and proportion(s) of the added antimicrobial agent(s). Label it also to include the statement: NOT FOR USE IN NEWBORNS, in boldface capital letters, on the label immediately under the official name, printed in a contrasting color, preferably red. Alternatively, the statement may be placed prominently elsewhere on the label if the statement is enclosed within a box. Label it also to include the statement: NOT FOR INHALATION.
- **USP REFERENCE STANDARDS** ⟨11⟩

USP Methylparaben RS

USP Propylparaben RS

Sodium Chloride Irrigation

» Sodium Chloride Irrigation is Sodium Chloride Injection that has been suitably packaged, and it contains no antimicrobial agents. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of NaCl.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass. The container may be designed to empty rapidly and may contain a volume of more than 1 L.

Labeling—The designation "not for injection" appears prominently on the label.

Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Chloride* ⟨191⟩.

Bacterial Endotoxins Test ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.

Sterility Tests ⟨71⟩: meets the requirements.

Other requirements—It meets the requirements for *pH*, *Iron*, and *Assay* under *Sodium Chloride Injection*.

www.webofpharma.com

Sodium Chloride Ophthalmic Ointment

DEFINITION
Sodium Chloride Ophthalmic Ointment is Sodium Chloride in a suitable ophthalmic ointment base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium chloride (NaCl). It is sterile.

IDENTIFICATION
• **A. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Sodium*
Sample solution: Transfer a quantity of Ophthalmic Ointment, equivalent to about 200 mg of sodium chloride, to a separator containing 25 mL of ether, and extract with 5 mL of water. Use the aqueous extract.
Acceptance criteria: Meets the requirements
• **B. IDENTIFICATION TESTS—GENERAL** ⟨191⟩, *Chloride*
Sample solution: Use the *Sample solution* from *Identification A.*
Acceptance criteria: Meets the requirements

ASSAY
• **PROCEDURE**
Sample solution: Transfer a quantity of Ophthalmic Ointment, equivalent to about 100 mg of sodium chloride, to a separator containing 50 mL of ether, and extract with four 20-mL portions of water. Combine the aqueous extracts in a conical flask, evaporate to a volume of about 10 mL, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS.
Titrimetric system
Mode: Direct titration
Titrant: 0.1 N silver nitrate VS
Endpoint detection: Visual
Analysis: Titrate, with shaking, with *Titrant* to a pink endpoint.
Calculate the percentage of the labeled amount of sodium chloride in the portion of Ophthalmic Ointment taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = *Titrant* volume consumed by the sample (mL)
N = *Titrant* normality (mEq/mL)
F = equivalent weight of sodium chloride, 58.44 mg/mEq
W = nominal amount of sodium chloride in the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **STERILITY TESTS** ⟨71⟩**:** Meets the requirements
• **OTHER REQUIREMENTS:** It meets the requirements for *Particulate and Foreign Matter* and *Container Contents* in *Ophthalmic Products—Quality Tests* ⟨771⟩, *Drug Product Quality, Universal Tests, Particulate and Foreign Matter*and*Container Contents.*

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes. Store at controlled room temperature. Store away from heat. Protect from freezing.

Sodium Chloride Inhalation Solution

» Sodium Chloride Inhalation Solution is a sterile solution of Sodium Chloride in water purified by distillation or by reverse osmosis and rendered sterile. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of NaCl. It contains no antimicrobial agents or other added substances.

Packaging and storage—Preserve in single-dose containers.
Identification—It responds to the test for *Sodium* ⟨191⟩ and for *Chloride* ⟨191⟩.
Sterility Tests ⟨71⟩: meets the requirements.
pH ⟨791⟩: between 4.5 and 7.0.
Assay—Pipet a volume of Inhalation Solution, equivalent to about 90 mg of sodium chloride, into a conical flask, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

Sodium Chloride Ophthalmic Solution

» Sodium Chloride Ophthalmic Solution is a sterile solution of Sodium Chloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sodium chloride. It may contain suitable antimicrobial and stabilizing agents. It contains a buffer.

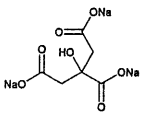
Packaging and storage—Preserve in tight containers.
Identification—Heat a portion of Ophthalmic Solution to boiling, and filter while hot. After cooling, the filtrate responds to the tests for *Sodium* ⟨191⟩ and for *Chloride* ⟨191⟩.
Sterility Tests ⟨71⟩: meets the requirements.
pH ⟨791⟩: between 6.0 and 8.0.
Assay—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 90 mg of sodium chloride, to a conical flask, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

Sodium Chloride Tablets

» Sodium Chloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of NaCl.

Packaging and storage—Preserve in well-closed containers.
Identification—A filtered extract of Tablets responds to the tests for *Sodium* ⟨191⟩ and for *Chloride* ⟨191⟩.
Disintegration ⟨701⟩: 30 minutes.
Uniformity of dosage units ⟨905⟩: meet the requirements.
Iodide or bromide—Digest 2.0 g of powdered Tablets with 25 mL of warm alcohol for 3 hours, cool, and filter. Evaporate the filtrate to dryness, dissolve the residue in 5 mL of water, filter if necessary, and add 1 mL of chloroform. Cautiously introduce, dropwise, with constant agitation, 5 drops of dilute chlorine TS (1 in 3): the chloroform does not acquire a violet, yellow, or orange color.

www.webofpharma.com



Barium—Digest 4.0 g of powdered Tablets with 20 mL of water, filter, and divide the solution into two equal portions. To one portion add 2 mL of 2 N sulfuric acid and to the other add 2 mL of water: the solutions are equally clear after standing for 2 hours.
Calcium and magnesium—Digest 1 g of powdered Tablets with 50 mL of water, and filter. Add 4 mL of 6 N ammonium hydroxide to the filtrate, and divide the mixture into two equal portions. Treat one portion with 1 mL of ammonium oxalate TS and the other portion with 1 mL of dibasic sodium phosphate TS: neither mixture becomes turbid within 5 minutes.
Assay—Dissolve a counted number of not less than 20 Tablets in about 100 mL of water, filter into a 500-mL volumetric flask, and wash the original container and the filter with 100 mL of water in divided portions, adding the washings to the original filtrate. Dilute with water to volume. Pipet a volume of the solution, equivalent to about 90 mg of sodium chloride, to a conical flask, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

Sodium Chloride Tablets for Solution

» Sodium Chloride Tablets for Solution are composed of Sodium Chloride in compressed form, containing no added substance. Sodium Chloride Tablets for Solution contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of NaCl.

Other requirements—The Sodium Chloride Tablets for Solution respond to the *Identification* test and meet the requirements for *Packaging and storage, Iodide or bromide, Barium, Calcium and magnesium, Disintegration, Uniformity of dosage units*, and *Assay* under *Sodium Chloride Tablets*.

Sodium Citrate

$C_6H_5Na_3O_7$ 258.07
1,2,3-Propanetricarboxylic acid, 2-hydroxy-, trisodium salt; Trisodium citrate (anhydrous) [68-04-2].

$C_6H_5Na_3O_7 \cdot 2H_2O$ 294.10
Trisodium citrate dihydrate [6132-04-3].

DEFINITION
Sodium Citrate is anhydrous or contains two molecules of water of hydration. It contains NLT 99.0% and NMT 100.5% of $C_6H_5Na_3O_7$, calculated on the anhydrous basis.

IDENTIFICATION
• **A. Identification Tests—General,** *Sodium* ⟨191⟩
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements
• **B. Identification Tests—General,** *Citrate* ⟨191⟩
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements
• **C.** Upon ignition, it yields an alkaline residue that effervesces when treated with 3 N hydrochloric acid.

ASSAY
• **Procedure**
Sample: Add 100 mL of glacial acetic acid to 350 mg of Sodium Citrate (previously dried at 180° for 18 h) in a 250-mL beaker. Stir until completely dissolved.
Analysis: Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 8.602 mg of $C_6H_5Na_3O_7$.
Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES
• **Tartrate**
Analysis: To a solution of 1 g in 2 mL of water in a test tube add 1 mL of potassium acetate TS and 1 mL of 6 N acetic acid. Rub the wall of the tube with a glass rod.
Acceptance criteria: No crystalline precipitate is formed.

SPECIFIC TESTS
• **Alkalinity**
Sample solution: 1.0 g in 20 mL of water
Acceptance criteria: The *Sample solution* is alkaline to litmus paper, but after the addition of 0.20 mL of 0.10 N sulfuric acid, no pink color is produced by 1 drop of phenolphthalein TS.
• **Water Determination,** *Method III* ⟨921⟩**:** Dry a sample at 180° for 18 h: the anhydrous form loses NMT 1.0% of its weight; the hydrous form loses 10.0%–13.0% of its weight.

ADDITIONAL REQUIREMENTS
• **Packaging and Storage:** Preserve in tight containers.
• **Labeling:** Label it to indicate whether it is anhydrous or hydrous.

Sodium Citrate and Citric Acid Oral Solution

DEFINITION
Sodium Citrate and Citric Acid Oral Solution is a solution of Sodium Citrate and Citric Acid in a suitable aqueous medium. It contains, in each 100 mL, NLT 2.23 g and NMT 2.46 g of sodium (Na), and NLT 6.11 g and NMT 6.75 g of citrate ($C_6H_5O_7$), equivalent to NLT 9.5 g and NMT 10.5 g of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$), and NLT 6.34 g and NMT 7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$).

IDENTIFICATION
• **A.** Sodium Citrate and Citric Acid Oral Solution imparts an intense yellow color to a nonluminous flame.
• **B.**
Sample solution: 2 mL of Oral Solution
Analysis: Add 2 mL of 15% potassium carbonate TS to the *Sample solution*, boil, and cool. Add 4 mL of potassium pyroantimonate TS.
Acceptance criteria: A dense precipitate is formed (indicates the presence of sodium).
• **C.**
Sample solution: A dilution of Oral Solution (1 in 20)
Analysis: Add 5 mL of sodium cobaltinitrite TS to 2 mL of *Sample solution*.
Acceptance criteria: A yellow precipitate is not formed immediately (indicates the absence of potassium).

www.webofpharma.com

• **D. Identification Tests—General** ⟨191⟩, *Chemical Identification Tests, Citrate*
Sample solution: 3–5 drops of Oral Solution
Analysis: Add 20 mL of a mixture of pyridine and acetic anhydride (3:1) to the *Sample solution.*
Acceptance criteria: A light red color is produced.

ASSAY

• **Sodium**
Sodium stock solution: 58.44 mg/mL of sodium chloride prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with water to volume.
Diluent: 1.04 mg/mL of lithium nitrate in water (equivalent to 15 mEq per 1000 mL of lithium) with a suitable nonionic surfactant
Standard stock solution: Pipet 50 mL of the *Sodium stock solution* into a 500-mL volumetric flask and dilute with water to volume.
Standard solution: Dilute 50 µL of the *Standard stock solution* with *Diluent* to 10 mL.
Sample stock solution: Transfer a volume of Oral Solution, equivalent to 1 g of sodium citrate dihydrate, to a 100-mL volumetric flask and dilute with water to volume.
Sample solution: Dilute 50 µL of the *Sample stock solution* with *Diluent* to 10 mL.
Blank: *Diluent*
Instrumental conditions
Mode: Flame photometry
Analytical wavelength: Sodium emission line at 589 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Adjust the flame photometer to read zero with the *Diluent.* Concomitantly determine the sodium flame emission readings for the *Standard solution* and the *Sample solution.*
Calculate the quantity (g) of sodium (Na) in 100 mL of Oral Solution taken:

$$\text{Result} = (R_{U,\,Na}/R_{S,\,Na}) \times (W/V) \times F \times (A_r/M_r) \times F_1$$

$R_{U,\,Na}$ = sodium emission reading of the *Sample solution*
$R_{S,\,Na}$ = sodium emission reading of the *Standard solution*
W = weight of sodium chloride in the *Sodium stock solution* (g)
V = volume of Oral Solution taken (mL)
F = ratio of the dilution factor of the *Sample solution* to the *Standard solution*, 0.04
A_r = atomic weight of sodium, 22.99
M_r = molecular weight of sodium chloride, 58.44
F_1 = conversion factor for each 100 mL of Oral Solution, 100 mL

Acceptance criteria: 2.23–2.46 g of sodium (Na) in each 100 mL of Oral Solution

• **Sodium Citrate**
Cation-exchange column: Mix 10 g of styrene–divinylbenzene cation-exchange resin with 50 mL of water in a suitable beaker. Allow the resin to settle and decant the supernatant until a slurry of resin remains. Pour the slurry into a 15-mm × 30-cm glass chromatographic tube (having a sealed-in, coarse-porosity fritted disk and fitted with a stopcock), and allow to settle as a homogeneous bed. Wash the resin bed with about 100 mL of water, closing the stopcock when the water level is about 2 mm above the resin bed.
Sample solution: Transfer a volume of Oral Solution, equivalent to 1 g of sodium citrate dihydrate, to a 100-mL volumetric flask and dilute with water to volume.
Titrimetric system
Mode: Direct titration
Titrant: 0.02 N sodium hydroxide VS
Endpoint detection: Visual
Analysis
Sample: *Sample solution*
Pipet 5 mL of the *Sample solution* carefully onto the top of the resin bed in the *Cation-exchange column.* Place a 250-mL conical flask below the column, open the stopcock, and allow to flow until the solution has entered the resin bed. Elute the column with 60 mL of water at a flow rate of about 5 mL/min, collecting about 65 mL of the eluate. Add 5 drops of phenolphthalein TS to the eluate, swirl the flask, and titrate with *Titrant.* Record the buret reading and calculate the volume of *Titrant* consumed.
Calculate the quantity (g) of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in 100 mL of the Oral Solution taken:

$$\text{Result} = \{[V \times N \times F \times (D/V_S)] - [(M_{r1}/M_{r2}) \times C]\} \times F_1 \times F_2$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 98.05 mg/mEq for sodium citrate dihydrate
D = dilution factor of the *Sample solution*, 20
V_S = volume of Oral Solution taken (mL)
M_{r1} = molecular weight of sodium citrate dihydrate, 294.10
M_{r2} = molecular weight of citric acid monohydrate, 210.14
C = concentration of citric acid monohydrate in the *Sample solution*, as obtained in the *Assay* for *Citric Acid* (mg/mL)
F_1 = conversion factor from mg to g, 0.001
F_2 = conversion factor for each 100 mL of Oral Solution, 100 mL

Acceptance criteria: 9.5–10.5 g of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in each 100 mL of Oral Solution

• **Citric Acid**
Sample solution: Transfer a volume of Oral Solution, equivalent to 0.67 g of citric acid monohydrate, to a 100-mL volumetric flask and dilute with water to volume.
Titrimetric system
Mode: Direct titration
Titrant: 0.02 N sodium hydroxide VS
Endpoint detection: Visual
Analysis
Sample: *Sample solution*
Transfer 5 mL of the *Sample solution* to a suitable flask. Add 25 mL of water and 5 drops of phenolphthalein TS. Titrate with *Titrant* to a pink endpoint. Record the buret reading and calculate the volume of *Titrant* consumed.
Calculate the quantity (g) of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$) in 100 mL of Oral Solution taken:

$$\text{Result} = V \times N \times F \times (D/V_S) \times F_1 \times F_2$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)
N = actual normality of the *Titrant* (mEq/mL)
F = equivalency factor, 70.05 mg/mEq for citric acid monohydrate
D = dilution factor of the *Sample solution*, 20
V_S = volume of Oral Solution taken (mL)
F_1 = conversion factor from mg to g, 0.001

USP Monographs

www.webofpharma.com

F_2 = conversion factor for each 100 mL of Oral Solution, 100 mL

Acceptance criteria: 6.34–7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$) in each 100 mL of Oral Solution

PERFORMANCE TESTS
- **DELIVERABLE VOLUME** ⟨698⟩
  For multiple-unit containers
  Acceptance criteria: Meets the requirements
- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩
  For single-unit containers
  Acceptance criteria: Meets the requirements

SPECIFIC TESTS
- **pH** ⟨791⟩**:** 4.0–4.4

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.

Sodium Fluoride

NaF 41.99
Sodium fluoride [7681-49-4].

DEFINITION
Sodium Fluoride contains NLT 98.0% and NMT 102.0% of NaF, calculated on the dried basis.

IDENTIFICATION
- **A. FLUORIDE**
  Sample: 1 g
  Analysis: Place the *Sample* in a platinum crucible in a well-ventilated hood, add 15 mL of sulfuric acid, and cover the crucible with a piece of clear, polished glass. Heat the crucible on a steam bath for 1 h, remove the glass cover, rinse it in water, and wipe dry.
  Acceptance criteria: The surface of the glass is etched.
- **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩
  Sample solution: 1 in 25
  Acceptance criteria: Meets the requirements

ASSAY
- **PROCEDURE**
  Sample solution: To 80.0 mg add a mixture of 5 mL of acetic anhydride and 20 mL of glacial acetic acid, and heat to dissolve. Allow to cool. [NOTE—The heating step to dissolve the sodium fluoride in the acetic acid mixture is critical. It is recommended to heat for a minimum of 30 min and use sonication, if necessary, to make sure dissolution is complete prior to the titration step.]
  Analysis: Add 20 mL of dioxane to the *Sample solution*. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 4.199 mg of NaF.
  Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES
- **CHLORIDE**
  Sample solution: 300 mg in 20 mL of water
  Analysis: To the *Sample solution* add 200 mg of boric acid, 1 mL of nitric acid, and 1 mL of 0.1 N silver nitrate.
  Acceptance criteria: Any turbidity produced is NMT that of a blank to which has been added 1.0 mL of 0.0010 N hydrochloric acid (NMT 0.012%).

SPECIFIC TESTS
- **ACIDITY OR ALKALINITY**
  Sample: 2.0 g
  Analysis: Dissolve the *Sample* in 40 mL of water in a platinum dish. Add 10 mL of a saturated solution of potassium nitrate, cool the solution to 0°, and add 3 drops of phenolphthalein TS.
  Acceptance criteria: If no color appears, a pink color persisting for 15 s is produced by NMT 2.0 mL of 0.10 N sodium hydroxide. If the solution is colored pink by the addition of phenolphthalein TS, it is rendered colorless by NMT 0.50 mL of 0.10 N sulfuric acid. [NOTE—Save the neutralized solution for the test for *Fluosilicate*.]
- **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 150° for 4 h: it loses NMT 1.0% of its weight.
- **FLUOSILICATE**
  Analysis: After the solution from the test for *Acidity or Alkalinity* has been neutralized, heat to boiling, and titrate while hot with 0.10 N sodium hydroxide until a permanent pink color is obtained.
  Acceptance criteria: NMT 1.5 mL of 0.10 N sodium hydroxide is required.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sodium Fluoride Gel

DEFINITION
Sodium Fluoride Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium fluoride (NaF), in an aqueous medium containing a suitable viscosity-inducing agent. It may contain a suitable buffering agent.
[NOTE—This monograph is only applicable to *Preventive treatment gels* and is not applicable to *Dentifrices* as defined under 21 CFR §355.3.]

Sodium Fluoride and Phosphoric Acid Gel

DEFINITION
Sodium Fluoride and Phosphoric Acid Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of fluoride ion, in an aqueous medium containing a suitable viscosity-inducing agent.

IDENTIFICATION
• **A.**
Sample: A suitable quantity of Gel nominally equivalent to about 500 mg of fluoride ion
Analysis: Place the *Sample* in a platinum crucible in a well-ventilated hood, and add 15 mL of *sulfuric acid.* Cover the crucible with a piece of clear, polished glass, and heat on a steam bath for 1 h. Remove the glass cover, rinse it in water, and dry.
Acceptance criteria: The glass surface exposed to vapors from the crucible is etched.
• **B.** *Identification Tests—General* ⟨191⟩, *Chemical Identification Tests, Phosphate*: Meets the requirements

ASSAY
• **PROCEDURE**
[NOTE—Store all solutions except the *Buffer solution* in plastic containers.]
Buffer solution: Dissolve 57 mL of glacial acetic acid, 58 g of *sodium chloride,* and 4 g of (1,2-cyclohexylenedinitrilo) tetraacetic acid in 500 mL of water. Adjust with 5 N *sodium hydroxide* to a pH of 5.25 ± 0.25, and dilute with water to 1000 mL.
Standard solution A: 420 µg/mL of USP Sodium Fluoride RS in water, equivalent to 190 µg/mL (10^{-2} M) of fluoride ion
Standard solution B: 19 µg/mL (10^{-3} M) of fluoride ion in water from *Standard solution A*
Standard solution C: 1.9 µg/mL (10^{-4} M) of fluoride ion in water from *Standard solution B*
Sample solution: Nominally 20 µg/mL of fluoride ion from Gel in water
Analysis
Samples: *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution*
Transfer 20 mL of *Standard solution A, Standard solution B, Standard solution C,* and *Sample solution* into separate plastic beakers, each containing a plastic-coated stirring bar. Transfer 20 mL of *Buffer solution* into each beaker. Concomitantly measure the potentials (see *pH* ⟨791⟩), in millivolts, of each solution with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a suitable reference electrode.
[NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]
Plot the logarithms of the fluoride-ion concentrations, in µg/mL, of *Standard solution A, Standard solution B,* and *Standard solution C* versus potential, in millivolts. From the measured potential of the *Sample solution* and the standard response line, determine the concentration, *C,* in µg/mL, of fluoride ion in the *Sample solution.*
Calculate the percentage of the labeled amount of fluoride ion in the portion of Gel taken:

$$\text{Result} = (C/C_U) \times 100$$

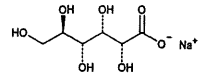
C = concentration of fluoride in the *Sample solution* (µg/mL)
C_U = nominal concentration of fluoride ion in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
• **pH** ⟨791⟩
Sample: About 40 mL
Analysis: Place the *Sample* in a plastic beaker, and determine the pH using a suitable electrode system.
Acceptance criteria: 3.0–4.0
• **VISCOSITY—ROTATIONAL METHODS** ⟨912⟩
Sample: A portion of Gel
Analysis: Transfer the *Sample* to a suitable plastic container, insert the stopper securely, and allow to stand until the *Sample* is free from air bubbles. Place it in a water bath

www.webofpharma.com

maintained at a temperature of 25 ± 0.5° until it adjusts to the temperature of the water bath (30 min or longer). Do not stir the *Sample* while it is in the bath. Remove the *Sample* from the bath, stir the *Sample* gently for 5 s, and without delay, using a rotational viscometer, determine the viscosity using the appropriate spindle to obtain a scale reading between 10% and 90% of full scale at a speed of 60 rpm or 30 rpm.



Calculate the viscosity, in centipoises, by multiplying the scale reading by the constant for the spindle and speed used.

Acceptance criteria: 7,000–20,000 centipoises

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, plastic containers.
- **LABELING:** Label Gel in terms of the content of sodium fluoride (NaF) and in terms of the content of fluoride ion.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Sodium Fluoride RS

Sodium Gluconate

$C_6H_{11}NaO_7$ 218.14

D-Gluconic acid, monosodium salt;
Monosodium D-gluconate [527-07-1].

DEFINITION

Sodium Gluconate contains NLT 98.0% and NMT 102.0% of $C_6H_{11}NaO_7$.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩
  Sample solution: 1 in 20
  Acceptance criteria: Meets the requirements
- **B. THIN-LAYER CHROMATOGRAPHY**
  Standard solution: 10 mg/mL of USP Potassium Gluconate RS in water. [NOTE—Heat in a water bath at 60° if necessary to dissolve.]
  Sample solution: 10 mg/mL of Sodium Gluconate in water. [NOTE—Heat in a water bath at 60° if necessary to dissolve.]
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel
  Application volume: 5 µL
  Developing solvent system: Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)
  Spray reagent: Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Develop in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool and spray with the *Spray reagent*. Heat the plate at 110° for 10 min.
  Acceptance criteria: The principal spot from the *Sample solution* corresponds in color, size, and R_F value to that from the *Standard solution*.

ASSAY

- **PROCEDURE**
  Sample: 150 mg
  Analysis: Transfer the *Sample* to a suitable conical flask and dissolve in 75 mL of glacial acetic acid, warming if necessary to dissolve. Cool, add quinaldine red TS, and titrate with 0.1 N perchloric acid VS to a colorless endpoint. Each mL of 0.1 N perchloric acid is equivalent to 21.81 mg of $C_6H_{11}NaO_7$.
  Acceptance criteria: 98.0%–102.0%

IMPURITIES

- **CHLORIDE AND SULFATE,** *Chloride* ⟨221⟩
  Sample: 1.0 g
  Acceptance criteria: The *Sample* shows no more chloride than corresponds to 1 mL of 0.020 N hydrochloric acid (NMT 0.07%).
- **CHLORIDE AND SULFATE,** *Sulfate* ⟨221⟩
  Sample: 2.0 g
  Acceptance criteria: The *Sample*, dissolved in boiling water, shows no more sulfate than corresponds to 1 mL of 0.020 N sulfuric acid (NMT 0.05%).
- **LEAD** ⟨251⟩
  Test preparation: 1.0 g in 25 mL of water
  Acceptance criteria: NMT 10 ppm
- **REDUCING SUBSTANCES**
  Sample: 1.0 g
  Analysis: Transfer the *Sample* to a 250-mL conical flask, dissolve in 10 mL of water, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of 0.1 N iodine VS, and 10 mL of 3 N hydrochloric acid, and titrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, omitting the specimen, and note the difference in volumes required (see *Titrimetry* ⟨541⟩). Each mL of the difference in volume of 0.1 N sodium thiosulfate consumed is equivalent to 2.7 mg of reducing substances (as dextrose).
  Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Potassium Gluconate RS

Sodium Hypochlorite Solution

NaClO 74.44

Hypochlorous acid, sodium salt;
Sodium hypochlorite [7681-52-9].

DEFINITION

Sodium Hypochlorite Solution contains NLT 4.0% and NMT 6.0%, by weight, of sodium hypochlorite (NaClO).
[CAUTION—This solution is not suitable for application to wounds.]

IDENTIFICATION

- **A.**
  Sample: Sodium Hypochlorite Solution
  Acceptance criteria: The *Sample* at first colors red litmus blue and then bleaches it.
- **B.**
  Sample: Sodium Hypochlorite Solution
  Acceptance criteria: The *Sample* imparts an intense yellow color to a nonluminous flame.

www.webofpharma.com

ASSAY

• **PROCEDURE**

Sample solution: 3 g of Sodium Hypochlorite Solution

Titrimetric system

(See *Titrimetry* ⟨541⟩.)

Mode: Direct titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Dilute the *Sample solution* with 50 mL of water, and add 2 g of potassium iodide and 10 mL of 6 N acetic acid. Titrate the liberated iodine with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, and make any necessary correction. Calculate the percentage of sodium hypochlorite (NaClO) in the portion of Sodium Hypochlorite Solution taken:

$$\text{Result} = [(V - B) \times N \times (F/W)] \times 100$$

V = sample *Titrant* volume (mL)
B = blank *Titrant* volume (mL)
N = normality of the *Titrant* (mEq/mL)
F = 37.22 mg/mEq
W = sample weight (mg)

Acceptance criteria: 4.0%–6.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, at a temperature not exceeding 25°.

Sodium Hypochlorite Compounded Topical Solution

DEFINITION

Sodium Hypochlorite Compounded Topical Solution contains NLT 0.20 g and NMT 0.32 g of sodium hypochlorite (NaClO) in 1000 mL of Topical Solution.

Prepare Sodium Hypochlorite Compounded Topical Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sodium Hypochlorite Solution	5.0 mL
Monobasic Sodium Phosphate, monohydrate	1.02 g
Dibasic Sodium Phosphate, anhydrous	17.61 g
Purified Water, a sufficient quantity to make	1000 mL

Dissolve the *Dibasic Sodium Phosphate, anhydrous* and the *Monobasic Sodium Phosphate, monohydrate* in about 500 mL of *Purified Water*. Add the *Sodium Hypochlorite Solution* and sufficient *Purified Water* to bring the preparation to final volume, and mix.

[NOTE—The source of the *Sodium Hypochlorite Solution* may be commercial unscented laundry bleach, nominally 5.25% (w/v) provided that the commercial laundry bleach was acquired recently.]

ASSAY

• **PROCEDURE**

Sample: 50.0 mL

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: To the *Sample* in a glass-stoppered flask add 0.5 g of potassium iodide and 10 mL of 6 N acetic acid. Titrate the liberated iodine with *Titrant*, adding 2 mL of starch TS as the endpoint is approached. Perform a blank determination and make any necessary correction. Each mL of *Titrant* is equivalent to 3.722 mg of sodium hypochlorite (NaClO).

Acceptance criteria: 0.20–0.32 g in 1000 mL

SPECIFIC TESTS

• **pH** ⟨791⟩**:** 7.8–8.2

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant, 1-L plastic containers, and store at controlled room temperature.

• **BEYOND-USE DATE:** NMT 7 days after the date on which it was compounded when stored at controlled room temperature

• **LABELING:** Label it to indicate that its strength is 0.025%, and to state the *Beyond-Use Date*. [NOTE—For external use only; it may be applied to wounds and burns.]

Sodium Iodide

NaI 149.89

Sodium iodide [7681-82-5].

DEFINITION

Sodium Iodide contains NLT 99.0% and NMT 101.5% of NaI, calculated on the anhydrous basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨191⟩

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL,** *Iodide* ⟨191⟩

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Sample: 500 mg

Analysis: Dissolve the *Sample* in 10 mL of water. Add 35 mL of hydrochloric acid, and titrate with 0.05 M potassium iodate VS until the dark brown solution that is produced becomes pale brown. Add 1 mL of amaranth TS, and continue the titration slowly until the red color just changes to yellow. Each mL of 0.05 M potassium iodate is equivalent to 14.99 mg of NaI.

Acceptance criteria: 99.0%–101.5% on the anhydrous basis

IMPURITIES

• **IODATE**

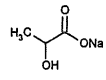
Iodate solution: Dilute 1 mL of potassium iodate solution (1 in 2500) with water to 100 mL.

Standard solution: Dissolve 100 mg of Sodium Iodide in ammonia- and carbon dioxide-free water and add 1 mL of *Iodate solution* to obtain 10 mL of solution. Transfer to a color-comparison tube.

Sample solution: Dissolve 1.1 g in sufficient ammonia- and carbon dioxide-free water to obtain 10 mL of solution. Transfer to a color-comparison tube.

Analysis: To each color comparison tube add 1 mL of starch TS and 0.25 mL of 1.0 N sulfuric acid, and mix.

Acceptance criteria: Any color produced in the *Sample solution* does not exceed that in the *Standard solution* (NMT 4 ppm).



www.webofpharma.com

• **THIOSULFATE AND BARIUM**
Sample solution: Dissolve 0.5 g in 10 mL of ammonia- and carbon dioxide-free water.
Analysis: Add 2 drops of 2 N sulfuric acid to the *Sample solution.*
Acceptance criteria: No turbidity develops within 1 min.
• **POTASSIUM**
Sample solution: Dissolve 1.0 g in 2 mL of water.
Acceptance criteria: The *Sample solution* yields no precipitate with 1.0 mL of sodium bitartrate TS.
• **LIMIT OF NITRATE, NITRITE, AND AMMONIA**
Sample solution: Dissolve 1.0 g in 5 mL of water.
Analysis: To the *Sample solution* contained in a test tube of 40-mL capacity add 5 mL of 1 N sodium hydroxide and about 200 mg of aluminum wire. Insert a pledget of purified cotton in the upper portion of the test tube, and place a piece of moistened red litmus paper over the mouth of the tube. Heat the test tube and its contents on a steam bath for 15 min.
Acceptance criteria: No blue coloration of the paper is discernible.

SPECIFIC TESTS
• **ALKALINITY**
Sample solution: Dissolve 1.0 g in 10 mL of water.
Analysis: Add 0.15 mL of 0.10 N sulfuric acid and 1 drop of phenolphthalein TS to the *Sample solution.*
Acceptance criteria: No red color is produced.
• **WATER DETERMINATION,** *Method I* ⟨921⟩: NMT 2.0%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers.

Sodium Lactate Injection

$C_3H_5NaO_3$ 112.06
Propanoic acid, 2-hydroxy-, monosodium salt.
Sodium lactate [72-17-3].

» Sodium Lactate Injection is sterile Sodium Lactate Solution in Water for Injection, or a sterile solution of Lactic Acid in Water for Injection prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_3H_5NaO_3$.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
Labeling—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL. The label includes also the warning: "Not for use in the treatment of lactic acidosis."
Identification—Overlay 2 mL of Injection on 5 mL of a 1 in 100 solution of catechol in sulfuric acid: a deep red color is produced at the zone of contact.
Bacterial Endotoxins Test ⟨85⟩ —It contains not more than 2.0 USP Endotoxin Units per mEq.
pH ⟨791⟩: between 6.0 and 7.3, the Injection being diluted with water, if necessary, to approximately 0.16 M (20 mg per mL).
Particulate Matter in Injections ⟨788⟩: meets the requirements under small-volume injections.
Other requirements—It meets the requirements under *Injections and Implanted Drug Products* ⟨1⟩.
Assay—Pipet into a small beaker a volume of Injection, equivalent to about 300 mg of sodium lactate, and evaporate to dryness. Add to the residue 60 mL of a 1 in 5 mixture of acetic anhydride in glacial acetic acid, and stir until the residue is completely dissolved. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 11.21 mg of $C_3H_5NaO_3$.

Sodium Lactate Solution

» Sodium Lactate Solution is an aqueous solution containing not less than 50.0 percent, by weight, of monosodium lactate. It contains not less than 98.0 percent and not more than 102.0 percent of the labeled amount of $C_3H_5NaO_3$.

Packaging and storage—Preserve in tight containers.
Labeling—Label it to indicate its content of sodium lactate.
Identification—It responds to the tests for *Sodium* ⟨191⟩ and for *Lactate* ⟨191⟩.
pH ⟨791⟩: between 5.0 and 9.0.
Chloride ⟨221⟩—A portion, equivalent to 1 g of sodium lactate, shows no more chloride than corresponds to 0.7 mL of 0.020 N hydrochloric acid (0.05%).
Sulfate—To 10 mL of a solution (1 in 100) add 2 drops of hydrochloric acid and 1 mL of barium chloride TS: no turbidity is produced.
Sugars—To 10 mL of hot alkaline cupric tartrate TS add 5 drops of Solution: no red precipitate is formed.
Limit of citrate, oxalate, phosphate, or tartrate—Dilute 5 mL with recently boiled and cooled water to 50 mL. To 4 mL of this solution add 6 N ammonium hydroxide or 3 N hydrochloric acid, if necessary, to bring the pH to between 7.3 and 7.7. Add 1 mL of calcium chloride TS, and heat in a boiling water bath for 5 minutes: the solution remains clear.

Limit of methanol and methyl esters—
Potassium permanganate and *phosphoric acid solution*—Dissolve 3 g of potassium permanganate in a mixture of 15 mL of phosphoric acid and 70 mL of water. Dilute with water to 100 mL.
Oxalic acid and *sulfuric acid solution*—Cautiously add 50 mL of sulfuric acid to 50 mL of water, mix, cool, add 5 g of oxalic acid, and mix to dissolve.
Standard preparation—Prepare a solution containing 10.0 mg of methanol in 100 mL of dilute alcohol (1 in 10).
Test preparation—Place 40.0 g in a glass-stoppered, round-bottom flask, add 10 mL of water, and add cautiously 30 mL of 5 N potassium hydroxide. Connect a condenser to the flask, and steam-distill, collecting the distillate in a suitable 100-mL graduated vessel containing 10 mL of alcohol. Continue the distillation until the volume in the receiver reaches approximately 95 mL, and dilute the distillate with water to 100.0 mL.
Procedure—Transfer 10.0 mL each of the *Standard preparation* and the *Test preparation* to 25-mL volumetric

USP Monographs

www.webofpharma.com

flasks, to each add 5.0 mL of *Potassium permanganate and phosphoric acid solution*, and mix. After 15 minutes, to each add 2.0 mL of *Oxalic acid and sulfuric acid solution*, stir with a glass rod until the solution is colorless, add 5.0 mL of fuchsin-sulfurous acid TS, and dilute with water to volume. After 2 hours, concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 575 nm, with a suitable spectrophotometer, using water as the blank: the absorbance of the solution from the *Test preparation* is not greater than that from the *Standard preparation* (0.025%).

Assay—Weigh accurately into a suitable flask a volume of Solution, equivalent to about 300 mg of sodium lactate, add 60 mL of a 1 in 5 mixture of acetic anhydride in glacial acetic acid, mix, and allow to stand for 20 minutes. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 11.21 mg of $C_3H_5NaO_3$.

Sodium Monofluorophosphate

Na_2PFO_3 143.95

Phosphorofluoridic acid, disodium salt.
Disodium phosphorofluoridate [10163-15-2].

» Sodium Monofluorophosphate contains not less than 91.7 percent and not more than 100.5 percent of Na_2PFO_3, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—
USP Sodium Fluoride RS

Identification—

A: Place about 1 g in a platinum crucible in a well-ventilated hood, and add 15 mL of sulfuric acid. Cover the crucible with a piece of clear, polished glass, and heat on a steam bath for 1 hour. Remove the glass cover, rinse it in water, and dry: the glass surface exposed to vapors from the crucible is etched.

B: A solution (1 in 10) with silver nitrate TS yields a white precipitate, which is soluble in diluted nitric acid and in dilute ammonium hydroxide (1 in 2).

C: A solution responds to the tests for *Sodium* ⟨191⟩.

pH ⟨791⟩: between 6.5 and 8.0, in a solution (1 in 50).

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 0.2% of its weight.

Arsenic, *Method I* ⟨211⟩: 3 ppm.

Limit of fluoride ion— [NOTE—Use plasticware throughout this test.]
